# HISTORY OF CIVILIZATION

VOL. I.

## The Prehistoric World; OR Vanished Races,

BY

E. A. ALLEN,

EACH OF THE FOLLOWING WELL-KNOWN SCHOLARS REVIEWED ONE OR MORE CHAPTERS AND MADE VALUABLE SUGGESTIONS.

C. C. ABBOTT, M. D.,
Author of "Primitive Industry."

PROF. F. W. PUTNAM,
Curator of Peabody Museum of Archæology and Ethnology, Harvard University.

A. F. BANDELIER,
Explorer for Archæological Institute of America. Author of "Archæological Tour in Mexico."

PROF. CHAS. RAU,
Curator of Archæological Department of Smithsonian Institute.

ALEXANDER WINCHELL, LL. D.,
Professor of Geology and Paleontology, University of Michigan.

CYRUS THOMAS, PH. D.,
Of the Bureau of Ethnology.

G. F. WRIGHT,
Of the United States Geological Survey, Prof. in Theological Seminary, Oberlin, O.

CINCINNATI:
CENTRAL PUBLISHING HOUSE.
1889.

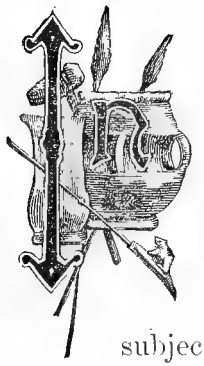
# PREFACE.



THIS series the author has sought to lay before the reader a detailed account of the development of culture, beginning with the most primitive times, and continuing the investigation down to modern eras. It is difficult to conceive of a more important subject. We live to-day in an enlightened state of society we call civilization. Nothing is more certain than that a few centuries back, the most important elements of our present civilization were unknown. Extending our observations further, we find grounds for believing that our present enlightened state has been developed from barbarism, and that barbarism itself is a growth out of savagism. We propose to trace as far as we can the steps which have thus served to conduct man from savagism to civilization.

The work is divided into four volumes, of which this book is the first. Our object in this volume is to give a description of life and times lying beyond the light of history. This is indeed an extensive subject, and calls for some explanation, both as to the general design of the work and what steps have been taken to secure correct information.

History is a word of varied import. In general, when we talk about history, we mean those accounts of past

events, times, and circumstances of which we have written records—not necessarily meaning alphabetical writing, because hieroglyphic records have furnished much true history. Hieroglyphic writing, which long preceded alphabetical writing, is itself a comparatively recent art. In no country do we find any records carrying us further back than a few thousand years before the Christian era. We have every reason to believe that the historical part of man's life on the globe is but an insignificant part of the whole. This historic period is not the same in all countries. It varies from a few centuries in our own country to a few thousands of years in Oriental lands. In no country is there a hard and fast line separating the historic period from the prehistoric. In the dim perspective of years the light gradually fades away, the mist grows thicker and thicker before us, and we at last find ourselves face to face with the unknown past.

This extensive period of time is not, however, utterly lost to us. We have simply to gather our information in some other way. Enthusiastic explorers, digging beneath the ashes of Vesuvius, have brought to light the remains of an entombed city. Of this city we indeed have historic records, but even if all such records had long since disappeared, we would gather much information as to the nationality of the inhabitants, their customs and manners, by a simple inspection of the relics themselves. Everywhere over the earth, entombed beneath the feet of the living, or crumbling on the surface, are the few relics of a past far antedating the relics of Pompeii. They are the proofs positive that some people inhabited the land in far away times.

Our object is to gather together the conclusions of the scientific world as to primitive man. We wish to see how

far back in the geological history of the globe we can find evidence of man's existence, and we desire to learn his surroundings and the manner of his life. There can be no more important field than for us to thus learn of the past—to read the story of primitive man, to walk with him the earth in ages long ago, with him to wage war on the huge animals of a previous epoch, to recede with him before the relentless march of the ice of the Glacial Age, to watch his advance in culture, to investigate whether there are any races of men now living which are the direct descendants of this primeval man.

The pleasantest part of an author's duty is to return thanks for assistance. After the manuscript was prepared with what care could be bestowed on it, it was determined to submit it to some of our best American scholars for criticism. Accordingly each of the gentlemen named on the title page were requested to review one or more chapters. As far as possible, each one was asked to review that chapter or chapters for which, either by reason of the position they held, or the interest they were known to take in such subjects, they would by common assent be acknowledged as eminently fitted to sit in judgment. In justice to them, it should be stated that they were not expected to concern themselves with the literary merits or demerits of the manuscript, but to criticise the scientific statements made therein. To each and all of these gentlemen the author would acknowledge his deep obligations.

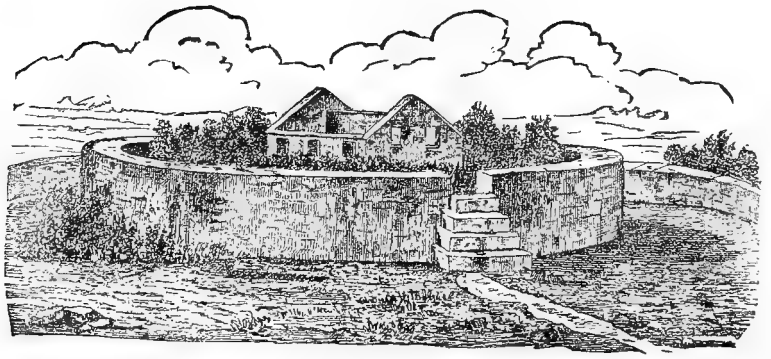
We are indebted to Rev. J. P. MacLean, the well-known archæologist, both for many valuable suggestions, and for the use of wood-cuts on pages 60, 138, and 396. We are also under obligation to Rev. S. D. Peet, editor of the *American Antiquarian*, for cuts illustrative of the

effigy mounds of Wisconsin. The officials of the SMITHSONIAN INSTITUTION, and the BUREAU OF ETHNOLOGY have our thanks for many cuts, for which credit is given them throughout the work.

Finally, the author wishes to say that it was the intention to make this work the joint production of the author and his partner, Mr. S. C. FERGUSON, but before any progress was made it was deemed advisable to change the programme. While the literary work has all been performed by the author, the many details necessarily connected with the publication of a book were attended to by Mr. FERGUSON.

E. A. ALLEN.

CINCINNATI, *January* 1, 1887.



Ruins of Cannar, Ancient Peru.

# CONTENTS.

## CHAPTER I.

INTRODUCTION.

DIFFICULTIES of the subject—Lesson to be learned—The pursuit of knowledge—Recent advances—Prehistoric past of the Old World—Of the New—Of Mexico and the South—The Isles of the Pacific—Similar nature of the relics—The wonders of the present age—History of popular opinion on this subject—The teachings of the Bible—Nature of the evidence of man's antiquity—The steps leading up to this belief—Geology—Astronomy—Unfolding of life—Nature of our inquiry, . . Page 19

## CHAPTER II.

EARLY GEOLOGICAL PERIODS.

NECESSITY of a general acquaintance with the outlines of Geology—A time in which no life was possible on the globe—Length of this period—History of life commences at the close of this period—On the formation of rocks—The record imperfect—The three great periods in animal life on the globe—Paleozoic Age—Animal and vegetable life of this period—Ideal scenes in this period—The Mesozoic Age—Animal and vegetable life of this period—Advance noted—Abundance of reptilian life—First appearance of birds—Nature's methods of work—the Cenozoic Age—Geological outline—Sketch of the Eocene Age—Of the Miocene Age—What is sufficient proof of the presence of man—Discussion on the Thenay flints—The Pliocene Age—Animal and vegetable life of this age—Was man present during this age?—Discussion of this subject—Summing up of the evidence—Conclusion, . . . . . 30

## CHAPTER III.

MEN OF THE RIVER DRIFT.

BEGINNING of the Glacial Age—Interglacial Age—Man living in Europe during this age—Map of Europe—Proof of former elevation of land—The animals living in Europe during this age—Conclusions drawn from these different animals—The vegetation of this period—Different climatic conditions of Europe during the Glacial Age—Proofs of the Gla-

cial Age—Extent of Glacial Ice—Evidence of warm Interglacial Age—The primitive state of man—Early English civilization—Views of Horace—Primitive man destitute of metals—Order in which different materials were used by man for weapons—Evidence from the River Somme—History of Boucher De Perthes's investigations. Discussion of the subject—Antiquity of these remains—Improvement during the Paleolithic Age—Description of the flint implements—Other countries where these implements are found—What race of men were these tribes—The Canstadt race—Mr. Dawkins's views—When did they first appear in Europe? The authorities on this question—Conclusion, . . . Page 61

CHAPTER IV.

CAVE-MEN.

OTHER sources of information—History of cave explorations—The formation of caves—Exploration in Kent's Cavern—Evidence of two different races—The higher culture of the later race—Evidence of prolonged time—Exploration of Robin Hood Cave—Explorations in Valley of the River Meuse—M. Dupont's conclusions—Explorations in the Valley of the Dordogne—The station at Schussenreid—Cave-men not found south of the Alps—Habitations of the Cave-men—Cave-men were hunters—methods of cooking—Destitute of the potter's art—Their weapons—Clothing—Their skill in drawing—Evidence of a government—Of a religious belief—Race of the Cave-men—Distinct from the Men of the Drift—Probable connection with the Eskimos, . . . . 99

CHAPTER V.

ANTIQUITY OF THE PALEOLITHIC AGE.

INTEREST in the antiquity of man—Connected with the Glacial Age—The subject difficult—Proofs of a Glacial Age—State of Greenland to-day—The Terminal Moraine—Appearance of the North Atlantic—Interglacial Age—Causes of the Glacial Age—Croll's Theory—Geographical causes—The two theories not antagonistic—The date of the Glacial Age—Probable length of the Paleolithic Age—Time since the close of the Glacial Age—Summary of results, . . . . . 139

CHAPTER VI.

THE NEOLITHIC AGE IN EUROPE.

CLOSE of the first cycle—Neolithic culture connected with the present—No links between the two ages—Long lapse of time between the two ages—Swiss lake villages—This form of villages widely scattered—Irish crannogs—Fortified villages—Implements and weapons of Neolithic times—

Possessed of pottery—Neolithic agriculture—Possessed of domestic animals—Danish shell-heaps—Importance of flint—The art of navigation—Neolithic clothing—Their mode of burial—The question of race—Possible remnants—Connection with the Turanian race—Arrival of the Celts, . . . . . Page 170

## CHAPTER VII.

### THE BRONZE AGE IN EUROPE.

RACES of Men, like Individuals—Gradual change of Neolithic Age to that of Bronze—The Aryan family—First Aryans Neolithic—Origin of Bronze—How Great discoveries are made—Gold the first metal—Copper abundant—No Copper Age—The discovery of Tin—Explanation of an Alloy—Bronze, wherever found, the same composition—What is meant by the Bronze Age—Knowledge in other directions—Gradual Growth of Culture—Three Centers of Bronze production—Habitations during the Bronze Age—The Bronze Ax—Implements of Bronze—Personal ornaments—Ornaments not always made of Bronze—Advance in Arts of living—Advance in Agriculture—Warlike Weapons—How they worked Bronze—Advance in Government—Trade in the Bronze Age—Religion of the Bronze Age—Symbolical figures—Temples of the Bronze Age—Stonehenge, . . . . . 216

## CHAPTER VIII.

### THE IRON AGE IN EUROPE.

BRONZE not the best metal—Difficulties attending the discovery of Iron—Probable steps in this discovery—Where this discovery was first made—Known in Ancient Egypt—How this knowledge would spread—Iron would not drive out Bronze—The primitive Iron-worker—The advance in government—Pottery and ornaments of the Iron Age—Weapons of early Iron Age—The battle-field at Tilfenau—Trade of early Iron Age—Invention of Money—Invention of Alphabetic Writing—Invasion of the Germanic Tribes—The cause of the Dark Ages—Connection of these three ages—Necessity of believing in an Extended Past—Attempts to determine the same—Tinière Delta—Lake Bienne—British Fen-lands—Maximum and Minimum Data—Argument from the wide-spread dispersion of the Turanian Race—Mr. Geikie's conclusions—The Isolation of the Paleolithic Age, . . . . . 244

## CHAPTER IX.

### EARLY MAN IN AMERICA.

CONFLICTING accounts of the American Aborigines—Recent discoveries—Climate of California in Tertiary Times—Geological changes near

its close—Description of Table Mountain—Results of the discoveries there—The Calaveras skull—Other relics—Discussion of the question—Early Californians Neolithic—Explanation of this—Date of the Pliocene Age—Other discoveries bearing on the Antiquity of man—Dr. Koch's discovery—Discoveries in the Loess of Nebraska—In Greene County, Ill.—In Georgia—Difficulties in detecting a Paleolithic Age in this country—Dr. Abbott's discoveries—Paleolithic Implements of the Delaware—Age of the deposits—The race of Paleolithic man—Ancestors of the Eskimos—Comparison of Paleolithic Age in this country with that in Europe—Eskimos one of the oldest races in the World, . Page 263

CHAPTER X.

THE MOUND BUILDERS.

MEANING of "Mound Builders"—Location of Mound Building tribes—All Mounds not the work of men—Altar Mounds—Objects found on the Altars—Altar Mounds possibly burial Mounds—Burial Mounds—Mounds not the only Cemeteries of these tribes—Terraced Mounds—Cahokia Mound—Historical notice of a group of Mounds—The Etowah group—Signal Mounds—Effigy Mounds—How they represented different animals—Explanation of the Effigy Mounds—Effigy Mounds in other localities—Inclosures of the Scioto Valley—At Newark, Ohio—At Marietta, Ohio—Graded Ways—Fortified Inclosures—Ft. Ancient, Ohio—Inclosures of Northern Ohio—Works of unknown import—Ancient Canals in Missouri—Implements and Weapons of Stone—Their knowledge of Copper—Ancient mining—Ornamental pipes—Their knowledge of pottery—Of Agriculture—Government and Religion—Hard to distinguish them from the Indians, . . . . . 307

CHAPTER XI.

THE PUEBLO COUNTRY.

DESCRIPTION of the Pueblo Country—Historical outline—Description of Zuñi—Definition of a Pueblo—Old Zuñi—Inscription Rock—Pueblo of Jemez—Historical notice of Pecos—Description of the Moqui tribes—The Estufa—Description of the San Juan country—Aztec Springs—In the Cañon of the McElmo—The Ruins on the Rio Mancos—On Hovenweep Creek—Description of a Cliff-house—Cliff Town—Cave Houses—Ruins on the San Juan—Cave Town—The Significance of Cliff-houses—Moqui traditions—Ruins in Northern New Mexico—Ruins in the Chaco Cañon—Pueblo Bonito—Ruins in South-western Arizona—

The Rio Verde Valley—Casa Grande—Ruins on the Gila—Culture of the Pueblo Tribes—Their Pottery—Superiority of the Ancient pottery—Conclusion, . . . . . Page 414

## CHAPTER XII.

### THE PREHISTORIC AMERICANS.

DIFFERENT views on this Subject—Modern System of Government—Ancient System of Government—Tribal Government universal in North America—The Indians not Wandering Nomads—Indian houses Communal in character—Indian Methods of Defense—Mandan Villages—Indians sometimes erected Mounds—Probable Government of the Mound Builders—Traditions of the Mound Builders among the Iroquois—Among the Delawares—Probable fate of the Mound Builders—The Natchez Indians possibly a remnant of the Mound Builders—Their early Traditions—Lines of resemblance between the Pueblo Tribes and the Mound Builders—The origin of the Indians—America Inhabited by the Indians from a very early time—Classification of the Indian Tribes—Antiquity of the Indian Tribes, . . . . . 483

## CHAPTER XIII.

### THE NAHUA TRIBES.

EARLY Spanish discoveries in Mexico—The Nahua tribes defined—Climate of Mexico—The Valley of Anahuac—Ruins at Tezcuco—The Hill of Tezcocingo—Ruins at Teotihuacan—Ancient Tulla—Ruins in the Province of Queratarо—Casa Grandes in Chihuahua—Ancient remains in Sinaloa—Fortified Hill of Quemada—The Pyramid of Cholula—Fortified Hill at Xochicalco—Its probable use—Ruins at Monte Alban—Ancient remains at Mitla—Mr. Bandelier's investigations—Traditions in regard to Mitla—Ruins along the Panuco River—Ruins in Vera Cruz—Pyramid of Papantla—Tusapan—Character of Nahua Ruins, . . . . . 517

## CHAPTER XIV.

### THE MAYA TRIBES.

THE geographical location of the Maya tribes—Description of Copan—Statue at Copan—Altar at Copan—Ruins at Quiriga—Patinamit—Utatlan—Description of Palenque—The Palace at Palenque—The Temple of the Three Inscriptions—Temple of the Beau-relief—Temple of the Cross—Temple of the Sun—Maler's Temple of the Cross—Significance of the Palenque crosses—Statue at Palenque—Other ruins in Tobasco and

Chiapas—Ruins in Yucatan—Uxmal—The Governor's House—The Nunnery—Room in Nunnery—The Sculptured Façades—Temple at Uxmal—Kabah—Zayi—Labna—Labphak—Chichen-Itza—The Nunnery—The Castillo—The Gymnasium—M. Le Plongon's researches—The tradition of the Three Brothers—Chaac-Mal—Antiquity of Chichen-Itza, . . . . . Page 564

## CHAPTER XV.

### THE CULTURE OF THE CIVILIZED TRIBES.

DIFFERENT views on this question—Reasons for the same—Their architecture—Different styles of houses—The communal house—The tecpan—The teocalli—State of society indicated by this architecture—The gens among the Mexicans—The phratry among the Mexicans—The tribe—The powers and duties of the council—The head chiefs of the tribe—The duties of the "Chief-of-men"—The mistake of the Spaniards—The Confederacy—The idea of property among the Mexicans—The ownership of land—Their laws—Enforcement of the laws—Outline of the growth of the Mexicans in power—Their tribute system—How collected—Their system of trade—Slight knowledge of metallurgy—Religion—Quetzalcohuatl—Huitzilopochtli—Mexican priesthood—Human sacrifice—The system of Numeration—The calendar system—The Calendar Stone—Picture-writing—Landa Alphabet—Historical outline, . . . . . 667

## CHAPTER XVI.

### ANCIENT PERU.

FIRST knowledge of Peru—Expeditions of Pizarro—Geography of Peru—But a small part of it inhabitable—The tribes of ancient Peru—How classified—Sources of our knowledge of Peru—Garcillaso De La Vega—Origin of Peruvian civilization—The Bolson of Cuzco—Historical outline—Their culture—Divided into phratries and gentes—Government—Efforts to unite the various tribes—Their system of colonies—The roads of the Incas—The ruins of Chimu—The arts of the Chimu people—The manufacture of Pottery—Excavation at Ancon—Ruins in the Huatica Valley—The construction of a Huaca—The ruins at Pachacamac—The Valley of the Canete—The Chincha Islands—Tiahuanuco—Carved gateway—The Island of Titicaca—Chulpas—Aboriginal Cuzco—Temple of the Sun—The Fortress—General remarks, . 761

# LIST OF ILLUSTRATIONS.

PAGE.

1. Pyramids and Sphinx, . . . . 29
2. Paleozoic Forest, . . . . . 33
3. The Pterodactyl, . . . . . 36
4. Ichthyosauri, . . . . . 38
5. The Labyrinthodon, . . . . . 39
6. The Paleotherium, . . . . . 42
7. Miocene Mammals, . . . . . 46
8. Cut Bones of a Whale, . . . . 57
9. Mastodon, . . . . . 60
10. Map of Europe, . . . . . 63
11. Scratched Stone, . . . . . 70
12. Interglacial Bed, . . . . . 74
13. Paleolithic Flints, . . . . . 80
14. Flint Implements, . . . . . 82
15. Section of Gravel-pit, . . . . . 83

THOU unrelenting Past!
Strong are the barriers round thy dark domain—
And fetters, sure and fast,
Hold all that enter thy unbreathing reign.

Far in thy realm, withdrawn,
Old empires sit in sullenness and gloom;
And glorious ages, gone,
Lie deep within the shadow of thy womb.

Full many a mighty name
Lurks in thy depths, unuttered, unrevered:
With thee are silent fame,
Forgotten arts, and wisdom disappeared.

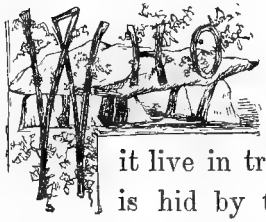
W. C. BRYANT.

# THE PREHISTORIC WORLD

## CHAPTER I.

### INTRODUCTION.

DIFFICULTIES of the subject—Lesson to be learned—The pursuit of knowledge—Recent Advances—Prehistoric past of the Old World—Of the New—Of Mexico and the South—The Isles of the Pacific—Similar nature of the relics—The wonders of the present age—History of popular opinion on this subject—The teachings of the Bible—Nature of the evidence of man's antiquity—Geology—Astronomy—Unfolding of life—Nature of our inquiry.



CAN read the book of the past? Who can tell us the story of Creation's morn? It is not written in history, neither does it live in tradition. There is mystery here; but it is hid by the darkness of by-gone ages. There is a true history here, but we have not learned well the alphabet used. Here are doubtless wondrous scenes; but our stand-point is removed by time so vast, the mist of years

is so thick before us, that only the ruder outlines can be determined. The delicate tracery, the body of the picture, are hidden from our eye. The question as to the antiquity and primitive history of man, is full of interest in proportion as the solution is beset with difficulties. We question the past; but only here and there a response is heard. Surely bold is he who would attempt, from the few data at hand, to reconstruct the history of times and people so far removed. We quickly become convinced that many centuries, and tens of centuries, have rolled away since man's first appearance on the earth. We become impressed with the fact, "that multitudes of people have moved over the surface of the Earth, and sunk into the night of oblivion, without leaving a trace of their existence: without a memorial through which we might have at least learned their names."[1]

To think of ourselves, is to imagine for our own nation an immortality. We are so great, so strong, surely nothing can move us. Let us learn humility from the past: and when, here and there, we come upon some reminder of a vanished people, trace the proofs of a teeming population in ancient times, and recover somewhat of a history, as true and touching as any that poets sing, let us recognize the fact, that nations as well as individuals pass away and are forgotten.

The past guards its secret well. To learn of it we must seek new methods of inquiry. Discouraged by the difficulties in the way, many have supposed it hidden from the present by a veil which only thickens as time passes. In the remains of prehistoric times they have failed to recognize the pages of history. They saw only monuments of ancient skill and perseverance: interesting sketches, not historical portraits. Some writers have held that we must give up the story

[1] Von Hellwald: "Smithsonian Report," 1866.

of the past, "whether fact or chronology, doctrine or mythology—whether in Europe, Asia, Africa, or America—at Thebes, or Palenque—on Lycian shore, or Salisbury plain—lost is lost, and gone is gone for evermore." Such is the lament of a gifted writer,[1] amongst the first to ponder over the mysteries of the past. At the present day, with better means at hand, a more hopeful view is taken. But here a caution is necessary; for, in attempting to reconstruct the history of primitive times, such is the interest which it inspires, that many allow imagination to usurp the place of research, and write in terms too glowing for history.[2]

The human mind is sleepless in the pursuit of knowledge. It is ever seeking new fields of conquest. It must advance: with it, standing still is the precursor of defeat. If necessary it invents new methods of attack, and rests not until it gains its objective point, or demonstrates the hopelessness of its quest. The world needs but be informed that on a given point knowledge is dim and uncertain, when there are found earnest minds applying to the solution of the mystery all the energies of their natures. All the resources of science are brought to bear; every department of knowledge is made to contribute of its store: and soon a mass of facts is established, and a new science is added to the department of human knowledge.

Thus, with our knowledge of prehistoric times, what so seemingly vain as to attempt to roll back the flight of time, and learn the condition of primeval man? All the light of ancient history makes but little impression on the night of time. By its aid we can but dimly see the outlines of the fortieth century back; beyond is gloom soon lost in night. But a few short years ago, men did not think it possible to gain further information. With the materials at hand, this could

[1] Palgrave. [2] Lubbock: "Prehistoric Times," p. 2.

not be done. The triumph of the intellect was simply delayed, not hopelessly repulsed. Geology was but just beginning to make good its claim to a place among the sciences. This unfolded to man the physical history of the world as read from the rocks, and deals with times so vast and profound that we speak no longer of years, but of ages. And with the aid of Geology grand secrets were wrung from the past, and new light was thrown on the manners and customs of primitive man. Thus the foundation for still another science was laid, called Archæology, or the science of Human Antiquities. These two sister sciences are the keys by whose aid we have not only acquired much information of a past that seemed a hopeless enigma—but, as Columbus on the waste of waters could perceive traces of land as yet invisible, so can the present seekers after knowledge trace the signs of a satisfactory solution of many of the great questions relating to the origin and history of the vanished races of mankind.

In whatever land we commence our investigations, we quickly come upon the evidences of an ancient life long antedating all historical information. Ancient Egypt has been a fruitful theme for the antiquarian's pen. The traveler has moralized over the ruins of her past greatness, and many pointed illustrations of national growth and decay have been drawn from her history.

Here was the seat of an ancient civilization, which was in the zenith of its power many centuries before Christ. The changes that have passed over the earth since that time are far more wonderful than any ascribed to the wand of the magician. Nations have come and gone, and the land of the Pharaohs has become an inheritance for strangers; new sciences have enriched human life, and the fair structure of modern civilization has arisen on the ruins of the past.

Many centuries, with their burden of human hopes and fears, have sped away into the past, since "Hundred-gated Thebes" sheltered her teeming population, where now are but a mournful group of ruins. Yet to-day, far below the remorseless sands of her desert, we find the rude flint-flakes that require us to carry back the time of man's first appearance in Egypt to a past so remote that her stately ruins become a thing of yesterday in comparison to them.

In the New World, mysterious mounds and gigantic earth-works arrest our attention. Here we find deserted mines, and there we can trace the sites of ancient camps and fortifications. The Indians of the prairies seem to be intruders on a fairer civilization. We find here evidences of a teeming population. In the presence of their imposing ruins, we can not think that nomadic savages built them. They give evidences rather of a people having fixed habitations, and seem to imply the possession of a higher civilization than that of the Indians. These questions demand solution; but how shall we solve the problem? Save here and there a deserted camp, or a burial mound, containing perhaps articles of use or adornment, all traces have vanished. Their earth-works and mounds are being rapidly leveled by the plow of modern times, and the scholar of the future can only learn from books of their mysterious builders.

In Mexico, and farther south, we find the ruins of great cities. To the student of antiquity, these far surpass in interest the ruined cities of the Nile or Euphrates valley. Babylon of old, with its walls, towers, and pleasure resorts, was indeed wonderful. In our own land cities, if not as ancient, yet fallen in more picturesque ruin, reward the labors of the explorer. Uxmal, Copan, and Palenque, invite our attention. Here are hieroglyphics in abundance, but

no Rosetta Stone supplies the key by whose aid a Champollion can unravel the mystery.

The luxuriant vegetative growth of the tropics, with its fierce storms, is every year hastening the obliteration of these ruins, and we must improve the time well, if we would learn from them what they have to say of the past.

The isles of the Pacific give evidence that, long before the dawn of authentic history, man lived there. Indeed, as the islands which gem that ocean, from their configuration and position, seem to be but the elevated plateaus and mountain peaks of a continent that has gone down beneath the blue wave of the Pacific, so, throughout Polynesia can be traced the fragmentary remains of a civilization, the greater portion of which has been completely buried by the waters of oblivion, leaving only here and there a trace to reconstruct, if we can, the entire structure.

The earliest remains of man are very similar in all lands. They consist of weapons of war and of the chase, implements of domestic use, and articles of personal adornment. Few and simple as they are, they are capable of imparting useful information as to early times. By their aid we become eye-witnesses of the daily life of primitive man. We learn that though lacking in almost every thing we consider essential for comfort and happiness, yet they were actuated by much the same hopes and fears as the men of the present age. The great burden of life was the same then as now. There was the same round of daily labor made necessary by the same ceaseless struggle for existence. Rude forts and warlike implements show there was the same encroachment of the strong on the weak as now.

This is a wonderful age in many respects. In none, however, more wonderful than in the wide-spread diffusion of knowledge. The ordinary people now understand more of

nature's secrets than the wise men of old. They are to-day interested in researches that a former generation would have relegated to the scholar and the man of leisure. No department of knowledge is retained for the researches of a favored few. The farmer, the mechanic, and the man of business are alike interested in a knowledge of prehistoric times. The rude implements of the past appeal to the curiosity of all. We arise from a study of the past with clearer ideas of man's destiny. Impressed with the great advancement in man's condition from the rude savagery of the drift, to the enlightened civilization of to-day, what may we not hope the advancement will be during the countless ages we believe a beneficent Providence has in store for his creature, man?

A history of the popular opinion of the antiquity of man is not only of interest, but should teach a lesson to all who think others are wrong because not holding the same views as they do. Hardly fifty years have passed since scientific men began to attribute to the human race an antiquity more remote than that assigned them by history and tradition. At first these views met with general opposition, much as did the theory of the present system of astronomy when it was first proclaimed. We laugh now at the ignorant fears and prejudices used to combat both.

It was claimed that the Bible taught that man had lived on the globe scarcely six thousand years. The Bible is the book to which the Anglo-Saxon mind clings with the greatest reverence. The memories of childhood are associated with its pages, and its very appearance recalls the prayers of long ago. It is not strange then that the Christian world guards with jealous care against any thing which may be thought to weaken the force of its statements.

But it is human nature to go to extremes: and, when

we give our support to one way of thinking, we find it difficult to be patient with those of the contrary opinion.

Now, the researches of some of the most eminent men and learned divines have amply shown, that there are no data given in the Scriptures on which to base an estimate as to the antiquity of man. Happily the Christian mind no longer shrinks from the conclusions reached by the scientist: and, indeed, it is the contemplation of the stupendous periods of Geological times, and the infinite greatness of the works of Creation as disclosed by Astronomy, with the extreme lowness of man's first condition as made evident by Archæology, that lend new force to the words, "What is man, that thou art mindful of him!"

The evidences on which we predicate an extreme antiquity for man are necessarily cumulative. It is not from one source alone that we obtain information, but from many. Eminent men in nearly every department of knowledge have lent their aid to the elucidation of this subject. It can only be understood by those who will fairly weigh the facts that modern discoveries have unrolled before their eyes. There are many who have not done this, and are consequently unable to project their mental vision so far back into the very night of time, as is now demanded for the beginning of man's first appearance on the earth. And, indeed, so enormously has this period been extended—so far back does it require us to go—that even the most enlightened investigator may well recoil in dismay when he first perceives the almost infinite lapse of years that are required by his calculation since the creation of man.

At this day the scholar must be ready to explain the steps by which he reaches his conclusions. Not necessarily explaining the minutiæ of his journey hither, but the main outlines of his course. This seems to call for a slight out-

line of Geology. The animal and vegetable tribes which have come and gone upon the earth, following each other like the shadows of passing clouds on a Summer's day, have left their remains in the rocks which at that time were forming. A close investigation of these remains shows that they form the record book of nature, wherein we are permitted to read somewhat of her secrets. This had long been a sealed book to man; but science, as we have seen, constantly extending her domain, at length taught him the alphabet.

And the Geologist now unfolds the past age of our world with a variety of detail, and a certainty of conclusion well calculated to inspire us with grateful admiration.

It is no longer a question that many ages must have rolled away, during which our world was totally unfit for life of any kind, either animal or vegetable.

The nebular theory of Laplace, as modified by the modern astronomers, so satisfactorily explains many of the phenomena of the solar system, that it takes rank almost as a demonstrated fact. According to the terms of this theory, our Earth, now so dependent on the sun for light and warmth, was itself a glowing orb, and as a bright star radiated its light and heat into space. Grand conception, and probably true. It is now useless to speculate as to how many cycles of almost infinite years had begun and ended, before Earth's fading fires gave notice that they must soon expire in night.

The stages through which the Earth passed in turn await the sun, save that there is no further beneficent luminary to give him light and heat: when time shall have quenched his fiery glow, death and night shall reign supreme, where now is life and light.

Time is long, and nature never hurries. She builds for infinite years, and recks not the time of building. The human mind is far too feeble to comprehend the duration of

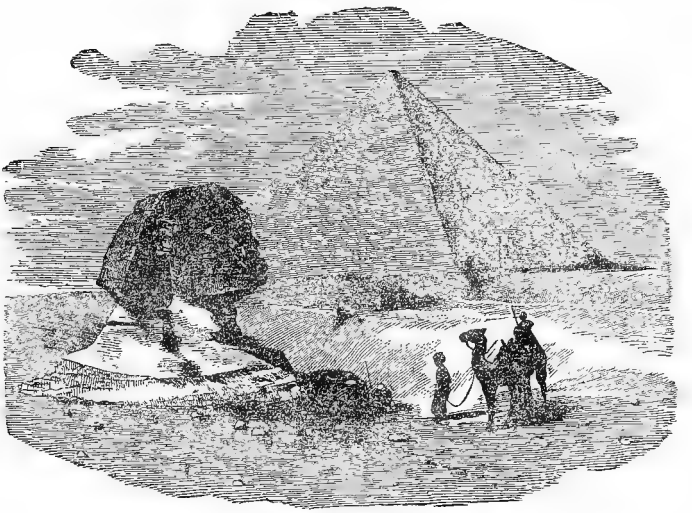
time that sped away and was gone ere the slowly falling temperature of the Earth admitted the formation of a crust over her surface. When that came, the first great scene was closed. The star had expired, the planet rolled in her annual course around the still glowing central sun. Now came the formative age of the world, when the great continents were outlined.

The atmosphere gradually freed itself from its weight of water-vapor, the rains descended, and the ocean took form and contour. We are concerned only with the outlines of Geology, not with its details. It is full of the most interesting facts, but is foreign to our present purpose. We will only say, there is a marked progression in the scale and importance of life forms.

The lower forms of animals appear first to be followed in time by the higher. It is true that some forms have survived through all the changes of Geological time to the present: yet, speaking generally, some forms of life are peculiar to each age, and the general phase of animal life is different with each period. They thus form epochs in the history of the world as read from the rocks, and though the beginning and ending of each age may blend by insensible gradations with that of the preceding and following, yet, taken as a whole, we observe in each such singularities of form and structure as to give name to each particular age.

In the fullness of time man appears; and it is our pleasant task to trace the evidence of his primitive state, his growth in culture, and his advancement made before the dawn of history. Our inquiry, then, is as to his prehistoric state. We use this term in the same sense as Dr. Wilson uses it: that is, to express the whole period disclosed to us by means of archæological evidence, as distinguished from what is known through historical records. We can not doubt

but that this includes by far the largest portion of man's existence. The time embraced within historical records, though different in different portions of the world, is but a brief period in comparison to the duration of time since he first went forth to possess the Earth. If we can make plain to our readers that man has lived in the world an extremely long time, going back indeed to a former Geological age—that his first state was very low and rude—that he has risen to his present high estate by means of his own exertions continued through long ages—and from this form a prophecy of a golden age to come in the yet distant future, we shall feel that we have not written in vain.

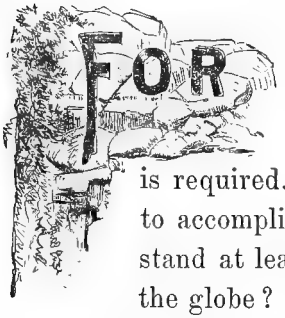


The Sphinx.

## CHAPTER II.

### EARLY GEOLOGICAL PERIODS.[1]

NECESSITY of a general acquaintance with the outlines of Geology—A time in which there was no life possible on the globe—Length of this period—On the formation of rocks—The record imperfect—The three great periods in animal life on the globe—Paleozoic age—Animal and vegetable life of this period—The Mesozoic age—Animal and vegetable life of this period—Advance noted—Abundance of reptilian life—First appearance of birds—Nature's methods of work—The Cenozoic age—Geological outline—Sketch of the Eocene age—Of the Miocene age—What is sufficient proof of the presence of man—Discussion of the Thenay flints—The Pliocene age—Animal and vegetable life of this age—Was man living during this age?—Discussion of this subject—Summing up the evidence—Conclusion.



A CLEAR understanding of questions relating to early man, a more or less extensive acquaintance with Geology is required. This is by no means a difficult task to accomplish. What so interesting as to understand at least the outlines of the history of life on the globe? To see how, following a definite plan, the vast continents have grown to their present size and form; to see how animal and vegetable life have evolved successively higher and higher forms; to see where in this wondrous drama of creation, this strange unfolding of life, the first faint, indecisive traces of man's presence are to be found; to learn what great changes in climate, in Geogony, and in life,

[1] The manuscript of this chapter was submitted to Prof. Winchell, of the University of Michigan, for criticism.

had occurred before man's appearance, let us pass in brief review the history of early geological periods.

As we have already stated, there must have been a very long period of time during which no life was possible on the globe. Of this era we know but little; for we find no strata of rocks of an earlier date than we know life, in its simplest forms, to have existed.[1] Still we are not less confident of the existence of this era, and the mind can dimly comprehend the scene, when a nearly shoreless ocean surged around the globe.[2]

As to the extent of time during which there was no life, we have no means of determining. That it was almost infinitely long is made apparent by the researches of eminent scholars on the cooling of lava. Toward the close of this extended period of time faint traces of life appear. Not life as we are apt to think of it. No nodding flowers were kissed by the sunshine of this early time. The earliest forms of flowerless plants, such as sea-weeds, and in dry places possibly lichens covering the rocks, were the highest forms of vegetable life. Animal life, if present, for the fact is denied by some, occurs in the very lowest form, merely structureless bodies, with no especial organs of sense, or nutrition: and their motion consisting simply in protruding and withdrawing hair-like processes.[3] Such was the beginning of life. This vast period of time, which includes the beginning, is known among geologists as Archean time.

From the close of this age, the history of life properly commences. It might be well to explain the means which the geologist uses to interpret the history of the globe. It is now understood that the forces of nature have always produced the same results as they do now. From the very

[1] Dana's "Manual of Geology," p. 146. [2] Ibid., p. 147.
[3] Nicholson's "Manual of Zoölogy," p. 59.

earliest time to the present, rocks have been forming. There, where conditions were favorable, great beds of limestone, formed from shells and corals, ground up by the action of the sea[1]—in other places, massive beds of sandstone or of sand, afterward consolidated into sandstone—were depositing. On the land surface, in places, great beds of vegetable *débris* were being converted into coal. Now we can easily see how the remains of organic bodies, growing at the time of the formation of these beds, should be preserved in a fossil form. Limestone rocks are thickly studded in places with all sorts of marine formations. Coal fields reveal wonders of early vegetative growth. From sandstone rocks, and shaly beds, we learn strange stories of animal life at the time they were forming. From a careful study of these remains, together with the formation in which they occur, not only in one locality but all over the earth, geologists have gradually unfolded the history of life on the globe. It is admitted that, at best, our knowledge in that direction is fragmentary. This arises from errors in observation as well as that fossil formations are rare, or at least localities where they are known to exist are but few. So our knowledge of the past is as if we were examining some record from which pages, chapters, and even volumes, have been extracted.

In consequence of this imperfect record we can not, as yet, trace a gradual successive growth from the low forms of animal and plant life, that characterized the closing period of Archean time, to the highly organized types of the present. The record suddenly ceases, and when we again pick up the thread we are surrounded by more advanced types, higher forms of life. Though we may hope that future discoveries will do much toward completing the records, we can not

[1] Dana's "Manual of Geology," p. 74.

PALEOZOIC FOREST

hope that they will ever really be perfected. So, from our present stand-point, the history of life on the globe falls naturally into three great divisions.[1] This is not only true of one country, but of all. This is no more than we might expect, when we reflect that nature's laws are universal in their action, and that the world, as a whole, has been subjected to the same set of changes.

The period following on after Archean time is called, by geologists, Paleozoic time.

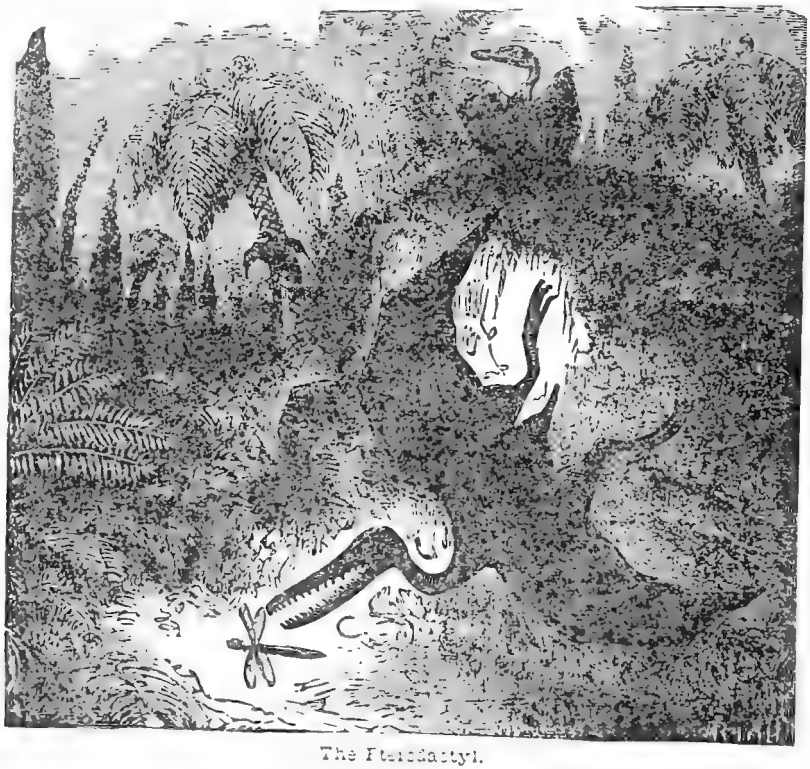
During the long course of time embraced in this age, the forms of life present wide differences from those of existing time.

This period produced the great beds of coal we use to-day. But the vegetation of the coal period would present strange features to our eyes. The vegetation commenced with the lowest orders of flowerless plants, such as sea-weeds; but, before it was brought to a close, there was a wonderful variety and richness of plants of the flowerless or Cryptogamic division. In some of the warmest portions of the globe, we have to-day tree-ferns growing four or five feet high. During the closing part of the Paleozoic time, there were growing all over the temperate zone great tree-ferns thirty feet or so in height. Some varieties of rushes in our marshes, a foot or two in height, had representatives in the marshes of the coal period standing thirty feet high, and having woody trunks.[2] Near the close of the Paleozoic time, vegetation assumed a higher form of life. Flowering plants are represented. Pines were growing in the coal measures.

In animal life a similar advance is noted. The class of animals having no backbone, or invertebrate animals, were

[1] Nicholson's "Manual of Zoölogy," p. 42.
[2] Dana's "Manual of Geology," p. 323.

largely represented. But, toward the close of the Paleozoic time, we meet with representatives of the backbone family. The waters swarmed with fishes.[1] Besides these, there were amphibians;[2] and reptiles in the closing portions.[3]



The Pterodactyl.

Thus we see what a great advance was made in life during this period. The forms of life during the early stages of this age were inferior in this, also, that they were all water species.[4] But, before it closes, we have a rich and varied terrestrial vegetation, and also air-breathing animals. The class Mammalia, to which man belongs, had no representative on the earth during the extended Paleozoic time.

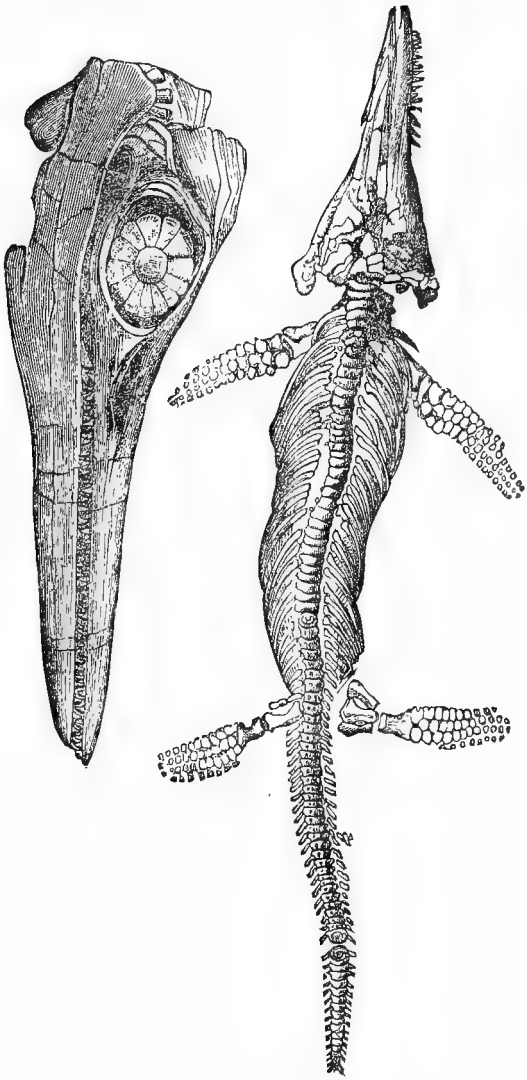
[1] Nicholson's "Zoölogy," p. 402.
[2] Dana's "Geology," p. 302.
[3] Dawkin's "Early Man in Britain," p. 6.
[4] Dana's "Geology," p. 382.

We can easily see, from the foregoing, how appropriately this period has been named that of old life forms. In imagination we can recall a scene of this old age. The air is sultry and full of vapors. The soil seems hot and steaming. This is a veritable forest, but we see none of the beautiful flowers which we associate with tropical vegetation to-day. In the branches of the graceful tree-ferns, we will look in vain for birds. They were yet far in the future. Neither were there any of the higher orders of animals present. Not a single representative of the great class of mammals enlivened the depths of the forest. There were fishes in the waters, but not the fishes of to-day. Some true reptiles and amphibians disported themselves in swampy jungles, but they were unimportant. Almost the only sound to break the stillness, was the hum of marsh-loving insects, the whistling of the wind, and the roar of the tempests, which we may well believe raged with the more than tropic severity of the present.[1]

The time at last came for the dawning of a new era. Vast changes had been taking place in the geography of both continents. The region to the south-west of the Green Mountains was upturned. The Alleghany Mountains were formed, and the region east of the Mississippi River became part of the stable land of the continent.[2] In Europe, nearly as great changes occurred. The conditions of life must have been greatly modified by these geographical changes. The life-forms bear testimony to this changed condition. Old forms die away, and are succeeded by those approaching more nearly our own times. The name of this period is the Mesozoic time, or the period of middle life forms.[3] It is instructive to notice the steady advance in the type of

[1] Haywood's, Heer's, "Primeval World of Switzerland."
[2] Dana's "Man. Geology," p. 395. [3] Nicholson's "Man. Zoölogy," p. 42.

life, both animal and vegetable. The abundant flowerless vegetation of the coal formation of the preceding epoch dwindles away. But the flowering trees increase in number and importance until, in the closing period of Mesozoic time, we have trees with deciduous leaves. A great many of our forest trees had representatives in the forests of that epoch.

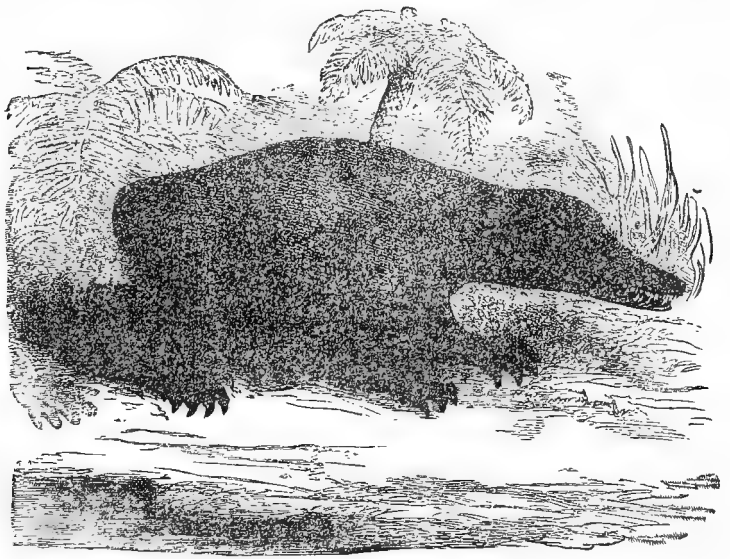


Ichthyosauri.

Palms and species like the big tree of California were growing side by side with species akin to our own common trees. But in the animal world there were many strange forms. This was the age of reptiles. They domineered on the land, in the air, and in the sea. On the land there stalked huge reptiles fifty and sixty feet long, and, when standing erect, at least thirty feet high.[1] Some of these huge

[1] Marsh: "American Assoc. Rep.," 1877.

creatures were carnivorous, living on other animals. Others fed on the foliage of trees. In the air, huge reptilian bats, veritable flying dragons with a spread of wings from ten to twenty feet, disported themselves.[1] In the sea there swam great reptilian whales, seals, and walruses.[2] There was a marvelous abundance of reptilian life. At the present day, there are not more than six species of reptiles in the whole world having a length of over fifteen feet, and not more than



The Labyrinthodon.

eighteen species exceeding ten feet in length. But from one limited locality, representing but one era of this age in England, there have been discovered four or five species of carnivorous reptiles twenty to fifty feet long, ten or twelve species of crocodiles, lizards, and swimming reptiles from ten to sixty feet long—besides multitudes of great flying reptiles and turtles. Doubtless similar scenes of animal life were everywhere represented.

[1] Marsh: "American Assoc. Rep.," 1877.

[2] Dawkin's "Early Man in Britain," p. 6.

Birds made their first appearance during the Mesozoic time, and here we obtain a clear view of nature's methods of work. There is no longer a doubt but that the first birds were simply modified reptiles. The first bird had a long jointed tail, and a bill well supplied with formidable teeth.[1] It was during this period that the first representative of the class Mammalia, to which man belongs, appears.[2] It is in the rocks of this era that we meet with remains of marsupials, the order to which opossums belong. This is the lowest of the Mammalian class. To the class Mammalia belong the most highly organized animals. They have been the ruling animals since the close of Mesozoic time. We must now watch their development with especial care. For this brief review, as far as it has gone, has shown a steady and gradual progress in life forms, the lower invariably preceding the higher. We therefore feel that it will be vain to seek for any trace of man until we find undoubted proofs of the existence of all the forms of animals below him. The last great division of time is called Cenozoic.[3] This means new life forms. In this age, the forms of life are much nearer our own. As it was some time during this epoch when man makes his appearance, we deem it best to go into more detail, and give the subdivisions of this period. It has been amply sufficient to give simply the outlines of the other periods.

---

[1] Nicholson's "Manual of Zoology," pp. 419 and 504.

[2] When we talk of first appearance, we mean the discovery of remains. All who believe in the doctrine of evolution, know that the class Mammalia must have appeared early in Paleozoic times. Thus, Mr. Wallace says, "Bats and whales—strange modifications of mammals—appear perfectly well developed in the Eocene. What countless ages back must we go for the origin of these groups—the whales from some ancestral carnivorous animal, the bats from the insectivora!" and even then we have to seek for the common origin of these groups at far earlier periods. "So that, on the lowest estimate, we must place the origin of the Mammalia very far back in Paleozoic times." ("Island Life," p. 201.)

[3] This word is also spelled Kainozoic, and Cainozoic. We follow Dana, p. 140.

In order to fix more clearly the sequence of life, we will give an outline showing the periods we have reviewed, and also the subdivisions of the Cenozoic time, which we are now to examine with more care.

OUTLINE.

LIFE.

- **Archæan Time.** — The Beginning. Includes the long lapse of time when the globe could not support life, but towards its close faint traces of life, both animal and vegetable appeared.
- **Paleozoic Time.** — The Period of Old Life Forms. Forests of flowerless trees; but pines grew in the coal measures. Animal life largely invertebrate; but amphibians and reptiles among the vertebrate appear at the close.
- **Mesozoic Time.** — The Period of Middle Life Forms. Flowering trees increasing in number and importance. Deciduous trees make their appearance. Animal life largely reptilian. The class Mammalia represented by marsupials.
- **Cenozoic Time.**
  - Tertiary, or Age of Mammals.
    - Eocene.
    - Miocene.
    - Pliocene.
  - Quaternary, or Age of Man.
    - Glacial or Pleistocene.
    - Recent.

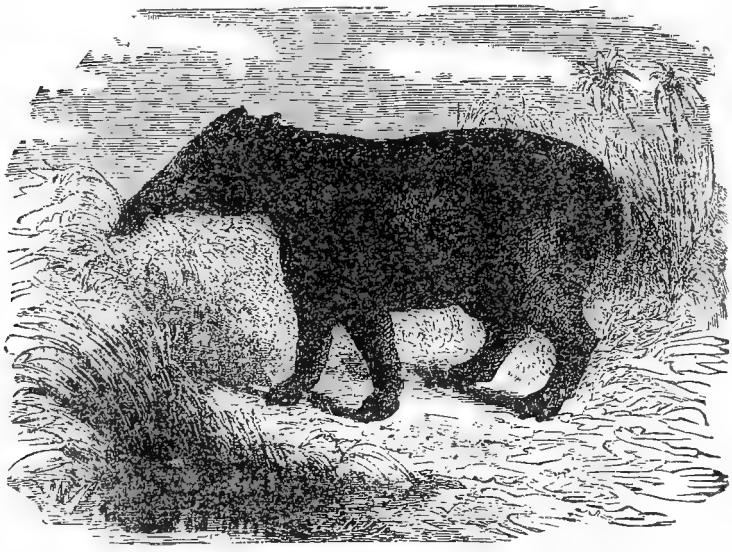
At the close of the Mesozoic time, great elevations of land took place in both America and Europe, especially in the northern portions.[1] This could not fail to have a great effect on life, both animal and vegetable.

During the Eocene, or first division of the Tertiary Age, we have simply to note the steady progress of life. There were forests of species of oaks, poplars, maples, hickories,

[1] Dana, "Manual of Geology," p. 488.

and other common trees, and others now found only in tropical regions. Palm trees were growing in the upper Missouri region of the United States. And England was decidedly a land of Palms, as no less than thirteen species are known to have been growing there. Cypresses, yews, and pines graced the scene.[1] Our special interest centers, however, in the mammals of this epoch.

In the preceding epoch marsupials only were represented. But in beds of the middle and closing portions of the Eo-



The Paleotherium.

cene period we meet with a sudden increase of Mammalian life. Whale-like animals were especially abundant in the seas; and on our Western plains were animals like the tapirs of India, and rhinoceros-like animals as large as elephants[2] but having no trunks, and diminutive little animals not larger than foxes, from which have come our horses. Europe also

[1] Dawkin's "Early Man in Britain," p. 28.

[2] Many of these animal forms were common during the early Eocene. (Winchell.)

had a varied Mammalian fauna. There were numerous hog-like animals. Animals, like the tapirs of tropical Asia and America, wandered in the forests and on the banks of the rivers. Herds of horse-like animals, about the size of Shetland ponies, fed on the meadows.[1] Animals that chew the cud were present, or at least had near representatives.[2]

Among the flesh-eating animals were creatures resembling foxes, wolverines, and hyenas.[3] This shows what a great advance had been made. But, besides all these, we are here presented with representatives of the order of Quadrumana, or four-handed animals. Several genera of lemurs are found in both America and Europe.

Now the Quadrumana are the order below man. Therefore it seems that, in the Eocene period, all the forms of life *below* man are represented. The time seems to be at hand when we can look, with some confidence, for traces of the presence of man himself. We must therefore be more cautious in our investigations.

The epoch following on after the Eocene is designated as the Miocene. We must remember that, though recent in a geological sense, yet it is immensely remote when measured by the standard of years. We must inquire into all the surroundings of this far away time. The geographical features must have been widely different from the present.

In the first place, the elevation of land to the north must have been sufficient to have connected the land areas of the Northern Hemisphere—North America, with Asia[4] and Greenland; and this latter country must have been united with Iceland, and, through the British Islands, with Europe. But, to compensate for this land mass to the north,

---

[2] Dana, "Geology," p. 517.
[3] Dawkin's "Early Man in Britain," p. 32.
[4] Marsh: "American Assoc. Rep.," 1877.

large portions of Central and Southern Europe were beneath the waves.[1] The proof of this extended mass of land is to be found in the wide distribution of similar animals and plants in the Miocene time. All the chief botanists are agreed that the north Polar region was the center from which plants peculiar to the Eocene and Miocene epochs spread into both Europe and America.[2] We may mention that the famous big trees of California are simply remnants of a wide-spread growth of these trees in Miocene times. They can be found in a fossil state at various places in British America, in Greenland, and in Europe. They are supposed to have originated somewhere in the north, and spread by these land connections we have mentioned into both Europe and America. But this is not the only tree that grew in the Miocene forests of both continents. The magnolia, tulip-tree, and swamp cypress are other instances.[3] Eleven species, growing in the Rocky Mountain regions in Eocene times, found their way to Europe in the Miocene times,[4] driving before them the plants of a tropical growth that had hitherto flourished in England. Now this implies land connection between the two continents. Furthermore, animals both large and small are found common to the two countries.[5] The climate over what is now the North Temperate Zone, and even further north, must have been delightful. There is ample testimony to this effect in the rich vegetative remains over wide areas.

In Spitzbergen, within twelve degrees of the pole, where now a dwarf willow and a few herbaceous plants form the only vegetation, and the ground is most of the time covered with snow and ice, there were growing, in Mi-

[1] Haywood's Heer's "Primeval World of Switzerland," p. 296.
[2] Dawkin's "Early Man in Britain," p. 20.
[3] Ibid., p. 43.
[4] Dana's "Manual of Geology," p. 498.
[5] Dawkin's "Early Man in Britain," p. 42.

ocene times, no less than ninety-five species of trees, including yews, hazels, elders, beech, elms, and others.[1] But it is in the Miocene forests of the continent of Europe where we meet with evidence of a singularly mild climate.

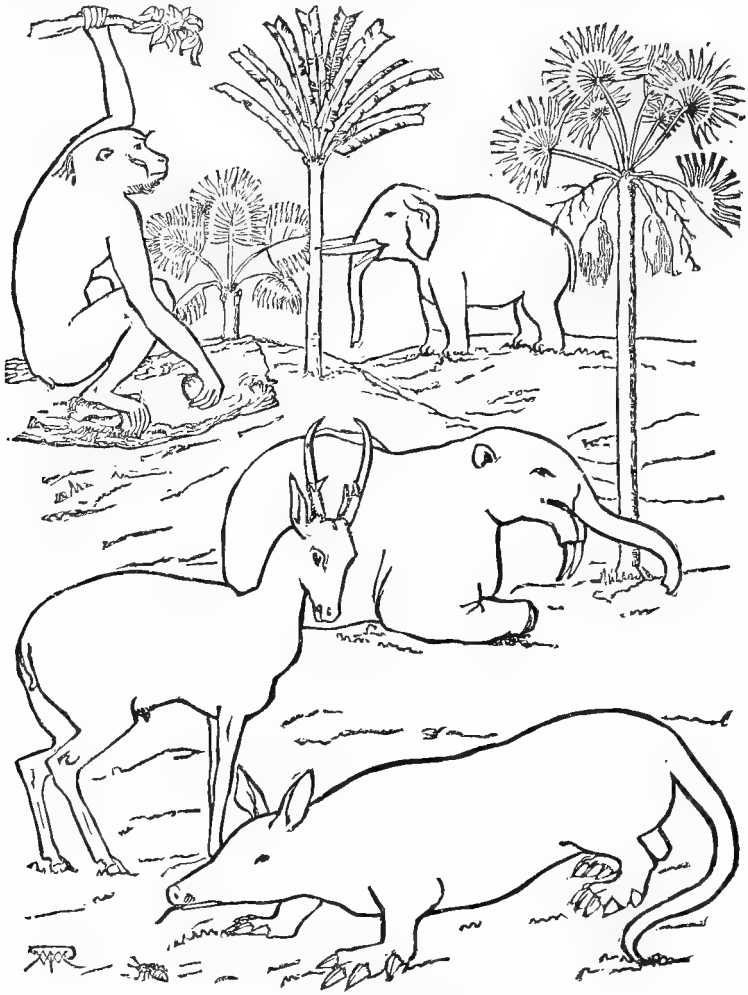
There were at least eleven species of palms growing in Switzerland; and one variety of them grew as far north as Northern Germany.[2]

We can not give a list of all the species. On the one hand, there were elms, willows, poplars, oaks, and beeches, thus far similar to the forest growth of temperate regions. Mingled with these were forests of trees like the tulip-tree, swamp cypress, and liquid amber or sweet gum of the southern part of the United States—plants whose home is in the warm and moist regions of the earth. But there were also representatives of the tropical regions—such as fig-trees, cinnamon-trees, and camphor-trees: these are found growing now in tropical countries. Fruit-trees of the cherry, plum, and almond species were also to be seen. Prof. Heer points out how all this should convince us that a large part of Europe, in the Miocene Age, possessed a climate not unlike that of the Madeira or Canary Islands to-day. He calls especial attention to the fact that these trees were nearly all of evergreen species, and that a severe winter would destroy them. He finds one hundred and thirty-one species of the Temperate Zone—species that can stand a moderate amount of cold, but not very hot and dry climates. He finds eighty-five species of tropical plants that could not possibly live where the Winters are severe. Mingled with these were nearly three hundred species whose natural home is in the warm, temperate portions of the earth. The only way you can explain this motley assemblage of trees is, to suppose

[1] Dana's "Manual of Geology," p. 514.

[2] Haywood's Heer's "Primeval World of Switzerland," p. 334.

that in what is now Europe was a climate free from extremes, allowing the trees to put forth flowers and fruits all



Miocene Mammals.

the year round. "Reminding us," says Prof. Heer, "of those fortunate zones where Nature never goes to rest."[1]

Let us now inquire as to the animals that roamed through

[1]Haywood's Heer's "Primeval World of Switzerland."

these great forests we have been describing. The Miocene period extended over a long lapse of time, and considerable change took place among the animals belonging to the different parts of this age. We will only give a general outline for the whole period. The marsupials lingered along into the early stages of this period, and then disappeared from Europe. The rhinoceros were present in the early stages, and continued through the entire age. We meet in this period animals of the elephant kind, two species, the mastodon and deinotherium. Antelopes and gazelles wandered in vast troops over the plains of Hungary, Spain, and Southern France. Carnivorous animals resembling tigers and hyenas found abundance of animal food. Herds of horse-like animals fed on the rich herbage of the meadows. The birds were largely represented. In the woods were to be seen flocks of gayly feathered paroquets and trogons. On the plains secretary-birds hunted the serpents and reptiles, which furnished them food—and eagles were on the watch for their prey. Cranes waded in the rivers for fish. Geese, herons, and pheasants must have been abundant.

Our main interest centers in the order Quadrumana. We must remember that this order appeared in the Eocene. Several species were present in the Miocene. They wandered in the forests of France, Switzerland, Germany, and Italy, and doubtless found abundant food in the figs and bread-fruit, walnuts, almonds, dates, and other nuts growing there.[1] One of the most important is regarded as belonging to the same genus as the Gibbons.[2] This is the genus which has been sometimes regarded as making a nearer approach to man than any other monkey.[3] Others, however, consider it as

[1] Dawkin's "Early Man in Britain," pp. 57 and 64.
[2] Ibid., p. 57: also, Haywood's Heer's "Primeval World of Switzerland."
[3] Nicholson's "Manual of Zoölogy," p. 605.

belonging to an extinct family.[1] In addition to this species there were at least three other species: thus there was no absence of simian life in the Miocene.[2]

From the sketch we have thus far drawn of the Miocene Age, it seems to have been a very favorable one in every respect. One writer[3] affirms, that "the world never experienced a more beautiful period." And indeed it seems as if the facts bear out this statement. A genial, temperate climate was the rule, even to high northern latitudes. We need not doubt but that there were grassy plains, wooded slopes, and rolling rivers. Was man present to take advantage of all these favorable surroundings? Did he wander through the evergreen forests, and hunt the deer, antelope, and hogs—the hipparions, and mastodons, and deinotheres—then so numerous?[4] We know of no inherent improbability of his existence at that time. An ape belonging to a highly organized genus was then living in Europe. Every condition considered necessary for the primeval Garden of Eden was then satisfied. Let us stop for a minute and examine the nature of the evidence considered sufficient to prove the presence of man during any of the past geological ages.

Should we be so fortunate as to find portions of the bones of the human skeleton in a geological formation in such positions that they could not possibly have been introduced there since the deposition of the containing bed, it would of course prove that man was at least as old as the formation itself. But it happens that human remains in beds of a previous geological age are very rare. Indeed, human remains in formations of the Pleistocene Age,[5] during which we have ample testimony, as we shall see, of the

[1] Dawkin's "Early Man in Britain," p. 58. [2] Ibid., 58.
[3] McLean: "Mastodon, Mammoth, and Man," p. 67.
[4] Dawkin's "Early Man in Europe," p. 66. [5] See "Outline," p. 41.

presence of man, are very rare. The cases in which there can be no doubt can be reckoned on the fingers. The explanation of this state of things is not at all difficult, for it is only under very rare circumstances that portions of the bones of animals even larger than man are preserved to us in geological strata. Vast numbers die and vanish away without leaving a trace behind them for every fragmentary bone we recover. In the case of man we must remember that, in previous eras, he was present in very small numbers; that, owing to his intelligence, he would not be as liable to be drowned and swept away, and so mingle his remains with beds of river detritus then forming, as were animals. Mr. Lyell has made some remarks on the draining of the Haarlem Lake by the government of Holland in 1853, which shows that even favorable circumstances do not always preserve remains for future inspection. Though called a lake, this body of water was an arm of the sea, covering about forty-five thousand acres. The population which had lived on the shores of the lake was between thirty and forty thousand souls. "There had been many a shipwreck, and many a naval fight on those waters, and hundreds of Dutch and Spanish soldiers and sailors had met there with a watery grave," yet not a solitary portion of the human skeleton was to be found in its bed.[1] Thus we see that, in the majority of cases, we must rely on other evidence than the presence of human bones to prove the existence of man in the geological periods of the past. In the case of the Haarlem Lake again, there was found the wreck of one or two vessels, and some ancient armor. So, had it been a disputed point whether man was a denizen of this planet at the time when the area in question was covered by water, it would have been settled beyond a doubt

[1] Lyell's "Antiquity of Man," p. 193.

by these relics of his industry, even though portions of the human frame itself were entirely wanting. And, in reality, proofs of this nature are just as satisfactory as it would be to discover human bones. If, on a desert island, we find arrow-heads, javelins, a place where there had been a fire, split bones, and other *débris* of a feast, we are as much justified in asserting that man had been there, as we would be had we seen him with our own eyes. In the same manner, if we detect in any strata of the past any undoubted products of human industry—such as weapons, or implements and ornaments—in such position that we know they could not have been deposited there since the formation of the bed itself, we have no hesitancy in asserting that man himself is of the same antiquity as the strata containing the implements. In the great majority of cases, this is the only kind of evidence possible to advance.

It is now well known that the first stage in the culture of any people, is what is called the Stone Age. That is to say, their weapons and implements were made from stone, or at least the majority of them were. We will discuss on another page this point, and also the grounds leading us to infer that many of the extremely rude forms are really the work of man.

Let us now return to the Miocene Age, in which we are to seek for the presence of man. In 1867 a French geologist, by the name of Bourgeois, who had been searching some beds of the Miocene Age, near Thenay, France, found a number of flints of such a peculiar shape, that he concluded they could only be explained by supposing that man formed them. In this case there is no question as to the age of the stratum containing the flints. All geologists are agreed that it is of the Miocene Age. The question then is, whether the flints were artificially cut or not. On this question

there has been a great division of opinion, and we can not do better than to examine and see where the principal scientific men stand on this point.

In 1872, at the scientific congress in Brussels, this question was referred to a committee composed of the most competent men from the different countries of Europe. We are sorry to say that, after a thorough consideration of them, the judges were unable to agree. Some accepted them, others rejected them, and still others were undecided. Some of the latter have since become convinced by recent discoveries.[1]

Since this discovery, similar specimens have been described as having been found in Portugal, and from another locality in France. Some men of the highest authority accept these flints as proving the presence of man in Miocene times. This is supported by such men as Quatrefages, Hamy, Mortillet, and Capellini.[2] These are all known to be competent and careful geologists. Another class does not think the evidence strong enough to declare these flints of human origin, and so do not think it proved that man lived in Europe in Miocene times; but do believe that we will eventually find proofs of his existence during that era in the warm and tropical regions of the globe. This is the view of such men as Lubbock, Evans, Huxley, and Winchell. Still others say that, during the vast lapse of years since Miocene times, all the species of land mammals then alive have perished[3]—their place being taken by other species—and therefore it is incredible that man, the most highly specialized of all animals, should have survived.

---

[1] Quatrefages's "Human Species," p. 151.

[2] Prof. Winchell says: "Quatrefages does not now consider the proof decisive (*Hommes Fossiles et Hommes Sauvages*, Paris, 1884, p. 95)." He cites, as agreeing with him, MM. Cotteau, Evans, "and, I believe, most of the members who have not publicly pronounced themselves."

[3] Dawkin's "Early Man in Britain," p. 67.

And hence, if these Thenay flints are really artificial in their origin, it is more reasonable to suppose they were cut by one of the higher apes, then living in France, than by man. This is the view of Prof. Dawkins and Prof. Gaudry.[1] As to the last view, it is surely but reasonable to suppose, with Quatrefages,[2] that the superior intelligence of man would serve to protect him from the operation of causes that would effect the extinction of lower animals. Hence, unless some evidence be produced to show that species of apes are known to make rude stone implements, or some evidence that they did this in past ages, we must believe, with Geikie and others, that these flints prove that Miocene man lived in France, unless indeed we refuse to believe that they are artificial.

It also seems to us that those who hold to the view that man was living in other parts of the world, as Asia, during the Miocene Age, ought readily to admit that a few wandering bands might penetrate into Europe.[3] The climate was tropical, there was an abundance of animal life, and, if man was living anywhere, it is very reasonable to suppose that, at some epoch during the course of the Miocene Age, he would have found his way to Europe, unless shut off by the sea. It therefore seems to us that the presence of those cut flints is conclusive of the presence of man in Europe during the Miocene Age. At the same time we can not affirm that this is the conclusion of the scientific world. They seem to have heeded the remark of Quatrefages, that "in such a matter there is no great urgency," and are waiting for further discoveries.

Thus far in our review we have noticed the steady progress

[1] Dawkins's "Early Man in Britain," p. 68. [2] "Human Species," p. 152.

[3] Prof. Winchell remarks that, though some savage races might have been living in tropical lands during the Miocene, still the oldest skull and jaws obtainable in Europe are of a higher type than these.

in the forms of life. In the Miocene Age we have seen all the types of life below man present, and some indications of the presence of man himself. We must now learn what we can of the Pliocene Age, the last division of the Tertiary Age.

The Pliocene Age need not detain us long. Considerable changes in the geography of both Europe and America were going forward during the Miocene Age, and the result was quite a change in climate. There was a steady elevation of the Pacific coast region of America, and, as a consequence, a period of great volcanic outbursts in California and Oregon.[1] At the same time the bridge connecting Asia and America was severed.[2] In Europe the Mediterranean area was elevated; but the land connecting Greenland with Europe sank, allowing the cold waters of the Arctic to communicate with both the North Sea and the Atlantic—England at that time forming part of the great peninsula extending north and west from Europe.[3] The climate during the Pliocene Age was cooler than that of the Miocene. This is marked in the vegetation of that period. The palms and the cinnamon trees, which in Miocene times grew in Germany, flourished no farther north than Italy during the Pliocene.[4]

Count DeSaporta, who made special researches in the flora of this period, found the remains of a forest growth buried under lava on the side of a mountain in Cantal France, at an elevation of about four thousand feet above the level of the sea. This consisted principally of pines. This shows that probably all Northern Europe was covered with somber forests of pine. In the same section he found, buried under volcanic ash, a vegetation consisting mostly of

[1] Dana's "Manual of Geology," p. 523.
[2] Marsh: "American Assoc. Rep.," 1877.
[3] Dawkins's "Early Man in Britain," p. 73. [4] Ibid., p. 78.

deciduous trees—maples, alders, poplars, willows, elms, and ashes. As this was growing at the height of about twenty-three hundred feet in Cantal France, it probably represents the vegetation of Britain and Northern Germany. Finally, the vegetation of Central and Southern France, as well as Northern Italy, was intermediate in character between the luxuriant evergreen forests of the Miocene Age and that now growing there. The tropical character of the vegetation was evidently passing away. The climate over a large part of Europe was now temperate, though probably warmer than at present.[1]

In the Mammalia we have to notice the disappearance of some species, and the arrival and spread of some others. The apes living as far north as Germany in the Miocene Age were restricted to Southern France and Italy in the Pliocene, and, at its close, vanished altogether from Europe. The first living species of mammals is found in the remains of the hippopotamus that frequented the rivers of Pliocene times. The mastodon of Miocene times was still to be seen, but along with it was a species of true elephants. The hipparion survived into this epoch, but the horse also makes its appearance. Great quantities of deer roamed over the land; and, as might be expected where they were so abundant, the carnivorous animals, allied to the bears and wolves, panthers, linxes, and tigers, were also to be found. "At night," says Mr. Dawkins, "the Pliocene forests of Central France echoed with the weird laughter of the hyena."

The gradual lowering of the climate is also shown by the remains of the mollusks deposited in beds of marine or sea formation during different eras of this age. It is found that the earlier the bed, the more southern mollusks are found in it. This shows us that, all through the Pliocene Age, the

[1] Dawkins's "Early Man in Britain," p. 77.

waters of the seas surrounding England were gradually growing cooler, thus compelling the retreat of those mollusks fitted only for a warm climate, and allowing a gradual increase in those species fitted for cold or northern latitudes. We also find, in deposits made near the close of Pliocene times, numbers of stone which show all evidence of having been borne thither by means of ice. So we may conclude that rafts of ice came floating down the North Sea during the closing period of the Pliocene Age.[1] Still, during the entire length of the Pliocene Age, Europe certainly offered an inviting home for man. Not only were the higher orders of animals present, but at least one living species was known. We find more proofs of his presence, but whether they are sufficient to convince us that man really lived during that epoch is to be seen.

Prof. Whitney has brought to the attention of the scientific world what he considers ample evidence of the presence of Pliocene man in California. We reserve this for discussion in another place. We will only remark, at present, that the evidence in this case is regarded as sufficient by some of the best of American scholars.[2] We simply mention them here, so that they may be borne in mind when we see what evidence Europe has to offer on this point. In 1863, M. Desnoyers, of France, discovered, in a stratum which he considered Pliocene, some bones of elephants and other animals cut and scratched in such a manner that he considered the cuts to be the work of man. As showing how cautious geologists are of accepting such conclusions, we mention this case. There was found in the same bed the remains of an extinct beaver. The question was at once raised, whether rodents by gnawing these bones could not have pro-

[1] Dawkins's "Early Man in Britain," p. 76.

[2] Winchell's "Pre-Adamites," Whitney's "Auriferous Gravels of California," Marsh's "Address before American Assoc.," 1879.

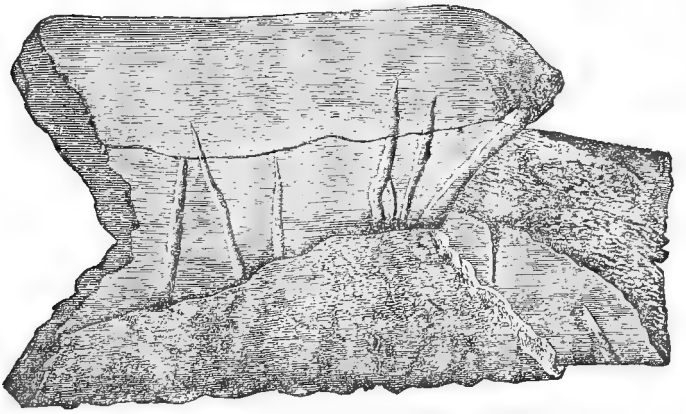
duced the cuts in question. Sir Charles Lyell, by actual experiments in the Zoölogical Gardens in London, soon showed that this was probably the fact.[1] Yet Sir John Lubbock thinks it quite likely some of them were of human origin.[2] Subsequently, however, M. Bourgeois discovered in the same bed worked flints, about the human origin of which there seems to be no doubt;[3] but a more careful study of the formation in which they occur has raised questions as to its age. Though usually held to be Pliocene, some careful observers consider it to be of a later age. Geologists can not be accused of rashly accepting statements as to the antiquity of man.

In 1867 there was discovered, in Northern Italy, a human skull in a railway cutting at a depth of nearly fifty feet. This stratum contains remains of several Pliocene animals. This is held to prove the existence of Pliocene man by several eminent observers, amongst others Prof. Cocchi, of Italy, and Forsyth Major.[4] But in this case Mr. Dawkins contends that it was not found under such conditions as render it certain that the stratum had been undisturbed, and so does not prove to a certainty that it was of the same age as the stratum.[5] And Mr. Geikie thinks that the stratum itself is of a later age than the Pliocene.[6] It is but right that geologists should thus carefully scan all the evidence produced.

In 1876 Prof. Capellini discovered, in a Pliocene deposit in Italy, the bones of a whale, which were so marked with cuts and incisions that he thought the only explanation was to say they had been cut by men. In this case[7] there is no

[1] "Antiquity of Man," p. 234.
[2] "Prehistoric Times," p. 433.
[3] Geikie's "Prehistoric Europe," p. 343.
[4] Dawkins's "Early Man in Britain."
[5] Ibid.
[6] "Prehistoric Europe," p. 318.
[7] Quatrefages's "Hum. Species," p. 150; Geikie's "Prehistoric Eur.," p. 345

dispute as to the age of the stratum. Neither is there much doubt but that the cuts are the work of man. It is quite true that Mr. Evans has suggested that they may be the work of fishes. In this he is followed by Prof. Winchell.[1] But there appears to be little ground for such belief, because the cuts are all on the outside faces of rib-bones, and the outer faces of the backbones. From the position occupied by the remaining portions of the skeleton, Prof. Capellini is sure that the animal had run aground, and, in that condition, was discovered and killed by men, who then, by means



Cut on Bones of a Whale from Pliocene Deposit.

of flint knives, cut away such portions of food as they wished. It must have been lying on its left side, since the cuts were all made on bones of the right.[2] It is not probable that fishes would have been apt to choose the outside faces of the ribs on the right side for their meals. These cut bones have been carefully examined by many competent men, who have agreed with Capellini that they are the work of men.[3] Mr. Dawkins thinks the cuts were artificial, but he says, "It is not, however, to my mind satisfactorily shown that these were obtained from undisturbed strata."[4]

[1] "Pre-Adamites."
[2] Geikie's "Prehistoric Europe," p. 344.
[3] Ibid.
[4] "Early Man in Britain," p. 92.

Now these bones have been found in several localities, always in Pliocene deposits, which formed the shores of the Pliocene sea.[1] Knowing how carefully geologists inquire into all the surroundings of a find, surely, if Capellini and others are the competent men they are admitted to be, they would have informed us long ago if they were not found in undisturbed strata.

Mr. Dawkins also objects because fragments of pottery were found in the strata. "Pottery," says he, "was unknown in the Pleistocene Age,[2] and therefore is unlikely to have been found in the Pliocene."[3] Mr. Geikie says this objection is founded on a mistake, as Prof. Capellini told him the pottery was found lying on the surface, and was never for a moment imagined by him as belonging to the same age as the cut bones.[4] There is also the objection, that, inasmuch as all the mammals then alive except one have perished, it is more than likely that, had man been in existence then, he too would have disappeared.

We considered this point fully when speculating as to the presence of man in the Miocene: so we have nothing further to offer. We might, however, suggest that, if the hippopotamus amongst mammals could survive all the changing time since the Pliocene, as it has done, it seems no more than fair to admit equal power of endurance to the human species. The position then of the scientific world as to the Pliocene Age of man is, on the whole, more decided in its favor than for the Miocene Age. Quite a number of eminent scholars, whose conclusions are worthy of all respect, unhesitatingly affirm the existence of Pliocene man in Europe. Others are not quite ready to admit his existence in Europe,

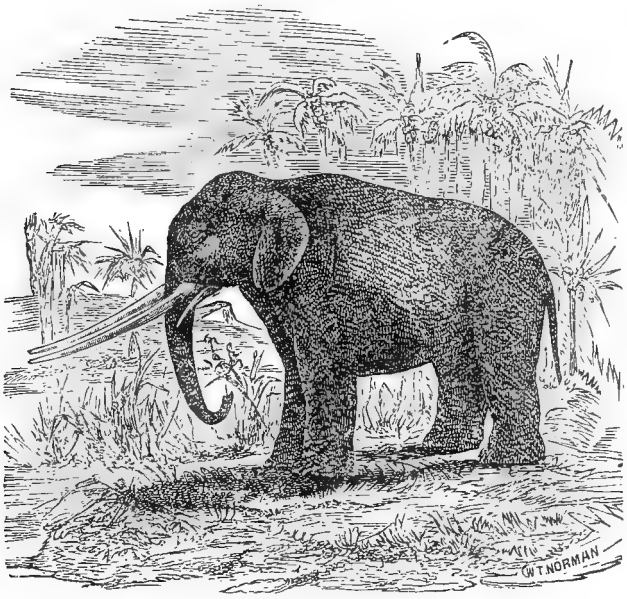
[2] Same as Glacial. See "Outline," p. 41.
[3] "Early Man in Britain," p. 92. [4] "Prehistoric Europe," p. 345, note 2.

but do think he was in existence elsewhere. Still others, with all due respect for the discoveries of Capellini, think it more prudent to await further discoveries. The reader, who has followed us through this brief outline of the past, can join which of the classes he will, and be sure of finding himself in good company.

This completes our review of past geological ages. With the termination of the Pliocene Age we find ourselves on firmer ground. We only wish to call attention once more to the gradual unfolding of life. We see that the rule has been that everywhere the lower forms of life precede the higher. In the plant world flowerless plants precede the flowering ones. The coal we burn to-day is mainly the remains of the wonderful growth of the flowerless vegetation of the Paleozoic Age. When flowering plants appear, it is the lower forms of them at first.

It was long ages before trees with deciduous leaves appeared. The growth of animal life is equally instructive. First invertebrate life, then the lowest forms of vertebrate life. The fishes are followed by amphibians—then reptiles, then birds. The first mammal to appear was the lowest organized of all—the marsupials. And we have seen the sudden increase of mammalian life in Tertiary times. We notice, in all the divisions of life, a beginning, a culmination, and a decline. There has never been such a growth of flowerless plants as in the Paleozoic, and flowering plants probably culminated in the Miocene. The same rule holds good for the animal world also. As man is the most highly organized of all the animals, we can not hope to find any evidence of his presence until we find proofs of the presence of all the lower types of life. Of course future discoveries may change our knowledge when the series is complete; but, from our present stand-point, he could not have lived before

the Miocene Age, and we have seen how faint and indecisive are the proofs of his presence even then. But should it finally be proved, beyond all dispute, that man did live in the Miocene Age, we must observe that this is but a small portion, but a minute fraction, of the great lapse of time since life appeared on the globe. We are a creation of but yesterday, even granting all that the most enthusiastic believer in the antiquity of man can claim.



The Mastodon.

# CHAPTER III.

## MEN OF THE RIVER DRIFT.[1]

BEGINNING of the Glacial Age—Inter-glacial Age—Man living in Europe during this age—Map of Europe—Proof of former elevation of land—The animals living in Europe during this age—Conclusions drawn from these different animals—The vegetation of this period—Different climatic conditions of Europe during the Glacial Age—Proofs of a Glacial Age—Extent of the Glacial Ice—Evidence of warm Inter-glacial Age—The primitive state of man—Early English civilization—Views of Horace—Primitive man destitute of metals—Order in which different materials were used by man for weapons—Evidence from the River Somme—History of Boucher de Perthes's investigations—Discussion of the subject—Antiquity of these remains—Improvement during Paleolithic Age—Description of the flint implements—Other countries where these implements are found—What race of men were these tribes—The Canstadt race—Mr. Dawkins's views—When did they first appear in Europe—The authorities on this question—Conclusion.

THE TERTIARY Age, with its wonderful wealth of animal and plant life, gradually drew to its close. In our "Outline" we have named the period that next ensued the Glacial Age.[2] This was sufficiently exact for our purpose then, but we must remember this is the name[3] for a long series of years. During this period great changes in climate occurred. At its commencement, a genial temperate climate prevailed throughout Europe; and this, as we

[1] This chapter was submitted to Prof. G. F. Wright, of Oberlin, for criticism.

[2] Lyell's "Antiquity of Man;" Geikie's "Prehistoric Europe," p. 332.

[3] It is, however, applicable to only a portion of the Quaternary, or Post-tertiary period. (Wright.)

know, was preceded, during the Miocene Age, by a warm tropical one.[1] This succession, then, shows us that, for some reason or other, the climate had been gradually growing colder. This change went forward uninterruptedly. Doubtless very gradually, from century to century, the seasons grew more and more severe, until, finally, the Summer's sun no longer cleared the mountains of the Winter's snow. This was the beginning of the Glacial Age proper.

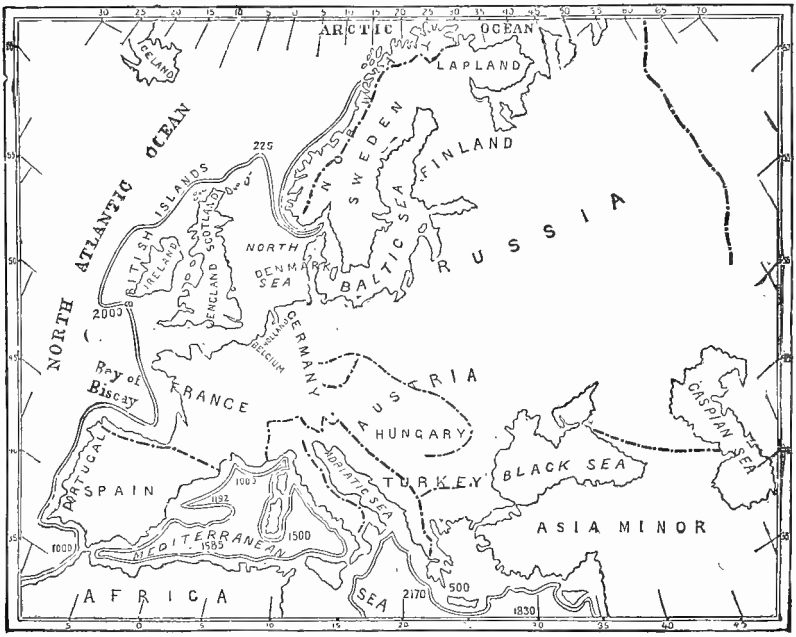
The best authorities also suppose that the reign of snow and ice was broken by at least one return (possibly more) of genial climate, when animals and plants from the south again visited the countries of Northern Europe—only, however, to be once more driven forth by a return of arctic cold. But finally, before the increasing warmth of a genial climate, the glaciers vanished, not to return again, and the Glacial Age became merged in that of the present.

It is no longer a question that man lived in Europe during the largest portion of this age, if not from the beginning. It is necessary, then, to come to a clear understanding of the successive stages of this entire age, and to trace the wonderful cycles of climate—the strange mutation of heat and cold, which must have exerted a powerful influence on the life, both animal and vegetable, of the period—and see when we first find decisive proofs of man's presence, and learn what we can of his condition.

The map of Europe, at the close of Pliocene times and the commencement of the Glacial Age, is of interest to us in several ways. From this it will be seen that it was considerably more elevated than at the present. As this is no fancy sketch, but is based on facts, it is well to outline them. Without the aid of man, land animals can not possibly pass from the main-land of a continent to an island lying some

[1] Page 48.

distance off the shore. But it is well known that animals like the rhinoceros, and several others, wandered as well over the surface of the British Islands as on the adjacent coast of Europe. We are therefore compelled to assume, that at that time the English Channel and the Irish Sea were not in existence. This necessitates an elevation of at least four hundred feet, which would also lay bare a large portion



Map of Europe.

of the North Sea.[1] In proof of this latter statement is the fact, that, at a distance from land in the North Sea, fishermen at the present day frequently dredge up bones and teeth of animals that then roamed in Europe.[2]

While there is no necessity for supposing an elevation greater than that required to lay bare a passage for animals

[1] Geikie's "Prehistoric Europe," p. 339.
[2] Dawkins's "Cave Hunting," p. 365.

back and forth, yet soundings undertaken by the British government have established the fact, that the ocean deepens very gradually away from the shores of the main-land until a depth of six hundred feet is reached, when the shore falls away very suddenly. This is supposed to be the sea-coast of that time. The English Channel would then have existed as the valley of the Seine, and the Rhine have prolonged its flow over the present bed of the North Sea. As the land stood at this height through a large portion of the Glacial Age, it is not at all unreasonable to suppose that primitive tribes hunted back and forth along these valleys, and so doubtless many convincing proofs of their presence at that early day lie buried underneath the waves of the sea. In like manner, at the south, we know that elephants, lions, and hyenas passed freely from Africa to Spain, Italy, and the Island of Crete,[1] and, consequently, the Mediterranean Sea must have been bridged in one or two places at least.[2]

The change from Pliocene times to early Glacial was so gradual that quite a number of animals lived on from one to the other, and, as we have already stated, one of these species has even survived to our own times.[3]

But we note the arrival in Europe of a great number of new animals, and the diversity of species seems at first an inexplicable riddle. The key, however, is to be found in the great climatic changes, which we have already mentioned as occurring during this age. On the one hand, we

---

[1] Dawkins's "Early Man in Britain," p. 112.

[2] Geikie's "Prehistoric Europe," p. 337.

[3] The majority of the Pliocene animals disappeared from Europe at the close of the period in question. This includes such animals as the mastodon, hipparion, and many kinds of deer (Geikie's "Prehistoric Europe," p. 334). The following animals survived into the Glacial Age, and some even into Interglacial periods: African hippopotamus (still living), saber-toothed lion, bear of Auvergne, big-nosed rhinoceros, Etruskan rhinoceros, Sedgwick's deer, deer of Polignac, Southern elephant. ("Prehistoric Europe," p. 95.)

find such animals as the musk-sheep, reindeer, and arctic fox, animals whose natural home is in high northern latitudes, where snow and ice prevail most of the year.[1] Yet during this age they lived in Southern France and Italy, which must then have had a far different climate than that at present.

Were we to confine our attention to these alone we would be convinced that the climate of Europe at that time was arctic in its severity. But side by side with the remains of these animals are found others which imply an altogether different climate. The hippopotamus, now frequenting the rivers of Africa, during that period roamed as far north as Yorkshire, England.[2] This animal could not live in a country where the cold was severe enough to form ice on the rivers. The remains of a number of other animals are found whose natural home is in the warm regions of the earth.[3] These two groups of animals, one from the north and one from the south, show how varied was the climate of Europe during the Glacial Age.

In addition to these, there was also a large number of animals whose home is in the temperate regions of the earth—animals that thrive in neither extremes of heat and cold. This includes a great many animals of the deer kind, several varieties of bears and horses; in fact, the majority of those with which we are acquainted.[4]

---

[1] The northern animals include the following: Alpine hare, musk-sheep, glutton, reindeer, arctic fox, lemming, tailless hare, marmot, spermophile, ibex, snowy vole, chamois. (Geikie's "Prehistoric Europe," p. 32.)

[2] Geikie's "Prehistoric Europe," p. 28.

[3] The following animals are given as southern species: Hippopotamus, African elephant, spotted hyena, striped hyena, serval, caffer cat, lion, leopard. In addition to the above there were also four or five species of elephants and three species of rhinoceros, which have since become extinct. (Geikie's "Prehistoric Europe," p. 32.)

[4] It is scarcely necessary to give a list of these animals. Prof. Dawkins enumerates thirty-three species. The following are some of the most import-

Now, what conclusion follows from this assemblage of animals? Many theories have been put forward in explanation. It has been suggested that Europe at that time had a climate not unlike that of some portions of the earth at present; that is, a long and severe Winter was followed by a short but warm Summer. During the Winter reindeer and other northern animals would press from the north in search of food, but would retire on the approach of Spring, when their feeding grounds would in turn be occupied by bisons and animals of a southern habitat. In confirmation of this view it is pointed out that a vast collection of bones, from the bottom of a sink-hole or pond in Derbyshire, England, conclusively show that in the summer-time it was visited by bisons with their calves, and in Winter by reindeer.[1] This theory is open to a great many objections. As is well known, some animals make quite extensive migrations annually, but we can scarcely believe that heavy, unwieldy animals, like the hippopotamus, were then such industrious travelers as to wander every year from Italy to Northern England and return.[2] But the very ground on which this theory rests, that of strongly contrasted summers and winters, could not be true of Europe or the western portions of it, owing to the presence of the Atlantic Ocean, and the influence which it inevitably exerts on the climate.[3] We see, then, that the presence of these different animals can be explained only by supposing great secular changes in climate. Let us see if we can strengthen this view by an appeal to the vegetation of this period.

We have seen how important a guide as to climate were

---

ant: Urus, bison, horse, stag, roe, beaver, rabbit, otter, weasel, martin, wildcat, fox, wolf, wild boar, brown bear, grizzly bear. (Geikie's "Prehistoric Europe," p, 32.)

[1] Dawkins's "Early Man in Britain," p. 191.

[2] Lubbock's "Prehistoric Times," p. 316.

[3] Geikie's "Prehistoric Europe," p. 37.

the remains of the vegetation of the early times. We therefore turn with more confidence to such discoveries as will tell us of the flora of this age. But there are many reasons why remains of plant growth should be few. As we shall soon learn, this was a period of flooded rivers; and in the gravels and loams thus formed is found our principal source of information as to the life of the age. But such a rush of waters would form gravelly banks or great beds of loam, and would sweep any plants which might be washed into its floods far out to sea; or if by chance they should become buried in such gravel beds, the action of water would speedily cause the decay of the tender portions, such as leaves, bark, and soft wood, in which case no profitable investigation could be made. Occasionally, however, around the shores of old lakes, vegetable beds have been buried, and we know that some mineral springs deposit a sort of protecting sediment on every thing with which they come in contact. By such means, at rare intervals, leaves, seeds, and fruits have been sealed up for future inspection, and from a careful study of all such instances much valuable information has been obtained. At one place in the valley of the Seine was discovered, under a bed of tufa, the remains of a forest growth. It is not doubted that the deposit belongs to the Glacial Age.[1]

Yet the forest growth reminds us of that prevalent during the Miocene Age. The fig-tree, canary, laurel, and box-tree grew in profusion. These are all southern forms. One severe winter would kill them all, and even hard frosts would prevent the ripening of their fruits.

Neither were the Summers hot and dry. This is shown by the presence of numerous plants which can not thrive in hot and dry localities, but live in the shady woods of North-

[1] Geikie's "Prehistoric Europe," p. 50.

ern France and Germany. The evidence of this forest growth surely presents us an inviting picture of Europe during a portion of the Glacial Age.

We are not without evidence, also, of a much more severe climate. In a lignite bed (a species of coal) found in nearly the same latitude as the forest growth just mentioned, we detect the presence of trees that grow only in cold northern climates, such as birch, mountain pine, larch, and spruce.[1] And in some peat-bogs of Southern Europe belonging to this age[2] are found willows now growing only in Spitzbergen, and some species of mosses that only thrive far to the north. It is quite evident that this deposit testifies to an altogether different climate from that indicated by the deposit before mentioned. No theory of migration can explain this assemblage of plants, unless it be migration taking place very slowly, in consequence of an equally slow change of climate.

From what we have just learned of the animals and plants living in Europe during this age, we can frame some conception of the different climatic conditions of Europe. On the one hand, we have a country with a mild and genial climate. Trees of a warm latitude were then growing as far north as Paris, and we may well suppose Europe to have abounded in shady forests and grassy plains, through which flowed large rivers. It was just such a country as that in which elephants and southern animals would flourish, while vast herds of deer and bovine animals wandered over the entire length and breadth of the land. Where animal life was so abundant there were sure to be carnivorous animals also, and lions, hyenas, tigers, and other animals added to the variety of animal life.

This, however, is but one side of the picture. The other

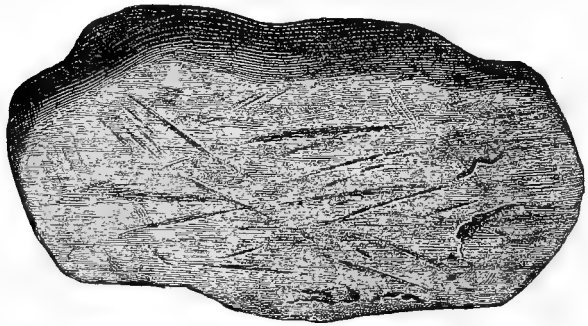
[1] Geikie's "Prehistoric Europe," p. 54. [2] Ibid., p. 55.

presents us with a very different scene; instead of an abundant forest growth, the land supported only dwarf birch, arctic willows, and stunted mosses. Arctic animals, such as musk-sheep and reindeer, lived all the year around in Southern France. The woolly mammoth lived in Spain and Italy. In short, the climate and conditions of life were vastly different in the two stages.

We must now turn our attention to the proofs of glaciers in Europe, the phenomena from which this age derives its name. Descriptions of Alpine glaciers are common enough, but as glaciers and the Glacial Age have a great deal to do with the antiquity of man, we can not do better than to learn what we can of their formation, and their wonderful extension during this period. The school-boy knows that by pressure he gives his snowball nearly the hardness of ice. He could make it really ice if he possessed sufficient strength. The fact is, then, that snow under the influence of pressure passes into the form of ice. In some cases nature does this on a large scale. Where mountains are sufficently elevated to raise their heads above the snow line we know they are white all the year around with snow. What is not blown away, evaporated, or, as an avalanche, precipitated to lower heights, must accumulate from year to year. But the weight pressing on the lower portions of this snow-field must soon be considerable, and at length become so great, that the snow changes to the form of ice. But as ice it is no longer fixed and immovable. We need not stop to explain just how this ice-field moves, but the fact is that, though moving very slowly, it acts like a liquid body. It will steal away over any incline however small, down which water would flow. Like a river it fills the valleys leading down from the mountains. But, of course, the lower down it flows the higher the temperature it meets, and it will sooner or later reach a point

where it will melt as fast as it advances. This stream of ice flowing down from snow-clad mountains is called a glacier. Those we are best acquainted with are but puny things compared with those of the polar regions, where in one case a great river of ice sixty miles wide, flowing from an unknown distance, some thousands of feet in depth (or height), pours out into the sea.[1]

We at once perceive that such a mass of ice could not pour down a valley without leaving unmistakable signs of its passage. The sides of the mountains would be deeply scarred and smoothed. Projecting knobs would be worn away. The surface of the valley, exposed to the enormous grinding power of the moving ice, would be crushed, pulverized, and dragged along with it. Pieces of stone, like that here represented, would form part of this moving *débris*, and as they were crowded along they would now and then grate over another piece of stone more firmly seated, and so their surface would be deeply scratched in the direction of their greatest length. There is always more or less water circulating under the Alpine glaciers, and the streams that flow from them are always very muddy, containing, as they do, quantities of crushed rock, sand, and clay.



Scratched Stone.

If, for any reason, this earthy matter was not washed out, it would form a bed of hard clay, in places packed with

[1] Kane's "Arctic Exploration," Vol. I, p. 225.

these striated stones. Such beds of clay are known as "till" or bowlder clay.[1]

This is descriptive, though in a very general way, of the glaciers as they exist to-day. Geologists have long been aware of the fact that they have convincing proofs of the former presence of glaciers in Northern Europe, where now the climate is mild. The mountains of Scotland and Wales show as distinct traces of glaciers as do those of the Alps. It is not necessary, in this hasty sketch, to enumerate the many grounds on which this conclusion rests. It is sufficient to state that by the united labors of many investigators in that field we are in possession of many conclusions relating to the great glaciers of this age which almost surpass belief; and yet they are the results of careful deductions. The former presence of this ice sheet itself is shown in a most conclusive manner by the bowlder clay formed underneath the great glacier, containing abundant examples of stone showing by their scratched surface that they have been ground along underneath the glacier. The rocks on the sides of the mountains are scratched exactly as are those in the Alps. By observing how high up on the mountains the striæ are, we know the thickness of the ice-sheet; and the direction in which it moved is shown in several ways.[2]

Briefly, then, the geologist assures us that when the cold of the Glacial Age was at its maximum glaciers streamed down from all the mountains of Scotland, Wales, and Northern England; that the ice was thick enough to overtop all the smaller hills, and on the plains it united in one great sea of ice some thousands of feet in thickness, that it stretched as far south as the latitude of London, England. But that to the west the ice streamed out across the Irish Sea, the islands to the west of Scotland, and ended far out

[1] Geikie's "Prehistoric Europe," p. 180. [2] Wallace's "Island Life," p. 104.

into what is now the Atlantic.[1] But these glaciers, vast as they were, were very small compared with the glaciers that streamed out from the mountains of Norway and Sweden. These great glaciers invaded England to the south-west, beat back the glacier ice of Scotland from the floor of the North Sea, overran Denmark, and spread their mantle of bowlder clay far south into Germany.[2]

While such was the condition of things to the north, the glaciers of the Alps were many times greater than at present. All the valleys were filled with glacier ice, and they spread far out on the plains of Southern Germany and westward into France. The mountains of Southern France and the Pyrenees also supported their separate system of glaciers. Ice also descended from the mountains of Asia Minor and North Africa.[3] In America we meet with traces of glaciers on a vast scale; but we can not pause to describe them here.[4]

It need not surprise us, therefore, to learn of reindeer and musk-sheep feeding on stunted herbage in what now constitutes Southern France. When a continuous mantle of snow and ice cloaked all Northern Europe, it is not at all surprising to find evidence of an extremely cold climate prevailing

---

[1] Geikie's "Prehistoric Europe," p. 189. [2] Ibid., p. 192, *et seq.*

[3] Dawkins's "Early Man in Britain."

[4] For fuller information on this topic see James Geikie's "The Great Ice Age;" also, by the same author, "Prehistoric Europe." In Appendix "B" of this latter work the author gives a map of Europe at the climax of the Glacial Age, showing the great extension of the glaciers. This map embodies the results of the labors of a great many eminent scholars. See also Croll's "Climate and Time;" also Wallace's "Island Life," pp. 102–202. We are not aware that the statements as set forth above are seriously questioned by any geologist of note. Some consider it quite possible that the bowlder clays of Southern England and Central Germany were deposited during a period of submergence from melting icebergs. (Dawkins's "Early Man in Britain," p. 116.) But even this demands vast glaciers to the north of this supposed submergence to produce the icebergs. The weight of authority, however, is in favor of the glaciers. (Geikie's "Prehistoric Europe," p. 175.)

throughout its southern borders. We thus see how one piece of evidence fits into another, and therefore we may, with some confidence, endeavor to find proofs of more genial conditions when the snow and ice disappeared, and a more luxuriant vegetation possessed the land, and animals accustomed to warm and even tropical countries roamed over a large extent of European territory. In Switzerland it was long ago pointed out that after the ancient glaciers had for a long time occupied the low grounds of that country they, for some cause, retreated to the mountain valleys, and allowed streams and rivers to work over the *débris* left behind them. At Wetzikon most interesting conclusions have been drawn. We there learn that, after the retreat of the glaciers, a lake occupied the place, which in course of time became filled with peat, and that subsequently the peat was transformed into lignite. To judge from the remains of animals and plants, the climate must have been at least as warm as that at present; and this condition of things must have prevailed over a period of some thousands of years to explain the thick deposits of peat, from which originated the lignites.[1]

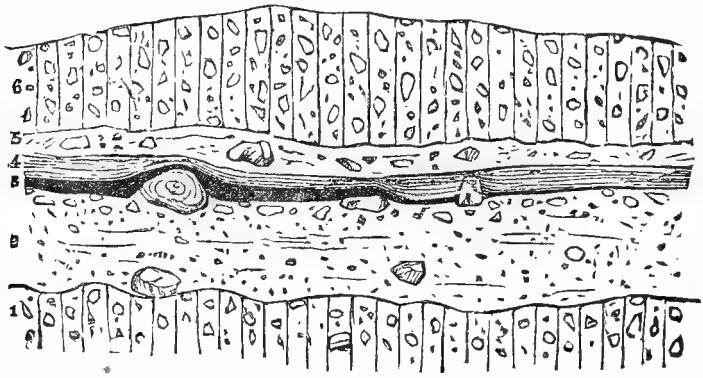
But we also know that this period came to an end, and that once more the ice descended. This is shown by the fact that directly overlying the lignite beds are alternating layers of sand and gravel, and, resting on these, glacier-born bowlders. The same conclusion follows from the discoveries made at many other places.

In Scotland it is well known that the bowlder clay contains every now and then scattered patches of peat and beds of soil either deposited in lakes or rivers. The only explanation that can be given for their presence is that they represent old land surfaces; that is, when the land was

[1] Haywood's Heer's "Primeval World of Switzerland," p. 200.

freed from ice, and vegetation had again clothed it in a mantle of green. In this cut is shown one of these beds. Both above and below are the beds of bowlder clay. The peat in the center varies from an inch to a foot and a half in thickness, and contains many fragments of wood, sticks, roots, etc.; and of animals, numerous beetles were found, one kind of which frequents only places where deer and ruminant animals abound.

From a large number of such discoveries it is conclusively shown that, after all, Scotland was smothered under



Interglacial Bed.

one enormous glacier, a change of climate occurred, and the ice melted away. Then Scotland enjoyed a climate capable of nourishing sufficient vegetation to induce mammoths, Irish deer, horses, and great oxen to occupy the land. But the upper bowlder clay no less conclusively shows that once more the climate became cold, and ice overflowed all the lowlands and buried under a new accumulation of bowlder clay such parts of the old land surface as it did not erode. Substantially the same set of changes are observed in English and German geology.[1]

[1] "Prehistoric Europe," p. 261. It is no longer a question that there was at least one mild period separating two periods of cold in Europe. See Lub-

Having thus given an outline of the climatic changes which took place in Europe during the Glacial Age, and the grounds on which these strange conclusions rest, we must now turn our attention to the appearance of man.

The uncertainties which hung over his presence in the earlier periods, spoken of in the former chapter, do not apply to the proofs of his presence during this age, though it is far from settled at what particular portion of the Glacial Age he came into Europe. We must remember we are to investigate the past, and to awaken an interest in the history of a people who trod this earth in ages long ago. The evidence on which we establish a history of the early tribes of Europe is necessarily fragmentary, but still a portion here and a piece there are found to form one whole, and enable us to form quite a vivid conception of manners and times now very far remote.

It is not claimed that we have surmounted every difficulty—on the contrary, there is yet much to be deciphered; but, in some respects, we are now better acquainted with these shadowy tribes of early times than with those whose history has been recorded by the historian's facile pen. He has given us a record of blood. He acquaints us with the march of vast armies, tells us of pillaged cities, and gives us the names of a long roll of titled kings; but, unfortunately, we know little of the home life, the occupation, or of those little things which make up the culture of a people. But the knowledge of primitive tribes, gathered from the scanty remains of their implements, from a thorough explo-

bock's "Prehistoric Times," p. 316; Dawkins's "Early Man in Britain," pp. 115–120; Lyell's "Antiquity of Man," pp. 282–285; Dana's "Manual of Geology," first edition, p. 561; Haywood's Heer's "Primeval World of Switzerland," Vol. II, p. 203; Wallace's "Island Life," p. 114; Croll's "Climate and Time." Mr. Geikie, in his works, "The Great Ice Age" and "Prehistoric Europe," maintains there were several warm interglacial epochs.

ration of their cavern homes, has made us acquainted with much of their home life and surroundings: and we are not entirely ignorant as to such topics as their trade, government, and religion. We must not forget that this is a knowledge of tribes and peoples who lived here in times immeasurably ancient as compared with those in existence at the very dawn of history.

We must try and form a mental picture of what was probably the primitive state of man; and a little judicious reasoning from known facts will do much for us in this direction. Some writers have contended that the first condition of man was that of pleasing innocence, combined with a high degree of enlightenment, which, owing to the wickedness of mankind, he gradually lost. This ideal picture, however consonant with our wishes, must not only give way before the mass of information now at our command, but has really no foundation in reason; "or, at any rate, if this primitive condition of innocence and enlightenment ever existed, it must have disappeared at a period preceding the present archæological investigations."[1] Nothing is plainer than that our present civilization has been developed from barbarism, as that was from savagism.[2] We need go back but a few centuries in the history of any nation, before we find them emerging from a state of barbarism. The energy and intelligence of the Anglo-Saxon has spread his language to the four corners of the globe; he has converted the wilderness into fruitful fields, and reared cities in desert lands: yet his history strikingly illustrates our point. A century back, and we are already in a strange land. The prominent points of present civilization were yet unthought of. No bands of iron united distant cities; no nerves of wire flashed electric speech. The wealth of that day could not buy many arti-

[1] Wright. [2] Morgan's "Ancient Society," p. 29.

cles conducive of comfort, such as now grace the homes of the poor. The contrast is still more apparent when we recall another of the countless centuries of the past. England, with Europe, was but just awakening to modern life. Printing had but just been invented. Great discoveries had been made, and mankind was but just beginning those first feeble efforts which were to bring to us our modern comforts. But a millennium of years ago, and the foundation of English civilization had but just been laid by the union of the rude Germanic tribes of the Saxons and the Angles. Similar results attend the ultimate analysis of any civilization. It was but yesterday that wandering hordes, bound together by the loose cohesion of tribal organization, and possessing but the germ of modern enlightenment, held sway in what is now the fairest portion of the world: and we, the descendants of these rude people, must reflect that the end is not yet—that the onward march of progress is one of ever hastening steps—and that, in all human probability, the sun of a thousand years hence will shine on a people whose civilization will be as superior to ours as the light of day exceeds the mellow glow of a moon-lit night.

If such are the changes of but a few centuries, what must we not consider the changes to have been during the countless ages that have sped away since man first appeared on the scene! The early Greek and Roman writers were much nearer right when they considered primitive man to have been but a slight degree removed from the brute world. Horace thus expresses himself: "When animals first crept forth from the newly formed earth, a dumb and filthy herd, they fought for acorns and lurking places—with their nails, and with fists—then with clubs—and at last with arms, which, taught by experience, they had forged. They then invented names for things, and words to express their thoughts; after

which they began to desist from war, to fortify cities, and enact laws." The learning of modern times leads to much the same conclusion.

It is evident that primitive man must have been destitute of metals; for it requires a great deal of knowledge and experience to extract metals from their ores. In the eyes of savages, the various metallic ores are simply so many varieties of stone—much less valuable for his purposes than flint, or some other varieties. We know it to be historically true, that a great many nations have been discovered utterly destitute of any knowledge of metals.

When we reflect how much of our present enlightenment is due to the use of metals, we can readily see that their discovery marks a most important epoch in the history of man. There is, then, every reason to suppose that stone was a most important article for primitive man. It was the material with which he fought his battle for existence, and we need not be surprised that its use extended through an enormously long period of time. Not only was primitive man thus low down in the scale, but of necessity his progress must have been very slow.

The time during which men were utterly destitute of a knowledge of metals, far exceeds the interval that has elapsed since that important discovery.[1] Scholars divide the stone age into two parts. In the first, the stone implements, are very few, of simple shapes, and in the main formed of but one variety of stone—generally flint—and they were never polished. In the second division, we meet with a great many different implements, each adapted to a different purpose. Different varieties of stone were employed, and they also made use of bone, shell, and wood, which were often beautifully polished.

[1] Geikie's "Prehistoric Europe," p. 365. Morgan's "Ancient Society," p. 39.

From what we have learned of the development of primitive society, it will not surprise us to learn that the first division of the age of stone comprises a vastly greater portion of time, and is far more ancient, than the second. We will give an outline showing the order of use of different materials; but it is here necessary to remark that Bronze was the first metal that man learned to use, and Iron the second.

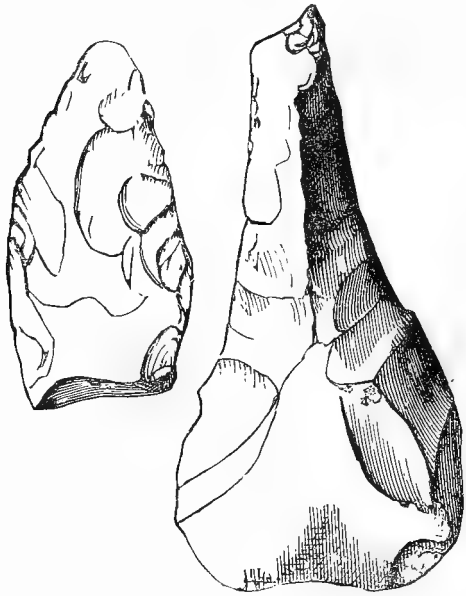
ORDER IN WHICH DIFFERENT MATERIALS WERE USED FOR WEAPONS AND IMPLEMENTS BY PRIMITIVE MAN.

| | | |
|---|---|---|
| Age of Stone. | Rough, or Old Stone Age. | Paleolithic. |
| | Polished, or New Stone Age. | Neolithic. |
| Age of Metals. | Bronze Age. | |
| | Iron Age. | |

In this outline the words Paleolithic and Neolithic are the scientific terms for the two divisions of the Stone Age, and will be so used in these pages.

The only races of men that we could expect to find in Europe during the Glacial Age would be Paleolithic tribes, and it is equally manifest that we must find traces of them in beds of this age, or in association with animals that are characteristic of this age, or else we can not assert the existence of man at this time. The valley of the river Somme, in Northern France, has become classical ground to the student of Archæology, since it was there that such investigations as we have just mentioned were first and most abundantly made. It is now well known that the surface features of a country—that is, its hills and dales, its uplands and lowlands—are mainly due to the erosive power of running water. Our rivers have dug for them-

selves broad valleys, undermined and carried away hills, and in general carved the surface of a country, until the present appearance is the result. It must be confessed that when we perceive the slow apparent change from year to year, and from that attempt to estimate the time required to produce the effects we see before us, we are apt to shrink from the lapse of time demanded for its accomplishment. Let us not forget that "Time is long," and that causes, however trifling, work stupendous results in the course of ages.



Paleolithic Flints.

But a river which is thus digging down its channel in one place, deposits the materials so dug away at other and lower levels, as beds of sand and gravel. In the course of time, as the river gradually lowers its channel, it will leave behind, at varying heights along its banks, scattered patches of such beds. Wherever we find them, no matter how far removed, or how high above the present river, we are sure that at some time the river flowed at that height; and standing there, we may try and imagine how different the country must have looked before the present deep valley was eroded.

In the case of the river Somme, we have a wide and deep valley, a large part of which has been excavated in chalk rock, through which the river now winds its way in

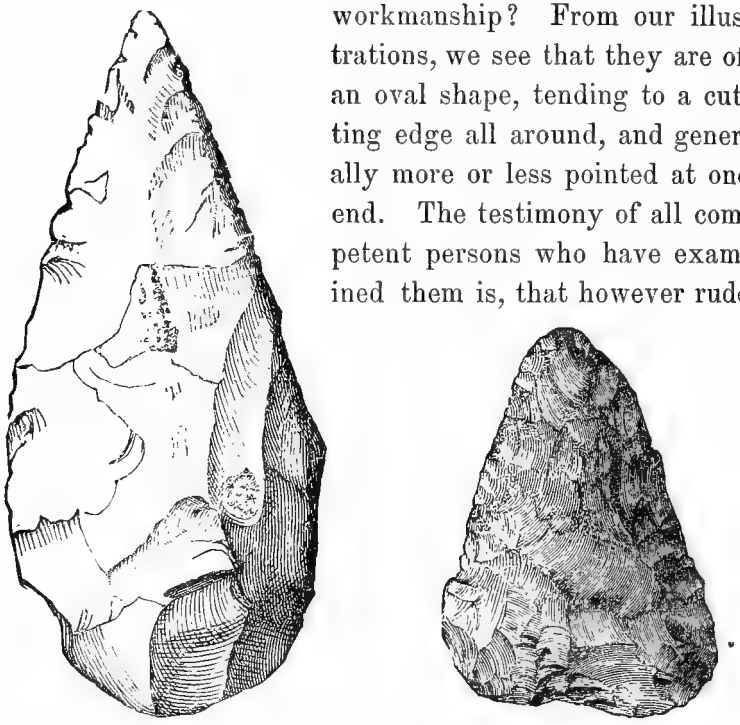
a sinuous course to the English Channel. Yet we feel sure that at some time in the past it was a mighty stream, and that its waters surged along over a bed at least two hundred feet higher than now. In proof of this fact we still find, at different places along the chalky bluff, stretches of old gravel banks, laid down there by the river, "reaching sometimes as high as two hundred feet above the present water level, although their usual elevation does not exceed forty feet."[1]

The history of the investigation of the ancient gravel beds of the Somme is briefly this: More than one instance had been noted of the finding of flint implements, apparently the work of men, in association with bones of various animals, such as hyenas, mammoths, musk-sheep, and others, which, as we have just seen, lived in Europe during the Glacial Age. In a number of cases such finds had been made in caves. But for a long time no one attributed any especial value to these discoveries, and various were the explanations given to account for such commingling. A French geologist, by the name of Boucher DePerthes, had noted the occurrence of similar flint implements, and bones of these extinct animals, in a gravel pit on the banks of the Somme, near Abbeville, France. He was convinced that they proved the existence of man at the time these ancient animals lived in Europe. But no one paid any attention to his opinions on this subject, and a collection of these implements, which he took to Paris in 1839, was scarcely noticed by the scientific world. They were certainly very rude, and presented but indistinct traces of chipping, and perhaps it is not strange that he failed to convince any one of their importance. He therefore determined to make a thorough and systematic exploration of these beds at Abbeville. In 1847 he published his great work on this subject, giving over sixteen hundred cuts of

[1] Rau's "Early Man in Europe," p. 14.

the various articles he had found, claiming that they were proof positive of the presence of man when the gravels were depositing.

Now there are several questions to be answered before the conclusions of the French geologist can be accepted. In the first place, are these so-called flint implements of human workmanship? From our illustrations, we see that they are of an oval shape, tending to a cutting edge all around, and generally more or less pointed at one end. The testimony of all competent persons who have examined them is, that however rude



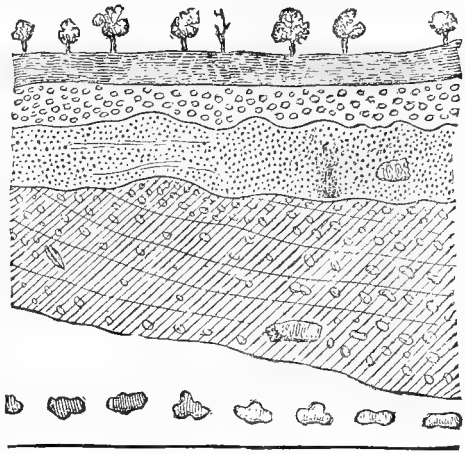
Flint Implements, so-called.

they may be, they were undoubtedly fashioned by man. Dr. C. C. Abbott has made some remarks on implements found in another locality, equally applicable to the ones in question. He says: "We find, on comparing a specimen of these chipped stones with an accidentally fractured pebble, that the chipped surfaces of the former all tend toward the production of a cutting edge, and there is no portion of the stone detached which does not add to the avail-

ability of the supposed implement as such; while in the case of a pebble that has been accidentally broken, there is necessarily all absence of design in the fracturing.[1]

Like the watch found on the moor, they show such manifest evidence of design, that we can not doubt that they were produced by the hand of man. But it is not enough to know that they are artificial, we must also know that they are of the same age as the beds in which they are found.

This cut represents a section of a gravel pit at St. Acheul, on the Somme. The implements are nearly always found in the lowest strata, which is a bed of gravel from ten to fourteen feet thick. Overlying this are beds of marl, loam, and surface soil, comprising in all a depth of fourteen feet. It has been suggested that the implements are comparatively recent, and have sunk down from above by their own weight, or perhaps have been buried in artificial excavations. The beds are however too compact to admit of any supposition that they may have been sunk there; and if buried in any excavation, evident traces of such excavation would have remained. We can account for their presence there in no other way than, that when the river rolled along at that high elevation, and deposited great beds of sand, these implements were someway lost in its waters, and became buried in the gravel deposits.



Section of Gravel Pit.

[1] "Primitive Industry," p. 485.

Finally, we have to consider the age of the deposits. This is a question that can be answered only by geologists, and we may be sure that more than ordinary attention has been bestowed upon them. The remains of many animals characteristic of the Glacial Age were found in the beds at Abbeville. These include those of the elephants, rhinoceros, hyenas, cave-bear, and cave-lion.[1]

In the formation of these gravel beds, ice has undoubtedly played quite an important part. Bowlders that could have got there only by the aid of ice, are found in several localities. Evidence gathered from a great many different sources all establish the fact that these gravels date as far back as the close of the Glacial Age at least, and there are some reasons for supposing them to be interglacial.

We can easily see that the melting away of the immense glaciers that we have been describing would produce vast floods in the rivers, and it is perhaps owing to the presence of such swollen rivers that are due the great beds of surface soil, called loam or loess, found in all the river valleys of France and Germany.[2] These deposits frequently overlie the gravel beds. They are then of a later date than the beds in which are found such convincing proofs of the presence of man, and if they themselves date from the close of the Glacial Age, it is no longer a question whether the gravel beds themselves belong to that age. Thus we see that we can no longer escape the conclusions of Boucher DePerthes. The discovery of rudely worked flints in the drift of the Somme River thus establishes the fact that some time during the Glacial Age, man in a Paleolithic state lived in France.

[1] Lubbock's "Prehistoric Times," 384.

[2] Geikie's "Prehistoric Europe," chap. ix. Most geologists suppose there was a general depression of the region below the sea level, or so as to form inland lakes, and that the loess was thus deposited, as perhaps it is depositing at the present time in the lakes of Switzerland. (Wright.)

Geological terms convey to us no definite ideas as to the lapse of time, and we have an instinctive desire to substitute for them some term of years. In most cases this is impossible, as we have no means to measure the flight of past time, nor are we yet prepared to discuss the question of time, since to do so we must learn a great deal more about the cause of the Glacial Age. We might, however, cite statements which can not fail to impress us with the fact that a great extent of time has passed.

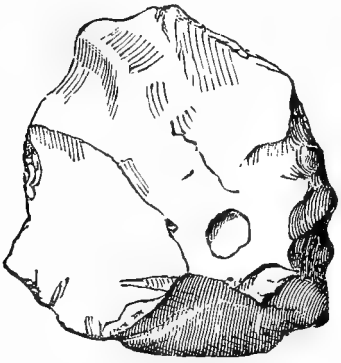
In the case of the river Somme we have a valley in some places a mile or more in width, and about two hundred feet in depth. This has mostly been excavated in chalk rock. Taking our present large rivers as a basis, it would require from one to two hundred thousand years for the Somme to perform this work.[1] It will not do, however, to take the present action of our rivers as a guide, since we have every reason to suppose this work went forward much more rapidly in past times. But we can not escape the conclusion that it demands a very long time indeed to explain it. The valley has remained in its present shape long enough to admit the formation of great beds of peat in some portions. Peat is formed by the decomposition of vegetable growth. Its growth is in all cases slow, depending entirely upon local circumstances. European scholars who have made peat formation a special study assure us that to form such immense beds as occur near Abbeville, several thousand years are required, even under the most favorable conditions.

Yet we would be scarcely willing to rest such important conclusions as the foregoing on the researches of one individual, or in one locality. As already stated, DePerthes made his discoveries public in 1847. Yet they were so opposed to all that had been believed previously, that but few took the

[1] Lubbock's "Prehistoric Times," p. 423.

pains to investigate for themselves. In 1853, Dr. Rigollot, of Amiens, who had been skeptical as to DePerthes, commenced to look for himself in the gravel beds at St. Acheul, about nine miles below Abbeville. As might be expected, he was soon convinced.

It may be said that the scientific world formally accepted the new theory when such English scientists as Evans, Falconer, Lyell, and Prestwich reported in its favor. Since that time, many discoveries of ancient implements have been made at various places in France and England under circumstances similar to those in the valley of the Somme. In England they have been found along almost all the rivers in the southern and southeastern part. One class of discoveries there gives us new ideas as to the extent of time that has passed since they were deposited. That is where they occur in gravel beds having no connection with the present system of rivers. In one case the gravel forms a hill fifteen feet high, situated in the midst of a swampy district, surrounded on all sides by low, flat surfaces. Several such instances could be given; but, in all such cases, we can not doubt that, somewhere near, there once rolled the waters of an ancient river, that man once hunted along its banks, and that, owing to some natural cause, the waters forsook their ancient bed—and that since then, in the slow course of ages, the action of running water has removed so much of the surface of the land near there, that we can not guess at its ancient configuration: we only know, from scattered patches of gravel, that we are standing on the banks of an ancient water-course.



Paleolithic Flint, England.

One instance, illustrative of the great change that has come over the surface features of the country, demanding for their accomplishment a great lapse of time, is furnished by the Isle of Wight. That island is now separated from the mainland by a narrow channel, called the South Hampton Water, or the Solent Sea.

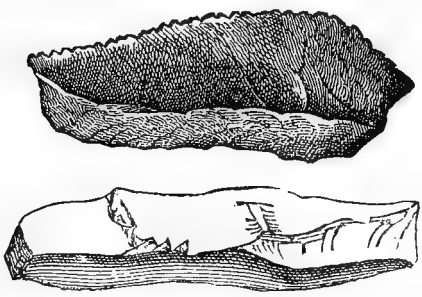
It is now known that this is nothing but an old river channel, in which the sea has usurped the place of the river. The coast is a river embankment, with the usual accompaniments of gravel beds, flint implements, and fresh water shells. On the shores of the island we find the opposite bank of the old river. A very great change must have taken place in the surface features before the sea could have rolled in and cut off the Isle of Wight from the mainland.

In speaking of the length of time demanded for this change, Dr. Evans says: "Who can fully understand how immeasurably remote was the epoch when what is now that vast bay was high and dry land, and a long range of chalk downs, six hundred feet above the sea, bounded the horizon on the South? And yet that must have been the sight that met the eye of primitive man who frequented the banks of that ancient river, which buried their handiwork in gravels that now cap the cliffs—and of the course of which so strange and indubitable a memorial subsists in what has now become the Solent Sea?"[1]

The illustrations scattered through this essay are representations of the stone implements found in the drift of European rivers. During all the long course of time supposed to be covered by the Paleolithic Age, there are but very few evidences of any improvement, as far as we can judge from the implements themselves. This is in itself a melancholy

[1] Evans's "Ancient Stone Implements," p. 621.

proof of the low condition of man. He had made so little advance in the scale of wisdom, he possessed so little knowledge, he was so much a creature of instinct, that, during the thousands of years demanded for this age, he made no appreciable progress. The advance of the last century was many times greater than that of the entire Paleolithic Age.



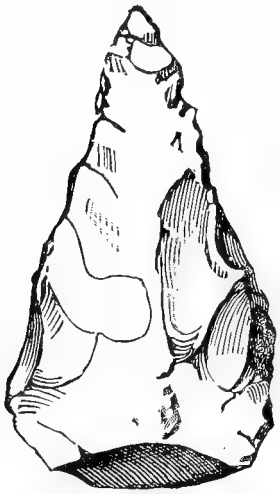
Flint Flakes.

A blow struck on one end of a piece of flint will, owing to the peculiar cleavage of flint, split off pieces called flakes. This is the simplest form of implement used by man. It is impossible to say with certainty how they were used; but, from the evidence observed on them, they were probably used as scrapers. The men of that day doubtless knew some simple method of preparing clothing from the skins of the animals they had killed, and probably many of these sharp-rimmed flakes were used to assist in this primitive process of tanning.

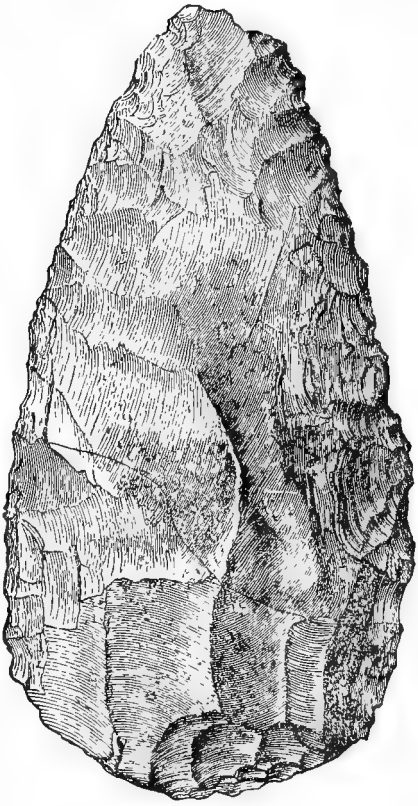
When the piece of flint itself was chipped into form, it was one whose shape would indicate a spear-head or hatchet. We present illustrations of each. Forms intermediate between these two are found. Some have such a thick heavy base that it is believed they were used in the hand, and had no handle or haft.

Others, with a cutting edge all round, may have been provided with a handle. M. Mortillet, of France, who has had excellent opportunities of studying this question very thoroughly, thinks that the hatchet was the only type of implement they possessed, and that it was used for every conceivable purpose—but that their weapon was a club, all

traces of which have, of course, long since vanished away.[1] These few implements imply that their possessors were savages like the native Australians. In this stage of culture, man lived by hunting, and had not yet learned to till the ground, or to seek the materials out of which his implements were made by mining. He merely fashioned the stones which happened to be within his reach in the shallows of the rivers as they were wanted, throwing them away after they had been used. In this manner the large numbers which have been met with in certain spots may be accounted for. Man at this time appears before us as a nomad hunter, poorly equipped for the struggle of life, without knowledge of metals, and ignorant of the art of grinding his stone tools to a sharp edge.[2] Of course we can not hope to learn



Spear Head Type.



Hatchet Type.

[1] *Pop. Science Monthly*, Oct., 1883. [2] Dawkins's "Ear. Man in Brit.," p. 163.

much of their social condition, other than that just set forth.

DePerthes found some flints which show evidence of their human origin, and yet it would be very difficult to say what was their use. He thinks they may have a religious significance, and has set forth a great variety of eloquent surmises respecting them. It only need be said that such theorizing is worse than useless. That while it is very probable these tribes had some system of belief, yet there is no good reason for supposing these flints had any connection with it. It has been supposed, from another series of wrought flints, that the men of this epoch were possessed of some sentiments of art, as pieces have been found thought to represent the forms of animals, men's faces, birds, and fishes; but as very few have been able to detect such resemblances, it is safe to say they do not exist.

As the love of adornment is almost as old as human nature itself, we may not be surprised to find traces of its sway then. Dr. Rigollot found little bunches of shells with holes through either end. The supposition is that these were used as beads; which is not at all strange, considering how instinctively savage men delight in such ornaments. These ancient hunters made use of beads partially prepared by nature.

Europe is not the only country where the remains of this savage race are found. They are found in the countries bordering the Mediterranean in Northern Africa, and in Egypt. In this latter country they are doubtless largely buried under the immense deposits of Nile mud; yet in 1878 Professor Haynes discovered in Upper Egypt scrapers and hatchets, pronounced by archæologists to be exactly similar to those of the river Somme. We are not informed as to their geological age, but there can be no question that they

are much older than any monument of Egyptian civilization hitherto known.[1]

Paleolithic implements have also been found in Palestine and in India. In the latter country the beds are so situated that they present the same *indicia* of age as do those of the Somme Valley. A great portion of the formation has been removed, and deep valleys cut in them by running water.[2] They have also been found in at least one locality in the United States; that is in the glacial gravel of the valley of the Delaware at Trenton, New Jersey. We must not confound these remains with those of the Indian tribes found scattered over a large extent of surface. Those at Trenton also are not only in all respects, except materials, similar to those of the Somme, but are found imbedded in a formation of gravel that was deposited at least as far back as the close of the Glacial Age, thus requiring the passage of the same long series of years since they were used, as do the implements of European rivers.[3] We must also bear in mind that no country has been so carefully explored for these implements as has Europe, and that the very country, Asia, where, for many reasons, we might hope to find not only unequivocal proofs of man's presence, but from our discoveries be able to clear up many dark points, as to the race, origin, and fate of these primitive tribes, is yet almost a sealed book.

But the scattered discoveries we have instanced show us that the people whose implements have been described in this chapter were very widely dispersed over the earth, and everything indicates that they were far removed from us in time. The similarity in type of implements shows that, wherever

[1] Wright's "Studies in Science and Religion," p. 278. See also British Association Report, 1882, p. 602.

[2] Lubbock's "Prehistoric Times," p. 356. [3] Abbott's "Primitive Industry."

found, they were the same people, in the same low savage state of culture—"Alike in the somber forests of oak and pine in Great Britain, and when surrounded by the luxuriant vegetation of the Indian jungle."[1]

We have yet two important points to consider. The first is, what race of men were these river tribes? and second, when did they arrive in Europe? Did they precede the glacial cold? did they make their appearance during a warm interglacial period? or was it not until the final retreat of the glaciers that they first wandered into Europe? These questions are far from settled; yet they have been the object of a great amount of painstaking research.

To determine the first point, it is necessary that anatomists have skeletons of the men of this age, to make a careful study of them. But for a great many reasons, portions of the human skeleton are very rarely found in such circumstances that we are sure they date back to the Paleolithic Age, and especially is this true of the men of the River Drift. In a few instances fragmentary portions have been found.

M. Quatrefages, of France, who is certainly a very high authority on these points, thinks that the hunter tribes of the River Drift belonged to the Canstadt race—"so named from the village of Canstadt, in Germany, near which a fossil skull was discovered in 1700, and which appears to be closely allied to the Neanderthal skull, discovered near Dusseldorf in 1857, and about which so much has been written."[2] Quatrefages supposes that this type of man is still to be found in certain Australian tribes. These are not mere guesses, but are conclusions drawn from careful study by eminent European scholars.[3]

[1] Dawkins's "Early Man in Britain," p. 172.
[2] Wright.
[3] Quatrefages's "Human Species," p. 307.

It is well known that a competent naturalist needs but a single fossil bone to describe the animal itself, and tell us of its habits. So also anthropologists need but fragments of the human skeleton, especially of the skull, to describe the characteristics of the race to which the individual belonged.

This cut, though an ideal restoration, is a restoration made in accordance with the results of careful study of fragmentary skulls found in various localities in Europe. The head and the face present a savage aspect; the body harmonized with the head; the height was not more than five feet and a half; yet the bones are very thick in proportion to their length, and were evidently supplied with a powerful set of muscles, since the little protuberances and depressions where the muscles are attached are remarkably well developed.[1] Huxley and Quatrefages have both pointed out that representatives of this race are to be found among some Australian tribes. "Among the races of this great island there is one, distributed particularly in the province of Victoria, in the neighborhood of Port Western, which reproduces, in a remarkable manner, the characters of the Canstadt race."[2] Not the least interesting result of this discovery is the similarity of weapons and implements. "With Mr. Lartet, we see in the obsidian lances of New Caledonia the

Neanderthal Man.

[1] "Human Species," p. 305.

[2] Ibid., p. 307.

flint heads of the lower alluvium of the Somme. The hatchet of certain Australians reminds us, as it did Sir Charles Lyell, of the Abbeville hatchet.[1]

Yet some hesitate about accepting these interesting inferences, thinking that the portions of the human skeleton thus far recovered, which are beyond a doubt referable to this period, are too fragmentary to base such important conclusions upon. This is the view of Boyd Dawkins, who thinks "we can not refer them to any branch of the human race now alive."[2] "We are without a clew," continues he, "to the ethnology of the River Drift man, who most probably is as completely extinct as the woolly rhinoceros or the cave bear."[3] Future discoveries will probably settle this point.

It is yet a much disputed point to what particular portion of the Glacial Age we can trace the appearance of man. We can profitably note the tendency of scientific thought in this direction. But a short time has elapsed since a few scholars here and there began to urge an antiquity for man extending back beyond the commonly accepted period of six thousand years. Though it is now well known and admitted that there are no good grounds for this estimate, yet such was its hold, such its sway over scientific as well as popular thought, that an appeal to this chronology was deemed sufficient answer to the discoveries of DePerthes, Schmerling, and others. It was but yesterday that this popular belief was overthrown and due weight given the discoveries of careful explorers in many branches, and the antiquity of man referred, on indisputable grounds, to a point of time at least as far back as the close of the preceding geological age.[4]

[1] Quatrefage's "Human Species," p. 306.

[2] "Early Man in Britain," p. 173. [3] Ibid., p. 233.

[4] We do not give any estimate in years as to this antiquity in this chapter.

It seems as if here a halt had been called, and all possible objections are urged against a further extension of time. It is, of course, well to be careful in this matter, and to accept only such results as inevitably follow from well authenticated discoveries. But it also seems to us there is no longer any doubt that man dates back to the beginning of that long extended time we have named the Glacial Age.[1]

In the first place, we must recall the animals that suddenly made their appearance in Europe at the beginning of this age. Though there were a number of species, since become extinct, the majority of animal forms were those still living.[2]

These are the animals with which man has always been associated. There is therefore no longer any reason to suppose the evolution of animal life had not reached that stage where man was to appear. We need only recall how strongly this point was urged in reference to the preceding geological epoch, to see its important bearings here. Mr. Boyd Dawkins has shown that the great majority of animals which invaded Europe at the commencement of this age, can be traced to Northern and Central Asia, whence, owing to climatic changes, they migrated into Europe.[3]

Inasmuch as man seems to have been intimately associated with these animals, it seems to us very likely that he came with them from their home in Asia. We think the tendency of modern discoveries is to establish the fact that man arrived in Europe along with the great invasion of species now living.[4]

---

[1] We must remember that this age is also variously called the Quaternary, Pleistocene, and Post Tertiary. We do not now refer to the evidence of man's existence in the Miocene and Pliocene, treated of in the preceding chapter.

[2] Mr. Dawkins finds that fifty-five out of seventy-seven species are yet living. "Early Man in Britain," p. 109.

[3] "Early Man in Britain," p. 110.

[4] Those who reject the proofs of the existence of man in Pliocene times because the evolution of life had not then reached a stage where we could hope

Turning now to the authorities, we find this to be the accepted theory of many of those competent to form an opinion.

In England Mr. Geikie has strongly urged the theory that the Glacial Age includes not only periods of great cold, but also epochs of exceptional mildness; and he strongly argues that all the evidence of the River Drift tribes can be referred to these warm interglacial epochs; in other words, that they were living in Europe during the Glacial Age.[1]

In answer to this it has been stated that the relics of River Drift tribes in Southern England overlie bowlder clay, and must therefore be later in origin than the Glacial Age.[2]

But, Mr. Geikie and others have shown that the ice of the last great cold did not overflow Southern England,[3] so that this evidence, rightly read, was really an argument in favor of their interglacial age.[4] The committee appointed by the British Association to explore the Victoria Cave, near Settle, urge this point very strongly in their final report of 1878.[5] To this report Mr. Dawkins, a member of the committee, records his dissent, but in his last great work he freely admits that man was living in England during the Glacial Age, if he did not, in fact, precede it.[6]

Mr. Skertchley, of the British coast survey, in 1879,[7] announced the discovery in East Anglia of Paleolithic imple-

to find man, are here confronted with a difficulty. If Mr. Dawkins be right (as stated above) then the various animals in question must have been living in Asia during the preceding Pliocene Age. There is no reason to suppose man was not associated with them, since he belongs to the same stage of evolution (Le Conte's "Elements of Geology," p. 568), and though, owing to climatic and geographical causes, the animals themselves might have been confined to Asia, there is surely no good reason why man may not, in small bands, and at various times, have wandered into Europe.

ments underlying the bowlder clay of that section. Mr. Geikie justly regards this as a most important discovery.[1]

Finally Mr. Dawkins, in his address as President of the Anthropological section of the British Association, in 1882, goes over the entire ground. After alluding to the discovery of paleolithic implements in Egypt, India, and America, he continues: "The identity of implements of the River Drift hunter proves that he was in the same rude state of civilization, if it can be called civilization, in the Old and the New World, when the hand of the geological clock struck the same hour. It is not a little strange that this mode of life should have been the same in the forests of the North, and south of the Mediterranean, in Palestine, in the tropical forests of India, and on the western shores of the Atlantic." This, however, is not taken as proving the identity of race, but as proving that in this morning-time of man's existence he had nowhere advanced beyond a low state of savagism. Mr. Dawkins then continues: "It must be inferred from his wide-spread range that he must have inhabited the earth for a long time, and that his dispersal took place before the Glacial epoch in Europe and America. I therefore feel inclined to view the River Drift hunter as having invaded Europe in preglacial times, along with other living species which then appeared." He also points out that the evidence is that he lived in Europe during all the changes of that prolonged period known as the Glacial Age.[2]

Sir John Lubbock also records his assent to these views. He says on this point: "It is, I think, more than probable that the advent of the Glacial Period found man already in possession of Europe."[3]

[3] Preface to Kains-Jackson's "Our Ancient Monuments."

In our own country Prof. Powell says: "It is now an established fact that man was widely scattered over the earth at least as early as the beginning of the Quaternary period, and perhaps in Pliocene times."[1]

This completes our investigation of the men of the River Drift. We see how, by researches of careful scholars, our knowledge of the past has been enlarged. Though there are many points which are as yet hidden in darkness, we are enabled to form quite a clear mental picture of this early race. Out of the darkness which still enshrouds the continent of Asia we see these bands of savages wandering forth; some to Europe, Africa, and the west; others to America and the east.

This was at a time when slowly falling temperature but dimly prophesied a reign of arctic cold, still far in the future. This race does not seem to have had much capacity for advancement, since ages came and went leaving him in the same low state. During the climax of glacial cold he doubtless sought the southern coasts of Europe along with the temperate species of animals. But whenever the climatic conditions were such that these animals could find subsistence as far north as England he accompanied them there, and so his remains are found constantly associated with theirs throughout Europe. Though doubtless very low in the scale, and at the very foot of the ladder of human progress, we are acquainted with no facts connecting them with the higher orders of animals. If such exists, we must search for them further back in geological time. The men of the River Drift were distinctively human beings, and as such possessed those qualities which, developing throughout the countless ages that have elapsed, have advanced man to his present high position.

HAVE been delving among the sands of ancient river bottoms for a proof of man's existence in far remote times. Slight and unsatisfactory as they may be to some, they are the materials with which we reconstruct a wondrous story of life and times removed from us by many a cycle of years.

Men have frequently resorted to the caverns of the earth for protection. In places we find caves that served this purpose during the Paleolithic Age. The men of the Drift, however, do not appear to have used them, save as temporary places of refuge, perhaps as a protection from bands of savage enemies, or from unusually inclement weather. But yet most surprising results have attended

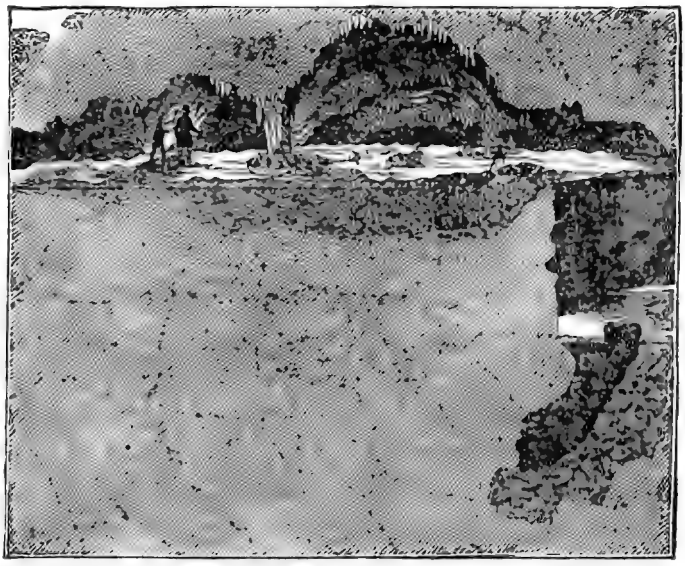
[1] The manuscript of this chapter was submitted to Prof. G. F. Wright, of Oberlin, for criticism.

the exploration of caves in England, France, and Belgium. We find in those gloomy places that the men of the Drift were not the only tribes of men inhabiting Europe during the Glacial Age. In fact, living at later date than the Drift tribes, but still belonging to the Paleolithic Age, were tribes of people who appear to have utilized caverns and grottoes as places of permanent resort, and, judging from their remains, they had made considerable advance in the arts of living as compared with the tribes of the Drift.

But before pointing out the grounds upon which these conclusions rest, it may be well to give a slight review of the history of cave research. The dread and awe which kept people away from caves during the Middle Ages preserved their contents for later discoverers. In the seventeenth century some adventurous spirits began to search in them for what they called Unicorn horns, which were deemed a most efficacious remedy for various diseases. This search served the good purpose of bringing to light various fossil bones of animals, and calling the attention of scientific men to the same.

The cave of Gailenreuth, in Bavaria, was explored by Dr. Goldfuss in 1810. He came to the conclusion that the bones of bears and other extinct animals were proofs of the former presence of the animals themselves. Dr. Buckland, a celebrated English writer, visited the cave in 1816, and became much interested in the work; so much so that when Kirkdale Cavern, in England, was discovered in 1821, he at once repaired to the spot and made a careful exploration. The results satisfied him that hyenas and other extinct animals had once lived in England. He followed up his explorations in a number of cases, and published a work on this subject in 1822, which marks the commencement of a new era in cave research.

In 1825 Kent's Cavern, near Torquay, was discovered, and Rev. J. McEnry made partial explorations in it. He discovered flint implements, and perceived they might be a proof of the presence of man with these extinct animals. Dr. Buckland had not found these relics, or else had passed them by as of no importance, for he refused to entertain the theory that man and the extinct animals had been contemporaneous. Explorations made in France in 1827–8 had



Gailenreuth.

furnished such strong evidence on this point that it was deemed established by some scholars, but being opposed to the prevailing belief, nothing came of it.

In 1829 Schmerling commenced his investigations in the caves of the valley of the Meuse. For years he continued his work under many difficulties. Sir Charles Lyell tells us he was let down day after day to the opening of the Engis Cave by a rope tied to a tree. Arriving there he crawled on all fours through a narrow passage way to the enlarged

chamber, where, standing in mud and water, he superintended the investigations. He examined over forty of those caves, and published his results in 1833. He clearly showed that man must have been living along with various animals now extinct in Belgium. But, as before remarked, it was deemed sufficient answer to this careful explorer to point out that his results were opposed to the accepted chronology, and so they were passed by. When the time at last came, and their true worth was recognized, Schmerling himself had passed away.

We have already seen what great results followed the exploration of DePerthes in the river gravels. When it had been clearly established that man and extinct animals had coexisted in Europe, the results of cave explorations were eagerly recalled, and governments vied with royal societies and private individuals in continuing the researches. The results are that a rich store of facts has been gathered from those gloomy resorts, illustrative of the later stages of Paleolithic art.

A word as to the formation of caves, grottoes, caverns, and rock shelters. These vary greatly in size, some being so small as to furnish protection to but few individuals; others, especially caves, so large that whole tribes might have found a place of resort within their chambers. They are found in all limestone countries. The formation of caves is now recognized as due to natural causes acting slowly through many years. Limestone rock is very hard and durable, but chemistry teaches us that water charged with carbonic acid gas will readily dissolve it. Rain-water falling from the clouds is sure to come in contact with masses of decaying vegetable matter, which we know is constantly giving off quantities of this gas. Laden with this the water sinks into the ground, and, if it comes in contact with lime-

stone, readily washes some of it away in solution. But beds of limestone rock are noted for containing great fissures through which subterranean waters penetrate far into the ground. We can readily see how this percolating water would dissolve and wear away the surface of the rocks along such a fissure, and in process of time we would have the phenomenon of a stream of water flowing under ground.

Owing to a great many causes—such, for instance, as the meeting of another fissure—we would expect that portions of this underground way would become enlarged to spacious halls. In some such a way as this it is now understood that all caves have originated.

Owing to many natural causes the river may, after a while, cease to flow, leaving enlarged portions of its channel behind as a succession of chambers in a cave. But water would still come trickling in from the tops and sides, and be continuously dripping to the floor, where it speedily evaporates. When such is the case it leaves behind it the limestone it held in solution. So, in process of time, if the deposition is undisturbed, there will be formed over the floor of the cave a more or less continuous layer of limestone matter known as stalagmite. The same formations on the top and sides of the cave are called stalactites. In places where the drip is continuous the stalactite gradually assumes the shape of an immense icicle; while the stalagmite on the floor of the cave, underneath the drip, rises in a columnar mass to meet the descending stalactite. A union of these is not uncommon, and we have pillars and columns presenting the strange, fantastic appearance on which tourists delight to dwell in their notes of travel.

While these accumulations are in all cases very slow, still we can not measure the time since it commenced by the rate of present growth, because this rate varies greatly at

different times and places even in the same cave. And we must also remark that this complete series of changes only occur in a few localities, the majority of caves being insignificant in size.[1]

From what has been said as to the formation of caves, we would expect them to occur in river valleys, and this is the case, though in some instances there have been such immense changes in the surface level of the country that we can now find no trace of rivers near them. This is exactly similar to some gravel deposits, which, as we have seen, are occasionally found where is now no running water. The most noted caverns, however, are found high up on the banks of existing rivers. We can not doubt that the rivers were the cause of the caves. But having excavated their beds below the level of the then existing caves, they ceased to flow in them, and left them to be occupied by savage animals and the scarcely less savage men. But at times, swollen by floods, the river would again assert its supremacy and roll its waters through its old channels.

These floods would not only tear up and rearrange whatever *débris* had already accumulated, but would introduce quantities of sediment and animal remains. In some such a manner as is here pointed out (though exactly how geologists are not agreed) caves were invaded, after being long occupied by men or animals, by floods of water. In many cases the evidence would seem to indicate that after such a visitation by water the cave and its water-rolled and water-arranged contents were left to silence, visited by neither man nor beast. In such instances stalagmitic coverings would gradually form over the confused *débris*, and in some places acquire a thickness of several feet. In some instances

[1] On the formation of caves consult Geikie's "Prehistoric Europe," p. 71; also Evans's "Ancient Stone Implements," p. 429.

several such floors are found one above the other, pointing to a prolonged period of usage, and then a quiet stage, in which the drip of falling water alone broke the silence, and nature sealed up another chapter of cave biography beneath the layer of stalagmite.

One of the most important caves of England is Kent's Cavern, before mentioned. This cave was carefully explored under the direction of a committee appointed by the British Association, and to show the care and thoroughness of the work we need only state that this work occupied the greater portion of sixteen years, and hence the results obtained may be regarded as, in a general way, illustrative of the life of the cave dwellers. "This cave is about a mile east of Torquay harbor, and is of a sinuous character, running deeply into a hill of Devonian limestone, about half a mile distant from the sea. In places it expands into large chambers, to which various distinctive names have been given."[1]

Let us see what general results have been reached by this committee. The investigation disclosed several different beds of stalagmite, cave earth, and breccia. The lowest layer is a breccia.[2] The matrix is sand of a reddish color, containing many pieces of rock known as red-grit and some pieces of quartz. This implies the presence of running water, which at times washed in pieces of red-grit. The surface features must have been quite different from the present, since now this rock does not form any part of the hill into which this cave opens.[3] And this change in drainage took place before this lowest layer was completed, since not only bears, but men, commenced to visit the cave. The

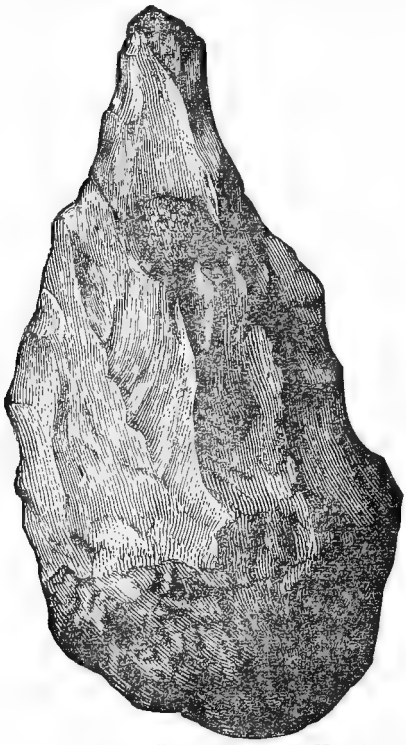
[1] Evans's "Ancient Stone Implements," p. 445.

[2] Pronounced Bret'-chá, a rock composed of fragments of older rock, united by a cement.

[3] Geikie's "Prehistoric Europe," p. 92.

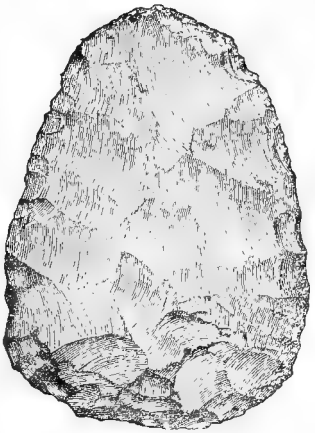
presence of bears is shown by numerous bones, and that of man by his implements.

We must notice that all the implements found in the breccia are similar to those of the Drift, being rudely formed and massive. No doubt these are the remains of Drift men, who, for some cause or other, temporarily visited the cave, perhaps contending with the cave bear for its possession. But a time at length arrived when for some reason neither animals nor man visited the cave. The slow accumulation of stalagmite went forward until in some places it had obtained a thickness of twelve feet. Freely admitting that we can not determine the length of time demanded for this deposition, yet none can doubt that it requires a very long time indeed. Says Mr. Geikie: "How many centuries rolled past while that old pavement was slowly accreting, no one can say; but that it represents a lapse of ages compared to which the time embraced by all tradition and written history is but as a few months, who that is competent to form an opinion can doubt?" But after this long period of quiet, from some source great torrents of water came rolling through the cave. We know this to be so, because in places it broke up this layer of stalagmite and washed it away, as well as large



Spear-head—Lower Breccia, Kent's Cavern.

portions of the breccia below, and after the floods had ceased, occasionally inundations still threw down layers of mud and silt. This accumulation is known as cave earth, and is the layer containing the numerous remains of the Cave-men. Here the explorers were not only struck with the large number of implements, but at once noticed that they were of a higher form and better made. Instead of the rude and massive implements of the Drift tribes, we have more delicate forms chipped all around. And we also meet with those that from their form may have been used as the heads of spears or arrows. Flakes were also utilized for various purposes. We also find implements, weapons, and ornaments of bone—a step in advance of Drift culture. They had "harpoons for spearing fish, eyed needles or bodkins for stitching skins together, awls perhaps to facilitate the passage of the slender needle through the tough, thick hides; pins for fastening the skins they wore, and perforated badgers' teeth for necklaces or bracelets."[1] Nothing of this kind has yet been shown as belonging to the men of the Drift.



Spear-head—Cave-earth, Kent's Cavern.

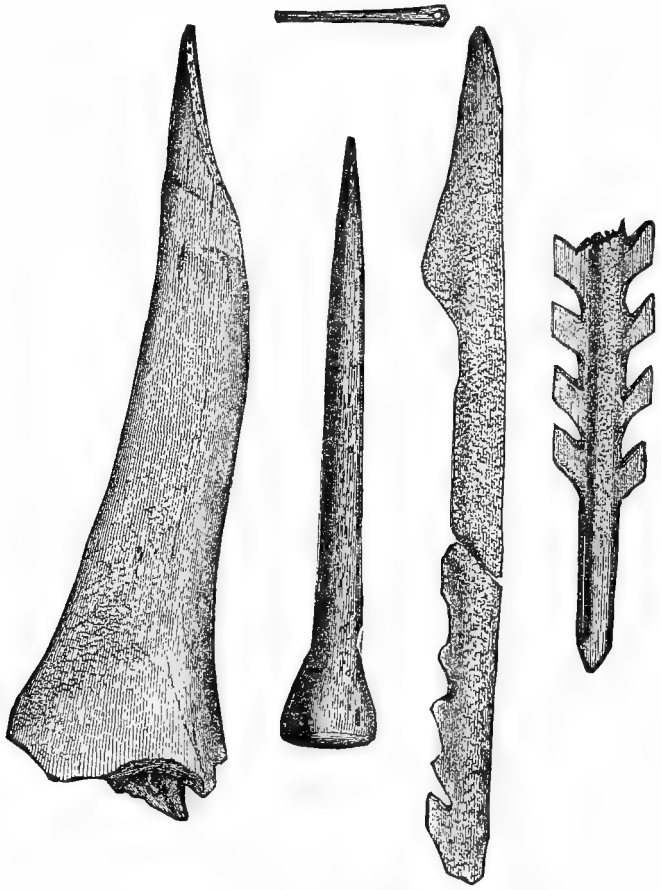
Flake—Cave-earth, Kent's Cavern.

The bones of a large number of animals are also found in the cave earth. The most abundant is the hyena, and no doubt they dragged in a great many others; but the agency of man is equally apparent, as the bones have often been split for the extraction

[1] Pengelly, quoted by Geikie, "Prehistoric Europe," p. 93.

of marrow. Besides bones of the hyena, we have also those of the lion, tiger, bear, and reindeer.[1]

With these animals man, from time to time, disputed possession of the cave. At one place on the surface of the



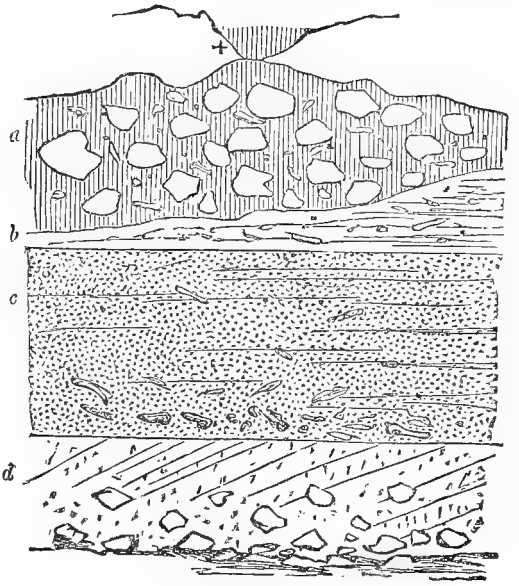
Harpoons, Pin, Awl, and Needle—Kent's Cavern.

cave earth is found what is known as the "black band." This is nothing more or less than the fire-place of these old tribes. Here we find fragments of partially consumed wood,

[1] Evans's "Ancient Stone Implements," p. 462.

bones showing the action of fire—in short, every thing indicating a prolonged occupancy by man.

No one can doubt but that this deposit of cave earth itself requires a prolonged time for its accumulation.[1] But this period, however prolonged, at length comes to an end. From some cause, both animals and man again abandoned the cave. Another vast cycle of years rolls away—a time expressed in thousands of years—during which nature again spread over the entombed remains a layer of stalagmite, in some places equal in thickness to the first formation. Above this layer we come to a bed of mold containing remains of the later Stone Age, of the Bronze, and even of the Iron Age. Below the first layer of stalagmite—the completed biography of Paleolithic times; above, the unfinished book of the present. Such are the eloquent results obtained by the thorough exploration of one cave. The results of all the other explorations, in a general way, confirm these. Mr. Dawkins explored a group of caverns in Derbyshire, England. These caverns and fissures are situated in what is



Robin Hood Cave.

† Stalagmite uniting roof to breccia; *a* Stalagmite breccia with bones and implements, 0 to 36 inches; *b* Cave earth with bones and implements, 21 to 52 inches; *c* Red clayey sand, 24 to 48 inches; *d* Light-colored sand with limestone blocks, 24 inches.

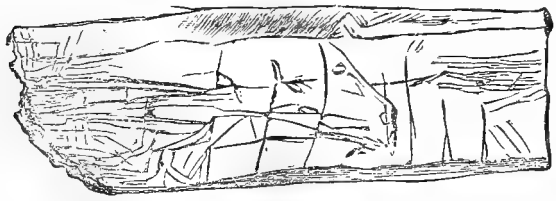
[1] Evans's "Ancient Stone Implement," p. 463.

known as Cresswell Crags, the precipitous sides of a ravine through which flows a stream of water dividing the counties of Derby and Nottingham.

This cut represents the different strata in Robin Hood cave. It will be seen that, at one place, the stalactite has united with the stalagmite below. It is not necessary to go into the details of this exploration. All the relics of man found in *d*, *c*, and the lower portions of *b*, are the rude and massive forms peculiar to the River Drift tribes. But the relics found in the breccia *a*, and the upper portion of the cave earth *b*, denote a sudden advance in culture. The rude tools of the lower strata are replaced by more highly finished ones of flint.

The most important discovery was that of a small fragment of rib, with its polished surface ornamented with the incised figure of a horse. The peculiar value of this discovery is, that it serves to connect the Cave-men of England with those of the continent, who, as we shall afterward see, excelled in artistic work of this kind.

In another cave of this series, in association with similar flints, were found the following bone implements. We can only conjecture the use of the notched bone.

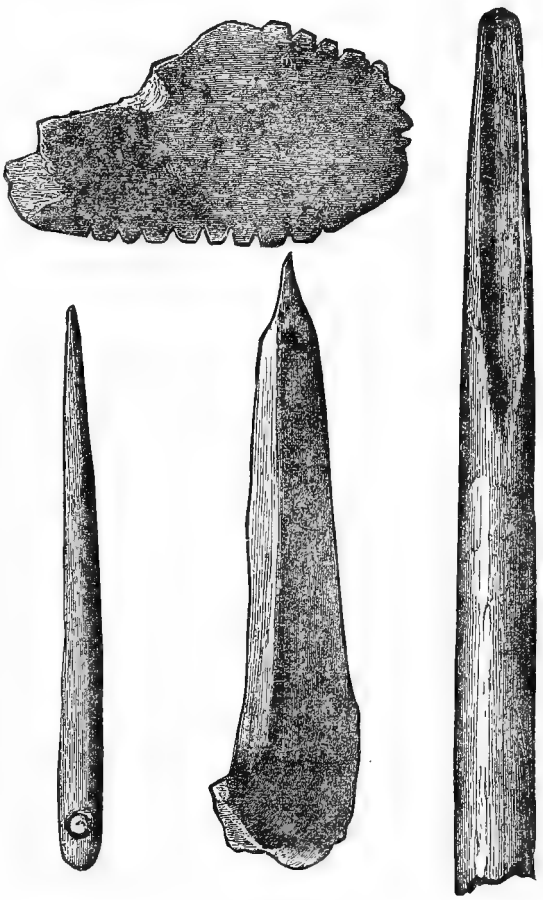


Horse Incised on Piece of Rib.

The pieces of reindeer horn, terminating in a scoop, may have served as a spoon to extract marrow.

We must not fail to notice that the more highly finished relics of the Cave-men are found in strata overlying those of the River Drift; and, in the case of Kent's Cavern, these two sets of implements are separated by a layer of stalagmite requiring a very prolonged time for its formation. This

would imply that the Cave-men came into England long after the tribes of the River Drift; and, judging from the relics themselves, they must have been a distinct people. We must recall how completely the climate and animals in England varied during the Glacial Age. We have also seen how closely connected the River Drift tribes were with the animals of the warm temperate regions. Coming at a later date, totally distinct from them in culture are those Cave-men — perhaps they may prove to be associated with the Arctic animals. But, before speculating on this point, we must learn the results attending the exploration of the caves of Belgium, France, and other countries on the continent of Europe.



Bone Implements—Cresswell Crags.

In the valley of the river Meuse (Belgium), and its

tributaries, have been found a number of caves and rock-shelters. It was in the caves of the Meuse that Schmerling made his explorations. When the real value of his work was recognized, the Belgian government had a thorough exploration made by M. Dupont, director of the Royal Museum in Brussels. This gentleman scientifically examined forty-three of these resorts. His opinions, therefore, are deserving of great weight; but, unfortunately, they are not accepted by all. These caves vary greatly in size—many being mere rock-shelters. From their position, we are at once struck with the prolonged period of time necessary to explain their formation. They are found at very different heights along the river's bank. In one case two caves are so situated that the river must have sunk its bed nearly two hundred feet between the time of their formation.[1]

M. Dupont thinks the evidence very clearly points to the presence of two distinct stages in cave life—one of which he calls the Mammoth period, and the other, which is more recent, the Reindeer. It is, however, known that the mammoth lived all through the Reindeer epoch, if not to later times; so the names bestowed on these periods do not seem very appropriate. We can readily see, however, that, while the names might be wrong, the two periods might be reality. In many cases, the same cave contained remains of both stages, separated by layers of cave earth, and it is noticed that, in such cases, those of the Reindeer stage are invariably of a later date. In general terms, M. Dupont finds that the implements of the Mammoth period are of a rude make, consisting of a poor kind of flint, and poorly finished. But, in beds of the Reindeer epoch, the flint implements consist, principally, of well-shaped blades and flakes—with numerous bodkins, or awls—javelins, or arrow-heads—besides articles of bone and horn,

[1] Geikie's "Prehistoric Europe," p. 102.

such as harpoons, and teeth of various animals drilled as if suspended for ornaments. Their workmanship indicates decidedly more skill than that of the implements obtained from the lower levels. But the most remarkable finds of the Reindeer epoch consist of portions of reindeer horn, showing etchings or engravings which have been traced by some sharp point, no doubt by a flint implement. One small bit of horn has been cut or scraped so as to present the rude outline of a human figure.

So far the evidence seems to bear out the same conclusions as do those of the British caves, though it also shows that the men of the Drift inhabited caves quite extensively. We must remember, however, that the greatest wealth of cave relics belongs to the so-called Cave-men, but that savage tribes have always resorted to caves as a place for occasional habitation.[1]

It is in France that we find the greatest wealth of relics of Cave-men. Sir John Lubbock has left us a description of the valley of the Vezère, where these caverns occur. The Vezère is a small tributary of the Dordogne. "The rivers of the Dordogne run in deep valleys cut through calcareous strata: and while the sides of the valley in chalk districts are generally sloping, in this case, owing probably to the hardness of the rock, they are frequently vertical. Small caves and grottoes frequently occur: besides which, as the

[1] Mr. Dawkins ("Early Man in Britain," p. 203) does not consider M. Dupont justified in dividing the remains found in the caverns of Belgium into two epochs. He considers them to be the remains of the same people, some tribes being, perhaps, farther advanced than others. Mr. Dawkins is, of course, high authority, but we think his argument could also be applied to prove there was no real difference between the men of the River Drift and the so-called Cave-men. This, in fact, is the opinion of many, including Mr. Evans, who is exceptionally well qualified to judge of these remains. We think, however, in view of the evidence adduced by Mr. Pengelly, Mr. Geikie, Mr. Dawkins, and others, few will venture to doubt that there is a wide difference between the men of the River Drift and those of the Caves.

different strata possess unequal power of resistance against atmospheric influence, the face of the rock is, as it were, scooped out in many places, and thus 'rock-shelters' are produced. In very ancient times these caves and rock-shelters were inhabited by men, who have left behind them abundant evidence of their presence.

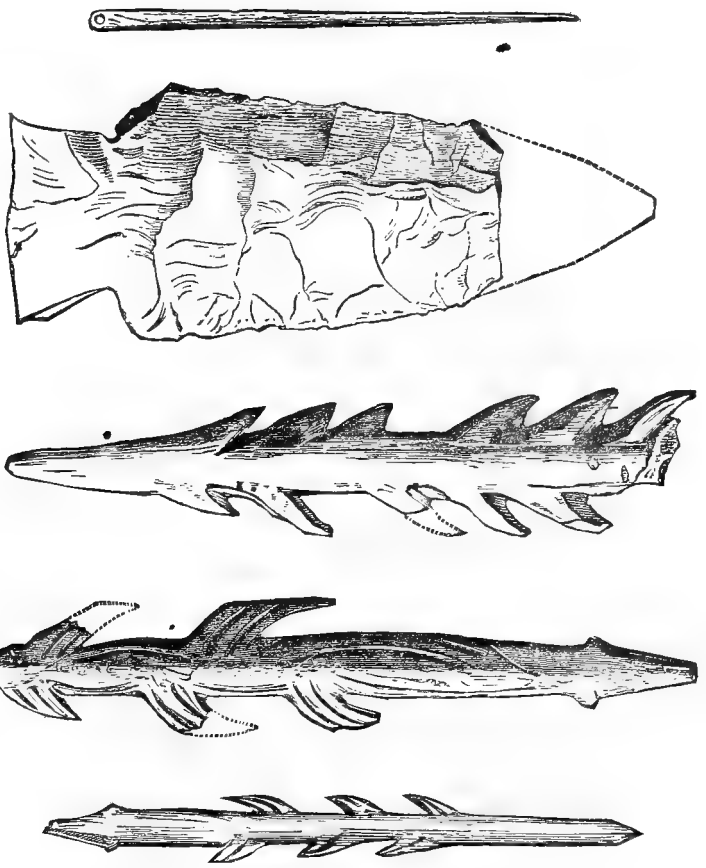
"But as civilization advanced, man, no longer content with the natural but inconvenient abode thus offered to him, excavated chambers for himself, and in places the whole face of the rock is honey-combed with doors and windows, leading into suits of rooms, often in tiers one over the other, so as to suggest the idea of a French Petra. Down to a comparatively recent period, as, for instance, in the troublous times of the Middle Ages, many of these, no doubt, served as very efficient fortifications, and even now some of them are in use as store-houses. and for other purposes, as, for instance, at Brantome, where there is an old chapel cut in solid rock.

"Apart from the scientific interest, it was impossible not to enjoy the beauty of the scene which passed before our eyes, as we dropped down the Vezère. As the river visited sometimes one side of the valley, sometimes the other, so we had at one moment rich meadow lands on each side, or found ourselves close to the perpendicular and almost overhanging cliff. Here and there we came upon some picturesque old castle, and though the trees were not in full leaf, the rocks were, in many places, green with box and ivy and evergreen oak, which harmonized well with the rich yellow brown of the stone itself."[1]

Thus it will be seen this valley has been a favorite resort for people at widely different times, and amongst others, the cave dwellers of the Paleolithic Age. As in the caves

[1] "Prehistoric Times," p. 330.

of Belgium, some of them are at a considerable height above the stream, while others are but little above the present flood line. Mr. Dawkins refers us to the results of the ex-



Bone Implements, Dordogne Caves.

ploration of a French scientist in one of the grottoes of this section, which seem to be exactly similar to the results obtained from the caves of Cresswell Crags and Kent's Cavern. The implements obtained from the two lower strata are rough choppers and rude flakes of jasper and other

simple forms. Above these beds was a stratum of black earth, underneath a sheet of stalagmite. Here were found implements of a far higher type: those of flints, consisting of flakes, saws, and scrapers, with finely chipped lance-heads and arrow-heads, and awls and arrow-heads of bone and antler.[1] Now these results can only be interpreted as were those in the English caverns. The lower and ruder implements belong to the men of the Drift; the later and more polished ones to the Cave-men.

Most of the relics obtained from these caverns belong to the Cave-men proper. However, the implements from one of them, known as Le Moustier, are of a rude type, and may belong to those of the Drift. But most of them are of superior make and finish. These specimens are all from caves in this vicinity.[2]

We have seen that the men of the Drift were very widely scattered over the earth. We find, however, that the Cave-men had a much more limited range. Dr. Fraas has shown their presence in Germany. At Schussenreid, in Bavaria, was found an open air station of these people. It was evidently a camping-ground, one of the few places where proofs of their presence have been discovered outside of caves. Here we found the usual *débris*, consisting of broken bones, charcoal, blackened hearth-stone, and implements of flint and horn. We must stop a minute to notice a bit of unexpected proof as to the severity of climate then prevailing in Europe. This deposit was covered up with sand, and on this sand were the remains of

[1] "Early Man in Britain," p. 198.

[2] French writers make four divisions of these caves, according to the degree of finish, which the specimens show. Mr. Dawkins does not think the difference in the implements sufficient to justify this view. With the possible exception of Le Moustier, as stated above, we think his view correct, which is also the opinion of Mr. Evans. ("Ancient Stone Implements," p. 439.)

moss, sufficiently perfect to determine the kind. We are assured that it is composed of species now found only in Alpine regions, near or above the snow-line, and in such northern countries as Greenland and Spitzbergen.[1] Dr. Fraas also proved their presence in several caves in Suabia. One known as the Hohlefels Cave was very rich in these relics. They have been found in Switzerland, as at Thayengen; but are not found south of the Alps or the Pyrenees. Men, indeed, inhabited caves in Italy, but they did not use the implements characteristic of the Cave men.[2] Mr. Dawkins points out that this range corresponds very nearly to that of the northern group of animals, thus differing widely from the men of the River Drift. In this connection we must notice that the reindeer is the animal whose remains are most commonly met with in the *débris* they have left in the caves. This animal surely testifies to a cold climate. We are thus justified in concluding that the Cave-men are associated with the Arctic group of animals.[3]

We must now turn our attention to the culture of the Cave-men. We must reflect that long ages, with great changes of climate and life, both animal and vegetable, have rolled away since the remains of these early races were sealed by the stalagmite formation in caves. The relics at their best are but scanty memorials of a people long since passed, and we can not expect, can not hope, to recover more than a general outline. But this will be found full of interest, for it is a picture of Paleolithic life and times existing in Europe long ages before the pyramids of Egypt were uplifted.

With respect to habitations, we have already seen that he took up his abode in caves, at least where they were suitable. According to their depth and the light penetrating

[1] Rau's "Early Man in Europe," p. 88.

[2] Dawkins's "Early Man in Britain," p. 205.

[3] Ibid., p.

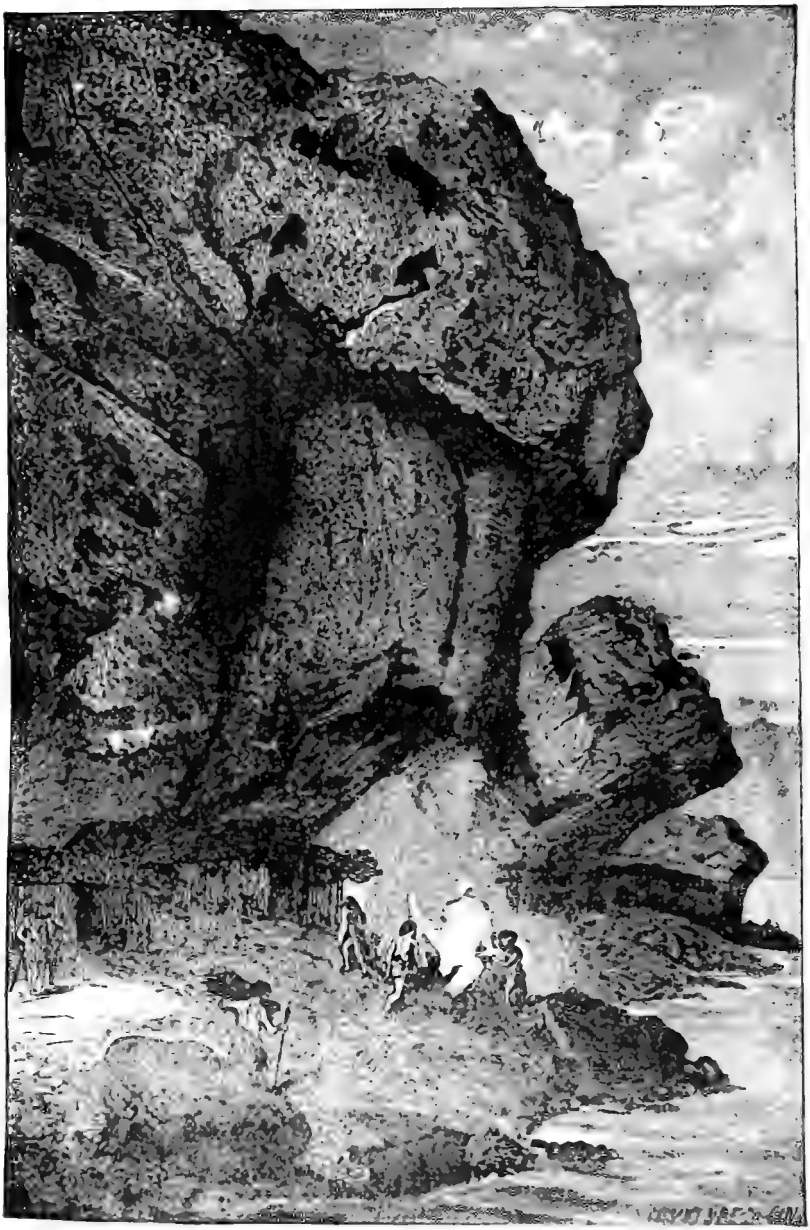
them, he either occupied the whole extent of them, or established himself in the outlet only. About the center of the cave some slabs of stone, selected from the hardest rock, such as sandstone or slate, were bedded down in the ground, and formed the hearth for cooking his food. But in no country are such resorts sufficiently numerous to shelter a large population; besides, they are generally at some distance from the fertile plains, where game would be most abundant. In such cases they doubtless constructed rude huts of boughs, skins, or other materials. Such an out-door settlement was the station at Solutré, France, where has been found an immense number of bones of horses, reindeers, also, though in less abundance, those of elephants, aurochs, and great lions.[1]

Where no cave presented itself, these people made for themselves convenient sheltering places under the cover of some great overhanging rock. In various places in France such resorts have been discovered. The name of "rock shelters" has been given to such resorts. In such places, where we may suppose they built rude huts, are found rich deposits of the bones of mammals, birds, and fishes, as well as implements of bone and horn.

We have frequently referred to the presence of hearths, showing that they used fire. Like other rude races, it is probable that they obtained fire by the friction of one piece of wood upon another. M. Dupont found in one of the Belgium caves a piece of iron pyrites, from which, with a flint, sparks could be struck.

Speculations have been indulged as to the probable condition of man before he obtained a knowledge of fire. If the acquisition of fire be regarded as one of the results of

[1] It is, however, thought that the station was used as a camping-ground by very different people, at widely different times.



ROCK SHELTER AT BRUNISTEL.

human endeavor, it must surely be classed as one of the most valuable discoveries which mankind has made. We do not believe, however, that we shall ever discover relics of races or tribes of men so low in the scale as to be ignorant of the use of fire. Even some of the flints which M. Bourgeois would refer to the Miocene Age show evidence of its action.[1]

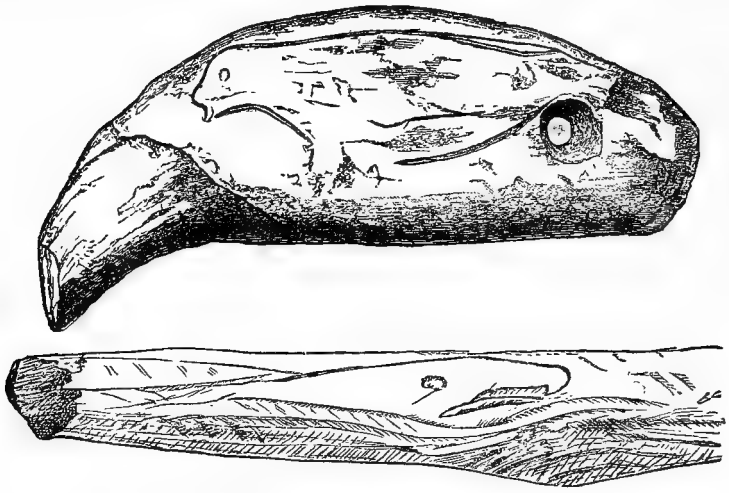
The men of the Caves supported life by hunting. But a very small part of their food supplies could have been drawn from the vegetable kingdom. When the climate was so severe that Alpine mosses grew at Schussenreid, acorns and like nuts would be about all they could procure from that source. The animals hunted by the Cave-men were principally reindeer, horses, bisons, and, occasionally mammoths and woolly rhinoceros. But they were not very choice in this matter, as they readily accepted as food any animal they could obtain by force or cunning. Wolves and foxes were not rejected, and in one cave large numbers of the bones of the common water rat were obtained. We know what animals were used as food, because we find their bones split for the purpose of procuring the marrow they contained. This was evidently to them a nutritious article of diet, since they were careful to open all the bones containing it, and bones so split are frequently the only means of detecting the former presence of man in some bone caves.

We must not forget that at that time the shore of the Atlantic Ocean, during a large part of the Paleolithic Age, was situated much farther west than it is now, and so in all probability many refuse heaps are now underneath the waves. From certain drawings that are found in some French caves, we know they were used for hunting both seals and whales.

[1] Lubbock's "Prehistoric Times," p. 434.

We can not doubt that the capture of a whale afforded as much enjoyment to them as it does to a tribe of Eskimos now. Bones of birds and fishes are found in many instances. The salmon appears to have been a favorite among fishes. Among the birds are found some species now only living in cold countries, such as the snowy owl, willow grouse, and flamingo. This is but another proof that the climate of Europe was then very cold.

The Cave-men were not afraid to attack animals greatly superior to them in strength. In the Hohlefels Cave in Ger-

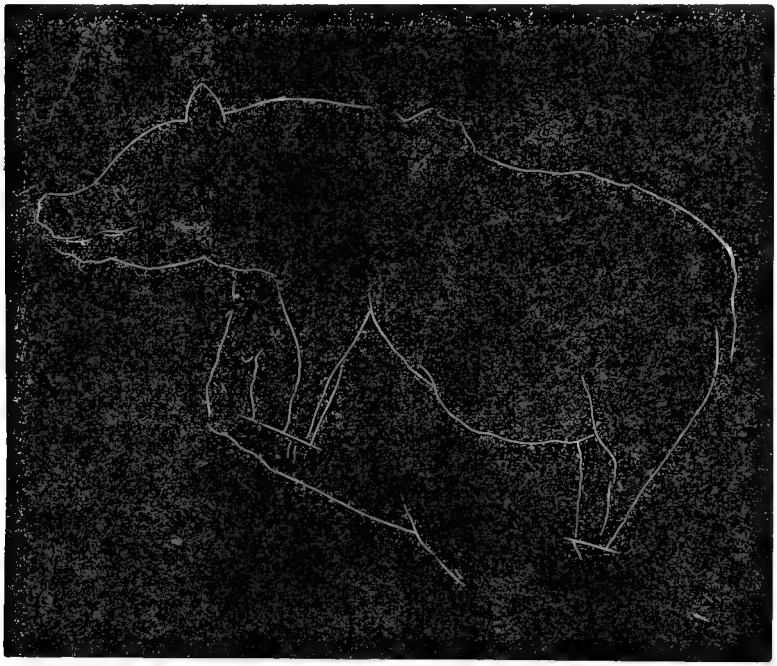


Whale and Seal, Incised on Bone.

many were found great quantities of the broken and split bones of cave bears, an animal very similar to the grizzly, and probably its equal in strength. The reindeer was the main reliance of these tribes. Its bones are found in great abundance, and it doubtless was to them all it is to the Lapps of Europe to-day, except, of course, that it was not domesticated.

Though fire would naturally suggest some rude method of cooking, we can scarcely find a trace of such operations,

and it has been a matter of conjecture how they proceeded. Sir John Lubbock thinks they boiled their food, and in the absence of pottery used wooden or skin vessels, bringing the water to a boiling point by means of stones heated red hot and thrown into the water. He points out the presence of peculiarly shaped stones found in some caves, which he



Cave Bear, Incised on Slate.

thinks were used for this purpose.[1] It is not supposed they had any articles of pottery during this epoch. This is quite an important point, because a knowledge of pottery marks an important epoch in the culture of a people.

A people possessed of this knowledge have passed from Savagism into the lower status of Barbarism.[2] A piece of pottery is as little liable to destruction as a piece of bone,

[1] "Prehistoric Times," p. 335. [2] Morgan's "Ancient Society," p. 12.

and so, had those people possessed pottery, there is no reason why pieces of it should not be found in every refuse heap, and amongst the *débris* of all caves. But such is not the case; no fragments of pottery have yet been found which can be referred with confidence to the epoch of the Cave-men.[1]

Some speculations have been indulged in as to whether the men of this age were cannibals or not. It need occasion no surprise if they were, since ancient writers assert that even during historical times this practice prevailed in Europe.[2] Though not definitely proven, there are many facts difficult of explanation, except on this supposition. However, it may well be that this, after all, only amounted to the custom of eating parts of an enemy killed in battle, as certain modern savages do that we would not call cannibals.[3]

It is not necessary to speak at much length of the methods of hunting. They had bows and arrows, daggers of reindeer horn, spears tipped with flint or bone, and harpoons. Besides, they made a formidable club of the lower jaw-bone of the cave-bear with its canine tooth still left in its place. Fishing with nets is not supposed to have been known, Harpooning was probably their favorite way. M. G. DeMortillet thinks they fished as follows: They fastened a cord to the middle of a small splinter of bone. This was then

[1] Lubbock's "Prehistoric Times," p. 338. J. C. Southall, in his valuable work, "Recent Origin of Man," p. 195, *et seq.*, argues that pottery was known at this time, and cites instances where it is stated to have been found. This is the opinion of Figuier also. ("Primitive Man," p. 54.) But Mr. Dawkins points out that these pieces of pottery are clearly of a Neolithic style, and does not think it proven that they are of Paleolithic age. Mr. Geikie also denies that there is any proof that they were acquainted with the potter's art. ("Prehistoric Europe," p. 18.) So the highest place in the scale of civilization we can assign these people to is that of Upper Savageism.

[2] Rau's "Early Man in Europe," p. 79.

[3] Geikie's "Prehistoric Europe," p. 22.

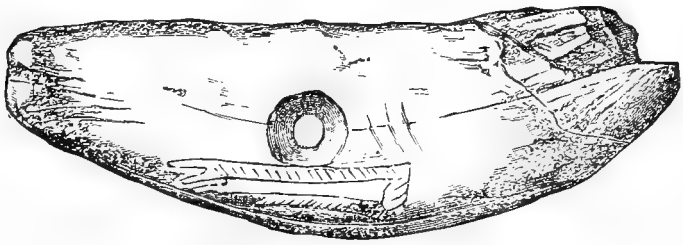
baited, and when swallowed by the fish, was very certain to get caught in the body.[1]

We know that rude tribes of to-day have many means of snaring animals. Doubtless similar scenes were enacted on their primeval hunting-grounds. French books contain illustrations of the men of this period driving game over precipitous sides. They had no dogs to assist them in the hunt, and though reindeer were around them in great abundance, it is not supposed that they thought of domesticating them.

Man is the only animal which seeks to protect his body from the Summer's heat or the cold of Winter by the use of clothing. We are, unfortunately, not able to present many details of the dress of man during the early Stone Age. We are, however, quite certain that when the climate was severe enough to permit such animals as the musk-sheep and the reindeer to inhabit South-western Europe, man must have been provided with an abundance of warm clothing, though doubtless rudely made and fashioned. Many reindeer horns found in France are cut and hacked at the base in such a way as to indicate that it was done when removing the skins. We also know that the rudest of savage tribes are never at a loss for some process of tanning hides and rendering them fit for use. From the immense number and variety of scrapers found among the cave *débris*, we are sure the preparation of clothing occupied no inconsiderable portion of their time. We also find numerous awls and splinters of flint and bone, which they doubtless used in exactly the same manner as similar tools are used by the Lapps to-day in Europe, that is, to pierce holes in the hides, through which to pass their rude needle and thread. The needles are made of reindeer horn, and they were not only smoothly polished, but the eyes are of such a minute size, and withal so regu-

[1] Figuier's "Primitive Man," p. 90.

larly made, that many at first could not believe they were drilled by the use of flint alone. This, however, has been shown to be the case by actual experiments. The thread employed was reindeer tendons, for bones of these animals are found cut just where they would be cut in removing



Glove, Incised on Bear's Tooth.

these tendons. This cut shows that they protected their hands by means of long gloves of three or four fingers.[1]

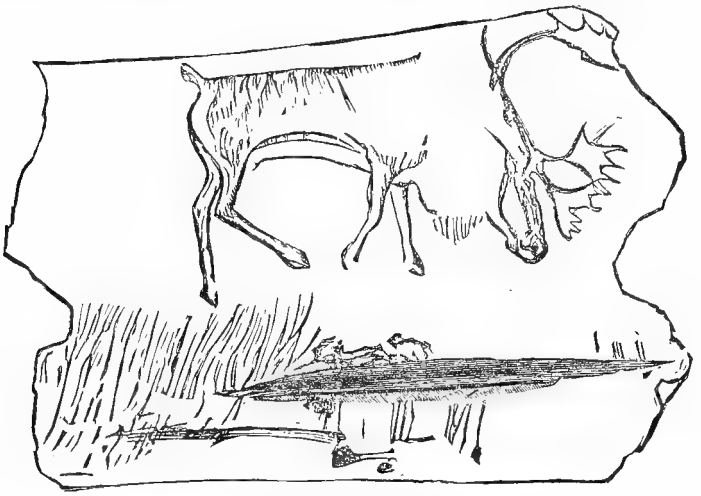
We have thus far been considering those arts which pertain more directly to living. We have presented some sketches found engraved on pieces of bone. We first noticed this among the relics found in one of the Creswell caves in England. It was also noticed in Belgium. It was among the Cave-men of Southern France that this artistic trait became highly developed. Among the reindeer hunters of the Dordogne were artists of no mean ability. We must pause a minute and mark the bearing of this taste for art. We have seen many reasons for supposing the men of the caves much farther advanced in the scale of culture than those of the Drift, but we have also seen that we can not rank them higher than the highest grade of savages.

Sir John Lubbock thus speaks of them: "In considering the probable condition of these ancient Cave-men, we must give them full credit for their love of art, such as it was; while, on the other hand, the want of metal, of polished

[1] Dawkins's "Early Man in Britain," p. 210.

flint implements, and even of pottery, the ignorance of agriculture, and the apparent absence of all domestic animals, including even the dog, certainly imply a very low state of civilization."[1]

They were certainly not as far advanced in civilization as the next race we will describe, yet the Neolithic people had no such skill as was possessed by the cave-men. This



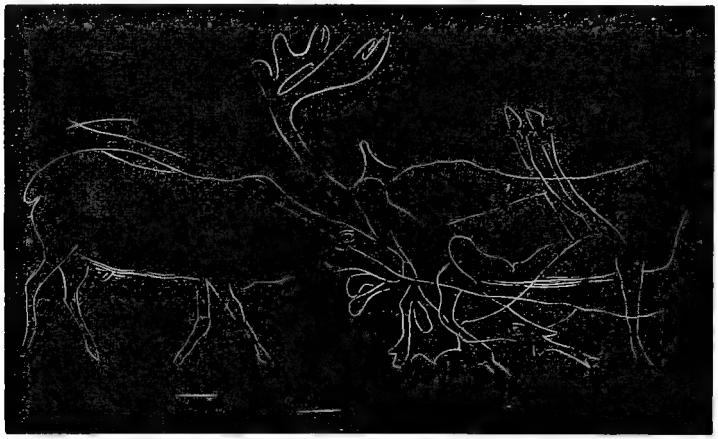
Reindeer Grazing.

need not surprise us, because "an artistic feeling is not always the offspring of civilization, it is rather a gift of nature. It may manifest its existence in the most barbarous ages, and may make its influence more deeply felt in nations which are behind in respect to general progress than in others which are more deeply advanced in civilization."[2]

In regard to the objects themselves, a glance at the illustrations show us that they are quite faithful sketches of the animals at that time common. As might be expected, sketches of the reindeer are numerous. This cut is regarded as the highest example of Paleolithic art, sketched on a

[1] "Prehistoric Times," p. 341. [2] Figuier's "Primitive Man," p. 105.

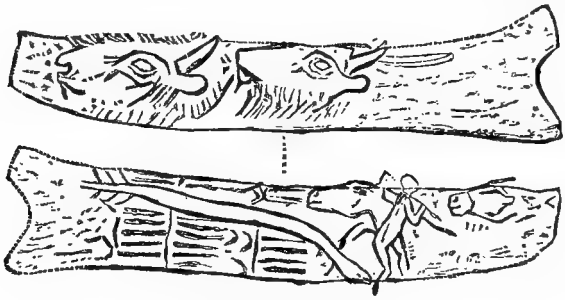
piece of horn and found in Switzerland. The animal is grazing, and the grass on which it feeds is seen below. We have on a piece of slate the outlines of a group of reindeer,



Group of Reindeers.

generally considered as representing a fight, though it may mean a hunt, and that the hunter has succeeded in killing a portion of the herd. Some, as we see, are on the ground.

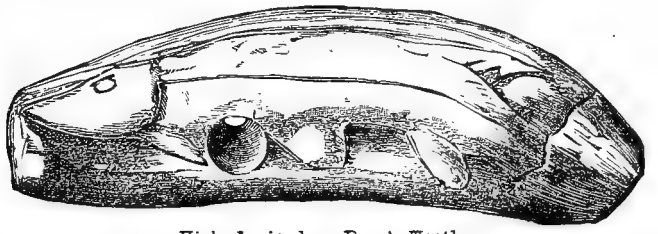
It would be exceedingly interesting could we but find well executed sketches of the men of this period, but, un-



Man and Other Animals.

fortunately, with one or two exceptions, no representations, however rude, have yet been discovered of the human form. Perhaps an explanation of this fact may be found in the well-

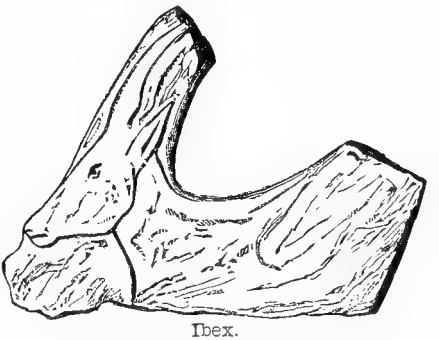
known reluctance of savage tribes to have any engravings taken of themselves, and we can well imagine that if any one was known to make drawings of human beings he would



Fish, Incised on Bear's Tooth.

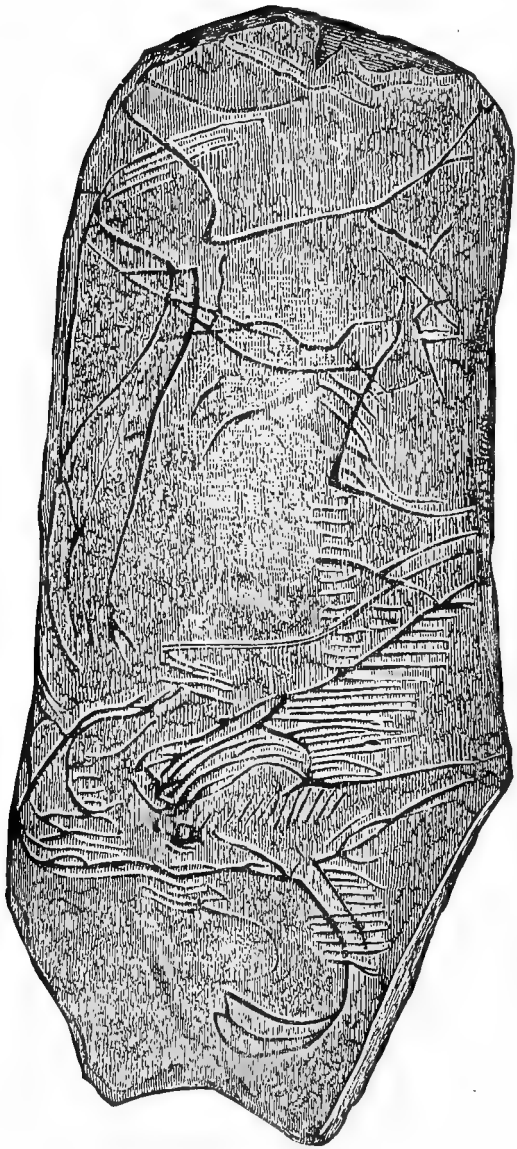
be regarded with suspicious distrust, and it would hardly be a safe accomplishment to possess. One very curious group represents a man, long and lean, standing between two horses' heads, and by the side of a long serpent or fish, having the appearance of an eel. On the reverse side of this piece of horn were represented the heads of two aurochs or bisons. Mr. Dawkins thinks this also represents a hunting sketch, and that the man is in the act of striking one of the horses with a spear.

On a fragment of spear-head found in France several human hands were engraved, but having only four fingers each. On this point Mr. Lartet assures us that some savage tribes still depict the hand without the thumb.[1] Representations of birds and reptiles are very rare; fishes are more common. On a piece of reindeer's horn was found this representation of the head and chest of an ibex. Of special interest to us is a representation of a



Ibex.

[1] Figuier's "Primitive Man," p. 111.



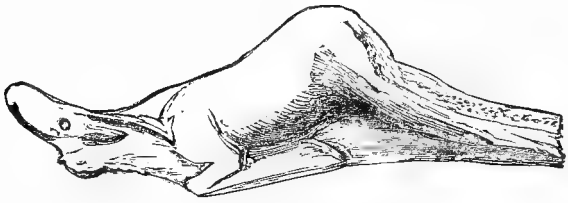
Mammoth—La Madeline Cave, France.

mammoth found engraved on a piece of mammoth tusk in one of the Dordogne caves. We have no doubt that the artist who engraved it was perfectly familiar with the animal itself.

Their artistic skill was not confined to the execution of drawings. They frequently carved pieces of reindeer horn into various animal forms. Our next cut shows us a dagger, the handle of which is carved to imitate a reindeer. It will be seen how the artist has adapted the position of the animal to the necessities of the case. Flowers are very seldom represented; but one implement from France has a very nice representation of some flowering plant engraved on it.

Take it all in all, the possession of this artistic instinct is certainly remarkable—the more so when we remember the

rudeness of his surroundings, and the few and simple means at his command for work. "A splinter of flint was his sole graving tool; a piece of reindeer horn, or a flake of slate or



Reindeer Carved on Dagger Handle.

ivory, was the only plate on which primitive man could stamp his reproduction of animated nature."[1]

Some speculations have been indulged in as to whether we have any traces of a government amongst the Paleolithic people. That they had some chief or leader is more than probable. In the caves of France we find a number of fragments of reindeer horn. Generally speaking, they show evidence of a good deal of care in making them. They are carved and ornamented with sketches of various animals, and invariably have one or more holes bored in the base. The idea has been quite freely advanced, that these are emblems of authority.[2] And some have pointed out, that, though they are too light for use as weapons, yet their "frequent occurrence, and uniformity of type, show that they possess a conventional significance."[3] Mr. Geikie says that these conjectures "are mere guess-work."[4] And Mr. Dawkins points out that they are very similar in design and ornament with an implement of the Eskimos known as an "arrow-straightener."[5]

Whatever may be our conclusions in regard to these ornamented pieces of reindeer horn, we can not doubt but that

[1] Figuier's "Primitive Man," p. 105. [2] Figuier's "Primitive Man," p. 102.

Flowers on Reindeer's Horn.

their social instincts found expression in some sort of alliance for the common good. This is shown by several facts: such, for instance, as the evidence of trade or barter between localities considerable distances apart. The inhabitants of Belgium must have gone to what is now Southern France to procure the flint they used. They also procured, from the same source, fossil seashells, which they valued highly.[1] We also notice the fact, that certain localities appear to have been used as the place of manufacture for certain articles, to the exclusion of others. In other words, the primitive people appear to have learned the great utility of a division of labor. One of the caves in Belgium appears to have been used as a place to make flint implements. Over twenty thousand articles of flint were found in this cave.[2] In France, while in one cave the implements were all of the spear-head type, in a neighboring cave horn was almost the only article used in the manufacture of implements. We must not, however, form an exalted idea of their trade—it was simply barter in a rude state of society.[3]

Various opinions have been held as to whether we have

[1] Figuier's "Primitive Man," p. 117. [2] Ibid., p. 118. [3] Ibid., pp. 94 and 95.

any trace of a religious belief. Theoretically speaking, they had some sort of a religion, though doubtless very vague and indistinct; for we know of no nation as far advanced as they were destitute of it.[1] It has been pointed out, that the bones of some animals, as the horse, were very rare, and their absence explained as the result of superstitious reasons. It

Ornamented Reindeer Horn—Use Unknown.

has also been conjectured that some of the perforated bones and teeth of animals found in various deposits were amulets worn for religious purposes; and some have gone so far as to infer, that the ornamentations on some of these so-called amulets represent the sun, and that, consequently, sun-worship prevailed among the Cave-men. While these various conjectures are, of course, possible, it is equally certain they are all "mere guess-work."

Early explorers describe with considerable degree of confidence the manner of burial among the Cave-men, and inferred from the remains found buried with the bodies that they had some notion of a life beyond the grave—and, accordingly, placed near the body food and drink to support him on his journey, weapons wherewith to defend himself, and his favorite implements, so that, arrived at the land of spirits, he would be well provided for. These result are not borne out by later investigations. The instance mentioned most prominently, that of the burial cave at Aurignac, France, has been shown to have no bearing on the question, as every thing indicates that the burials were of a much later date.

[1] This, as Sir John Lubbock points out, depends on our meaning of the word "religion." ("Prehistoric Times," p. 589.)

We have yet a most important question before us—one that is still engaging the attention of scientific men in Europe. That is the question of race. Who were these early tribes? Are they in any way connected with the men of the Drift? Have we any representations of them now living upon the earth? On these questions there is quite a diversity of opinion. In various caves in France and Belgium, skulls and other bones of the human skeleton have been found. These have been studied with care by the best scholars in Europe; and M. Quatrefages has set forth the results in his various works, in which he connects them, not only with the men of the River Drift, but with the race of men that inhabited Europe during the succeeding Neolithic Age, and, indeed, with men now living in France and Belgium.

There is no question as to the correctness of these inferences—the only one is, whether the skulls and fragmentary skeletons are really remains of the Cave-men. This must be made perfectly clear and unquestioned before we are to accept them. Mr. Dawkins reviews the various cases where skeletons have been found in caves.[1] He points out that, in every instance, very serious doubts can be raised as to whether they are really remains of the Cave-men or not.

Until these objections are met, we do not see how the opinion of M. Quatrefages (above) can be accepted. But if these instances are not accepted, then, in all other instances where there is no doubt, the remains are in such a fragmentary condition that no conclusion can be made from them. So as far as remains of the human skeleton are concerned, we can form no conclusions as to the race to which the Cave-men belonged.

---

[1] "The principal instance are Cro-Magnon, Frontal, and Furforz, in Belgium; Aurignac, Bruniquel, and Mentone, in France. "Cave-Hunting," chap. vii.

We have already noted, that the Cave-men came into Europe much later than the men of the Drift, and that their range was very limited, corresponding, in fact, with that of the northern group of animals. When the cold of the Glacial Age passed away, the musk-sheep, reindeer, and other animals, were driven out of Europe. They are found now only in high northern latitudes, such as Greenland. Mr. Dawkins thinks that there, also, are to be found the Cave-men of the Paleolithic Age, now known as the Eskimos. Though not accepted by all authorities, yet some of our best scholars find much to commend in this theory.

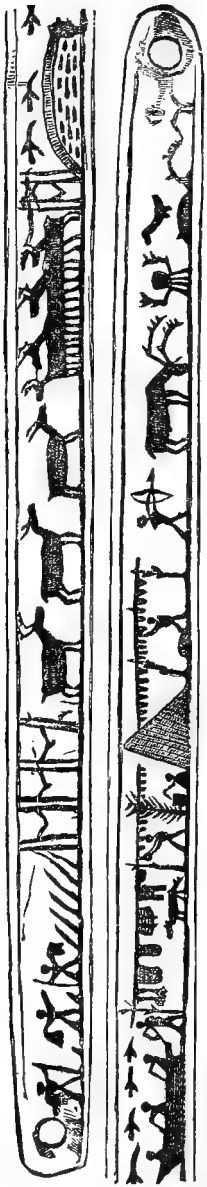
We have undoubted proofs that, in America, the Eskimos formerly lived much farther south.[1] And Dr. Abbott thinks the Paleolithic implements discovered in New Jersey, bearing such striking resemblance to those of Europe, are undoubtedly their work.[2] Therefore, there is no absurdity in asserting that they once lived in Western Europe; the more so, when we reflect that the climate, the animals—in fact, all their surroundings—must have been similar to those of their present habitats.

When we come to examine the customs and habits of these Eskimos, we are at once struck with their resemblance to what we have seen was the probable state of life among the Cave-men. At Solutré, for instance, we have vast refuse heaps of bones of animals. We find similar heaps around the rude huts of the Eskimos to-day. Captain Parry describes one as follows: "In every direction round the huts were lying innumerable bones of walruses and seals, together with skulls of dogs, bears, and foxes."[3]

[1] "Contributions to N. A. Ethnology," vol. i, p. 102; "U. S. Geographical Survey West of the 100th Meridian," vol. vii, p. 12; Abbott's "Primitive Industry," p. 517.

[2] "Primitive Industry," 518.

[3] Quoted by Lubbock, "Prehistoric Times," p. 507.



Eskimo Art.

Other points of comparison strike us when reading Sir John Lubbock's account of their habits and customs. For instance: "Their food, if cooked at all, is broiled or boiled; their vessels, being of stone or wood, can not, indeed, be put on the fires, but heated stones are thrown in until the water becomes hot enough and the food is cooked." "Their food consists principally of reindeer, musk-ox, walrus, seals, birds, and salmon. They will, however, eat any kind of animal food. They are very fond of fat and marrow, to get at which they pound the bones with a stone." "The clothes of the Eskimos are made from the skins of the reindeer, seals, and birds, sewn together with sinews. For needles they use the bones of either birds or fishes." "The Eskimos have also a great natural ability for drawing. In many cases they have made rude maps for our officers, which have turned out to be substantially correct. Many of their bone implements are covered with sketches."

In this cut we have a bone drill on which are sketched reindeer, geese, a baider or flat-bottomed boat, a tent around which various articles of clothing are hung up to dry, a woman apparently engaged in the preparation of food, and a hunting scene.

Now, we know that savage tribes, widely separated by time and space, will, after all, under the pressure of common necessities, invent much the same implements

and live much the same life. But still, where every thing seems to coincide, the climate, the animals, the mode of life proved the same, and especially when both are seen possessed of a common artistic skill, together with the known fact that in the Western Continent the Eskimos did formerly live much farther south; there is surely a strong case made out, and therefore the probabilities are that the Eskimos are the representatives of the Cave-men of Europe.[1] And yet we must be cautious on this point; or rather we remember that the phrase, "predecessors of the Eskimos," does not imply that they were in all respects like them. An examination of the rude sketches of the Cave-men left by themselves seems to indicate that the whole body was covered with hair. "The hunter in the Antler from Duruthy Cave has a long, pointed beard, and a high crest of hair on the poll utterly unlike the Eskimo type. The figures are also those of a slim and long-jointed man."[2]

This completes our review of the Paleolithic people, and it only remains to present some general conclusions. The Glacial or Pleistocene Age is seen to have been of immense duration, and characterized by great changes in climate. We have found that two races of men occupied Europe during this time. The men of the River Drift are the most ancient.

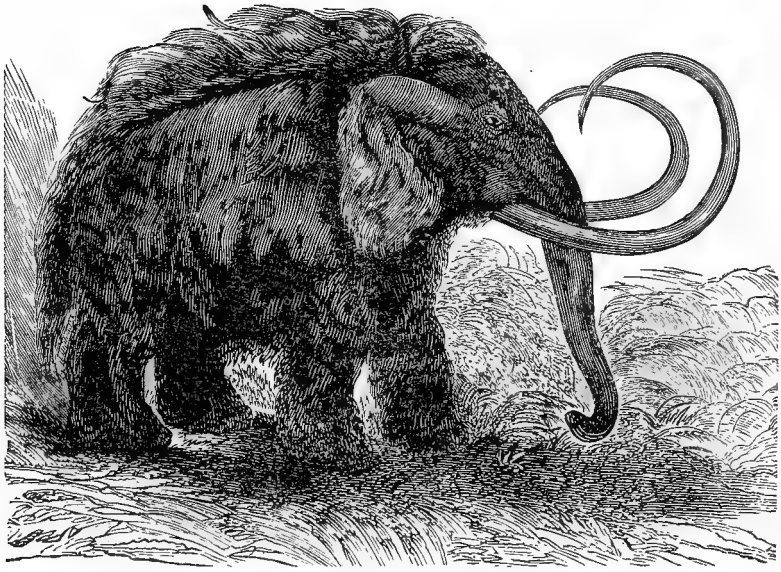
We have seen that they can be traced over wide-extended areas. They seem to have invaded Europe, along with the great invasion of animals from Asia, constituting the temperate group of animals; and with those animals they probably shifted back and forth, as the cold of the Glacial Age increased or waned. These people seem to have completely vanished. At a later date, when the cold of the Glacial Age was once more severe, associated with animals

[1] Dawkins's "Early Man in Britain," p. 242.

[2] Prof. Grant Allen, *Popular Science Monthly*, November, 1882, p. 99.

now living only in high northern latitudes, came the Cave-men, whose discussion has formed the subject of this chapter.

It will be seen how much we owe to patient investigators. The results are, indeed, bewildering. They make us acquainted with a people the very existence of whom was not known a few years back. Though the whole life of those ancient races seemed hopelessly lost in the night of time, the gloom is irradiated by the light of modern science, which lays before our astonished vision the remains of arts and industries of the primitive tribes that occupied Europe during the morning-time of human life.

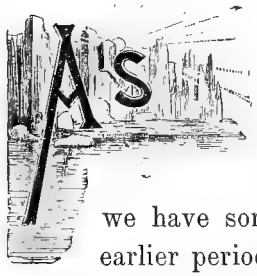


The Mammoth

# CHAPTER V.

## ANTIQUITY OF THE PALEOLITHIC AGE.[1]

INTEREST in the Antiquity of man—Connected with the Glacial Age—The Subject Difficult—Proofs of a Glacial Age—State of Greenland to-day—The Terminal Moraine—Appearance of the North Atlantic—Interglacial Age—Causes of the Glacial Age—Croll's Theory—Geographical causes—The two theories not Antagonistic—The date of the Glacial Age—Probable length of the Paleolithic Age—Time since the close of the Glacial Age—Summary of results.



AS WE have already remarked, geological periods give us no insight as to the actual passage of years. To say that man lived in the Glacial Age, and that we have some faint traces of his presence in still earlier periods, after all conveys to our minds only vague ideas of a far-away time. The more a geologist studies the structure of the earth, the more impressed is he with the magnitude of the time that must have passed since "The Beginning." At present, however, there are no means known of accurately measuring the time that has passed. It is just as well that it is so, since, were it known, the human mind would be utterly incapable of comprehending it. But as to the antiquity of man, it is but natural that we should seek more particularly to solve the problem and express our answer in some term of years.

Now, we have seen that the question of the antiquity of man is intimately connected with that of the Glacial

[1] The manuscript of this chapter was submitted to Prof. G. F. Wright, of Oberlin, for criticism.

Age. That is to say, the relics of man as far as we know them in Europe, are found under such circumstances that we feel confident they are not far removed from the period of cold. For it will be found that those conservative scholars who do not think that man preceded the Glacial Age, or inhabited Europe during the long course of years included in that period, do think he came into Europe as soon as it passed away. So, in any case, if we can determine the date of the Glacial Age, we shall have made a most important step in advance in solving the problem of the antiquity of man himself. So it seems to us best to go over the subject of the Glacial Age again, and see what conclusions some of our best thinkers have come to as to its cause, when it occurred, and other matters in relation to it.

It is best to state frankly at the outset that this topic is one of the great battle-grounds of science to-day, and that there are as yet but few points well settled in regard to it. One needs but attempt to read the literature on this subject to become quickly impressed with the necessity of making haste slowly in forming any conclusions. He must invoke the aid of the astronomer, geologist, physical-geographer, and physicist. Yet we must not suppose that questions relating to the Glacial Age are so abstruse that they are of interest only to the scholar. On the contrary, all ought to be interested in them. They open up one of the most wonderful chapters in the history of the world. They recall from the past a picture of ice-bound coasts and countries groaning under icy loads, where now are harbors enlivened by the commerce of the world, or ripening fields attesting the vivifying influence of a genial sun. Let us, therefore, follow after the leaders in thought. When we come to where they can not agree we can at least see what both sides have to say.

Somewhat at the risk of repetition, we will try and impress on our readers a sense of the reality and severity of the Glacial Age. There is danger in regarding this as simply a convenient theory that geologists have originated to explain some puzzling facts, that it is not very well founded, and is liable to give way any day to some more ingenious explanation. On the contrary, this whole matter has been worked out by very careful scholars. "There is, perhaps, no great conclusion in any science which rests upon a surer foundation than this, and if we are to be guided by our reason at all in deducing the unknown from the known, the past from the present, we can not refuse our assent to the reality of the Glacial Age of the Northern Hemisphere in all its more important features.[1] At the present day glaciers do exist in several places on the earth. They are found in the Alps and the mountains of Norway, and the Caucasus, in Europe. The Himalaya mountains support immense glaciers in Asia; and in America a few still linger in the more inaccessible heights of the Sierra Nevada. It is from a study of these glaciers, mainly however, those of the Alps, that geologists have been enabled to explain the true meaning of certain formations they find in both Europe and America, that go by the name of drift.

When in an Alpine valley we come upon a glacier, filling it from side to side, there will be noticed upon both sides a long train of rock, drift, and other *debris* that have fallen down upon its surface from the mountain sides. If two of these ice-rivers unite to form one glacier, two of these trains will then be borne along in the middle of the resulting glacier. As this glacier continues down the valley, it at length reaches a point where a further advance is rendered impossible by the increased temperature melting the

[1] Wallace's "Island Life," p. 113.

ice as fast as it advances. At this point the train of rocks and dirt are dumped, and of course form great mounds, called moraines. The glacier at times shrinks back on its rocky bed and allows explorers to examine it.

In such cases they find the rocks smoothed and polished, but here and there marked with long grooves and striæ. These points are learned from an examination of existing glaciers. Further down the valley, where now the glaciers never extend, are seen very distinctly the same signs. There are the same moraines, striated rocks, and bowlders that have evidently traveled from their home up the valley. The only explanation possible in this case is that once the glaciers extended to that point in the valley.

It required a person who was perfectly familiar with the behavior of Alpine glaciers, and knew exactly what marks they left behind in their passage, to point out the proofs of their former presence in Northern Europe and America, where it seems almost impossible to believe they existed. Such a man was Louis Agassiz, the eminent naturalist. Born and educated in Switzerland, he spent nine years in researches among the glaciers of the mountains of his native country. He proved the former wide extension of the glaciers of Switzerland. With these results before them, geologists were not long in showing that there had once been glacial ice over a large part of Europe and North America.

The proofs in this case are almost exactly the same as those used to show that the ancient glaciers of Switzerland were once larger than now. But as the great glaciers of the glacial age were many times larger than any thing we know of at the present day, there were of course different results produced. For instance, the water circulating under Alpine glaciers is enabled to wash out and carry away the mass of pulverized rock and dirt ground along underneath the ice.

But when the glaciers covered such an enormous extent of country as they did in the Glacial Age, the water could not sweep away this detritus, and so great beds of gravel, sand, and clay would be formed over a large extent of country. But to go over the entire ground would require volumes; it is sufficient to give the results.

The interior of Greenland to-day is covered by one vast sea of ice. Explorers have traversed its surface for many miles; not a plant, or stone, or patch of earth is to be seen. In the Winter it is a snow-swept waste. In the Summer streams of ice-cold water flow over its surface, penetrating here and there by crevasses to unknown depths. This great glacier is some twelve hundred miles long, by four hundred in width.[1] Vast as it is, it is utterly insignificant as compared with the great continental glacier that geologists assures us once held in its grasp the larger portion of North America.

The conclusions of some of our best scholars on this subject are so opposed to all that we would think possible, according to the present climate and surroundings, that they seem at first incredible, and yet they have been worked out with such care that there is no doubt of the substantial truth of the results.

The terminal moraine of the great glacier has been carefully traced through several States. We now know that one vast sea of ice covered the eastern part of North America, down to about the thirty-ninth parallel of latitude. We have every reason to think that the great glacier, extending many miles out in the Atlantic, terminated in a great sea of ice, rising several hundred feet perpendicularly above the surface of the water. Long Island marks the southern extension of this glacier. From there its temporal moraine has been traced

[1] Nordenskiold's "American Journal of Science," vol. 110, p. 58.

west, across New Jersey and Pennsylvania, diagonally across Ohio, crossing the river near Cincinnati, and thence west across Indiana and Illinois. West of the Mississippi it bears off to the north-west, and finally passes into British America.[1]

All of North America, to the north and north-east of this line, must have been covered by one vast sea of ice.[2] Doubtless, as in Greenland to-day, there was no hill or patch of earth to be seen, simply one great field of ice. The ice was thick enough to cover from sight Mt. Washington, in New Nampshire, and must have been at least a mile thick over a large portion of this area,[3] and even at its southern border it must in places have been from two hundred to two thousand feet thick.[4] This, as we have seen, is a picture very similar to what must have been presented by Europe at this time.[5]

The Northern Atlantic Ocean must have presented a dreary aspect. Its shores were walls of ice, from which ever and anon great masses sailed away as icebergs. These are startling conclusions. Yet, in the Southern Hemisphere to-day is to be seen nearly the same state of things. It is well-known that all the lands around the South Pole are covered by a layer of ice of enormous thickness. Sir J. A. Ross, in attempting to reach high southern latitudes, while yet one thousand four hundred miles from the pole, found his further progress impeded by a perpendicular wall of ice one hundred and eighty feet thick. He sailed along that barrier four hundred and fifty miles, and then gave up the attempt. Only at one point in all that distance did the ice

[1] Wright's "Studies in Science and Religion," p. 307, where a map of this moraine is given.

[2] There is, however, a small area in the south-west part of Wisconsin where, for some reason, the ice passed by.

ANTARTIC ICE SHEET.

wall sink low enough to allow of its upper surface being seen from the mast-head. He describes the upper surface as an immense plain shining like frosted silver, and stretching away as far as eye could reach into the illimitable distance.[1]

The foregoing makes plain to us one phase of the Glacial Age. Though it may not be quite clear what this has to do with the antiquity of man, yet we will see, in the sequel, that it has considerable. As to the periods of mild climate that are thought by some to have broken up the reign of cold, we do not feel that we can say any thing in addition to what has been said in a former chapter.[2]

We might, however, say, that the sequences of mild and cold climate are not as well made out in America as they seem to be in Europe; or at least our geologists are more cautious as to accepting the evidence as sufficient. And yet such evidences are not wanting: as in Europe, at various places, are found layers of land surfaces with remains of animals and plants, but both above and below such surface soil are found beds of bowlder clay. These offer undeniable evidence that animals and plants occupied the land during temperate inter-glacial epochs, preceded and followed by an Arctic climate, and ice-sheets like those now covering the interior of Greenland, and the Antarctic Continent.[3]

We have thus, though somewhat at length, gone over the evidence as to the reality and severity of the Glacial Age. It was during the continuance of such climate that Paleolithic man arrived in Europe, though it was not perhaps until its close. We must not lose sight of the fact that our principal object at present is to determine, if we can, a date for either the beginning or ending of this extraordinary season of cold,

---

[3] Abbott's "Primitive Industry," p. 545; Quoted from "Geology of Minnesota." Report, 1877, p. 37.

and thereby achieve an important step in determining the antiquity of man.

A moment's consideration will show us that a period of cold sufficient to produce over a large portion of the Northern Hemisphere the results we have just set forth must have a cause that is strange and far-reaching. It can not be some local cause, affecting but one continent, since the effect produced is observed as well in Europe as in America.

Every year we pass through considerable changes in climate. The four seasons of the year seem to be but an annual repetition, on a very small scale of course, of the great changes in the climate of the earth that culminated in the Glacial Age; though we do not mean to say, that periods of glacial cold come and go with the regularity of our Winter. The changes in the seasons of the year are caused by the earth's position in its orbit, and its annual revolution around the sun. It may be that the cause of the Glacial Age itself is of a similar nature; in which case it is an astronomical problem, and we ought, by calculation, to determine, with considerable accuracy, dates for the beginning and ending of this epoch.

Nothing is clearer than that great fluctuations of climate have occurred in the past. Many theories have been put forth in explanation. It has been suggested that it was caused by loss of heat from the earth itself. That the earth was once a ball of incandescent matter, like the sun, and has since cooled down, is of course admitted. More than that, this process still continues; and the time must come when the earth, having yielded up its internal heat, will cease to be an inhabitable globe. But the climate of the surface of the earth is not dependent upon the heat of the interior. This now depends "according to the proportion of heat received either directly or indirectly from the sun; and so it

must have been during all the ages of which any records have come down to us."[1]

Some have supposed that the sun, traveling as it does through space, carrying the earth and the other planets with him, might, in the course of ages, pass through portions of space either warmer or colder than that in which it now moves. When we come to a warm region of space, a genial climate would prevail over the earth; but, when we struck a cold belt, eternal Winter would mantle a large part of the globe with snow and ice. This, of course, is simply guess-work. No less than seven distinct causes have been urged; most of them either purely conjectural, like the last, or manifestly incompetent to produce the great results which we have seen must be accounted for. But, amongst these, two causes have been advanced—the one astronomical, the other geographical; and, to the one or the other, the majority of scholars have given their consent.

It will be no harm to see what can be said in favor of both theories. So, we will ask the reader's attention, as it is our earnest desire to make as plain as possible a question that has so much to do with our present inquiry. In the course of our investigations, we can not fail to catch glimpses of wonderful changes in far away times; and can not help seeing what labor is involved in the solution of all questions relating to the same.[2]

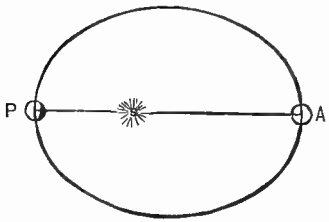
The earth revolves around the sun in an orbit called an ellipse. This is not a fixed form, but slowly varies from year to year. It is now gradually becoming circular. It

[1] Geikie's "Great Ice Age," p. 97.

[2] The astronomical theory, which we will first examine, was first enunciated by Mr. Croll, following a suggestion of the astronomer Adhemer. Mr. Croll's views were set forth in many able papers, and finally gathered into a volume entitled "Climate and Time in their Geological Relation." The ablest defense of these views is that by Mr. James Geikie, in his works "The Great Ice Age," and "Prehistoric Europe."

will, however, not become an exact circle. Astronomers assure us that, after a long lapse of time, it will commence to elongate as an ellipse again. Thus, it will continually change from an ellipse to an approximate circle, and back again. In scientific language, the eccentricity of the earth's orbit is said to increase and decrease.

In common language we would state that the shape of the path of the earth around the sun was sometimes much more elongated and elliptical than at others. The line drawn through the longest part of an ellipse is called the major axis. Now the sun does not occupy the center of this line, but is placed to one side of it; or, in other words, occupies one focus of the ellipse. It will thus be seen that the earth, at one time during its yearly journey, is considerably nearer to the sun than at others. The point where it approaches nearest the sun is called *Perihelion*, and the point where it reaches the greatest distance from the sun is called its *Aphelion*. It will be readily seen that the more elliptical its orbit becomes the greater will be the difference between the perihelion and aphelion distance of the sun. At present the earth is about three millions of miles nearer the sun in perihelion than in aphelion. But we must remember the orbit of the earth is now nearly circular. There have been times in the past when the difference was about thirteen millions of miles. We must not forget to add, that the change in the shape of the earth's orbit is not a regular increase and decrease between well-known extremes. It is caused by the attraction of the other planets. It has been calculated at intervals of ten thousand years for the last million years. In this way it has been found that "the intervals between connec-



Earth's Orbit.

tive turning points are very unequal in length, and the actual maximum and minimum values of the eccentricity are themselves variable. In this way it comes about that some periods of high eccentricity have lasted much longer than others, and that the orbit has been more elliptical at some epochs of high eccentricity than at others."[1] We have just seen that the earth is nearer the sun at one time of the year than at another. At present the earth passes its perihelion point in the Winter of the Northern Hemisphere, and its aphelion point in the Summer. We will for the present suppose that it always reaches the points at the same season of the year. Let us see if the diminished distance from the sun in Winter has any thing to do with the climate.

If so, this effect will be greatly magnified during a period of high eccentricity, such as the earth has certainly passed through in the past. We will state first, that the more elliptical the orbit becomes, the longer Summer we have, and the shorter Winter. Astronomically, Spring begins the 20th of March, and Fall the 22d of September. By counting the days between the epochs it will be found that the Spring and Summer part of the year is seven days longer than the Fall and Winter part. But if the earth's orbit becomes as highly eccentrical as in the past, this difference would be thirty-six days.[2]

This would give us a long Spring and Summer, but a short Fall and Winter. This in itself would make a great difference. We must bear in mind, however, that at such a time as we are here considering, the earth would be ten millions of miles nearer the sun in Winter than at present. It would certainly then receive more heat in a given time during Winter than at present.[3] Mr. Croll estimates that

[1] Geikie's "Great Ice Age," p. 114.
[2] Lubbock's "Prehistoric Times," p. 420, Table 4. [3] Ibid., Table 5.

whereas the difference in heat received during a given time is now one-fifteenth,[1] at the time we are considering it would be one-fifth. Hence we see that at such a time the Winter would not only be much shorter than now, but at the same time would be much milder.

These are not all the results that would follow an increase of eccentricity. The climate of Europe and North America is largely modified by those great ocean currents—the Gulf Stream and the Japan current. Owing to causes we will not here consider, these currents would be greatly increased at such a time. As a result of these combined causes, Mr. Croll estimates that during a period of high eccentricity the difference between Winter and Summer in the Northern Hemisphere would be practically obliterate. The Winter would not only be short, but very mild, and but little snow would form, while the sun of the long Summers, though not shining as intense as at present, would not have to melt off a great layer of snow and ice, but the ground became quickly heated, and so warmed the air. Hence, if Mr. Croll be correct, a period of high eccentricity would certainly produce a climate in the Northern Hemisphere such as characterized many of the mild interglacial epochs as long as the earth passed its perihelion point in Winter.

We have so far only considered the Northern Hemisphere. As every one knows, while we have Winter, the Southern Hemisphere has Summer. So at the very time we would enjoy the mild short Winters, the Southern Hemisphere would be doomed to experience Winters of greatly increased length and severity. As a consequence, immense fields of snow would be formed, which, by pressure, would be changed to ice, and creep away as a desolating glacier. It is quite true that the short Summer sun would shine with

[1] Geikie's "Great Ice Age," p. 123.

increased warmth, but owing to many causes it would not avail to free the land from snow and ice.

As Mr. Geikie points out, "An increased amount of evaporation would certainly take place, but the moisture-laden air would be chilled by coming into contact with the vast sheets of snow, and hence the vapor would condense into thick fogs and cloud the sky. In this way the sun's rays would be, to a large extent, cut off, and unable to reach the earth, and consequently the Winter's snow would not be all melted away." Hence it follows that at the very time the Northern Hemisphere would enjoy a mild interglacial climate, universal Spring, so to speak, the Southern Hemisphere would be encased in the ice and snow of an eternal Winter.

But the earth has not always reached its perihelion point during the Winter season of the Northern Hemisphere. Owing to causes that we need not here consider, the earth reaches its perihelion point about twenty minutes earlier each year, so if it now passes its perihelion in Winter of the Northern Hemisphere, in about ten thousand years from now it will reach it in Summer, and in twenty-one thousand years it will again be at perihelion in Winter. But see what important consequences follow from this. If during a period of high eccentricity we are in the enjoyment of short mild Winters and long pleasant Summers, in ten thousand years this would certainly be changed. Our Summar season would become short and heated; our Winters long and intensely cold. Year by year it would be later in the season before the sun could free the land from snow, and at length in deep ravines and on hill-tops the snow would linger through the brief Summer, and the mild interglacial age will have passed away, and again the Northern Hemisphere will be visited by snow and ice of a truly Glacial Age. If, therefore, a period

of high eccentricity lasts through the many thousand years, we must expect more than one return of glacial cold interspersed by mild interglacial climates.

We have tried in these last few pages to give a clear statement of what is known as Croll's theory of the Glacial Age. There is no question but what the earth does thus vary in its position with regard to the sun, and beyond a doubt this must produce some effect on the climate, and we can truthfully state that the more the complicated question of the climate of the earth is studied, the more grounds do scholars find for affirming that indirectly this effect must have been very great. And yet we can not say that this theory is accepted as a satisfactory one even by the majority of scholars. Many of those who do not reject it think it not proven. Therefore, before interrogating the astronomer as to the data of the Glacial Age, according to the terms of this theory, let us see what other causes are adduced; then we can more readily accept or reject the conclusions as to the antiquity of man which this theory would necessitate us to adopt.

The only other cause to which we can assign the glacial cold, that is considered with any favor by geologists, is geographical; that is to say, depending on the distribution of land and water. Glaciers depend on the amount of snow-fall. In any country where the amount of snow-fall is so great that it is not all evaporated or melted by the Summer's sun, and consequently increases from year to year, glaciers must soon appear, and these icy rivers would erelong flow away to lower levels. If we suppose, with Sir Charles Lyell, that the lands of the globe were all to be gathered around the equator, and the waters were gathered around the poles, it is manifest that there would be no such a thing as extremes of temperature, and it is, perhaps, doubt-

ful whether ice would form even in polar areas.[1] At any rate, no glaciers could be formed, as there would be no land on which snow could gather in great quantities.

If, however, we reverse this picture, and conceive of the land gathered in a compact mass around the poles, shutting out the water, but consider the equatorial region of the earth to be occupied by the waters of the ocean, we would manifestly have a very different scene. From the ocean moisture-laden winds would flow over the polar lands. The snowfall would necessarily be great. In short, we can not doubt but what all the land of the earth would be covered with glaciers.[2]

Although these last conceptions are purely hypothetical, they will serve the good purpose of showing the great influence that the geographical distribution of land and water have on the climate of a country. Of one thing, however, geologists have become more and more impressed of late years. That is, that continents and oceans have always had the same relative position as now; that is to say, the continents have followed a definite plan in their development. The very first part of North America to appear above the waters of the primal sea clearly outlined the shape of the future continent. Mr. Dana assures us that our continent developed with almost the regularity of a flower. Prof. Hitchcock also points out that the surface area of the very first period outlined the shape of the continent. "The work of later geological periods seems to have been the filling up of the bays and sounds between the great islands, elevating the consolidated mass into a contiental area."[3] So it is not at all probable that the lands of the globe were ever grouped, as we have here supposed them.

[1] Wallace's "Island Life," p. 143. [2] Ibid., p. 124.
[3] "Geology of New Hampshire," Vol. II, p. 5.

This last statement is liable, however, to leave us under a wrong impression; for although, as a whole, continental areas have been permanent, yet in detail they have been subject to wonderful and repeated changes. "Every square mile of their surface has been again and again under water, sometimes a few hundred feet deep—sometimes, perhaps, several thousand. Lakes and inland seas have been formed and been filled up with sediment, and been subsequently raised into hills, or even mountains. Arms of the sea have existed, crossing the continent in various directions, and thus completely isolating the divided portions for varying intervals. Seas have become changed into deserts and deserts into seas."[1]

It has been shown beyond all question that North-western Europe owes its present mild climate to the influence of the Gulf Stream.[2] Ocean currents, then, are a most important element in determining the climate of a country. If we would take the case of our hypothetical polar continent again, and, instead of presenting a continuous coast line, imagine it penetrated by long straits and fiords, possessing numerous bays, large inland seas, and in general allowing a free communication with the ocean, we are very sure the effect would be widely different.

Under these circumstances, says Mr. Geikie, the "much wider extent of sea being exposed to the blaze of the tropical sun, the temperature of the ocean in equatorial regions would rise above what it is at present. This warm water, sweeping in broad currents, would enter the polar fiords and seas, and everywhere, heating the air, would cause warm, moist winds to blow athwart the land to a much greater extent than they do at present; and these winds thus distributing warmth and moisture, might render even the high

[1] Wallace's "Island Life," p. 99. [2] Geikie's "Great Ice Age," p. 103.

latitude of North Greenland habitable by civilized man." So we see that it is necessary to look for such geographical changes as will interfere with the movements of marine currents.

Now, it is easy to see that comparatively small geographical changes would not only greatly interfere with these currents, but might even cause them to entirely change their course. An elevation of the northern part of North America, no greater in amount than is supposed to have taken place at the commencement of the Glacial Age, would bring the wide area of the banks of Newfoundland far above the water, causing the American coast to stretch out in an immense curve to a point more than six hundred miles east of Halifax, and this would divert much of the Gulf Stream straight across to the coast of Spain.[1]

Such an elevation certainly took place, and if continued westward, Behring's Strait would also have been closed. It is to such northern elevations, shutting out the warm ocean currents, that a great many geologists look for a sufficient explanation of the glacial cold.

Prof. Dana says: "Increase in the extent and height of high latitude lands may well stand as one cause of the Glacial Age." Then he points out how the rising of the land of Northern Canada and adjacent territory, which almost certainly took place, "all a sequel to the majestic uplift of the Tertiary, would have made a glacial period for North America, whatever the position of the ecliptic, or whatever the eccentricity of the earth's orbit, though more readily, of course, if other circumstances favored it."[2]

It may occur to some that if high northern lands be all

[1] Wallace's "Island Life," p. 149. Hitchcock's "Geology of New Hampshire," Vol. II, p. 7, gives a map showing what immense areas in that section would be raised to the surface by a raise of three hundred feet.

[2] *American Journal of Science*, 1871, p. 329.

that is necessary for a period of cold, we ought to have had it in the Miocene Age, when there was a continuous land connection between the lands of high polar areas and both Europe and America, since we know that an abundant vegetation spread from there, as a center, to both these countries. But at that epoch circumstances were different. The great North Temperate lands were in a "comparatively fragmentary and insular condition."[1] There were great inland seas in both Europe and Asia, through which powerful currents would have flowed from the Indian Ocean to Arctic regions.

Somewhat similar conditions prevailed in North America. The western part was in an insular condition. A great sea extended over this part of the country, joining the Arctic probably on the north, through which heated water would pour into the polar sea. And so, instead of a Glacial Age, we find evidence of a mild and genial climate, with an abundant vegetation.

We thus see that there are two theories as to the cause of the Glacial Age presented for our consideration. Both of them have received the sanction of scholars eminent for their scientific attainments. On inspection we see they are not antagonistic theories. They may both be true for that matter, and all would admit that whatever effect they would produce singly would be greatly enhanced if acting together. Indeed, there are very good reasons for supposing both must have acted in unison.

There seem to be very good reasons for not believing that the eccentricity of the earth's orbit, acting alone, produced the glacial cold. If that were the case, then whenever the eccentricity was great we should have a Glacial Age. Now, at some period of time during the long-extended

[1] Wallace's "Island Life," p. 184.

Tertiary Age we are certain the eccentricity of the earth's orbit became very great, much more so, in fact, than that which is supposed to have produced the cold of the Quaternary Age. But we are equally certain there was no glacial epoch during this age."[1] What other explanation can we give for its non-appearance except that geographical conditions were not favorable?

But, on the other hand, there are certain features connected with the phenomena of the Glacial Age that seem very difficult of explanation, if we suppose that geographical changes alone produced them. We must remember that evidences of the former presence of glaciers are found widely scattered over the earth. We shall, therefore, have to assume an elevation not only for America and Europe, but extend it over into Asia, and take in the Lebanon Mountains, for they also show distinct traces of glaciers. And this movement of elevation must also have affected the Southern Hemisphere, the evidence being equally plain that at the same comparatively late date glaciers crushed over Southern Africa and South America.[2] This is seen to prove too much. Again, how can we explain the fact that some time during the Glacial Age we had a submergence, the land standing several hundred feet lower than now, but still remained covered with ice, and over the submerged part there sailed icebergs and ice-rafts, freighted with their usual *débris?* That such was the state of things in Europe we are assured by some very good authorities.[3]

Neither do geographical causes afford an adequate explanation of those changes of temperature that surely took

[1] Wallace's "Island Life," p. 182.

[2] Ibid., p. 157 and note. Prof. Wright thinks this statement doubtful. He refers to the date of the Glacial Age in the Southern Hemisphere.

[3] Wallace's "Island Life," p. 200; Dawkins's "Early Man in Britain," p. 119; Geikie's "Great Ice Age," p. 256; Quatrefages's "Human Species," p. 288.

place during the Glacial Age. These last considerations show us how difficult it is to believe that geographical causes could have produced the Glacial Age.

We are assured that all through the geological ages the continents had been increasing in size and compactness, and that just at the close of the Tertiary Age they received a considerable addition of land to the north. The astronomer also informs us that at a comparatively recent epoch the eccentricity of the earth's orbit became very great. The conditions being favorable, it is not strange that a Glacial Age supervened.

We have been to considerable length in thus explaining the position of the scientific world in regard to the cause of the Glacial Age. Our reason for so doing is that this age is, we think, so connected with the Paleolithic Age of man, that it seems advisable to have a clear understanding in regard to it. What we have to say is neither new nor original. It is simply an earnest endeavor to represent clearly the conclusions of some of our best scholars on this subject, and we have tried to give to each theory its due weight. Our conclusions may be wrong, but, if so, we have the consolation of erring in very good company.

We have now gone over the ground and are ready to see what dates can be given. Though the numbers we use seem to be very large indeed, they are so only in comparison with our brief span of life. They are insignificant as compared with the extent of time that has surely rolled by since life appeared on the globe. Let us, therefore, not be dismayed at the figures the astronomer sets before us.[1]

About two hundred and fifty thousand years ago the earth's path around the sun was much the same as that of the present. No great changes in climate were liable to take

[1] For these results, see McFarland's Calculations in "American Journal of Science," 1880, p. 105.

place at that time. During the next fifty thousand years the eccentricity steadily increased. Towards the end of that time all that was necessary to produce a glacial epoch in the Northern Hemisphere was favorable geographical causes, and that our earth should reach its point nearest the sun in Summer. This it must have done when about half that time had elapsed.

We can in imagination see what a slow deterioration of climate took place. Thousands of years would come and go before the change would be decisive. But a time must have at length arrived when the vegetation covering the ground was such as was suited only for high northern latitudes. The animals suited for warm and temperate regions must have wandered farther south; others from the north had arrived to take their place. We can see how well this agrees with the changes of climate at the close of the Pliocene Age. The snows of the commencing Glacial Age would soon begin to fall, finally the sun would not melt them off of the high lands, and mountain peaks, and so a Glacial Age would be ushered in.

We have referred to the fact that the earth reaches its perihelion point a little earlier each year, and, as a consequence, we would have periods of mild climate alternating the cold. This extended period of time, equal to twenty-one thousand of our ordinary years, has been named the Great Year of our globe. Mr. Wallace has pointed out some very good reasons for thinking Mr. Croll's theory must be modified on this point. He thinks that when once a Glacial Age was fairly fastened on a hemisphere, it would retain its grasp as long as the eccentricity remained high, but whenever the Summer of the Great Year came to that hemisphere, it would melt back the glacial ice for some distance, but this area would be recovered by the ice when the Winter of the Great Year supervened. These effects would be different

when the eccentricity itself became low. Then we would expect the glacial conditions to vanish entirely when the Summer of a Great Year comes on.[1]

As we have made the theoretical part of this chapter already too long, we must hurry on. We can only say that this view is founded on the fact that when a country was covered with snow and ice, it had, so to speak, a great amount of cold stored up in it, so much, in fact, that it would not be removed by the sun of a new geological Summer. This ought to be acceptable to such geologists as are willing to admit the advance and retreat of the great glacier, but yet doubt the fact of the interglacial mild climate.

But now to return to the question of time about two hundred and twenty thousand years ago. Then the Northern Hemisphere, according to this theory, was in the grasp of a Glacial Age. According to Mr. Wallace, as long as the eccentricity remained high, there could be no great amelioration of climate, except along the southern border of the ice sheet, which might, for causes named, vary some distance during the Great Year. Two hundred thousand years ago the eccentricity, then very high, reached a turning point. It then steadily, though gradually, diminished for fifty thousand years; at that time the eccentricity was so small, though considerably larger than at present, that it is doubtful if it was of any service in producing a change of climate.[2] At that time, also, the Northern Hemisphere was passing through the Summer season of the Great Year. We ought, therefore, to have had a mild interglacial season. Except in high northern latitudes the ice should have disappeared. This change we would expect to find more marked in Europe than in America.

We need only recall how strong are the evidences on

[1] "Island Life," p. 153. [2] See chart, p. 124, Wallace's "Island Life."

this point. Nearly all European writers admit at least one such mild interval, and though not wanting evidence of such a period in America, our geologists are much less confident of its occurrence.

But from that point the eccentricity again increased. So when the long flight of years again brought secular Winter to the Northern Hemisphere, the glaciers would speedily appear, and as eccentricity was again high, they would again hold the country in their grasp. Fifty thousand years later, or one hundred thousand years ago, it passed its turning point again; eighty thousand years ago, it became so small that it probably ceased to effect the climate. Since then it has not been very large. Twenty-five thousand years ago it was less than it is now, but it is again growing smaller. According to this theory, then, the Glacial Age commenced about two hundred and twenty thousand years ago. It continued, with one interruption of mild climate, for one hundred and forty thousand years, and finally passed away eighty thousand years ago.

What shall we say to these results? If true, what a wonderful antiquity is here unfolded for the human race, and what a wonderful lapse of time is included in what is known as the Paleolithic Age! How strikingly does it impress upon our minds the slow development of man! Is such an antiquity for man in itself absurd? We know no reason for such a conclusion. Our most eminent scholars nowhere set a limit to the time of man's first appearance. It is true, many of them do not think the evidence strong enough to affirm such an antiquity, but there are no bounds given beyond which we may not pass.

Without investigation some might reject the idea that man could have lived on the earth one hundred thousand years in a state of Savagism. If endowed with the attributes of humanity, it may seem to them that he would

long before that time have achieved civilization. Such persons do not consider the lowliness of his first condition, and the extreme slowness with which progress must have gone forward. On this point the geologists and the sociologists agree. Says Mr. Geikie: "The time which has elapsed from the close of the Paleolithic Age, even up to the present day, can not for a moment compare with the æons during which the men of the old stone period occupied Europe." And on this subject Mr. Morgan says: "It is a conclusion of deep importance in ethnology that the experience of mankind in Savagery was longer in duration than all their subsequent experience, and that the period of Civilization covers but a fragment of the life of the race."[1] The time itself, which seems to us so long, is but a brief space as compared with the ages nature has manifestly required to work out some of the results we see before us every day. We are sure, but few of our scholars think this too liberal an estimate. All endeavor to impress on our minds that the Glacial Age is an expression covering a very long period of time.

As to the time that has elapsed since the close of the Glacial Age there is some dispute, and it may be that we will be forced to the conclusion that the close of the Glacial Age was but a few thousand years ago. Mr. Wallace assures us, however, that the time mentioned agrees well "with physical evidence of the time that has elapsed since the cold has passed away."[2]

Difficulties are, however, urged by other writers. We can see at once that as quick as the glaciers are removed the denuding forces of nature, which are constantly at work, would begin to rearrange the *débris* left behind on the surface, and in the course of a few thousand years must effect great changes. Now, in some cases the amount of such

[1] "Ancient Society," p. 39. [2] "Island Life," p. 201.

change is so small that geologists are reluctant to believe a vast lapse of time has occurred since the glaciers withdrew. Mr. Geikie tells us of some moraines in Scotland that they are so fresh and beautiful "that it is difficult to believe they can date back to a period so vastly removed as the Ice Age is believed to be."[1] In our own country this same sort of evidence is brought forward, and we are given some special calculations going to show that the disappearance of the glaciers was a comparatively recent thing.[2]

It will be seen that these conclusions are somewhat opposed to the results previously arrived at. In explanation Mr. Geikie thinks the cases spoken of in Scotland were not the moraines of the great glaciers, but of a local glacier of a far later date. He thinks that the climate, while not severe enough to produce the enormous glaciers of early times, was severe enough to produce local glaciers still in Scotland.[3] It is possible that a similar explanation may be given for the evidence adduced in the United States. We can only state that, according to the difference in climate between the eastern and western sides of the Atlantic Ocean, when the climate was severe enough to produce local glaciers in Scotland, it would produce the same effect over a large part of eastern United States down to the latitude of New York City.[4] And while it is true there would not be as much difference in climate on the two sides of the Atlantic in Glacial times as at present, since the Gulf Stream, on which such difference depends would then have less force, still it was not entirely lacking, and the difference must have been considerable.[5]

[2] On this point consult Wright's "Studies in Science and Religion," pp. 232–347; also Prof. Lewis in "Primitive Industry," pp. 547–551.

[3] "Prehistoric Europe," p. 560.

[4] See any isothermal map.

[5] Wallace's "Island Life," p. 154, note.

Prof. Hitchcock has made a suggestion that whereas we know a period of several months elapses after the sun crosses the equator before Summer fairly comes on, so it is but reasonable to suppose that a proportionate length of time would go by after the eccentricity of the earth's orbit became small, before the Glacial Age would really pass away. He accordingly suggests it may have been only about forty thousand years since the glaciers disappeared.[1]

At the close of the Glacial Age Paleolithic man vanished from Europe. This, therefore, brings us to the conclusion of our researches into what is probably the most mysterious chapter of man's existence on the earth.

It may not come amiss to briefly notice the main points thus far made in our investigation of the past. As to the epoch of man's first appearance, we found he could not be expected to appear until all the animals lower than he had made their appearance. This is so because the Creator of all has apparently chosen that method of procedure in the development of life on the globe. According to our present knowledge, man might have been living in the Miocene Age, and with a higher degree of probability in the Pliocene. But we can not say that the evidence adduced in favor of his existence at these early times is satisfactory to the majority of our best thinkers. All agree that he was living in Europe at the close of the Glacial Age, and we think the evidence sufficient to show that he preceded the glaciers, and that as a rude savage he lived in Europe throughout the long extended portion of time known as the Glacial Age.

We also found evidence of either two distinct races of men inhabiting Europe in the Paleolithic Age, or else tribes of the same race, widely different in time and in culture.

[1] "Geology of New Hampshire," Vol. III, p. 327, referred to in Wright's "Studies in Science and Religion," p. 327.

The one people known as the men of the River Drift apparently invaded Europe from Asia, along with the species of temperate animals now living there. This people seem to have been widely scattered over the earth. The race has probably vanished away, though certain Australian tribes may be descendants of them. They were doubtless very low in the scale of humanity, having apparently never reached a higher state than that of Lower Savagism. The second race of men inhabiting Europe during the Paleolithic Age were the Cave-dwellers. They seem to have been allied to the Eskimos of the North. They were evidently further advanced than the Drift men, but were still savages.

The Paleolithic Age in Europe seems to have terminated with the Glacial Age. But we are not to suppose it came to an end all over the earth at that time. On the contrary, some tribes of men never passed beyond that stage. When the light of civilization fell upon them they were still in the culture of the old Stone Age. We are to notice that in such cases the tribes thus discovered were very low in the scale. The probable data for the Paleolithic Age have formed the subject of this chapter. While claiming in support of them the opinions of some eminent scholars, we freely admit that it is not a settled question, but open to very grave objections, especially the date of the close of the Glacial Age, which seems to have been comparatively recent, at least in America. We think, however, that these objections will yet be harmonized with the general results. Neither is this claimed to be an exhaustive presentation of the matter. It is an outline only—the better to enable us to understand the mystery connected with the data of Paleolithic man.

In these few chapters we have been dealing with people, manners, and times, of which the world fifty years ago was ignorant. Many little discoveries, at first apparently discon-

nected, are suddenly brought into new relation, and behold, ages ago, when the great continents were but just completed, races of men, low in the scale, it is true, but yet with the stamp of humanity upon them, are seen filling the earth. With them were many great animals long since passed away. The age of animals was at an end. That of man had just begun.

The child requires the schooling of adversity and trial to make a complete man of himself, and it is even so with races of men. Who can doubt that struggling up from dense ignorance, contending against adverse circumstances, compelled to wage war against fierce animals, sustaining life in the midst of the low temperature which had loaded the Northern Hemisphere with snow and ice, had much to do in developing those qualities which rendered civilization possible.

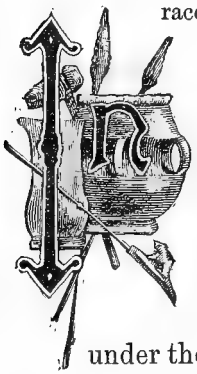
As to the antiquity of man disclosed in these chapters, the only question that need concern us is whether it is true or not. Evidence tending to prove its substantial accuracy should be as acceptable as that disproving it. No great principle is here at stake. The truth of Divine Revelation is in no wise concerned. There is nothing in its truth or falsity which should in any way affect man's belief in an overruling Providence, or in an immortality beyond the grave, or which should render any less desirable a life of purity and honor. On the contrary, we think one of the greatest causes of thanksgiving mortals have is the possession of intellectual powers, which enable us to here and there catch a glimpse of the greatness of God's universe, which the astronomer at times unfolds to us; or, to dimly comprehend the flight of time since "The Beginning," which the geologist finds necessary to account for the stupendous results wrought by slow-acting causes.

It seems to us eminently fitting that God should place man here, granting to him a capacity for improvement, but bestowing on him no gift or accomplishment, which by exertion and experience he could acquire; for labor is, and ever has been, the price of material good. So we see how necessary it is that a very extended time be given us to account for man's present advancement. Supposing an angel of light was to come to the aid of our feeble understanding, and unroll before us the pages of the past, a past of which, with all our endeavors, we as yet know but little. Can we doubt that, from such a review, we would arise with higher ideas of man's worth? Our sense of the depths from which he has ascended is equaled only by our appreciation of the future opening before him. Individually we shall soon have passed away. Our nation may disappear. But we believe our race has yet but fairly started in its line of progress; time only is wanted. We can but think that that view which limits man to an existence extending over but a few thousand years of the past, is a belittling one. Rather let us think of him as existing from a past separated from us by these many thousand years; winning his present position by the exercise of God-given powers.

# CHAPTER VI.

## THE NEOLITHIC AGE IN EUROPE.[1]

CLOSE of the first cycle—Neolithic culture connected with the present—No links between the two ages—Long lapse of time between the two ages—Swiss lake villages—This form of villages widely scattered—Irish cranogs—Fortified villages—Implements and weapons of Neolithic times—Possessed of pottery—Neolithic agriculture—Possessed of domestic animals—Danish shell-heaps—Importance of flint—The art of navigation—Neolithic clothing—Their modes of burial—The question of race—Possible remnants—Connection with the Turanian race—Arrival of the Celts.



THE preceding chapters we have sought to learn what we could of the Paleolithic Age. We have seen what strange people and animals occupied the land, and have caught some glimpses of a past that has been recovered to us out of the very night of time. From under the ashes of Vesuvius archæologists have brought to light an ancient city. We gaze on it with great interest, for we there see illustrated the state of society two thousand years ago. But other cities of that time are still in existence, and not only by the aid of tradition and song, but from the pages of history, we can learn of the civilization of the Roman people at the time of the destruction of Pompei; so that, in this case, our knowledge of the past is not confined to one source of information. But no voice of history or tradition,

[1] The manuscript of this chapter was submitted to Prof. Chas. Rau, of the Smithsonian Institution, for criticism.

or of existing institutions, speaks to us of the Paleolithic Age. Of that remote time, the morning time of human life, we learn only from the labors of geologists and archæologists. We are virtually dealing with a past geological age. The long term of years thus defined drew to its close amidst scenes of almost Arctic sterility. In all probability, glaciers reflected the sun's rays from all the considerable hills and mountains of Central and Northern Europe, though forming, perhaps, but a remnant of the great glaciers of the Ice Age. The neighboring seas must have been whitened by the glistening sails of numerous icebergs. Such was the closing scene of Paleolithic life.

The first great cycle of human life, as far as we know it now, was concluded in Europe. We do not mean to say that it terminated all over the world. In other regions it survived to far later times. But, in Europe, Paleolithic animals and men had worked out their mission, and we have now to record the arrival and spread of a new race, bringing with them domestic animals, a knowledge of rude husbandry, and many simple arts and industries of which their Paleolithic predecessors were ignorant.

We recall, that the men of the Paleolithic Age seemed incapable of advancement;[1] or their progress was so slow that we scarcely notice it. But we can trace the lines of advancement from the Neolithic culture to that of the present. We have, however, to deal with people and times far removed from the light of history.

We have before us, then, a new culture and a new people. On the one hand is Paleolithic man, with his rude stone implements, merely chipped into shape—surrounded

[1] The Cave-men were, undoubtedly, considerably in advance of the Men of the Drift. If we regard the two as but one race of men, then the statement is not true. We have, however, given our reasons for considering the Cave-men as a different race. Hence the statement made above.

by many animals which have since vanished from the theater of life—inhabiting a country which, at its close at least, was more like Greenland of to-day than England or France. The scene completely changes, when the misty curtain of the past again rises and allows us to continue our investigations into primitive times.

We would naturally expect to find everywhere, connecting links between these two ages—the culture of the one gradually changing into the culture of the other. This, however, is not the case. The line of demarkation between the ages is everywhere plainly drawn; and, furthermore, we are learning that a very long time elapsed between the departure, or disappearance, of the Paleolithic tribes, and the arrival of their Neolithic successors. This is shown in a great many ways, and we will notice some of them. We learn that Neolithic man occasionally used caves as a place of habitation. In such cases there is nearly always a thick layer of stalagmite between the strata containing the Paleolithic implements and the Neolithic strata—though this stalagmite is unmistakable evidence of the lapse of many years, we can not determine how many, as we do not know the rate of formation.

This lapse of time is shown very plainly when we come to consider the changes wrought in the surface features of the country by the action of running water. We know that rain, running water, and frost, constituting what we call denuding forces, are constantly at work changing the surface of a country. We know that, in general, this change is slow. But great changes have been wrought between these two ages.

In the British Islands, we know that the rivers had time to very materially change the surface features of the land. The important rivers of Scotland had carved out channels

one hundred feet deep in places; and along their courses, especially near their mouths, had plowed out and removed great quantities of glacial material—forming broad flats which became densely wooded before Neolithic man made his appearance on the scene. In some cases the entire surface of the land had been removed, leaving only knolls and hills of the old land surface. Examples of this occur on the east coast of England, and in what is known as the Fen-lands. The final retreat of the glaciers must have left the country covered with *débris*. After this had been largely denuded, the country became densely wooded. It was not until these changes had taken place, that Neolithic man wandered into Europe.[1]

But still another ground exists for claiming a long interval between these two ages, namely, the great changes that took place in the animal world of Europe during these two epochs. Many different species of animals characteristic of the Paleolithic Age vanished as completely from Europe as the rude tribes that hunted them, before the appearance of Neolithic tribes. But little change in the fauna of England has taken place in the last two thousand years. So it is obvious that the great change above-mentioned demands many centuries for its accomplishment. Huge animals of the elephant kind, such as the mammoth, no longer crashed through the underbrush, or wallowed in the lakes. The roars of lions and tigers, that haunted the caves of early Europe, were no longer heard.[2] In short, there had disappeared forever from Europe the distinctly southern animals that diversified the fauna of Paleolithic times. Even the Arctic animals were banished to northern latitudes, or mountain heights.

[1] Consult Geikie's "Prehistoric Europe," chapters on "British Post-glacial and Recent Deposits."

[2] Lions still lived in Greece at the time of Herodotus. See "Polymnia," vii, 125, etc.

We have dwelt to some length on the proofs of a long-extended time between these two ages. The more we reflect on these instances, the more impressed are we with a sense of duration vast and profound, in which the great forests and grassy plains of Europe supported herds of wild animals all unvexed by the presence of man. We will only mention one more point and then pass on.

We have seen that the highest rank we can assign to Paleolithic man in the scale of civilization is Upper Savagism. But when Neolithic man appeared, he was in the middle status of Barbarism. The time, therefore, between the disappearance of Paleolithic man and the arrival of Neolithic man was long enough to enable primitive man to pass one entire ethnical period, that of Lower Barbarism. But this requires a very long period of time, probably several times as long as the entire series of years since Civilization first appeared, which is supposed to be in the neighborhood of five thousand years ago.[1]

We must now turn our attention to Neolithic man himself and learn what we can of his culture, and discover, if possible, what race it was that spread over Europe after it had been for so long a time an uninhabitable country. A few remarks by way of introduction will not be considered amiss.

We are learning that tribal organization, implying communism in living, is characteristic of prehistoric people.[2] Tribal organization sufficed to advance man to the very confines of civilization. We have no doubt but that this was the state of society amongst the Neolithic people. But this implies living in communities or villages. We need not pic-

[1] This last argument is drawn from Mr. Morgan's work. It is well to state that his divisions are very far from being accepted by all authorities.

[2] Morgan's "Ancient Society."

ture to ourselves a country dotted with houses, the abodes of single families; such did not exist, but here and there were fortified villages.

Still another consequence follows from this tribal state of society. There was no such thing as a strong central government. Each tribe obeyed its own chief, and a state of war nearly always existed between different tribes. Such we know was the state of things among the Indian tribes of America. Travelers tell us that it is so to-day in Africa. Each tribe stood ready to defend itself or to make war on its neighbors. One great point, therefore, in constructing a village, was to secure a place that could be easily defended.

Bearing these principles in mind, let us see what we can learn of their habitations. Owing to a protracted drouth, the water in the Swiss lakes was unusually low in the Winter of 1854, and the inhabitants of Meilen, on the Lake Zürich, took advantage of this state of affairs to throw up embankments some distance out from the old shore, and thus gain a strip of land along the coast. In carrying out this design, they found in the mud at the bottom of the lake a number of piles, some thrown down and others upright, fragments of rough pottery, bone and stone instruments, and various other relics.

Dr. Keller, president of the Zürich Antiquarian Society, was apprised of this discovery, and proceeded at once to examine the collection made and the place of discovery. He was not long in determining the prehistoric nature of the relics, and the true intent of the pile remains. He proved them to be supports for platforms, on which were erected rude dwellings, the platforms being above the surface of the water, and at some distance from the shore, with which they were connected by a narrow bridge.

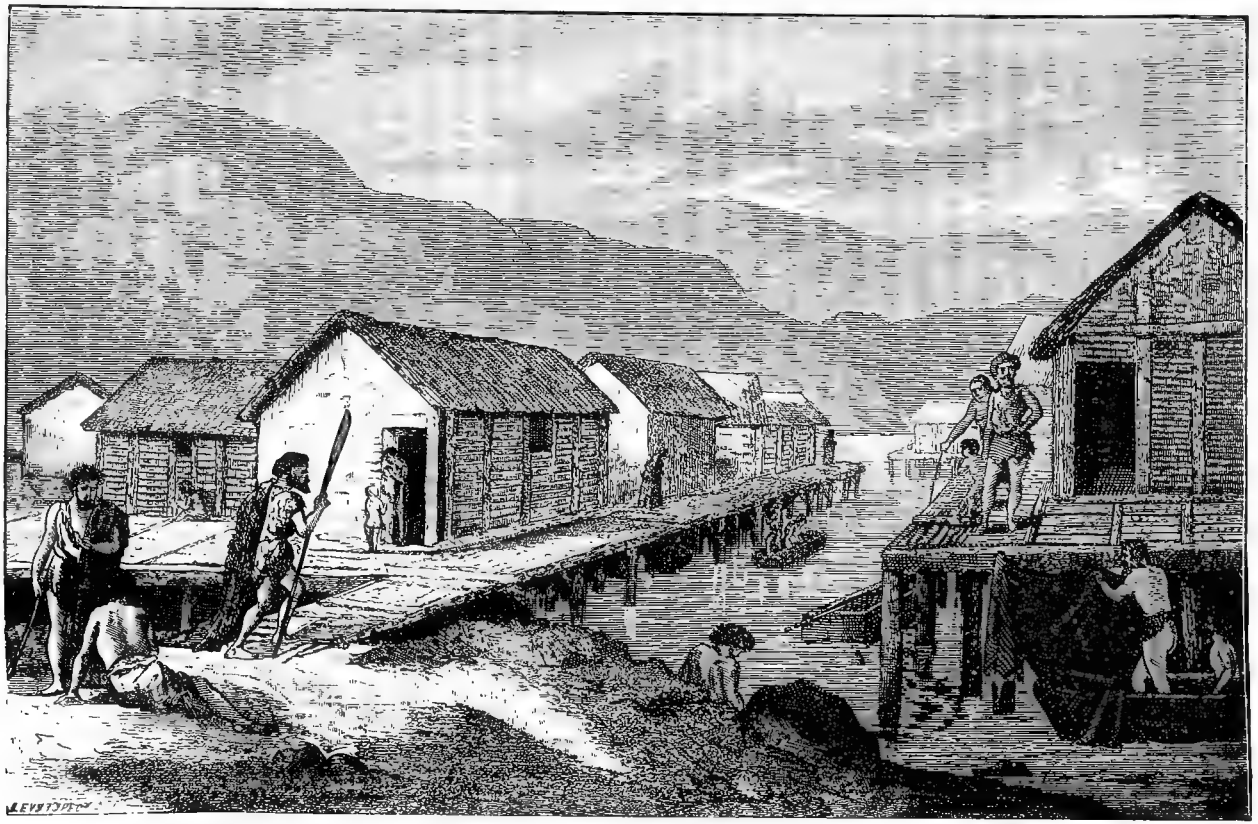
This was the first of a series of many interesting discov-

eries from which we have learned many facts as to Neolithic times. The cut we have introduced is an ideal restoration of one of these Swiss lake villages. It needs but a glance to show how admirably placed it was for purposes of defense. Unless an enemy was provided with boats, the only way of approach was over the bridge. But the very fact that they resorted to lakes, where at the expense of great labor they erected their villages, is a striking illustration of the insecurity of the times.

This discovery once made, it is surprising what numbers of these ancient lake villages have been discovered. Switzerland abounds in large and small lakes, and in former times they must have been still more numerous, but in the course of years they have become filled up, and now exist only as peat bogs. But we now know that during the Neolithic Age the country was quite thickly inhabited, and these lakes were the sites of villages. Over two hundred have been found in Switzerland alone. Fishermen had known of the existence of these piles long before their meaning was understood. Lake Geneva is one of the most famous of the Swiss lakes. Though in the main it is deep, yet around the shore there is a fringe of shallow water.

It was in this shallow belt that the villages were built. The sites of twenty-four settlements are known. We are told that on "calm days, when the surface of the water is unruffled, the piles are plainly visible. Few of them now project more than two feet from the bottom, eaten away by the incessant action of the water. Lying among them are objects of bone, horn, pottery, and frequently even of bronze. So fresh are they, and so unaltered, they look as if they were only things of yesterday, and it seems hard to believe that they can have remained there for centuries."[1]

[1] Lubbock's "Prehistoric Times," p. 189.



LAKE VILLAGE, SWITZERLAND.

A lake settlement represents an immense amount of work for a people destitute of metallic tools. After settling on the locality, the first step would be to obtain the timbers. The piles were generally composed of the trunks of small-sized trees at that time flourishing in Switzerland. But to cut down a tree with a stone hatchet is no slight undertaking. They probably used fire to help them. After the tree was felled it had to be cut off again at the right length, the branches lopped off, and one end rudely sharpened. It was then taken to the place and driven into the mud of the lake bottom. For this purpose they used heavy wooden mallets. It has been estimated that one of the settlements on Lake Constance required forty thousand piles in its construction.[1]

The platform which rested on these piles was elevated several feet above the surface of the water, so as to allow for the swash of the waves. It was composed of branches and trunks of trees banded together, the whole covered with clay. Sometimes they split the trees with wedges so as to make thick slabs. In some instances wooden pegs were used to fasten portions of the platform to the pile-work.

As to the houses which were erected on these platforms, though they have utterly vanished, yet from a few remains we can judge something as to the mode of construction. They seem to have been formed of trunks of trees placed upright, one by the side of the other, and bound together by interwoven branches. This was then covered on both sides with two or three inches of clay. A plaster of clay and gravel formed the floor, and a few slabs of sandstone did duty for a fire-place. The roof was of bark, straw, or rushes. There does not seem to have been much of a plan used in laying out a settlement. As population increased other piles

[1] Figuier's "Primitive Man," p. 223.

were added, and thus the village gradually extended. No one village would be likely to contain a great number of inhabitants. Calculations based on the area of one of the largest settlements in Lake Geneva, gives as a result a population of thirteen hundred, but manifestly nothing definite is known.

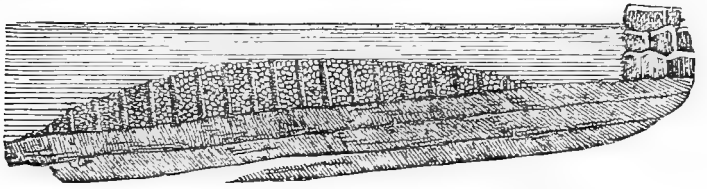
This brief description gives us an idea of a method of constructing villages which, as we shall soon see, extended all over Europe, though varied somewhat in detail. The condition of the remains indicate that these settlements were often destroyed by fire. At such times quantities of arms, implements, and household industries would have been lost in the water, and so preserved for our inspection.

This mode of building found such favor among the early inhabitants of Europe that it continued in use through the Neolithic Age, that of Bronze, and even into the age of Iron. Passages here and there in ancient histories evidently refer to them. Though they have long since passed away in Switzerland, the Spaniards found them in Mexico, and they are still to be seen in some of the isles of the Pacific. Remembering this, we need not be surprised if we find in one small lake settlements belonging to widely different ages. Here one of the Stone Age, there one of the Bronze, or even a confused mingling of what seems to be several ages in one settlement.[1]

There is scarcely a country in Europe that does not contain examples of lake villages. From their wide distribution we infer that a common race spread over the land. We will now mention some differences in construction discovered at some places, where, from the rocky nature of the bed

[1] On lake settlements, consult Keller's "Lake Dwellings;" Rau's "Early Man in Europe," chap. v; Sir John Lubbock's "Prehistoric Times," chap. vi; Figuier's "Primitive Man," p. 218, *et seq.*

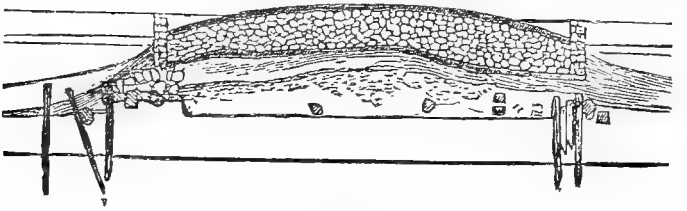
of the lake, it was impossible to drive piles so as to form a firm foundation. They sometimes packed quantities of stone around the piles to serve as supports in a manner as here indicated. "In all probability the stones used were con-



Foundation, Lake Village.

veyed to the required spot by means of canoes, made of hollowed out trunks of trees. Several of these canoes may still be seen at the bottom of Lake Bienne, and one, indeed, laden with pebbles, which leads us to think it must have foundered with its cargo."[1]

In some cases these heaps of stone and sticks rise to the surface of the water, or even above it, the piles in such cases serving more to hold the mass together than as a support to the platform on which the huts were erected. This mode of construction could only be employed in small lakes. This makes in reality an artificial island, and seems



Irish Crannog.

to have been the favorite method of procedure in the British Islands. In Ireland and Scotland immense numbers of these structures are known. They are called crannogs. This cut represents a section of one in Ireland. Though

[1] Figuier's "Primitive Man," p. 222.

they date back to the Neolithic Age, yet they so exactly meet the wants of a rude people that they were occupied down to historic times.

The advantage of forming settlements where they could only be approached on one side were so great that other places than lakes were resorted to. Peat-bogs furnished nearly as secure a place of retreat as do lakes. These have been well studied in Northern Italy. They do not present many new features. They were constructed like the lake villages, only they were surrounded by a marsh, and not by a lake. In some of the Irish bogs they first covered the surface of the bog with a layer of hazel bushes, and that by a layer of sand, and thus secured a firm surface.[1] In this case the villages were still further defended by a breast-work of rough spars, about five feet high. One of the houses of this group was found still in position, though it had been completely buried in peat. No metal had been used in its construction. The timbers had been cut with a stone ax, and the explorer was even so fortunate as to find an ax, which exactly fitted many of the cuts observed on the timbers.

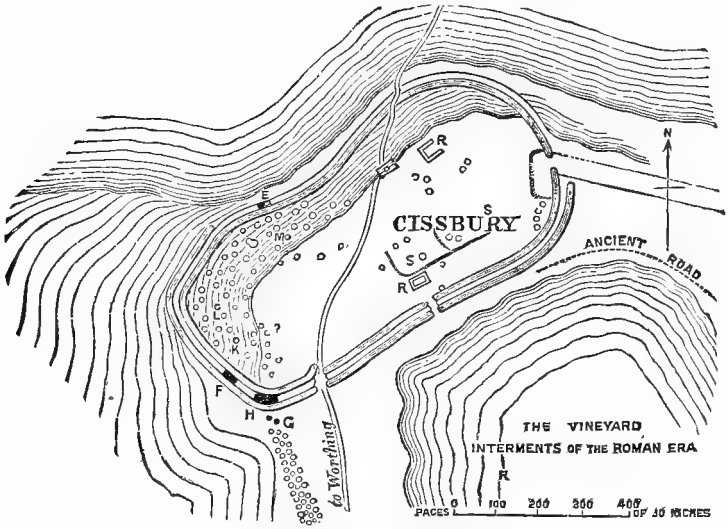
But we are not to suppose that lakes and bogs afforded the only sites of villages. They are found scattered all over the surface of the country, and, as we shall soon see, they show the same painstaking care to secure strong, easily defended positions. They have been generally spoken of as forts, to which the inhabitants resorted only in times of danger. We think, however, they were locations of villages, the customary places of abode. For this is in strict accordance with what we find to be the early condition of savage life in every part of the world.

Traces of these settlements on the main-land have been mostly obliterated by the cultivation of the soil during the

[1] Dawkins's "Early Man in Britain," p. 270.

many years that have elapsed since their Neolithic founders occupied them. In Switzerland the location of five of these villages are known. In all instances they occupied places very difficult of approach—generally precipitous sides on all but one or two. On the accessible sides ramparts defended them. The relics obtained are in all respects similar to those from the lake villages.[1]

Fortified inclosures have been described in Belgium. We are told, "They are generally established on points



Fortified Camp, Cissbury.

overhanging valleys, on a mass of rocks forming a kind of headland, which is united to the rest of the country by a narrow neck of land. A wide ditch was dug across this narrow tongue of land, and the whole camp was surrounded by a thick wall of stone, simply piled one upon another, without either mortar or cement." "One of these walls, when described, was ten feet thick, and the same in height." "These intrenched positions were so well chosen that most of

[1] Keller's "Lake Dwellings." Translated by Lee.

them continued to be occupied during the ages which followed." The Romans occasionally utilized them for their camps. Over the whole inclosure of these ancient camps worked flints and remains of pottery have been found.[1] These fortified places have been well studied in the south of England.

What is known as the South-Downs in Sussex is a range of hills of a general height of seven hundred feet. This section is about five miles wide and fifty miles long. Four rivers flow through these downs to the sea. In olden times their lower courses must have been deep inlets of the sea, thus dividing those hills into five groups, each separated from the other by a wide extent of water and marsh land. To the north of these hills was a vast expanse of densely wooded country. It is not strange, then, to find traces of numerous settlements among these hills. As the surface soil is very thin, old embankments can still be traced. The cut given is a representation of Cissbury, one of the largest of these camps. It incloses nearly sixty acres. The rampart varies according to the slope of the hill. Where the ascent was at all easy it was made double. Fortified camps are very numerous throughout the hill country. They vary, of course, in size, but the situation was always well chosen.[2]

As for the buildings themselves, or huts of the Neolithic people, we know but little. They were probably built much the same as the houses in the lake settlements. We meet with some strange modifications in England. Frequently within these ramparts we find circular pits or depressions in the ground. They are regarded as vestiges of habitations, and they must have been mainly under ground. "They occur singly and in groups, and are carried down to a depth of from seven to ten feet through the superficial gravel into

[1] Figuier's "Primitive Man," p. 153.

[2] General Lane Fox's "Hill Forts of Sussex," Archæology, vol. xvii.

the chalk, each pit, or cluster of pits, having a circular shaft for an entrance. At the bottom they vary from five to seven feet in diameter, and gradually narrow to two and a half or three feet in diameter in the upper part. The floors were of chalk, sometimes raised in the center, and the roof had been formed of interlaced sticks, coated with clay imperfectly burned."[1]

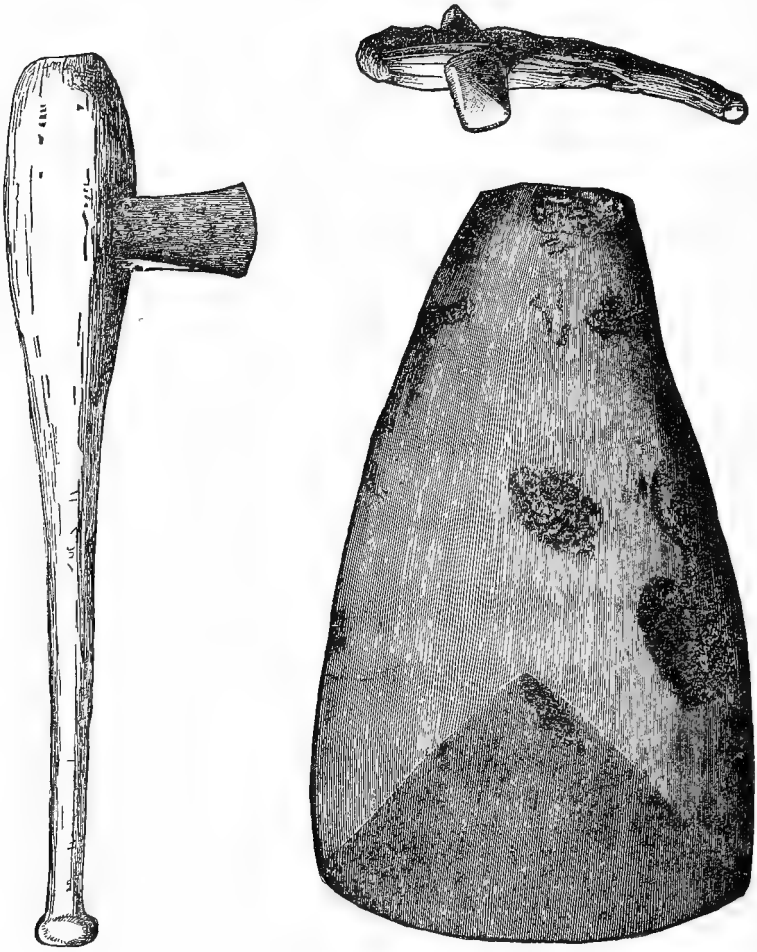
In the north of Scotland, instead of putting them under ground, they built them on the natural surface, and then built a mound over them all. In appearance this was scarcely distinguishable from a mound, but on digging in we discover a series of large chambers, built generally with stones of considerable size, and converging toward the center, where an opening appears to have been left for light and ventilation, In some instances the mound was omitted, and we have simply a cluster of joining huts, with dry, thick walls. These have been appropriately named "Bee-hive Houses."[2]

We can form a very good idea of Neolithic Europe from what we have learned as to their habitations. A well-wooded country, abounding in lakes and marshes, quite thickly settled, but by a savage people, divided into many tribes, independent of and hostile to each other. The lakes were fringed with their peculiar settlements; they are to be noticed in the marshes, and on commanding heights are still others. The people were largely hunters and fishers, but, as we shall soon see, they practiced a rude husbandry and had a few domestic animals. Such was the condition of Europe long before the Greek and Latin tribes lit the beacon fires of civilization in the south.

It is evident that the builders of the lake settlements

[1] Dawkins's "Early Man in Britain," p. 267.
[2] Lubbock's "Prehistoric Times," p. 56.

and of the fortified villages were an intelligent and industrious people, though their scale in civilization was yet low.



Neolithic Axes.

Their various implements of bone, horn, and stone display considerable advance over the rude articles of the Drift.

One of the most important implements was the ax. The Paleolithic hatchet, we remember, was rude, massive, and only roughly chipped into shape, and was intended to be

held in the hand. The Neolithic ax was a much better made one, and was furnished with a handle. They were enabled to accomplish a great deal with such axes. "Before it, aided by fire, the trees of the forest fell to make room for the tiller of the ground, and by its sharp edge wood became useful for the manufacture of various articles and implements indispensable for the advancement of mankind in culture."[1] These axes vary in size and finish. As a general thing they are ground to a sharp, smooth edge, but not always, nor were they always furnished with a handle.

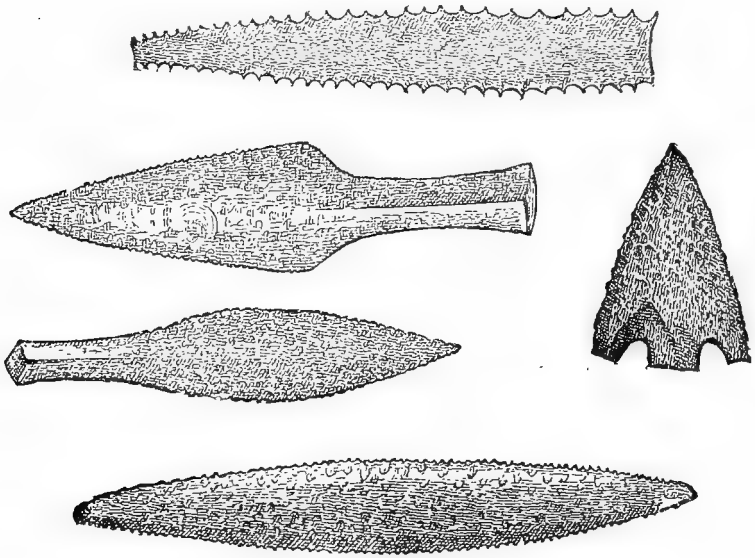
Some axes are found with a hole bored in them, through which to pass a handle. These perforated axes are found in considerable numbers, and some have denied that they could be produced without the aid of metal. It is almost self-evident that the perforated axes are later in date than the solid ones, and probably many of them are no earlier in time than the Age of Metals. There is, however, nothing to show that all belong to so late a time. Besides, experiments have amply shown that even the hardest kind of flint can be drilled without the aid of metals.[2]

Warlike implements are, of course, quite common. Many of the axes found are probably war axes. Then besides we have arrow-heads, spears, and daggers. These are considered to be "marvels of skill in flint chipping."[3] Stone was used for a great many other purposes, such as scrapers, sling-stones, hammers, saws, and so on. Flint was generally the kind of stone used. Our civilization owes a great deal to this variety of stone. It is not only hard, but its cleavage is such that it was of the greatest use to primitive man. In a general way the Neolithic stone

[1] Mr. Dawkins's "Early Man in Britain," p. 274.
[2] Smithsonian Report, 1868. [3] Lubbock's "Prehistoric Times," p. 103.

implements are seen to be better adapted to the object in view than the Paleolithic specimens. They are also generally polished.

Wood was largely used in their common household implements. But it is only in exceptional cases that it has been preserved to us. They have been recovered, however, in peat-bogs and in the remains of lake settlements. These wooden utensils consist of bowls, ladles, knives, tubs, etc.

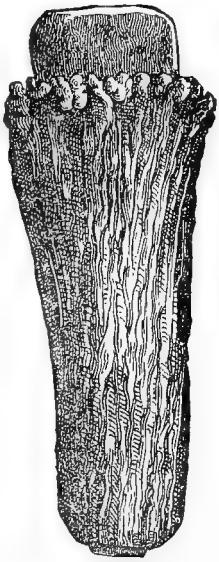


Neolithic Weapons.

They used fire to hollow them out, and the blows of the flint hatchet, used to remove the charred portions, are still to be observed in some specimens.

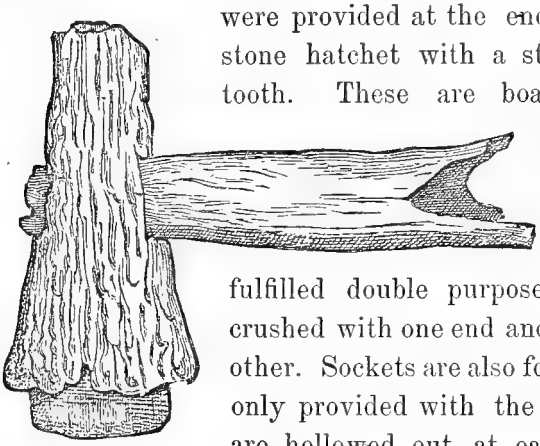
The Neolithic people had learned how to manufacture pottery, though not of a very superior quality. It is all hand-made: so the potter's wheel had not yet been introduced. The material is clay mixed with gravel or pounded shells. Very often they ornamented their clay vessels with lines and dots. The bowls or jars were evidently suspended by

cords, for the bottom was made too rounding for them to stand erect. Besides, we find the holes for the cords, and in some places handles.



Ax in Sheath.

No notice of Neolithic tools would be complete without mentioning the use made of horn and bone. One peculiar use for which they employed horn was as a socket for holding other implements. Thus this figure shows us an ax in a socket of horn. The middle of the socket is generally perforated with a round or oval hole, intended to receive a handle of oak, birch, or some other kind of wood adapted for such a use. The cut below represents a hatchet of this kind. A number of these sockets have been found, which were provided at the end opposite to the stone hatchet with a strong and pointed tooth. These are boars' tusks, firmly buried in the stag's horn. These instruments, therefore, fulfilled double purposes: they cut or crushed with one end and pierced with the other. Sockets are also found which are not only provided with the boars' tusks, but are hollowed out at each end, so as to hold two flint hatchets at once, as is seen in our next figure. Chisels and gouges were also sometimes placed in bone handles. Portions of horn probably at times did duty as hoes. We give a representation of such an



Hafted Hatchet in Sheath.

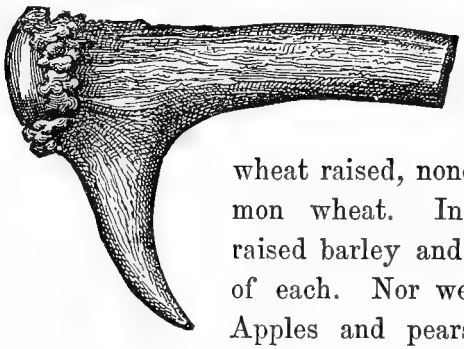
Sheath, with two Hatchets.

implement.[1] We must now seek some information as to how the men of the Neolithic Age supported life.

From the remains of fish at all the lake settlements it is evident they formed no inconsiderable portion of their food. Fishing nets and hooks have been discovered. They were successful hunters as well. But the men of this age were no longer dependent on the chase for a livelihood. We have mentioned several times that they were acquainted with agriculture. This implies a great advance over the primitive hunters of the early Stone Age.

Chisels in Sheath.

On the shores of the lakes which furnished them with a place of habitation they raised many of our present species of grain. Owing to a cause of which we have already spoken—that is, destruction of the lake settlements by fire—the carbonized remains of these cereals have been preserved to us. There were four varieties of wheat raised, none exactly like our common wheat. In addition to this they raised barley and millet, several varieties of each. Nor were the fruits neglected. Apples and pears were dried and laid away for use in the Winter. Seeds of the common berries were found in abundance, show-



Horn Hoe.

[1] Figuier's "Primitive Man," pp. 161–166.

ing that these primitive people were fully alive to their value.

From this it follows that the Neolithic people were not only tillers of the soil, but horticulturists as well. According to Dr. Keller, the vegetable kingdom furnished their principal supply of food. Hazelnuts, beechnuts, and chestnuts were found in such quantities as to show they had been gathered for use. Neither hemp, oats, nor rye were known. Not only do we find the remains of the grains, fruits, seeds, etc., from which the above conclusions are drawn, but, farther than this, pieces of bread have been found in a carbonized state, and thus as effectually preserved as the bread of a far later date found in the ovens of Pompeii. According to Figuier, the peasant classes of Tuscany now bake bread, after merely bruising the grain, by pouring the batter on glowing stones and then covering it with ashes. As this ancient prehistoric bread is of similar shape, it was probably baked in an equally primitive fashion.[1]

Aside from the natural interest we feel in these evidences as to ancient industry, a study of the remains of plants cultivated by the Neolithic people reveals to us two curious and suggestive facts. It has been found that the wild plants then growing in Switzerland are in all respects like the wild plants now growing there. But the cultivated plants—wheat, millet, etc.—differ from all existing varieties, and invariably have smaller seeds or fruits.[2] This shows us that man has evidently been able to effect considerable change by cultivation, in the common grains, during the course of the many centuries which separate the Neolithic times from our own age. But if this rate of change be adopted as a measure of time, what shall we say as to the antiquity de-

[1] "Primitive Man," p. 171. [2] Lubbock's "Prehistoric Times," p. 219.

manded to explain the origin of cultivated grain from the wild grasses of their first form?

We learn, in the second place, that the cultivated plants are all immigrants from the south-east—their native home being in South-eastern Europe and Asia Minor. We shall afterward see that this is true of the domestic animals also. There can be but one explanation for this. The ancient inhabitants of Europe must have come from that direction, and brought with them the plants they had cultivated in their eastern homes, and the animals they had reduced to their service. The traces of agriculture thus found in Switzerland are by no means confined to that country. In other countries of Europe, such as England and France, we also find proofs that men cultivated the earth. In localities where we do not find the grain itself, we find their rude mills, or mealing stones, which as plainly indicate a knowledge of the agricultural art as the presence of the cereals themselves.[1]

As we have stated, Neolithic man in Europe possessed domestic animals. He was not only a cultivator of the soil, but he was a herdsman as well; and he kept herds of oxen, sheep, and goats. Droves of hogs fattened on the nuts of the forest, and the dog associated with man in keeping and protecting these domestic animals. We know that the Swiss Lake inhabitants built little stalls by the sides of their houses, in which they kept their cattle at night. But these domestic animals were not descendants of the wild animals that roamed the forests of Europe. Like the plants, they are immigrants from the south-east. Our best authorities consider they were brought into Europe by the invading Neolithic tribes.

The knowledge of husbandry, though rude, and the pos-

[1] Dawkins's "Early Man in Britain," p. 268.

session of domestic animals, though of a few species only, strikingly indicate the advance over the Paleolithic tribes. They also had fixed places of living. This culture spread all over Europe. That it was substantially the same everywhere there is no doubt. Certain refuse heaps in Denmark, Scotland, and indeed in all the sea-coast countries, have been thought to support a different conclusion. Those of Denmark have been very carefully studied, and so we will refer to them. All along the Baltic coast, but especially in Denmark, have been discovered great numbers of mounds, which were found to consist "almost entirely of shells, especially of the oyster, broken bones of animals, remains of birds and fishes, and, lastly, some wrought flints." The first supposition in regard to those shell-heaps was that they were of marine formation, accumulated beneath the sea, and elevated to the surface along with the gradual rise of the land. But they are now known to be nothing more or less than the sites of ancient settlements. The location of the rude cabins can still be traced. The ancient hearths are still in place. "Tribes once existed here who subsisted on the products of hunting and fishing, and threw out around their cabins the remains of their meals, consisting especially of the *débris* of shell-fish." These heaps gradually accumulated around their rude dwellings, and now constitute the refuse heaps in question.[1]

The careful investigation of their contents has failed to disclose any evidence of a knowledge of agriculture, and the only domestic animal found is the dog. The implements are altogether of stone and horn. No trace of metal has yet been obtained. As a rule, they are rudely made and finished. Though of the Neolithic type, they are not polished except in a few instances. The principal interest

[1] These heaps are generally called "kjökken-möddings"—meaning kitchen refuse.

turns on the question of age of these refuse heaps. Some think they were accumulated at the very beginning of the Neolithic Age—that these tribes preceded by many years the men of the Swiss Lakes. Others think they were tribes of the same great people, living at the same time. On such a point as this, only those who have carefully studied the deposits are entitled to speak.

Some few facts stand out quite prominently. The size of the mounds[1] indicate long-continued residence—showing that these people had permanent places of abode. As they are not confined to Denmark, but are found generally throughout Europe, it would seem to imply that the Neolithic people preferred to live as fishers and hunters wherever the surroundings were such that they could by these means obtain an abundant supply of food. Some shell-heaps in Scotland were still forming at the commencement of the Bronze Age; and Mr. Geikie, on geological grounds, assigns the shell-heaps of Denmark to a late epoch of the Stone Age.

It seems to us quite natural that isolated tribes, living where game was abundant, and where fishing met with a rich reward, should turn in disgust from the agricultural life of their brother tribes, and, resuming the life of mere hunters and fishers, speedily lose somewhat of their hardly won culture—for civilization is the product of labor. Whenever a people from necessity or choice abandon one form of labor for another demanding less skill to triumph over nature, a retrogression in culture is inevitable.[2]

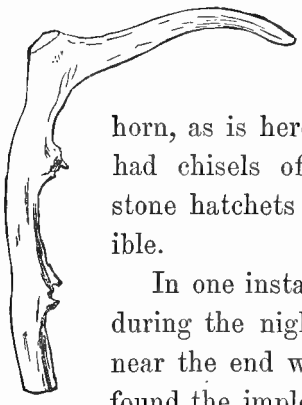
From what we have stated as to the use of flint we can

---

[1] One mound is spoken of as being one thousand feet long, two to three hundred feet wide, and ten feet high.

[2] On Danish Shell Mounds, consult Keary's "Dawn of History," p. 369, *et seq.;* Lubbock's "Prehistoric Times," chap. vii; Geikie's "Prehistoric Europe," pp. 365–9; Figuier's "Primitive Man," pp. 129–134; Rau's "Early Man in Europe," pp. 108–113; Dawkins's "Early Man in Britain," pp. 302–305.

readily see that it was a valuable material. Sections where it was found in abundance would as certainly become thickly populated as the iron and gold regions of our own day. In Paleolithic times the supply of flint was mostly obtained from the surface and in the gravel of rivers. In Neolithic times men had learned to mine for flint. Flint occurs in nodules in the chalk. Near Brandon, England, was discovered a series of these workings. They consist of shafts connected together by galleries. These pits vary in size from twenty to sixty feet in diameter, and in some cases were as much as thirty feet deep. From the bottom of these shafts they would excavate as far as they dared to the sides. They made no use of timbers to support the roof, and so these side excavations were not of great extent. In these old workings the miners sometimes left behind them their tools. The principal one was a pick made of deer's horn, as is here represented. Besides these, they had chisels of bone and antler. The marks of stone hatchets on the sides of the gallery are visible.



Miner's Pick.

In one instance the roof had caved in, evidently during the night, and on clearing out the gallery near the end where the roof stood firm, there were found the implements of the workmen, just as they were left at the close of the day's work; and in one place on the pick, covered with chalk dust, was still to be seen the marks of the workman's hand. How many years, crowded with strange scenes, have swept over England since that chalky impression was made! The surface of the earth is a palimpsest, on which each stage of culture has been written over the faint, almost obliterated, records of the past. Not only the living man, who has left there

the impression of his hand has passed away, but also his people and his culture. And now it is only here and there that we catch a faint tracing underlying our later civilization, by which we reconstruct the history of these far-away times.

Nothing would be more natural than that where flint was found in abundance a regular manufactory of implements would be established. Such was the case at Cissbury, which we have already mentioned as one of the early British towns. Mines had been dug within the walls inclosing the town. The surface of the ground near the old mines at this place is literally covered by splinters of flint in every stage of manufacture, "from the nodule of flint fresh out of the chalk, spoilt by an unlucky blow, to the article nearly finished and accidentally broken.[1] Here the flint was mined and chipped into rudimentary shape, but carried away to be perfected and polished.

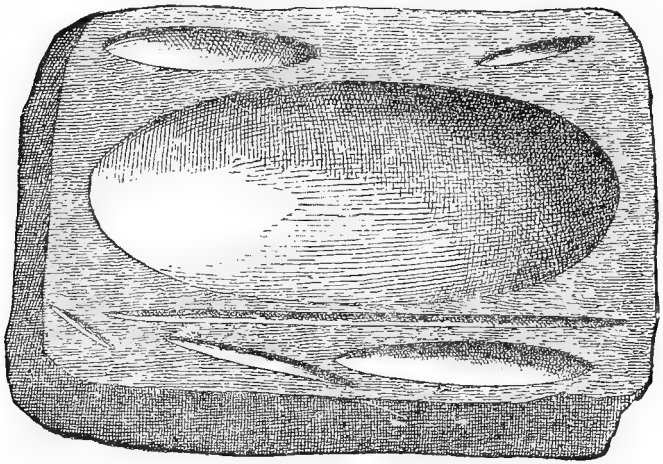
A very important place in Neolithic manufactures was noticed near Tours, France. Here was an abundant supply of flint, and very easily obtained, and the evidence is conclusive that here existed real manufactories. Of one stretch of ground, having an area of twelve or fourteen acres, we are told: "It is impossible to walk a single step without treading on some of these objects." Here we find "hatchets in all stages of manufacture, from the roughest attempt up to a perfectly polished weapon. We find, also, long flakes or flint-knives cleft off with a single blow with astonishing skill."

But in all these objects there is a defect; so it is concluded that these specimens were refuse thrown aside in the process of manufacture. As at Cissbury, very few polished flints are found, so we may conclude the majority of weapons were carried elsewhere for completion. But some weapons were completed here. In the neighborhood have been

[1] Dawkins's "Early Man in Britain," p. 279.

found the stones used as polishers. This cut shows us one used in polishing the axes. The workmen would take one of the rough-hewn instruments, and, rubbing it back and forth on such a stone as this, gradually produced a smooth surface and a sharpened edge.[1]

We have suggested that our civilization owes a great deal to flint. If we will consider the surroundings of their manufacturing sites, we will see the force of this remark.



Polishing Stone.

It must have taxed to the utmost the powers of these primitive men to sink the shafts and run the galleries to secure a supply of this valuable stone. In short, they had to invent the art of quarrying and working mines. This would lead to the division of labor, for while one body of men would become experts as miners, others would become skillful in chipping out the implements, and still others would do the finishing and polishing. A system of barter or trade

[1] Figuier's "Primitive Man," pp. 147–150 and 154. Another very important place was the Island of Rügen, in the Baltic Sea. Rau's "Early Man in Europe," p. 137.

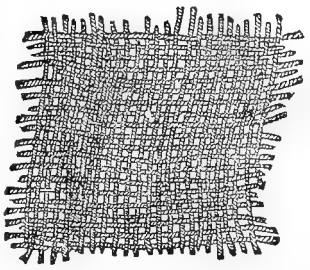
would also arise, for the workmen at the mines and factories would have to depend on others for food and clothing, and in payment for the same would furnish them implements. As localities where flint could be obtained in suitable quantities are but few, we can see how trade between widely

Neolithic Boat-making.

scattered tribes would arise. This kind of traffic is shown to have extended over wide distances in Neolithic times. For instance, there has been found scattered over Europe axes made of varieties of stone known as nephrite and jade. They were highly valued by primitive tribes, being very hard and of a beautiful green color. They are thought to

have been employed in the observance of superstitious rites. But quarries of these varieties of stone do not occur in Europe. An immense amount of labor has been expended in finding their native home. This is now known to be in Asia.[1] Manufactured in Asia, axes of these materials may have drifted into Europe and finally arrived in England.

Trade between different tribes must have been greatly facilitated by means of canoes, which Neolithic man knew well how to make. The art of navigation was probably well advanced. The canoes were formed of the trunks of large trees. In most cases they were hollowed out by means of the ax and fire combined. Sometimes the ends were partially rounded or pointed, but often cut nearly square across—rather a difficult shape to propel fast or to guide properly. These ancient boats have been found in nearly all the principal rivers of Europe, and in many cases, no doubt, come down to much later date than the Neolithic Age. From the remains of fish found in their refuse heaps we are confident that in some such a shaped boat as this they trusted themselves far out at sea. They served to transport them from the shores of Europe to England, and at a later date to Ireland.



Neolithic Cloth.

The clothing of the men of the Neolithic Age doubtless consisted largely of the prepared skins of the animals, and some fragments of leather have been found in the lake settlements. But a very important step in advance was the invention of spinning and weaving, both of which processes were known at this time. The cloth which is here represented "is formed of twists of interwoven flax, of rough

[1] "Proceedings American Antiq. Society, April, 1881," p. 286.

workmanship, it is true, but none the less remarkable, considering the epoch in which it was manufactured. Balls of thread and twine have also been found.[1] This cut is a spindle-whorl. These have been discovered very often. They were made sometimes of stone and at other times of pottery and bone. The threads were made of flax, and the combs which were used for pushing the threads of the warp into the weft show that it was woven into linen on some kind of a loom. Several figures of the loom have been given, but we have no certainty of their correctness.[2]

Spindle-whorl.

Let us now see if we can gather any thing as to the religious belief of Neolithic man. On this point we can at best only indulge in vague conjectures. Yet some light seems thrown on this difficult subject by examination of the burial mounds. This introduces us to a subject of much interest which, in our hurried review, we can but glance at.

Weaver's Comb.

Scattered over Europe are found numbers of mysterious monuments of the past. Some of them we have mentioned already as the embankments surrounding ancient villages. But aside from these are other monuments, such as burial mounds, rude dolmens, and great standing stones, sometimes arranged in circles, sometimes in rows, and sometimes standing singly. Many of these remains may be of a far later date than the Neolithic Age, still it is extremely

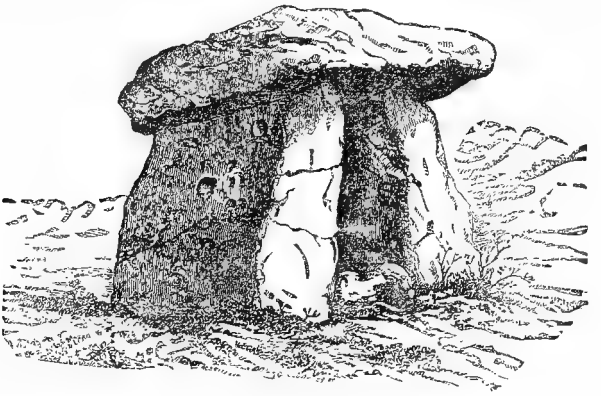
[1] Figuier's "Primitive Man," p. 262.

[2] See remarks of Prof. Rau on this subject ("Early Man in Europe," pp. 128–9 and note.) Mr. Dawkins thinks it "probable also that the art of weaving woolen cloth was known, although, from its perishable nature, no trace of it has been handed down to us." ("Early Man in Britain," p. 275.)

Chambered Burial Mound, Denmark.

difficult to draw a dividing line between the monuments of different ages.

Burial mounds are found everywhere, many in Europe going back to the Neolithic Age, though some are of a very recent construction. The Egyptian Pyramids are burial

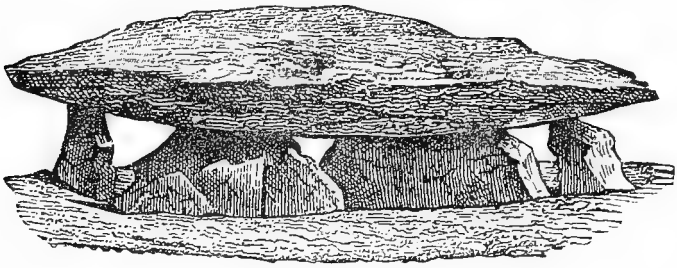


Dolmen, England.

mounds on the grandest scale. The first cut represents a Danish Tumulus, or burial mound, of this Age. The openings lead to the center of the mound, where they connect with

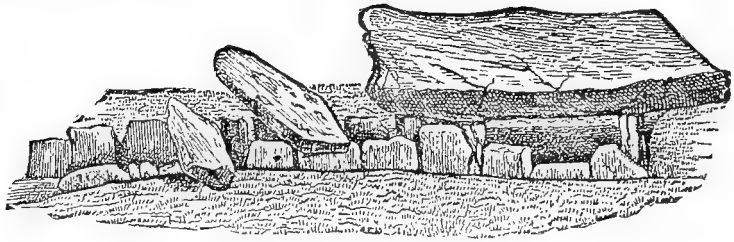
chambers in which the bodies were formerly placed. There are, of course, various modifications of this tumulus. Often the gallery was omitted, a rude chamber was erected, and a mound reared over it. Sometimes, indeed, no chamber was made, but simply a mound placed over the body.

There have been found in England a great many stones arranged as in the preceding cut, though generally not built with such regularity as is there represented. They are named Dolmens, a word meaning stone tables. They were more



Dolmen, France.

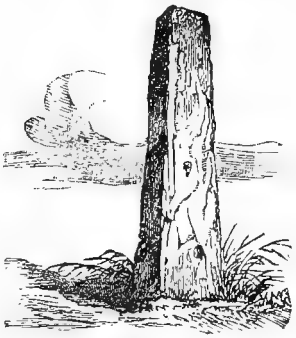
generally made of rough stones, rudely arranged. This cut represents one found in France. In early times these were supposed to have been rude altars used by the mysterious Druids in celebrating their rites. They are now known to be the tombs of the Neolithic Age. They are, in fact, the



Dolmen, once Covered with Earth.

chambers above mentioned. The mound of earth has since disappeared and left its chamber standing exposed to the air. Traces of the old passage way are still met. Whether all

Dolmens were once covered with earth or not, is not yet known. In the majority of cases they probably were. In the last cut portions of stone are still buried in the earth. We are told that in India the people in some places still erect Dolmens similar to those of Neolithic times.[1]



Menhir.

Aside from the tombs themselves, there are other arrangements of great stones which must have once possessed great significance to their builders, but their meaning is now lost. Of this nature are the blocks of rough stone set up in the ground generally in the vicinity of tombs. These are the standing stones, or menhirs, which, as we have stated, are arranged in various forms. When arranged in circles,

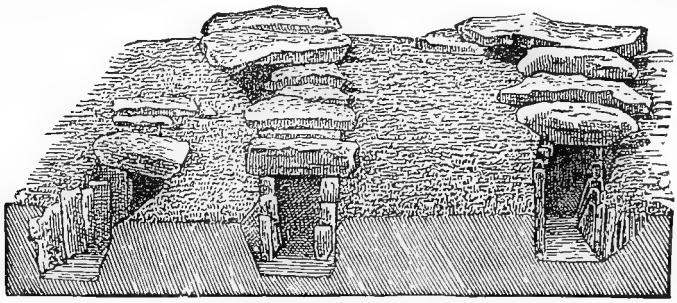
Stone Circle, England.

they are generally regarded as tombs. When placed in long parallel rows, as at Carnac, in France, we are not sure of their meaning. We are told that the Hill tribes of India to this day erect combinations of gigantic stones into all the shapes we have here described.[2]

The peculiar shape of the burial mounds, with a passage way conducting us to an interior chamber, or series of chambers, probably arose from the belief entertained by many

[1] Lubbock's "Prehistoric Times," p. 132.
[2] Lubbock's "Prehistoric Times," p. 130.

savage people, that the dead continue to live an existence much like that when alive, and consequently the same surroundings were deemed necessary for their comfort. So the tomb was made similar to the house of the living. The ordinary Winter huts of the Laplander are very similar in shape and size to the burial tumuli, and amongst some people, as



Chambered Tomb, France.

the inhabitants of New Zealand, the house itself is made the grave. It was closed up and painted red, and afterward considered sacred.

So it may quite well be that the Neolithic inhabitants of Denmark, "unable to imagine a future altogether different from the present, or a world quite unlike our own, showed their respect and affection for the dead by burying with them those things which in life they had valued most; with women, their ornaments, with warriors, their weapons. They buried the house with its owner, and the grave was literally the dwelling of the dead. When a great man died he was placed on his favorite seat, food and drink was arranged before him, his weapons were placed by his side, his house was closed, and the door covered up, sometimes, however, to be opened again when his wife or children joined him in the land of spirits."

That they believed in a life beyond the grave is shown by the objects they buried with the individuals. These

are implements of various kinds, flakes, arrow-heads, scrapers, celts, and pottery, doubtless intended to be of service to the deceased. We know this to be a very common proceeding amongst all barbarous people. In some cases it would appear as if they realized that the material things themselves could be of no service to the departed, but imagined that in some vague way the spirits of things might be of service to the spirits of men, and so they would purposely break the flints and throw the fragments into the grave. Sometimes they may have buried only models of the objects they wished to give to the dead, imagining that in this way the spirits of the objects represented would accompany and be of service to the spirits of the departed. To this day the Eskimos bury small models of boats, spears, etc., rather than the objects themselves. The ancient Etruscans buried jewelry, but made it so thin and fragile that it could not have been of service to the living. In China this is carried still further, and paper cuttings or drawings of horses, money, etc., are burned at the grave.

These remarks may explain the absence of remains so often noticed in Neolithic burials in England. But other evidence can be given to show this belief in future life. The mounds were of course often erected over noted chiefs, and we are not without evidence that he was not allowed to go unattended into the other world. It has been noted that often skeletons have been met with having the skull cleft, and in one case, at least, all but one presented that appearance. It is but reasonable to suppose that these skeletons were those of captives or slaves sacrificed to be the attendants of the chief in the spirit world. Funeral feasts were also held in honor of the dead. Thus we may gather from burial mounds something of the religious belief of their occupants.

It is not improbable that ancestor worship, or the worship of the dead, was part of their faith, so that the mounds became temples. On this point we are told "it is impossible not to believe then that the people who made these great, and in some cases elaborately constructed, tombs would continue ever after to regard them as in some sort consecrated to the great chiefs who were buried under them. Each tribe would have its own specially sacred tombs, and perhaps we may here see a germ of that ancestor-worship which may be traced in every variety of religious belief."[1]

We now approach a difficult part of our inquiry, but, at the same time, one that possesses for us a great interest. Who were these people into whose culture we have been inquiring? While laying the foundation of our present civilization, though being the fountain head from whence many of the arts and industries, which now make our existence comfortable and happy, take their feeble origin, gradually developing and expanding as the time rolls on, have they themselves, as a race, vanished in the mighty past, or are their descendants still to be found in Europe? Who were they? Whence and when? Difficult problems, but we have read to but little purpose if we have not already learned that earnest observers need but the slightest clue to enable them to trace out brilliant results.

In the first place, are there any grounds for supposing the Neolithic people to be the descendants of those who hunted the reindeer along the Vézère? This view has its supporters. M. Quatrefages, a very able scholar indeed, maintains that the Neolithic people were the same race as

[1] On this subject consult Lubbock's "Prehistoric Times," chap. v.; Keary's "Dawn of History," p. 363-6; Geikie's "Prehistoric Europe," p. 375; Dawkins's "Early Man in Britain," p. 284–9; Ferguson's "Rude Stone Monuments;" Figuier's "Primitive Man," chap. iii.; Rau's "Early Man in Europe," p. 139; "Archæology," Vol. XLII.

those who inhabited the caves and found shelter in the rock grottoes of France.[1] This, to others, does not seem credible. We must recall the long lapse of time that it is apparent has elapsed between the two ages. We have seen how different were the two cultures; as Mr. Geikie remarks, "So great, indeed, is the difference between the conditions of life that obtained in the two ages of Stone, that we can hardly doubt that the two people came of different stocks."[2] The Neolithic people brought with them domestic animals and plants whose native home is in Western Asia. We can hardly account for this fact, if we suppose them to be the descendants of Paleolithic tribes in France.

Abandoning, therefore, any attempt to trace lines of connection between the people of the two ages, let us carefully study all the facts connected with the Neolithic people and their culture, to see if we can solve the problem by so doing. We have noticed that substantially the same stage of culture existed throughout Europe from Switzerland to the British Islands. This points to the presence of a common race during at least a portion of the time. But if there was a common race living in Europe they would certainly possess common physical features. As a race they may have been tall in stature, or medium, or short, and portions of the human skeleton would show a uniformity in this regard.

Now one of the means that scientists use to determine the races of men is a comparison of skulls, measured in a systematic manner. The objection has been made that no reliance can be placed on these results, because at the present day skulls of all sorts of shapes and sizes can be obtained among people of the same nationality. But these objections would not apply to people of prehistoric times. Their surroundings would be simple and natural—not arti-

[1] "Human Species," p. 335.

[2] "Prehistoric Europe," p. 547.

ficial and complex, as in modern times. In our times people of different nationality are constantly coming in contact, and intermarriage results; but in prehistoric times this was not liable to occur, and so the comparative purity of blood would certainly produce a much greater uniformity of physical features.[1]

From a very careful examination of a great number of burial mounds in Great Britain, it has been ascertained that in all of those that date back to Neolithic times, and contain portions of human skeletons, the bones are always those of individuals small in stature, the average height being about five and a half feet. The skulls are of that variety known as long skulls. From this we can at once form a mental picture of the Neolithic inhabitants of Britain. No less important conclusions have been deduced from the study of burial mounds on the continent. We meet with remains of these same small-sized people. "They have left traces of their presence in numerous interments in chambered tombs and caves in Belgium and France, as well as in Spain and Gibraltar. We may therefore conclude that at one period in the Neolithic Age the population of Europe, west of the Rhine and north of the Alps, was uniform in physique and consisted of the same small people as the Neolithic inhabitants of Britain and Ireland."[2]

We must now inquire whether there are any people living in Europe which might have descended from the original stock. We are in the position of those who, from a few broken down arches, a ruined tower and dismantled wall, would seek to form a mental picture of the stately building that once stood there. If we can here and there discover, by the light of history or exploration, some races or tribes that, owing to their geographical position, have escaped the

[1] Dawkins's "Early Man in Britain," p. 310, note 3. [2] Ibid., p. 314.

fate that befell the great body of their countrymen, we may perhaps replace our mental picture by one founded on reality. Nor need we be in doubt where to seek for such scattered remnants of people. Successful invaders always appropriate to their own use the fertile lowlands and the fruitful portions of the country of their helpless foes. But a weak people have often, in the rocky fastnesses of their land, made a successful stand. So, to determine the race, we will examine the people living in such regions, and see if there are any that physically conform to what is already known of the Neolithic people, and so entitled to claim a relationship by descent.

Both slopes of Pyrenees Mountains, between France and Spain, have been occupied from time immemorial by a peculiar race of people known as the Basque. Secure in their mountain homes, they have resisted foreign civilization, and retained their national characteristics as well as their liberties, though they have been nominally vassals to many powers, from the early Carthaginians to the later French and Spanish. From the many invasions they have undergone the Basque language and people are by no means uniform. But Dr. Broca, one of the most learned anthropologists in Europe, has shown that the original Basques were dark in complexion, with black hair and eyes. In addition to this, the efforts of some of the most eminent scholars in Europe,[1] who have made numerous examinations of skulls and skeletons obtained from ancient Basque cemeteries, have conclusively shown that in all physical features the Basques agree with men of Neolithic times.[2]

The Basques do not belong to the great division of the

[1] Thurman, Virchow, Huxley, and others.

[2] Mr. Dawkins is inclined to view them as a remnant of the Neolithic people. Whether our scholars will ultimately accept his views, remains to be seen.

human family known as Aryans, to which the English-speaking races, as well as the nations of Europe generally, belong. They belong to a far older division of the human family—the Turanian[1]—and were doubtless in possession of Europe long before the Indo-European nations commenced their westward migrations from Central Asia. They are described as being brave, industrious, and frugal, with patriarchal manners and habits. They scorn authority, except what emanates from themselves, and have but few nobility. They are impetuous, merry, and hospitable, fond of music and dancing.[2] Of their warfare we are told they are "not distinguished in open warfare, but unconquerable in guerrilla warfare, and famed for defense of walled cities."[3] Such are the Basques of to-day, and many of these traits of character, we doubt not, were the same amongst the Neolithic people.

Mr. Dawkins also thinks that two tribes, living in Northern Italy, in the very earliest historical times, are other remnants of the same people. One of these were the Ligurians. Investigations and traditions show that some time before the dawn of history they had been driven out of the pleasant parts of Southern France, but had made a successful stand in the mountain regions of Northern Italy. They, like the Basques, were strong, active, and warlike. They were small in stature, swarthy in features, and long-headed. To the south of these were the Etruscans. But little is known of them, though the evidence is that long before the Christian Era they were a powerful people. In physical features they resembled those already described. Their sculpture exhibits only short, sturdy figures, with large heads and thick arms.

[3] Brace's "Races of the Old World," p. 82.

Another possible remnant of these people existed at the very dawn of history in the mountainous regions of Wales. They were known as Silures, but have since become absorbed in the surrounding population. In civilization and physical features they agree with the remnants already described.

In the north of Russia are found the Finns. Their origin and migrations are alike unknown. One thing is certain, they belong to the Turanian family, and so are probably allied to the Basques and Etruscans. It is possible that they also are but a sorry remnant of the once wide-spread Neolithic people. Driven out of the fairer portions of Europe, they have found an asylum in their present bleak surroundings. Like the people already described, they are short in stature, and dark visaged.[1]

The tribes we have thus briefly mentioned are regarded by some as representatives of the Neolithic people. Prof. Winchell, speaking of the wide-spread extension of the Turanian race, assures us, that "history, tradition, linguistics, and ethnology conspire to fortify the conclusions that, in prehistoric times, all Europe was overspread by the Mongoloid (Turanian) race, of which remnants have survived to our own times in the persons of the Basques, Finns, Esths, Lapps, and some smaller tribes."[2] Researches into the surroundings of these people, combined with what we have already learned as to the culture, customs, and manners of the Neolithic people in the preceding pages, throw no little light on this age. The darkness of oblivion seems dispelled by the light of science, and we behold before us the Europe of Neolithic times, thickly inhabited by a race of people, small in stature, dark visaged, and oval-faced—fond of war and the chase, yet having a rude system of agriculture. The

[1] Brace's "Races of the Old World," p. 82. [2] "Pre-Adamites," p. 150.

picture seems complete; and we have now only to raise some inquiries as to the great stock of people to which they belonged, and conjecture as to the date of their arrival in Europe.[1]

We are now learning that far back in the past, when mankind was yet young in the world, the great Turanian family held a commanding position. They seem to have dispersed widely over the earth. Their migrations began long before that of the Aryan and Semitic people. When tribes of these later people began their wanderings, they found a Turanian people inhabiting the country wherever they went. Long before the times of Abraham, the fertile plains of Chaldea were the home of powerful tribes of this family. Egypt, and the fertile Nile Valley, the home of ancient civilization, was their possession at a time long preceding the rise of the Pharaohs. Their Asiatic origin is corroborated by what we have learned of their domestic animals and cereals, which we know to be also from Asia, or the south-east. These Turanian tribes, at some far remote time, must have appeared in Asia Minor. Urged onward by the pressure of increasing population, they passed into Europe and Northern Africa. Their progress was, doubtless, slow; but they gradually filled Europe. The English Channel must have presented no inconsiderable barrier, and it was after Europe had been populated for a long time that they ventured to brave its passage in their rude canoes.

The Neolithic culture, which we have treated of in reference to Europe only, is seen to have been of Turanian origin. From its Asiatic home it spread over the entire

[1] It is unnecessary to caution the reader, that, after all, our knowedge of "prehistory" is vague. Prof. Virchow, who is eminent authority on these points, thinks it not yet possible to identify the prehistoric people of Europe; and good authorities hold that the Turanian tribes just named are the remnants of Paleolithic tribes, instead of Neolithic.

world—to the islands of the Pacific, and even America. The road that leads from barbarism to civilization is long and difficult, and it is not strange that but one or two families of men were able to attain that end by their own unaided effort.[1] The Turanian Family, which probably advanced man from savagism into barbarism, seems to have at that stage exhausted its energies. This is but an illustration of the fact that a race, like an individual, has a period of growth, a maturity of healthful powers, and an old age of slow decadence. After thus dispersing over the world, carrying with them the culture of the Neolithic Age, they seem to have halted in their progress. It remained for a new people, starting, perhaps, from the same state of culture, but with new energies, to discover and employ metals in the construction of tools and implements. This gave them so great a command over nature that civilization became possible. But whatever considerable advance the Turanian races were able to make beyond the Neolithic culture was by reason of intercourse with these later people. Where completely isolated from them, as in the New World, they remained, for the most part, in the Neolithic culture.[2]

We have hitherto spoken as if there was but one race in Europe during Neolithic times. In the main this is true; yet, near the close of this time, a different race arrived in Europe. That this is so, is proved by the same line of evidence used to determine the Neolithic people. We shall have much to say of them hereafter. They were the vanguard of the great Aryan race. This calls for some explanation. It has been found that the principal languages of Europe and South-western Asia have certain common charac-

[1] Morgan's "Ancient Society," p. 39.

[2] The exceptions to this statement are the higher classes of sedentary Indians, of which we shall treat in future pages.

teristics; so much so that we are justified, even compelled, to assume that the nations speaking these languages, such for instance as the Teutonic, Sclavic, Italic, Greek, Persian, Hindoostanee, and others, are descendants from a common ancestor. These people are called, collectively, Aryans. They were the ones who drove the Turanians out of the fairest portions of Europe. Though they appeared at a late date, they have filled the most important places in history, and the civilization of the world to-day is Aryan.

Now we must again form a mental picture of Neolithic Europe—after it had been for a long time in the possession of the Turanian tribes, the first band of Aryan invaders make their appearance. They must have appeared somewhere near the south-eastern confines of Europe, but they pressed forward to the western portion. They firmly seated themselves in the western and central parts of Europe, driving out the Turanian tribes who had so long possessed the land. They were themselves still in the Neolithic stage of culture. But they probably did not long antedate the knowledge of metals. Mr. Dawkins thinks that it caught up with them before they arrived in Britain, and that they are the ones who introduced bronze into that island. The Aryan tribe, who thus made their appearance in Europe, are identified as the Celts of history.

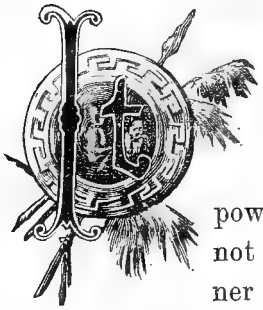
The Neolithic Age thus drew to its close, but not all at once. It disappeared first in the southern portion of Europe—from Greece and Italy; but it lingered to a far later date in the north: among the scattered tribes of Turanian people it would still assert its sway. Even after metals were introduced, the cheapness and abundance of stone would cause it to be used, among the poorer people at least. But finally this culture gives way to a higher one in Europe—though it still survived in portions of Asia, the Isles

of the Pacific, and in America. We can but reflect on the difference between the two ages of stone. The former ends amidst Arctic scenes—and, in the darkness that ensues, ages pass before we again detect the presence of man. The Neolithic closes gradually, everywhere giving way to a higher culture. We must not forget that our present civilization owes much to our far away Neolithic ancestors. When we reflect on the difficulties that had to be overcome before animals could be profitably held in a domestic state, or cultivation of the earth made profitable, we almost wonder that they succeeded in either direction. Aside from these, we turn to them for the origin of trade, navigation, and mining. No inconsiderable part of the battle of civilization had thus been won.

# CHAPTER VII.

## THE BRONZE AGE IN EUROPE.[1]

RACES of Men, like Individuals—Gradual change of Neolithic Age to that of Bronze—The Aryan family—First Aryans Neolithic—Origin of Bronze—How Great discoveries are made—Gold the first metal—Copper Abundant—No Copper Age—The discovery of Tin—Explanation of an Alloy—Bronze, wherever found, the same Composition—What is meant by the Bronze Age—Knowledge in other Directions—Gradual Growth of Culture—Three Centers of Bronze Production—Habitations during the Bronze Age—The Bronze Ax—Implements of Bronze—Personal ornaments—Ornaments not always made of Bronze—Advance in Arts of living—Advance in Agriculture—Warlike Weapons—How they worked Bronze—Advance in Government—Trade in the Bronze Age—Religion of the Bronze Age—Symbolical figures—Temples of the Bronze Age—Stonehenge.



IS with races of men as with individuals, the progressive growth of youth soon reaches its limit and maturity of power. While it brings greater strength, it has not the buoyancy of early years, so the manner of life becomes fixed, and onward progress stops. They can then only hope to hold on the even tenor of their way, happy if increasing years do not bring again their childhood state. The Neolithic people entered Europe early in the youth of the race which spread their civilization over the globe, but the race to which they belonged appear to have reached their zenith of development long ages ago, since which time, whatever higher culture they have reached has been a

[1] The manuscript of this chapter was submitted to Prof. Chas. Rau, of the Smithsonian Institution for criticism.

gift to them by other people. Their energies became exhausted, and for a long series of years Europe was filled by the camps, lake villages, and fortified places of Neolithic times.

As to the absolute length of time during which they inhabited Europe, we have no data to determine. Relatively, their sojourn, however long, was but a short time compared to the duration of the old Stone Age. It presents no such evidence of lapse of ages as can be observed in the older deposits, yet we may be sure that it was for no inconsiderable period.

The Paleolithic Age was apparently terminated in Europe by the cold of the last glacial epoch. No such natural course put an end to the Neolithic Age, but as the strong have an advantage over the weak, the young over the old, so does a race young, undeveloped, or in the early maturity of its powers, have an advantage over the older and more fixed civilization with which it comes in contact. To understand the causes which introduced into Europe the Bronze Age, we must refer to the Aryan race and to Asia.

We have in the preceding chapter briefly mentioned the Aryan race. They have so much to do with the higher culture of the Metallic Ages, that it seems not out of place to refer once more to their origin. The evidence goes to show that the ancient Aryans inhabited some portion of Southwestern Asia. As a race or family, they appear to have been one of the latest developed. Yet a record of their progress is a record of civilization.

Unless we reflect, we are liable to be misled by the expression, recent development. The Hindoos, one of the latest members of this family, were in India several thousand years before Christ.[1] But however far back we trace them, we find

[1] Brace's "Races of the Old World," p. 60.

them in possession of metals. Aside from this, we know that before the different Aryan tribes had commenced their migration (with the exception, however, of the Celts), while they formed but one mass of people, they worked some of the metals.[1] They could have acquired this knowledge only after the passage of many years, when they were ignorant of it. This bespeaks a profound antiquity for the Aryan family.

As we have seen, Europe, while yet inhabited by Neolithic people, was invaded by a branch of the Aryans. We do not know the date of this invasion, yet it must have been an early date, since the Celts separated from the Aryans before the use of metals. The Aryans have ever been noted as an aggressive people, and under different names have, in modern times, carried victorious arms in all quarters of the globe. This is equally characteristic of the primitive Aryans. Though it is not apparent that they possessed any higher culture than the people who already inhabited Europe, yet they everywhere triumphed over them and possessed themselves of the fairest portion of the Neolithic domain, driving the primitive inhabitants to those mountainous regions where their descendants are found to-day.

It is not probable that the Aryan invaders waged exterminating war against the Neolithic tribes. The evidence shows that there was considerable mingling of the two races. It has been suggested, however, that the Neolithic people who were not driven away were reduced to slavery.[2] However that may be, the remains of the two people are found side by side in chambered tombs and sepulchral caverns, showing that they dwelt together in the same area. As before remarked, the Aryan invaders are identified as the Celts.

[1] Brace's "Races of the Old World," p. 61.

[2] Dawkins's "Early Man in Britain," p. 343.

That it was relatively late in the Neolithic Age when they made their appearance, is shown by the fact that they had only reached the English Channel when a knowledge of bronze caught up with them.

We must now endeavor to learn the origin of bronze. The impulsive energies of this newer race found vent not only in conquest over the neighboring tribes, but it is extremely probable that they are the ones who first compelled nature to yield up her metallic stores to be of service to man. If the knowledge of fire was the starting point of human advancement, surely the knowledge of metals, their useful properties, and how to extract them from their ores, may lay claim to being the starting point of our present enlightenment. We have but to glance around us to see how many of our daily comforts are dependent on the use of metals. Should we, by any mischance, become deprived of the use of iron, or of the useful alloys, bronze and brass, our civilization would be in great danger of reverting to Savagism. Man, destitute of metals, can do but little to improve his surroundings; but grant him these, and victory over his environment is secured.

We can not retrace the exact steps of this beautiful discovery; we are not sure to what family it is to be ascribed. Perhaps not to any one alone. Nature may have taken her children by the hand, and kindly guided their feeble steps in the line of experiments leading up to this knowledge, and, finally, one family, more fortunate than the others, succeeded in the attempt. All great discoveries have been approached in different directions, by different people. No sooner is it made than this fact appears, and people widely separated by time and place are found to be on the verge of the same great truth. It was probably so at the discovery of metallurgy.

The Turanian tribes, who had so long inhabited Europe, were suddenly confronted by the victorious hosts of the Celts, the vanguard of the Aryans, the precursors of a higher culture. The movements of these primitive people could not fail to have a great effect on the human mind. It would become alert, keen, and active. Such was the state of ancient society when a knowledge of bronze was introduced—a discovery which consigned stone, hitherto the substance most commonly made use of to advance human interests, to a subordinate position, and opened up for man the exhaustless mineral stores of nature.

It is suggested by some that gold was the first metallic substance employed. Its glittering particles would attract the attention of primitive man, and little articles of ornament were early manufactured from it. To be sure, the supply was very limited; but what there was would serve the useful purpose of imparting to men some idea of metallic substances. Portions of it falling in the fire might have suggested the idea of smelting and of molding—might, at least, have lead to experiments in that line. The supply of gold existing in a native state is so small, that no use could have been made of it except for ornaments.

Iron, we know, is the most abundant mineral. But it is very rare in a native state, and its ores have nothing distinguishing about them, and so it is not strange that another metal received the attention of primitive man. That metal was probably copper. It is often found in a pure state in nature. In the Michigan mines of our own country, masses of pure copper many tons in weight have been discovered.[1] No such rich deposits are found in the Old World; but considerable quantities of native copper were obtained, and it was

[1] "One mass estimated to weigh two hundred tons." Dana's "Manual of Mineralogy," p. 291.

by no means a rare metal. Copper possesses several qualities that would attract attention. It is quite malleable; that is, it can be easily hammered into shape. We can imagine the surprise of the old stone-workers at finding a stone that, instead of breaking or splitting, could be hammered into shape. By accident, or otherwise, it would be learned, in time, that it could be melted. This would lead to the idea of molding.

If the above process were followed out, there would be a real Copper Age preceding that of Bronze: no trace of such an age has yet been detected in Europe. "But there is, however, every reason for believing, that, in some parts of the world, the use of native copper must have continued for a lengthened period before it was discovered that the addition of a small portion of tin not only rendered it more fusible, but added to its elasticity and hardness."[1] The absence of a Copper Age in Europe would imply that the art of manufacturing bronze was discovered in some other locality.

Copper by itself is so soft that it would not be of much use to man, except the experience they would gain of melting and molding. In our own country the aboriginal inhabitants were well acquainted with copper, and even knew how to mold it. Yet, except as just pointed out, it is not probable that it exerted any marked influence on their development.[2] In the old world supplies of native copper are limited, and recourse must be had to the ores of copper. Now these ores, such as copper-pyrites, are nearly always of a bright color, and as such would attract the attention of primitive man. They might suspect that these bright colored ores

[1] Evans's "Ancient Bronze Implements," p. 2.

[2] Rau's "Anthropological Subjects," p. 89. In his preface to this collection he asserts his belief, that "former inhabitants of North America, notwithstanding all assertions to the contrary, were unacquainted with the art of melting copper." Ibid., vii.

contained copper from finding similarly colored ores in connection with native copper, in fact passing from one form to the other. But it requires no little skill to reduce the ores of copper; and, when obtained, for reasons just pointed out, it would not be of great utility. But primitive man was thus cautiously and experimentally feeling his way to a knowledge of metallurgy.

All the evidence obtainable goes to show that tin was known as early as copper, or at least soon after. Its ores though not striking on account of their color, are on account of their great weight. It is comparatively easy to reduce it from its ores. It is quite widely distributed over the earth. It often occurs in the gravels of rivers, where, as we have already mentioned, primitive men must have, at a very early date, sought for gold. Owing to their weight, the gravel of tin-stone would remain behind with the gold when it was washed. "In process of time its real nature might have been revealed by accident; and, before the eye of the astonished beholder, the dull stone, flung into the fire, became transfigured into the glittering metal."[1]

When two metals come together in a molten state, they often form, not a mixture of the two, part copper and part tin, for example, but a new compound, different from either, called an alloy. Copper is, so to speak, a sociable metal, and readily unites with many different metals—amongst others with tin, when it forms bronze, the article that marks a new state in the history of primitive culture. It seems to us strange that an alloy, a combination of two different metals, should have been the first used by man, and not a simple metal like iron. Such, however, is the fact of the case; and we have tried to point out the probable steps which led up to the invention of bronze. We can scarcely

[1] Dawkins's "Early Man in Britain," p. 401.

comprehend the difficulties which attended the labors of the primitive metal-workers. There were no books containing the wisdom of many, from which the investigator could draw his stores of knowledge: and the only way that knowledge could be disseminated was by word of mouth.

Now, when one man makes an important step in a discovery, hundreds of earnest workers, some, perhaps, in distant places, are quickly made aware of the fact, and extend its scope, or point out its imperfections, and thus hasten on the desired end. Then, each individual, or community, must, of necessity, have commenced at the beginning, and the discoveries made would hardly be perpetuated in the memory of others. There were so many obstacles to be overcome before a knowledge of bronze could be acquired, in the then existing state of human knowledge, that it must ever remain a source of wonder to us, at the present day, that it was invented at all.

We may picture to ourselves the ancient copper-worker, after numerous experiments, guided by some good genius, finally hitting on some process by which, from his mass of ore, he extracted a nearly pure piece of copper. Having learned how to reduce these ores, there are many ways in which it might have been found that a mixture of the two metals would form a new compound of greatly increased value.

It must have taken a long course of experiments to determine what proportions of each metal to use to make the best bronze. It is interesting to know that these early workers had learned the proportions of each to use, not varying a great deal from the results of modern research—that is, from ten to twelve per cent of tin. Bronze relics, no matter where obtained, whether in the Old or the New World, do not widely depart from this standard, and such

instances as do would probably denote that the supply of tin became short. This uniformity of composition would imply that the art of making bronze was discovered in one place, from which it gradually spread over the globe.

This fact is a key to the culture of the Bronze Age. Widely separated communities, destitute of a knowledge of metals, would instinctively make use of stone. In this case uniformity of type would not imply community of knowledge. But a knowledge of metals is altogether different. It is wonder enough that one community should have hit on the invention of bronze. The chance would be against its independent discovery in widely separated areas. They would be more apt to chance on the production of some other metal. Thus; tribes in the interior of Africa are said to have passed direct from the Stone to the Iron Age, a knowledge of bronze not having been carried to them.

We are thus able to form a true conception of the Bronze Age. It did not prevail over the world at the same time. Indeed, as we shall subsequently see, there is every reason to suppose it spread very slowly, and that it still lingered in Central and Northern Europe long after its use had been abandoned for that of iron in the South. Neither, when it was first introduced, did it put a stop to the use of stone. It was necessarily costly, and on its first appearance in a country, brought hither by trade, could only be afforded by rich and powerful chiefs and warriors. As time advanced, and they learned to make it cheaper, and each country took up its separate manufacture, it would gradually supersede stone. But bronze was never cheap enough to drive out the use of stone altogether. This only occurred when the art of working iron was discovered.

We shall learn that the knowledge of bronze, while a very important and distinguishing phase of culture of the

Bronze Age, was not its only characteristic. It was distinguished by the arrival and spread of the Aryan races, by a great extension of commerce, by more refinements in the comforts of life, by the increasing strength of government, which in after ages flowered out in the mighty nations of antiquity, and rendered historic civilization possible.

Some facts stand out with great prominence. The origin of this culture is lost in the very night of time. We may be sure that it goes back to a profound antiquity, and that it extended over a long series of years.

It is evident there was no great and sudden change from the culture of the Stone Age to that of Bronze. It was as if the darkness of night had given place to the roseate light of dawn, to be shortly followed by the full day of historic times. It was probably introduced by trade. The articles introduced in this way would consist of simple implements, weapons, and ornaments. Following after the trade would be found the smelter with his tools, and, where the conditions were favorable, local manufactories would be set up. But this home industry would not prevent importation of more pretentious articles from abroad. This would account for the rich collections of shields, swords, and golden cups found in Denmark that betray an Etruscan origin.

Investigations of recent scholars show that the bronze of the early Bronze Age came from Asia Minor. Subsequently there were three great centers of bronze production, each having certain styles. These were the Russian on the east, the Scandinavian on the north, and the Mediterranean on the south. If this view be correct, bronze must have been in use in the South of Europe long before it was in the North. This view of the introduction of bronze is, we think, that of the best scholars in Europe. Others, however, think bronze was brought in by the invasion of the

Aryan tribes. Mr. Keary says: "The men of the Bronze Age were a new race, sallying out of the east to dispossess the older inhabitants, and if, in some places, the Bronze men and the Stone men seem to have gone on for a time side by side, the general characteristic of the change is that of a sudden break."[1] We have shown that it was carried to England by an invasion, and it was, perhaps, so introduced into Denmark, but in other countries of Europe by trade.[2]

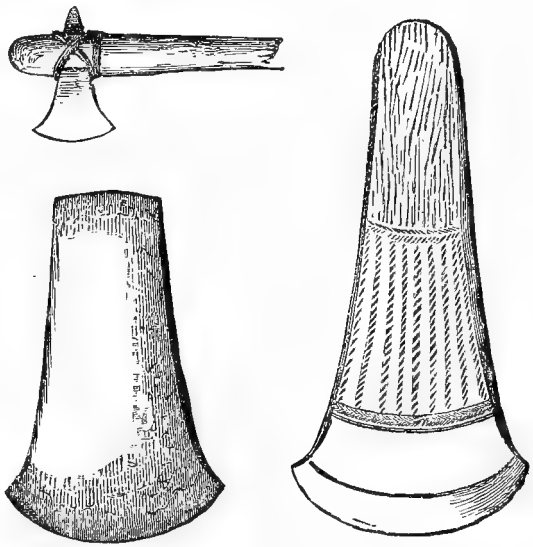
Let us now see what change in the home life, in the culture of the people, would be brought about by the use of bronze. We must reflect that we are not to deal with some new race, but with the same race that inhabited Europe at the close of Neolithic times. The people who had triumphed over nature with their implements of stone were now put in possession of weapons and implements of greatly increased efficiency. The results could not fail to advance their culture. We would not expect any great change in the houses. They would, however, be much better built. The metallic tools were certainly a long ways ahead of the best stone implements. With the aid of metallic axes, knives, saws, gouges, and chisels, their cabins could be increased in size and appearance. They still built settlements over the lakes, but the Bronze Age settlements were more substantially built, and placed farther out from shore. Fortified places were still numerous; the remains of thousands of them of this age have been found in Ireland. But the forests were cleared, wild animals disappeared, society became more settled, and we may be sure that an increasing number of little hamlets were scattered over the country.

Caves were resorted to during this epoch only in times

[1] "Dawn of History," p. 367.

[2] For an excellent discussion of this subject, about which there is yet much uncertainty, we would refer the reader to Evans's "Ancient Bronze Implements," chap. xxii.

of danger. One at Heathbury Burn, in England, contained portions of the skeletons of two individuals, surrounded by many articles of bronze and a mould for casting bronze axes. It is not difficult to read the story. In some time of sudden danger workers in bronze fled hither with their stores, but owing to some cause were unable to escape the death from which they were fleeing, and their bodies. with their mineral stores, were lost to sight until the modern explorer made them a subject of scientific speculations.[1]



Bronze Axes—First Form.

The most important implement was the ax. Our civilization has originated from many small things. It is difficult to overestimate the importance of the ax in advancing civilization. The stone axes, easily blunted and broken, could have made but little impression on the vast forests of pine, oak, and beech, covering the greater part of Britain and the continent in the Neolithic Age. Clearings necessary for pasture and agriculture must unquestionably, then, have been produced principally by the aid of fire. Under the edge of the bronze ax clearings would be rapidly produced, pasture and arable land would begin to spread over the surface of the country; with the disappearance of the forests the wild animals would become

[1] Dawkins's "Early Man in Britain," p. 355.

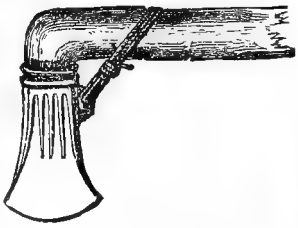
scarce, hunting would cease to be so important, agriculture would improve, and a higher culture inevitably follow. "When first the sound of the woodman's ax was heard in the forests of the north, the victory of man over his natural environments was secured, and the forest and morass became his forever."[1]

Bronze Axes—Second Form.

The bronze ax was used for a great variety of purposes, not only as an ax, but as chisel, hoe, etc. As might be expected, the oldest axes were simply modeled after the stone ones. The preceding cut represents these simple forms. They were inserted into the handle much the same as they did the stone axes. It never occurred to these ancient workers to cast the axes with a hole in them for the handle.

The above cut represents the second form of the ax. The trouble with the first was that much usage would inevitably split the handle. To remedy this, a stop or ridge was raised across the celt, and the metal and the wood were made to fit into one another.

The small figure illustrates this method of hafting. It would be quite natural to bend the sides of this second



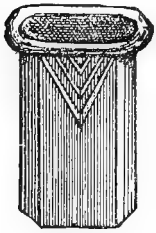
Bronze Axes—Third Form.

[1] Dawkins's "Early Man in Britain," p. 350.

form around, and thus would arise a third form, in which the handle was let into a socket, of which we also give a cut. As a general thing, bronze axes were plain, but they were sometimes ornamented with ridges, dots, and lines.

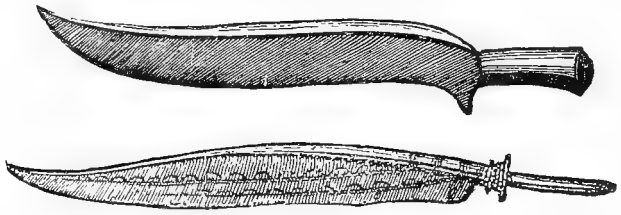
Chisel.

In addition to axes, they of course had many other implements of bronze. Chisels were made much the same as at present, except that the handle fitted into a socket. A few hammers have been discovered in the Swiss lake villages. Bronze knives of different styles and sizes were quite numerous. The workmenship on them is generally skillful. They were, as a rule, fitted into a handle of bone, horn, or wood, and the blade was nearly always carved. In some cases the knives also ended in a socket, into which the handle fitted.[1]



Hammer.

In matters of personal ornament, the men and women of the Bronze Age were as willing to make use of artificial helps as their descendants to-day, and no doubt fashion was quite as arbitrary in her rule then as now. Among some savage nations the dressing of the hair—especially of the men—is carried to a very elaborate pitch.[2]



Bronze Knives.

In this respect, some of the dandies of the Bronze Age certainly excelled. They evidently built up on their heads a

[1] "Prehistoric Times," p. 34. [2] "Early Man in Britain," p. 351.

great pyramid of hair; in some cases large enough to allow of the use of hair-pins two feet long. Of course such a structure as this was intended to last a lifetime. So careful were they of this head-dress that they used a crescent-shaped pillow of earthenware, so that it might not be disturbed when they slept. Dr. Keller, who first described these crescent-shaped articles, thought they were religious emblems of the moon. He may be right, as the matter is not yet decided, but some think they were the pillows in question. At first thought this would seem absurd, but when we learn of the habits of the natives of Abyssinia and other savage races, we cease to wonder.

Crescent—Use Doubtful.

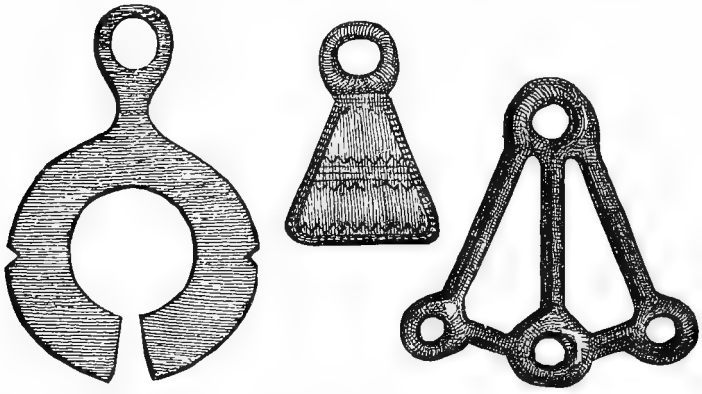
Hair-pin.

In speaking of the ornaments of the Bronze Age, a caution is necessary, because ornaments of bronze may belong to any age. Bracelets and rings have been quite numerous. The bracelets vary much in shape, are decidedly artistic in workmanship, and often set off with carved designs. Some of this shape are composed of a single ring of varying width, the ends of which almost meet and terminate by a semicircular clasp; others are a combination of straight or twisted wires ingeniously joined to one another. "Some of these ornaments remain even up to the present

Bracelet.

day in a perfect state of preservation. In an urn from one of the lake settlements six specimens were discovered, the designs of which appeared quite as clearly as if they had only just been engraved."[1]

We are called on to notice one important point in reference to these bracelets and rings. That is, they are so small they could scarcely be worn nowadays; a fact leading us to infer that the people must have been of small size. It has also been noticed that the handles of the



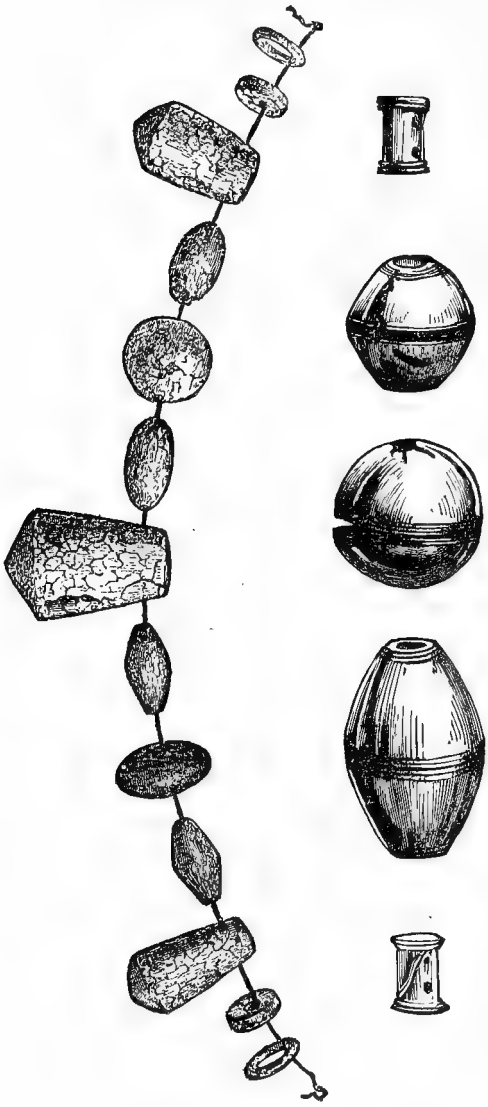
Bronze Pendants.

swords are smaller than would be convenient for soldiers now. Some ornaments of bronze were worn as pendants. For this purpose they were provided with a circular hole, and were probably worn suspended around the neck.

Ornaments were not always of bronze. Necklaces were sometimes made of amber, and gold beads were quite common. We give a cut of both. They are from burial mounds of this age in England. We remember the ornamentations on implements in the Paleolithic Age was by engraving animal forms. In the Neolithic Age they seem to have cared very little for ornamenting. During the Bronze Age the ornamentation was of a simple but

[1] Figuier's "Primitive Man," p. 255.

pleasing and uniform style. It consisted of simple geometrical patterns, combination of circles, dots, and straight lines. In this next figure we have given the principal designs found in France.

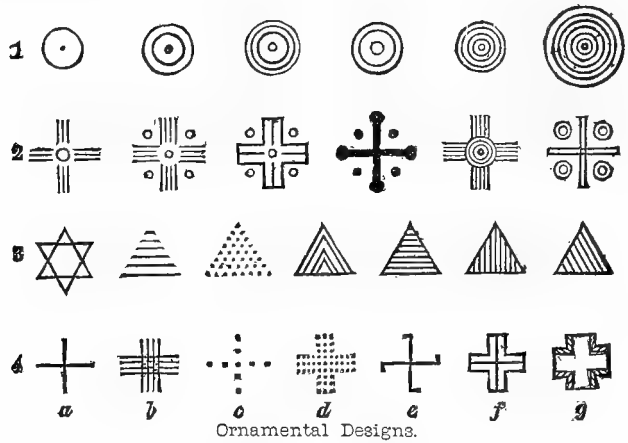


Necklace and Beads.

In the arts of living an increase in culture is noticeable. We have seen that in Neolithic times they were acquainted with the use of the distaff. In the Bronze Age they manufactured woolen cloth. We have but few specimens of this cloth, because it is under only very exceptional circumstances that woolen fabrics can be preserved for any great length of time. From examinations of burial mounds of this period, it would appear that the better class of people were clad in linen and woolen. Probably the use of the skins of animals for dress purposes was mostly discontinued during this age. Woolen cloaks of this period

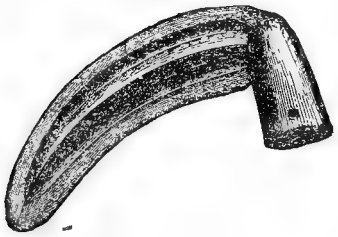
have been found in Denmark, though probably dating from near the close.

In agriculture we detect only such advances as improved



Ornamental Designs.

implements would suggest. They used the sickle in gathering in the harvest. We find no implements which we are sure were used for agricultural purposes. Yet they must have had some means of preparing the ground for the cereals. The day of wild animals was gone. In the lake settlements of this age the domestic animals outnumbered the wild species.[1]



Bronze Sickle.

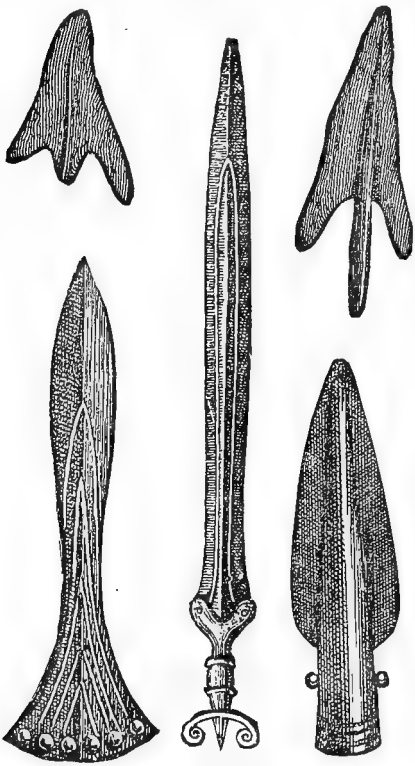
During this age the horse was used for riding and driving, and oxen were used for plowing. The proof of this fact is certain sketches found in Denmark. But the use of Bronze in that country continued after iron had been introduced in the south of Europe. Pottery was more carefully made—though the wheel for turning it was not yet introduced. The shapes were varied and elegant; sometimes, instead of having a

[1] Rau's "Early Man in Europe," p. 135, and note.

flat base, they came to a point below—in which case they had to be placed in a support before they could stand upright. Nearly all the pottery bears the ornamentation peculiar to the Bronze Age—that is, straight lines, dots, etc.

Clay Vessel and Support.

During this age, the inhabitants were as much given to war and conquest as any rudely civilized people: we, therefore, meet with remains of their weapons. The principal ones were swords, daggers, spear-heads, and arrows. The swords are always more or less leaf-like in shape, double-edged, sharp-pointed, and intended more for stabbing and thrusting, rather than cutting. No hand guards were used.



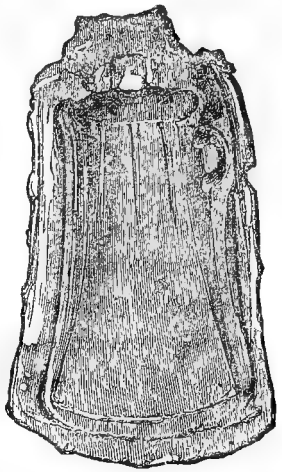
Bronze Weapons.

Sometimes the handles were fastened to the swords by means of rivets; and, at other times, the handle was plaited with wood or bone. They are of different lengths, intermediate between the sword and the dagger. It is doubtful whether they made use of shields.

Bronze shields are, indeed, found; but, from the ornaments and other circumstances, they are generally considered to belong to the Iron Age: for we shall subsequently learn that the introduction of iron did not prevent the con-

tinued use of bronze. The bow was well known; and this must have necessitated the use of arrows. Some bronze arrows have been found; but a flint arrow is nearly as serviceable as bronze, and much cheaper, so we may be sure they were more common. They also employed spears and javelins, and the bronze heads of these weapons are found in various places. The invading Celt found many camps and fortified places already in existence, and continued them in use after the original occupant had been driven away.

As we have spent some time in learning the different objects manufactured out of bronze, it may be of interest to learn somewhat of their methods of working bronze. We have already stated how the amateur worker in bronze would follow on after the trader—and so the objects of bronze would be made in all the countries of Europe. Molds have been found in various places. This is a mold for casting the axes having a socket in which to put the handle. It was found in the cave at Heathbury Burn, already mentioned. None of the bronze objects were forged out, as a smith forges out objects of iron—they were cast. In the absence of steel, it would be almost impossible to cut bronze; hence it was necessary to make the casting as nearly perfect as possible. Sometimes the molds were cut out of stone, as in the figure just given. The molds themselves were, in this case, difficult to make; besides, they could scarcely be made so perfect as not to leave a little ridge, where the two halves of the mold came together, which, as just explained, owing to the absence of steel, it would be



Mold.

very difficult to remove. In process of time they discovered an easier way of making the molds, that employed at the present day—that is, by the use of sand. The ridge would still remain, and is to be plainly seen on specimens of ancient bronze.

To overcome the difficulty just mentioned, they invented a third method of casting, which displays great ingenuity. A model of the object desired was made of wood or wax, and inclosed in prepared earth mixed with some inflammable material, in order that, when subjected to heat, it might become porous. The whole was then heated until the wax or wood disappeared. The mold was then ready for use. The great advantage of this method was that there were no projecting lines of junction to disfigure the complete implement. This seems to have been the most common method employed. This explains the fact, that we seldom find any two bronze objects exactly similar to one another. Any impression left on the wax model would be faithfully reproduced. Marks of the spatula, with which the wax was worked, are frequently found; and, in one case, the impression of the human finger was observed.[1]

A people as highly cultured as those of the Bronze Age must have had some system of government, and one that was a sensible advance over the government of the Neolithic people. In the Neolithic Age it was, doubtless, tribe against tribe. Confederacies, the union of several tribes for common purpose of defense, must have been more common at this age.[2] The first Aryan tribes to arrive in Europe, as we have seen, were the Celts. In time, they had to withstand the pressure of invasion themselves. The Belgæ, and other Germanic tribes, were also on the move. But war at this pe-

[1] Lubbock's "Prehistoric Times," p. 39.
[2] Morgan's "Ancient Society," pp. 119, 120.

riod would partake more of the nature of people against people, than of tribe against tribe. The civil and the military departments of government must have taken more definite shape, and we are not without evidence of fairly organized and disciplined forces. As early as two thousand eight hundred years before Christ, the sea-coast people of Europe, while yet in the Bronze Age, allied their forces for the conquest of Egypt.[1]

We have referred to the influence of trade in shaping civilization. It is commerce that to-day is carrying civilization to remote corners of the globe. Long before the dawn of history, it was an active agent in advancing culture. It is important to note the great expanse of commerce, both inland and marine, which prevailed during the Bronze Age. An important article of trade was, of course, bronze. The people who first learned the secret of its manufacture would speedily find a demand for their wares from surrounding tribes, and we have already pointed out how this trade would quickly give rise to local manufactures. But, to produce bronze, we know tin is just as necessary as copper—and all the countries of Europe are not provided with these metals; so more or less trade would inevitably take place. In various ways the stores of the bronze merchant might be lost, and only revealed in after years by accident. One of these deposits, found in France, is evidently the store of a merchant or trader from Etruria to the tribes of the north and west, and so gives us a quite a vivid idea of the trade of that early time. It consisted of over four hundred articles of bronze, "comprising knives, sickles, lance-heads, horse-bits, rings, buttons, pendants, and bracelets."[2]

As an article of adornment, amber was highly prized, not

[1] Dawkins's "Early Man in Europe," p. 449.
[2] Dawkins's "Early Man in Britain," p. 383.

only by the people of Europe during the Bronze Age, but also by the people of the preceding Neolithic Age. This caused a trade to spring up which certainly did its share in enlightening the people. The main supply must have been obtained from the shores of the Baltic. That the trade was of importance, is evidenced by the fact that amber has been found scattered over Europe in the tombs of the Neolithic and Bronze Ages.

We have given a passing glance at the religion of each age we have examined. It must be confessed that great uncertainty hangs over the results. From a close examination of their industries, we can gather considerable as to the home life and general enlightenment of prehistoric times. A knowledge of religious belief is gathered mainly from a study of their burial customs. This is a very important part of our investigation, because a religious belief is one of the exponents of the culture of a people.

We have seen that in the Neolithic Age the dead were buried surrounded by implements, weapons, and ornaments for use in the future life. The descendants of these people throughout Europe, even in the Bronze Age, would still continue this custom. The implements buried with the body were more often of stone than bronze. We must constantly bear in mind that bronze was costly. This will explain its absence in many cases. It is interesting to note in this connection that these are "cases in which it is evident that flint implements were deposited in graves rather in deference to ancient customs than because they were still in every-day use."[1] We also notice that during this age, often the objects placed in the graves were, from their shape, obviously not intended for daily use. This would clearly indicate that the popular mind became impressed with the fact that these vo-

[1] Lubbock's "Prehistoric Times," p. 157.

tive offerings, however freely given, could be of no assistance to the departed, but they still continued the custom because it was sanctioned by usage of past years.

But the dead were not always buried during the Bronze Age, nor, indeed, as a general rule. The invading race doubtless brought with them a new religion. Many of the ornamentations on their swords, vases, and other articles, are supposed by some writers to be religious symbols. From the frequent occurrence of the circle, and combinations of circles, it has been suggested that they worshiped the sun. And the occurrence of customs observable even at a late day, in various portions of Europe, as pointed out by Prof. Nelson, show that the worship of the fire-god, or the sun, was once widely extended in Europe.[1] On this point we are further told: "That even as late as the time of Canute the Great,[2] there is a statute forbidding the adorement of the

Burial Mound.

sun and the moon."[3] So it is not strange that in the new faith a different method of burial would be followed. That was by cremation. "The dead were burned, were purified by being passed through the fire along with their possessions."[4] The ashes was then gathered together and placed in urns and burial mounds and barrows. The votive offerings of flint and bronze articles in daily use were also thrown in the fire, and their burnt remains placed with the other ashes

[1] Lubbock's "Prehistoric Times," p. 74.

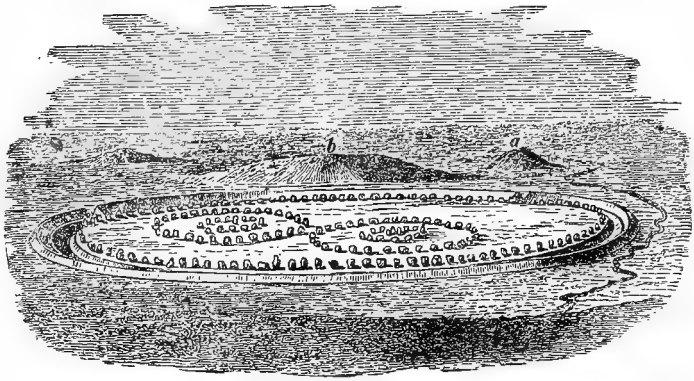
[3] Ferguson's "Rude Stone Monuments."
[4] Dawkins's "Early Man in Britain," p. 367.

in the burial urn. The cut is that of a bell-shaped barrow of the Bronze Age.

We have just seen what inferences have been drawn from the use of the circle as an ornament. This is not the only sign that has been thought to have some symbolical meaning. The cross was also used as an ornament, and possessed probably some religious significance. A third figure which has caused some discussion was the triangle. "It is, on the whole, very probable that all these signs, which are not connected with any known object, bear some relation to certain religious or superstitious ideas entertained by the men of the



Avebury Restored.

Bronze epoch, and, as a consequence of this, that their hearts must have been inspired with some degree of religious feeling."[1]

We have mentioned the use of stone circles in Neolithic times. During the Bronze Age they built the circle very large, sometimes twelve hundred feet in diameter, and they were sometimes made of earth. These circles are regarded by some[2] as being simply burial places, and many of them have been proved to be such. But others regard them as temples, meaning thereby not a building, in our sense of the

[1] Figuier's "Primitive Man," p. 283.

[2] Ferguson's "Rude Stone Monuments."

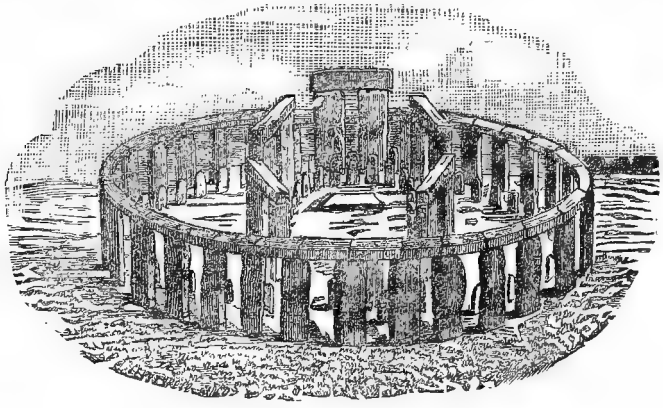
word, but a place of sanctity, and probably where some form of worship was held. "Even if we allow that they were originally tombs in every case, it does not follow that they have not also been temples, for the religious sentiment has, in all ages, and in all places, tended to center in tombs, which ultimately have become places of worship. Many of our Christian Churches have originated in this manner, and it is a most obvious transition from the tomb to the temple. The worship of the spirits of the dead at the one would naturally grow into the worship of the Great Unknown in the other.[1]

The preceding cut is a restoration of one of the largest of these temples. Here we see a circle twelve hundred feet in diameter, of upright stones, guarded by both a ditch and embankment. From the two openings in the embankment formerly extended two long winding avenues of stone. Between them rises Silbury Hill, the largest artificial mound in Great Britain, being one hundred and thirty feet high. The area of the large inclosure was about twenty-eight and a half acres. This was a temple of no inconsiderable size. It was of course in ruins when the earliest account of it was written, and we can only speculate as to the lapse of time since it was venerated as a place of worship.

Stonehenge, on Salisbury Plain, is a better known ruin, though not on as large a scale as at Avebury. The cut gives us a restoration of it. The outer circle of standing stones is one hundred feet in diameter, and when entire consisted of one hundred stones. These are of sandstone, and were obtained in the vicinity. A course of stone was laid along the top. We notice within a smaller circle of stone. The material of these stones is such that we know they must have come from a distance. Mr. James tells us that they are erratic—that is, bowlders brought from the

[1] Dawkins's "Early Man in Britain," p. 377.

North of Scotland by the glaciers—and that others of the same kind are still to be seen lying around the country.[1] But the more common opinion is that they were brought there by the people from a distance, perhaps Cornwall or the Channel Islands. If this be true, it is evidence of a strong religious feeling, and a peculiar value must have been attached to the material, since for any ordinary monument the stones in the neighborhood would have sufficed. Still nearer the center were five groups of three great stones each, and



Stonehenge Restored.

immediately within these a horseshoe of smaller stones. Finally, near the head of the horseshoe, a great slab of sandstone is supposed to have served for an altar. The date of the two structures just described has been a matter of some dispute.

It is worthy of notice that in the immediate neighborhood of both of them are found a great number of barrows of the Bronze Age. Over three hundred were erected in the neighborhood of the latter. In the opinion of many this fixes their date in the Bronze Age. Stonehenge, in its ruined state, has formed the subject of no little speculation,

[1] James's "Stonehenge," p. 3,

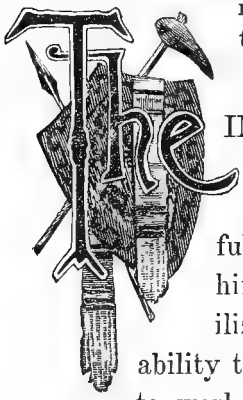
Modern explorers, in connecting it with the Bronze Age, have not dispelled from it the enchantment of mystery. We must ever wonder as to the nature of the rites there observed. Our questionings meet with but feeble response; for though we have learned somewhat of past times, it is comparatively but little. Ruined columns, crumbling burial mounds, and remains of stone and bronze will always be surrounded with more or less mystery—a striking illustration that science is able to dispel but little of the darkness which unnumbered years have thrown around the culture of the past.

Ancient Tower, Scotland.

# CHAPTER VIII.

## THE IRON AGE IN EUROPE.

BRONZE not the best metal—Difficulties attending the discovery of Iron—Probable steps in this discovery—Where this discovery was first made—Known in ancient Egypt—How this knowledge would spread—Iron would not drive out Bronze—The primitive Iron-worker—The advance in government—Pottery and ornaments of the Iron Age—Weapons of early Iron Age—The battle-field at Tilfenan—Trade of early Iron Age—Invention of Money—Invention of Alphabetic Writing—Invasion of the Germanic Tribes—The cause of the Dark Ages—Connection of these three Ages—Necessity of believing in an extended past—Attempts to determine the same—Tinière Delta—Lake Bienne, British Fen-beds—Maximum and Minimum data—Argument from the widespread dispersion of the Turanian Race—Mr. Geikie's conclusions—The isolation of the Paleolithic Age.



THE INTRODUCTION of bronze was the harbinger of better days to the various tribes of Europe. Without metals it is doubtful if man would ever have been able to raise himself from barbarism. His advance in civilization has been in direct proportion to his ability to work metals. As long as he knew how to work bronze only he could not hope for the best results. The trouble was not in the metal itself, but in the supply; for copper and tin, the constituents of bronze, are found only in limited amounts. When we reflect on the multiplicity of purposes for which some metallic substance is needed, we at once perceive that men require a metal which can not only be worked cheaply,

but must exist in great abundance, so that the needs of a rich and varied culture may be met.

The Divine Author of nature has stored away just such a metal, and in such exhaustless quantities that it forms an ingredient in nearly all soils, and flows away in the waters of many springs and rivers. It exists in abundance in nearly every country of the globe, in some forming veritable mountain masses. We refer to iron, the king of metals; and when man had learned to reduce it from its ores he had taken the first step in a new direction, the end whereof is yet far distant.

We have in the preceding chapter presented some reasons why copper would be known before iron. In the first place, how were men to learn there was such a thing as iron? Supposing its ores did occur in abundance, there was nothing to attract attention to them. They were not of great heft, like tin ore, or of striking color, like the ores of copper. In the hills, and under the foot of man, nature indeed had imprisoned a genius; but there was no outward sign by which man was to divine his presence. Copper, as we have seen, occurs frequently in a native form that is ready for use, without reducing from its ores. Native iron, on the contrary, is almost the rarest of substances, though it is reported as occurring in one or two localities on the earth.[1] Almost the only examples of native iron has been obtained from meteorites. Strange as it may seem, these wanderers in space, which occasionally flame athwart the sky, consist largely of pure iron; at least this is true of such specimens as have from time to time been found on the earth's surface. This supply is of course extremely limited, yet some Siberian tribes are said to make knives from iron obtained in this manner.[2] Moreover the evidence of language, as

[1] Dana's "Manual of Mineralogy," p. 230. [2] "Primitive Man," p. 298.

used by the ancient Greeks and Egyptians, would imply the meteoric origin of the first known form of the metal.[1] But though such accidental finds might prove the existence of another metal, they would furnish no hint how to extract it from its ores, or indeed, that it existed in the form of ores.

The prolonged schooling in metallurgy, which men received during the Bronze Age, could not fail to give them many hints, and doubtless accidental discoveries of metallic substances were made. We can conceive how, by accident or design, iron ore, treated in a similar manner to copper and tin ore, would leave behind a mass of spongy iron. The difficulty would be in working it; for, as we have seen, they were in the habit of casting their articles of bronze. But iron is very difficult of fusion. It was a long while before they learned how to do that. They had therefore to learn an entirely new art—that is, to fashion their implements of iron by hammering the heated mass.

There is no reason to suppose that iron was first discovered in Europe. Its spread has been from the east and south to the north and west. It, in all probability, was discovered, like bronze, in Asia. Although evidence, both archæological and traditional, goes to show that bronze was in use long before iron, yet iron has been known from time immemorial. Explain it how we will, civilization and history follow close after the knowledge of iron. Wherever the light of history first falls on the nations of the Old World, we find them acquainted with iron, but such knowledge, at least on the part of the Mediterranean nations, does not long precede history, for at that early time, iron was still a most precious metal. It was not yet produced in sufficient quantities to take the place of bronze; hence the prehistoric Iron Age was there but of short duration.

[1] Evans's "Ancient Stone Implements," p. 5.

Among the early Egyptians iron was known, but was probably not very common. There is on this subject some diversity of opinion; some believing that at the very earliest historical period they were skilled in working it, and employed it in all the affairs of life, but others assure us that at the most ancient period they did not really use iron, and that bronze was the metal employed for all ordinary purposes.[1]

A wedge of iron is said to have been found in a joint between the stones of the great pyramid. Here, then, at the dawn of historic times, iron seems to be making its way among a bronze-using people. The ancient Chaldeans employed iron as an ornament, but not for implements. With them it was therefore a precious metal. Among the Assyrians, iron was largely used, and at a comparatively early date. A careful study of the poems of Homer shows that the Greeks of nearly three thousand years ago had a knowledge of iron, though it was a highly prized metal. But to the north of the Mediterranean the prehistoric Iron Age was of longer duration.

We can readily see that a knowledge of iron would spread in much the same way as did bronze. When first introduced, it would be rare and costly, and so would be used sparingly. Bronze axes have been found with the edge of iron. Afterwards, as it became more abundant, it would be used altogether for cutting instruments and weapons, while bronze, being more easily worked, would still be used for ornaments, brooches, etc. At Hallstadt, in Austria, was discovered a cemetery which evidently belongs to a time when iron was taking the place of bronze. In this case, the implements of bronze are those forms which we have learned were produced near the close of the Bronze

[1] Evans's "Ancient Bronze Implements," p. 8.

Age. The iron implements are not those forms best suited for that metal, but imitations of those of bronze.[1] We remember when bronze was first introduced, the weapons were simply copies of those forms already made in stone.[2]

We may suppose that a knowledge of iron would spread rapidly. The knowledge of metallurgy necessary for the production of bronze was at this time widely disseminated. It would require, therefore, but a hint to start them in experiments. In the dissemination of this knowledge, commerce, of course, played a most important part. Whenever the early Greek and Roman writers have occasion to mention the arms of the less civilized tribes of Europe, we learn they were of iron. This shows that at a very early time this knowledge had spread all over Europe.[3]

It is scarcely necessary to remark that the use of iron would not drive out the use of bronze. That would still be used for many purposes; and even stone would continue in use, at least for some purposes. At the battle of Marathon, arrow-heads and lances of stone were largely used. We can easily understand how, by one of a number of causes, some rude tribes, yet unacquainted with the use of metal, would come to occupy the site of some settlement, the inhabitants of which had been in the Bronze or Iron Age. This actually happened at ancient Troy, where the remains of a stone-using folk have been found above those of a people using metal. This, though an exception to the general rule, need give us no surprise.

Iron manufacture at the present day, is one of our great industries. In its present form it is the final development of an industry whose first unfoldings we have now to glance at. That the first process man employed to procure iron should have been very rude, is what we would expect.

[1] "Ancient Bronze Implements," p. 3. [2] Ibid., p. 40. [3] Ibid., p. 19.

Some of the partially civilized tribes of to-day may give us an insight into the process employed. We are told that in Tartary each native makes the iron he needs, just as every household would make its own bread. The furnace is a very small affair, not holding more than three pounds of ore. This is filled with ore and charcoal. The bellows are used, and after the charcoal is all burned out, the result is a small piece of spongy iron, which needs only repeated heating and hammering to be made serviceable.[1] Primitive furnaces, on a somewhat larger scale, have been discovered in Switzerland. Here the excavation was made in the side of a hill, and a rude, dome-shaped chimney built over it.

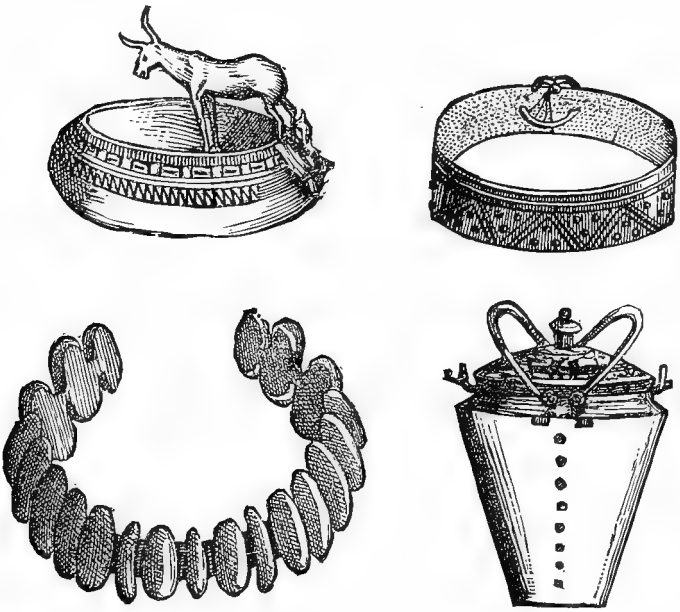
We must not forget that our task ends where the historian's begins. The use of iron did not long precede history, so we have but little to describe as to the customs and manners of life during the prehistoric Iron Age. A general advance in all the social arts must surely have taken place. Improved tools, and more cheaply produced, could not fail to advance man very materially in culture. Some lake settlements were still in use as places of residence, but better means of protection than water was now known—walled cities were in use, especially around the Mediterranean sea.

Mr. Morgan has traced for us the evolution of government. At this early date the Greek and Roman people were engaged in substituting for ancient society the modern idea of government founded on territory.[2] The great body of European tribes were now in the final stage of barbaric life. Their system of government was doubtless the highest known to ancient society—that of confederacies; the union of tribes speaking dialects of the same language, for offensive and defensive purposes.

[1] Figuier's "Primitive Man," p. 300.

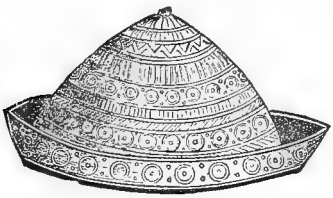
[2] "Ancient Society," p. 216.

As characteristic of the advance of this epoch, we may mention the appearance of pottery made on the potter's wheel, and baked in an improved kind of furnace. Pre-



Ornaments.

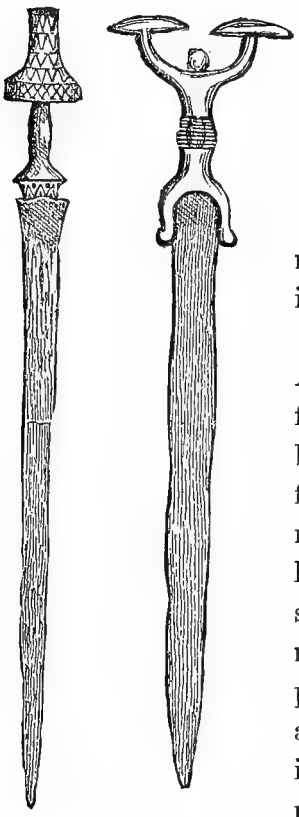
vious to this epoch all the pottery had been moulded by hand and baked in an imperfect manner in the open air. This may be thought to be but a small improvement. Our civilization, however, depends upon small improvements. Only during the early part of this age, while iron was scarce, and therefore valuable, would it be used for the purpose of ornaments. Iron brooches have been found in considerable quantities in the lake settlements. Bronze would still be the principal article used for ornaments. The articles of bronze manufactured for ornamental purposes, are certainly very tasty, and dis-



Gold Ornament.

play a great deal of skill. Nor was gold entirely forgotten. The cap-shaped ornament of gold was found in Ireland. During the Bronze age, as we have seen, there was no attempt made to represent animal forms by way of ornaments; but we meet with such representations during the early part of the Iron Age. This shows how they ornamented the sheath of a sword found in one of the Swiss lakes.

Ornamental Sword-sheath.

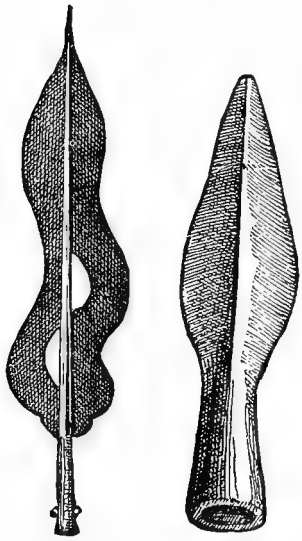


Swords.

The warriors of the early Iron Age possessed leaf-shaped swords for stabbing. The hilts were of bronze. This period was a struggle for existence, on the part of the various tribes of Europe. War must have been very common, so it is not strange that a large number of relics of this age are of warlike implements. Lance-heads, javelins, and arrow-heads have been found in abundance. It appears, from experiments ordered by the Emperor Napoleon III, that the javelins could only have been used as missile weapons, and that they were thrown, not by the hand merely grasping the shaft, but

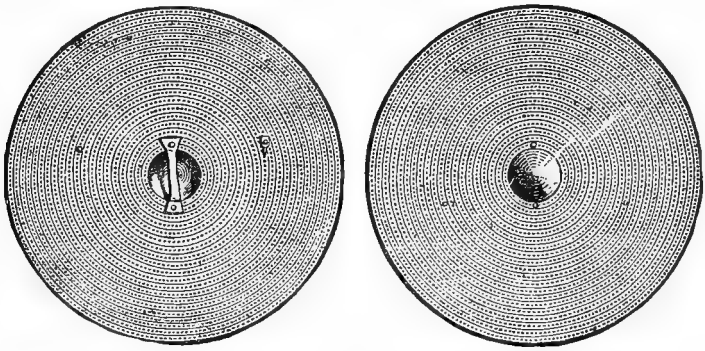
by means of a cord or thong, something after the principle of a sling.[1]

Some years ago an old battle-field was discovered at Tiefenau, in Switzerland. On it were found a great number of objects made of iron, such as fragments of chariots, bits for horses, wheels, pieces of coats of mail, and arms of various sorts, including no less than a hundred two-handed swords. All of these were made of iron.[2] The soldiers also carried with them shields, made sometimes of bronze, as in the cut below, or of wood, studded with iron.



Lance-head and Javelin.

There is evidence of considerable volume of trade at this time. The Mediterranean was the theater of an extended commerce. Phœnician sailors not only ventured to brave the Mediterranean sea, but carried their vessels out on the Atlantic at as early a



Shields.

date as 500 B. C. The Greek traders were also active. Massilia, or as it is known in modern times, Marseilles, was

[1] Figuier's "Primitive Man," p. 325. [2] "Prehistoric Times," p. 7.

the seat of a thriving trade. African ivory has been found in the tombs of Hallstadt, in Austria, in connection with ornaments of amber from the Baltic, and gold from Transylvania. The inhabitants of this town possessed in their salt mines the source of a lucrative trade. The trader of the Iron Age was able to take an immense stride by reason of the invention of money. Heretofore, in Europe, we have not met with coins, and trade must have been carried on by means of barter.

Acquainted as we are at the present day with money and the mechanism of exchange, it is difficult to see how any extended trade could be carried on without some unit of value, yet no coins are known earlier than the Iron Age.[1] The most ancient coins known are Greek, and date back to the eighth century before Christ. This coin is one found in one of the lake settlements. It is made of bronze, and the figures are not stamped, but obtained by melting and casting.[2] This, however, is not a Greek coin, but a Gallic one. On the battlefield of Tiefenau, mentioned above, several Greek coins, struck at Massilia, were found.[3]

Gallic Coin.

It is scarcely necessary to point out, that though iron gives its name to this age, it by no means follows that the only difference between this and the Bronze Age is the use of iron. "The pottery is different, the forms of the implements and weapons are different, the ornamentation is different, the knowledge of metallurgy was more advanced, silver and lead were in use, letters had been invented, coins

[1] M. Desor, in "Smithsonian Reports," 1865, tells us that small brass rings were probably used by people of the Swiss lake villages of the Bronze Age epoch as money.

[2] Figuier's "Primitive Man," p. 310.

[3] Lubbock's "Prehistoric Times," p. 7.

had been struck."[1] That wonderful invention, the phonetic alphabet, was made during the early part of this age. The past was no longer simply kept alive in the memory of the living, handed down by tradition and song. Inscriptions, and monuments, and books abounded, and we are no longer confined to an inspection of their handiwork, or examination of their habitations, and explanation of ancient burial mounds for our knowledge of their life and surroundings. It is no longer the archæologists' collections, but the writings of the historian that unfolds past times and customs.

Let us cast a glance at the condition of Europe at the dawn of history. We have seen that in general terms the Bronze Age coincided with the arrival and spread of the Celts, though the earlier Celts were still Neolithic. The use of iron could scarcely have been inaugurated before the innumerable hordes of the Germanic tribes, probably driven from their Asiatic homes by the presence of invading people, were on the march. The world has, perhaps, never witnessed such a movement of people as convulsed Europe for several hundred years, beginning the second century before Christ and continuing until the fall of the Western Empire of Rome. The light of history dawns on a stormy scene in Europe. The Celts confined to the Western portion had been largely subjected by the Roman armies, but the largest portion of Europe held by the Germanic tribes was the seat from whence assault after assault was made on the Roman Empire, which at length, weakened by internal dissensions and enervated by luxury, split in twain, and the western, and most important part, fell before its barbarian foes.

The various tribes could not keep alive the civilization they had overthrown. The wandering hordes of Germanic people could not easily forget their former barbaric life, their

[1] Lubbock's "Prehistoric Times," p. 17.

marches of conquest, and careers of pillage. But the claims of civilization, though light and pleasant, are none the less imperative, and a people who seek her rewards must form settled communities, develop public spirit, organize government, and sink the individual in the public good. Not appreciating these claims, it is not strange that the incipient civilization nearly expired, and that the night of the Dark Ages enwrapt Europe. From out that darkness, composed of the descendants of the people whose culture we have been investigating, finally emerged the mediæval nations of Europe.

Tne review has been a pleasant one, for it is a record of progress. The difference between the culture of the Neolithic and the Iron Age is great, but it is simply a development, the result of a gradual growth. Civilization and history have only hastened this growth. If we look around us to-day we can trace the elements of our civilization back through the eras of history, and though the faint beginning of some can be noticed, yet many of them come down to us from prehistoric times. We have treated of these early people in the three stages of culture known as the Neolithic, Bronze, and Iron Ages. We have seen there is no hard and fast line dividing the different stages of culture. To borrow the words of another, these stages of progress, like the three principal colors of the rainbow, overlap, intermingle, and shade off the one into the other, and yet in the main they are well defined.[1]

We instinctively long to set bounds to the past, to measure it by the unit of years. It affords us satisfaction to give dates for events long since gone by. For any event in the domain of history, it is natural and appropriate to gratify this desire. It gives precision to our thoughts, and more firmly fixes the march of events. But the historical portion

[1] Evans's "Ancient Bronze Implements," p. 1.

of human life on the globe is but a small part of the grand whole. When we pass beyond history, or into prehistoric times, we find ourselves utterly at a loss as to dates.

We have referred in the preceding pages to the commonly accepted belief of a few years ago, that, at most, a few thousand years express the whole period of human life on the globe. This was supposed to be the teaching of the Scriptures, but Infinite Wisdom left not only his word, but he left an imperishable record of the past in rocky strata and excavated valley, in dripping caves and mountain masses. When it was seen that the claims of geology for a greatly extended past, one transcending the powers of the human mind to conceive its length, could no longer be successfully denied, then it was that earnest investigators in the field of human antiquity could no longer shut their eyes to the fact that if geological evidence were worth any thing, man must have existed in the world for a far longer time than one covered by the brief period hitherto relied on.

This truth is so patent and plain that it has received the unqualified indorsement of the most learned scholars. Distinguished divines have been amongst its able expounders, and instead of being in opposition to the Bible, as already stated, the earnest reader finds in the periods of the geologists unexpected confirmation of its truths. The evidence of an extended past for man is not, however, wholly of a geological nature, though these have been the ones principally relied on. The archæologist to-day summons to his aid the science of language, studies into the origin of civilization and the comparison of the different races of men, and derives from each and all of these concurrent testimony as to a vast, shadowy, and profound antiquity for man, one stretching way beyond the dawn of history, far into the very night of time.

As we have now spent some time in tracing out the cul-

ture of these early ages, it may be well to see if there are any means at our command to determine the absolute chronology of the various ages. At the very outset of our inquiry, we shall perceive that we have no such class of facts as guided our investigations into the age of the Paleolithic remains. We have but to recall the situation in which the implements of that age were found, always under such circumstances, that we see at once that a great lapse of time has passed since they became imbedded where found, and then the bones of the various extinct animals, found so associated with the implements, that we are justified, even compelled, to admit they occupied the same section of country, and then, from a variety of causes, we are satisfied that they occupied Europe at the close of the Glacial Age, if not for long ages before. All this gave us a point of departure, and we have showed with what care scholars have studied all questions relating to the date of the Glacial Age.

But aside from the fact that geology points out that a long time went by after the close of the Glacial Age before Neolithic man arrived on the scene, we are largely deprived of its aid in our investigations; for all the various implements and specimens of the household industries, from which we derive our knowledge of these latter ages, are found only in surface deposits; that is, in the modern alluvia and silt of river bottoms, in superficial deposits, in caves, and in peat-bogs; and even in other instances where apparently deeply buried, as in the submerged forest deposits of the British coasts, we know that, geologically speaking, their age is recent.

But in spite of these difficulties, attempts have been made from time to time to determine the absolute chronology of these ages. The results, however, can only be considered as approximations of the truth. We will call attention to

some of these calculations. Their value to us consists in showing us the methods by which this problem has been attacked, and not in the results obtained. M. Morlot, of Switzerland, has sought to determine this question by a study of the delta of the Tiniere, which is a small river flowing into the lake of Geneva. Like all mountain streams, it brings down considerable quantities of sediment, with which it has formed a conical shaped delta. Cuttings for a railroad exposed a fine section of this cone, and showed that at three different times layers of vegetable soil, which must once have been its old surface were found.

The lowest surface was some twenty feet beneath the present surface, and here were found relics of the Stone Age. The second layer was at the depth of ten feet, and contained relics of the Bronze Age. Finally the first buried layer, three feet beneath the present surface, was found to contain relics of the Roman Age. Obtaining from other data the time that has elapsed since the deposits of the Roman layer, he readily calculates the age of the Stone and Bronze layers. By this means he obtains for the Bronze Age an antiquity of between three and four thousand years, and for the Neolithic Age from five to seven thousand years.[1] M. Morlot does not claim for his calculation more than approximate accuracy.[2] But if we were to allow it a greater accuracy than its author claims, it would still only show us that from a period of from five to seven thousand years ago, tribes of stone using folks lived in Switzerland. It tells us nothing as to their first appearance, or the total length of this age.[3]

[1] "Smithsonian Report," 1860, p. 342. [2] Ibid.

[3] Mr. Southall, in "Recent Origin of Man," p. 475, quotes, from Dr. Andrews, of Chicago, to the effect that these calculations are very erroneous, as he thinks that M. Morlot forgot that the size of the cone would increase more and more slowly. On the contrary, M. Morlot says as follows: "Only this growth must have gone on at a gradually diminishing rate, because

Other calculations of a similar nature have been made. The Lake of Bienne, in Switzerland, has been gradually silting up along its margins from time immemorial. About seven hundred and fifty years ago there was an abbey built at one place on the then existing shore of the lake. Since that time the gain of land has been about twelve hundred feet. A considerable distance further up the valley are found the remains of a lake settlement of the Stone Age. If the gain of land has been uniform, it has not been far from seven thousand years since the lake washed round the ancient settlement. Of course the land may have gained faster at one time than at another, but from the general configuration of the valley it is considered that its gain was regular.[1]

Mr. Skertchly, of the Geological Survey of England, has furnished still another estimate, based on the growth of the Fen-beds on the east coast of England. It is sufficient to state that he also arrives at an estimate of about seven thousand years for the Neolithic period.[2] Now these results are interesting, and their substantial agreement is, to say the least, striking. We must remember, however, that none of them are free from error. They may serve to clear up our thoughts on this subject, but we notice they tell us nothing as to the beginning of the Neolithic Age.

Abandoning the effort to obtain dates for the various ages, attempts have been made to calculate the entire interval that has elapsed since the close of the Glacial times, and thus set bounds to the first appearance of Neolithic

---

the volume of a cone increases as the cube of its radius. Taking this fact into consideration, etc." (Smithsonian Report, 1860, p. 341.) There are, however, several objections to this calculation, for which see Lubbock's "Prehistoric Times," p. 400; also Quatrefages's "Human Species," p. 138.

[1] Lubbock's "Prehistoric Times," p. 402. For criticisms on this calculation see Southall's "Recent Origin of Man." [2] British Assoc. Rep., 1879.

man. We briefly touched on this question in determining the antiquity of the Paleolithic Age, and we say, as far as this country was concerned, it was comparatively a recent thing, but as for Europe, it must be at a very remote time. M. Quatrefages has called our attention to two investigations in Europe, which, in order to understand this question, we will now glance at. The waters of the Rhone carry into Lake Geneva every year quantities of sediment. In other words, from this and other sources, the lake is gradually being filled up. Carefully calculating the amount carried into the lake in a year, estimates have been made of the length of time it has taken the river to fill up the lake as much as it has.

But in making this calculation the date arrived at was a maximum one—that is, a point beyond which it is not reasonable to suppose the time extended. These calculations gave as a result one hundred thousand years. The meaning of this is that the time elapsed since the close of the Glacial Age was something less than the number just stated. On the other hand, a minimum date for this time has been obtained by estimating the amount of erosion in the valley of the River Saone, in France. From this we know that the time can not be less than seven thousand years.[1]

It is, perhaps, doubtful whether we shall ever be able to obtain satisfactory answers to these questions. From what we have repeatedly seen of the slowness of development of primitive man, we do not doubt but what the antiquity of Neolithic Man goes much farther back than seven thousand years. When a naturalist finds in widely separated parts of the world animals belonging to a common order, he is justified in concluding that the order is a very ancient one. To illustrate, the opossum belongs to an order

[1] Quatrefages's "Human Species," p. 139, *et seq.*

of animals of which the only other representatives are found in Australia and the neighboring islands.[1] We are not surprised, therefore, to learn that this order was the first to appear in geological time.[2] We think the rule is equally applicable to races of men. We are told that the Turanian race, or, as it is often named, the Mongoloid race, is a very widely scattered one. Its representatives are found over the larger portion of Asia, in Northern Europe, the islands of the Pacific; and they were the only inhabitants of the New World at the time of the conquest.[3] This wide dispersion would imply that they were one of the ancient races of the world, and as such their antiquity must be far greater than the above named number of years.

This point grows clearer when we see what light is afforded on this subject by historical research. The Turanian people were in full possession of Europe while yet the ancestors of the Hindoos and the various European nations dwelt together as one people in Asia. As a race they had grown old when the Celts commenced their wanderings. Egypt comes before us as a powerful people, at a time at least as early as six thousand years ago. Even at that time they had attained civilization. But we need not doubt that there is a long series of years lying back of that, during which this people were slowly advancing from a previous condition of barbarism. The Egyptian people themselves are, in part at least, descendants of a Turanian people that probably in former times occupied the valley of the Nile and North Africa.[4]

Mr. Geikie has lately gone over the entire ground from

[1] Nicholson's "Manual of Zoölogy," p. 535.

[2] Dana's "Manual of Geology," p. 416, note.

[3] Keary's "Dawn of History," p. 382; Morgan's "Systems of Consanguinity and Affinity."

[4] Dawkins's "Early Man in Britain," p. 324.

the point of view of a geologist. He ranges over a wide field, and appeals in support to writers of acknowledged ability in all branches of learning[1]. Yet the impression we gather from his writings is that of ill-defined, but far-reaching antiquity, one necessary to account for the great climatic and geographical changes which he shows us have taken place since the Glacial Age. But he tells us that any term of years he could suggest would be a mere guess. We can not do better than leave the matter here. Perhaps as a result of the research of our present scholars, we may soon have more precise results.

These closing essays have impressed on us clearly and distinctly the isolation of the Paleolithic Age. When we reflect on its prolonged duration, its remoteness in time, and its complete severance from the Neolithic and succeeding ages, we are almost ready to wonder whether they were indeed human beings. But beginning with the Neolithic Age, we come to our own era. This primitive culture seems to have been the commencement of our own culture, and so the industries, household implements, and weapons of these ages possess a greater interest to us. We have now completed our inquiry into prehistoric life in Europe, and are ready to turn our attention to other parts of the field. What we have thus far learned shows us how true it is that the past of human life on the globe is full of mystery. We trust that what has been written will enable our readers to form clearer conceptions of life in Europe during these far away times.

# CHAPTER IX.

## EARLY MAN IN AMERICA.[1]

CONFLICTING accounts of the American Aborigines—Recent discoveries—Climate of California in Tertiary Times—Geological changes near its close—Description of Table Mountain—Results of the discoveries there—The Calaveras skull—Other relics—Discussion of the question—Early Californians Neolithic—Explanation of this—Date of the Pliocene Age—Other discoveries bearing on the Antiquity of man—Dr. Koch's discovery—Discoveries in the Loess of Nebraska—In Greene County, Ill.—In Georgia—Difficulties in detecting a Paleolithic Age in this country—Dr. Abbott's discoveries—Paleolithic Implements of the Delaware—Age of the deposits—The race of Paleolithic man—Ancestors of the Eskimos—Comparison of Paleolithic Age in this country with that in Europe—Eskimos one of the oldest races in the World.

THE energy and skill of Columbus were crowned with success, and the storm-tossed Atlantic was found to lave the shores of a western continent, reflecting minds in Europe were much interested in the strange stories they heard of the inhabitants of the New World. On the one hand Spanish adventurers told scarcely credited stories of populous cities, temples glittering with gold and silver ornaments, and nations possessed of a barbaric civilization scarcely inferior to their own. On the other hand were accounts of morose savages, cruel and vindictive in nature, depending on fishing and the chase for a livelihood. Nearly four centuries have elapsed since that time. The aboriginal

[1] The manuscript of this chapter was submitted to Dr. C. C. Abbott, of Trenton, New Jersey, for criticism.

inhabitants have nearly diaappeared, leaving their origin and prehistoric life almost as great a riddle to us as it was to the early colonists.

But in endeavoring to unroll the pages of their history, we have chanced upon some strange discoveries. The Aztecs, that people whose culture is to-day such an enigma to our scholars, are known to be a late arrival in the valley of Anahuac. They were preceded in that section by a mysterious people, the Toltecs, whose remains excite our liveliest curiosity, but of which we have yet learned but little. Yucatan is shown to have been for many centuries the home of a people whose advancement equaled that of the Aztecs at their palmiest day. Like important discoveries attended the labors of explorers in the North. The entire valley of its great river is known to have been the home of a numerous population, that, from the nature of their remains, we call the Mound-builders. Who these people were, when and whence they came, and whither they went, are questions whose solution is by no means accomplished. Nor are such discoveries the only results. A study of their institutions has done much in revealing the constructions of ancient society, and thereby throwing light on some mysterious chapters of man's existence.

Of late years interest in the antiquity of man in America has been reawaked by the discoveries of human remains in Pliocene deposits in California, and the Glacial gravel of the Delaware at Trenton, New Jersey. Before this it was supposed that we had no authentic instance of human remains in America found under such circumstances that it was necessary to assign to them a profound antiquity. If these latter day discoveries be true, we can not escape the conclusion that man lived in America at as early a date as that indicated by any of the European explorations. Some hold

that the proof of his existence here in Pliocene times is far more satisfactory than any evidence of his presence in Europe during that time. There is something fascinating in this belief. If some of the most eminent scientists of America are not mistaken, man lived on our Pacific coast before the great ice-sheets that pulverized the surface of the earth and dispersed life before them came down from the north. He ranged along the western rivers before the volcanic peaks of the Sierras were uplifted, and his old hunting-grounds are to-day buried underneath the great lava flow which desolated ancient California and Oregon. But this assertion has not been allowed to pass undisputed, nor has it received the assent of all scientists.

We can easily understand why scholars subject all questions relating to the first appearance of man to very careful scrutiny. If a competent geologist should assert that he had found, in undoubted Pliocene formations, bones of some species of animals not hitherto suspected of living at that date, his statement would be accepted as proof of the same. But in the case of man, every circumstance is inquired into. It is but right that the utmost care should be exercised in this direction. But, on the other hand, we are not justified in demanding mathematical demonstration in every case of the accuracy of a reported discovery. Yet such seems to be the position of a portion of the scientific world. For, although they willingly admit that man has lived on the earth for a very long time indeed, they urge all sorts of objections to extending that time into a past geological age.

Accordingly, when Professor Whitney states as the result of many years spent in the investigation of the Tertiary formation of California, that he finds evidence of the existence of man in the Pliocene Age, it is not strange that one part of the scientific world listens incredulously to his state-

ments, and are at once ready to explain away the facts on which he relies. He may, of course, be mistaken, for it is human to err, but his proofs are sufficiently strong to convince some of the best scholars in America. We can do no more than to lay the facts before the reader and let him judge for himself.

We have seen what a genial climate prevailed in Europe during the Tertiary Age. This must also have been true of California. A rich and varied vegetation decked the land. The great trees of California of our day then flourished in Greenland, Iceland, and Western Europe. The cypress of the Southern States was then growing in Alaska and other high northern latitudes. The climate probably passed from a tropical one, in early Tertiary times, to a milder or temperate one in Pliocene times. Amongst the animals inhabiting America were three species of camels. Rhinoceroses, mastodons, and elephants trooped over the land. Tigers and other carnivora prowled in the forests. Herds of horse-like animals, one scarcely distinguishable from our common horse, grazed in the valleys, along with several species of deer. From the presence of the old drainage beds, we know that majestic rivers rolled their watery burden through the land. Such a country might well afford a home for man if he were present.

To understand fully the course of events which now took place we must venture on geological ground. The great Pacific Ocean, lying to the west of America, is constantly exerting a lateral pressure, which during Tertiary times showed its effect in the uplifting of the great mountain ranges of the western coast.[1] During late Tertiary times, as a counterpart to the upward movement, a great subsidence commenced in the Pacific region.[2] Doubtless many islands,

[1] Dana's "Manual of Geology," p. 735, *et seq.* [2] Ibid., p. 753.

some think an entire continent even, disappeared beneath the waves. The completion of the various mountain ranges left the coast firm and unyielding; hence, as it could not bend before the fiery flood forced upward from below by the downward motion just mentioned, it broke, and the torrent of molten rock leaped out as a lava flow. In consequence of this, near the close of Pliocene times, the surface of California and Oregon, especially the north of California, became buried under the lava and ashes of the most desolating volcanic outbreak that the earth has ever known.

Let us now see what bearing this has on the question of the antiquity of man. Scattered here and there throughout California are numerous masses of basaltic lava, which appear as elevated ridges, the softer strata around having been denuded away. They have received the general name of Table Mountains. They have not only been noted for their picturesque beauty, but miners long since found that the gravels underneath the lava covering were rich in gold. In Tuolumne County the Table Mountain is a flow of lava which originated in lofty volcanoes several miles away.

It extends along the north side of the Stanilaus, which is a small river flowing in a south-westerly course through the county. The mountain is in the form of a ridge about two thousand feet above the present level of the river. At one point the river breaks through this ridge, which has been worn away for a considerable distance. From this point the ridge appears as a continuous mountain, stretching away to the south for a distance of twenty miles, from where it crosses the river. "As seen from a distance the Table Mountain reveals its origin at once, in the contrast between the long, straight line of its upper edge and the broken and curving ones which the eroded hills of the auriferous strata everywhere exhibit. Its dark color and com-

parative absence of trees and shrubs on its top and sides also indicate very clearly that the materials of which it is composed are very different from that of the surrounding hills."[1]

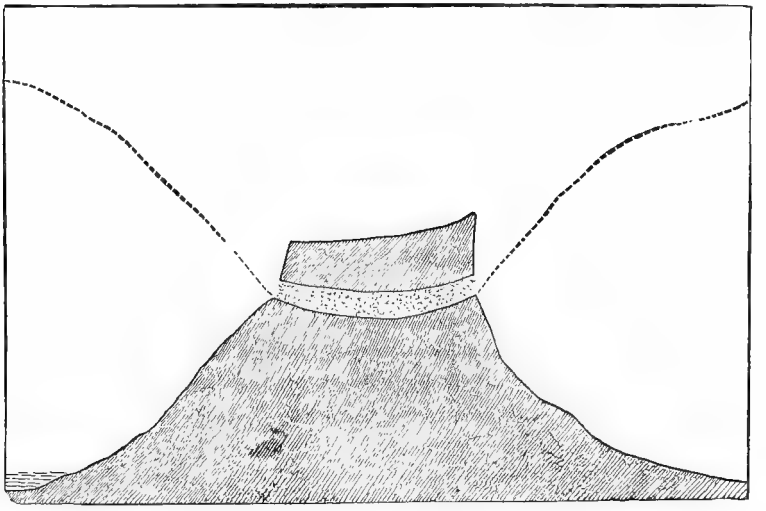
This is the celebrated Table Mountain of Tuolumne County. It is simply a vast flow of lava. It must have been a grand sight when this river of fire came rolling down from its volcanic fount. Its present position on top of an elevated ridge is a very singular one. In explanation of that we arrive at some very important conclusions, and we can not fail to be impressed with the fact that countless ages have rolled away since that lava flood poured down the mountain side. "No one can deny that a stream of melted lava, running for forty miles down the slope of the Sierra, must have sought and found a depression or valley in which to flow; for it is impossible that it should have maintained for any distance its position on the crest of a ridge." Lava is about as thick as molten iron, and would as surely seek some valley in which to flow as would so much water. "The valley of the Stanilaus, now two thousand feet deep, could not then have existed; for this flow of lava is clearly seen to have crossed it at one point."

"The whole face of the country must, therefore, have undergone an entire change since the eruption took place, during which this mass of lava was poured out. The valley of the Stanilaus must have then been occupied by a range of mountains. The same is true of the other side, where now is the valley of Wood's Creek; for such ranges must have existed in order to form and wall in the valley in which the current of lava flowed. There has been, therefore, an amount of denudation during the period since this volcanic mass took its position of not less than three or four

[1] Whitney's "Geology of California," Vol. I.

thousand feet of perpendicular depth, and this surprising series of changes is not peculiar to one locality, but the whole slope of the Sierras, through the gold region, is the scene of similar volcanic outflows and subsequent remodeling of the surface into a new series of reliefs and depressions."[1]

In order to fully realize the change here spoken of, an imaginary section of Table Mountains is here presented. Here we see the two valleys on the sides, and the mass of



Imaginary Section of Table Mountain.

lava covering the top of the mountain. The dotted lines represent the position of the old line of hills, which must once have inclosed the valley down which coursed the fiery torrent.

We require to dwell on this fact before we can fully understand its meaning. The "eternal hills," two and three thousand feet in height, have been completely washed away, and where they stood is now a deep valley. But the old valley, protected by its stony covering, is now a mountain ridge; and this, we are told, is not a solitary instance, but

[1] Whitney's "Geological Survey of California," Vol. I.

the entire surface of the country has been thus denuded. We stand in awe before the stupendous results, which nature, working through vast cycles of time, has accomplished.

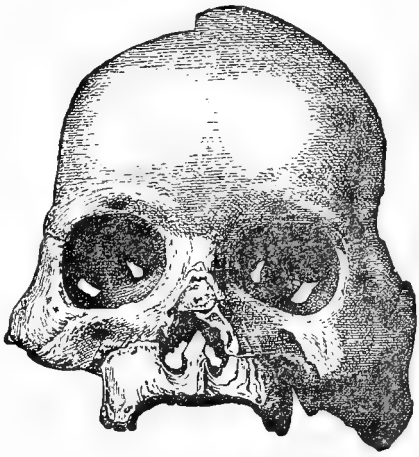
But if this lava flow took place in a pre-existing valley, we ought to find under the rocky covering beds of gravel, rolled stones, and other *débris* peculiar to a river bed. Such, in fact, we do find extended along directly underneath the lava, about fifteen hundred feet above the general level of the country. These old river gravels are found to be very rich in gold, and miners have tunneled into them in numerous places in search of the valuable metal. In order to determine the geological age of these gravels, and subsequent lava flow, a careful examination of portions of plants and bones of animals found therein has been made. The plants are pronounced by competent authority[1] to be Pliocene, totally distinct from any specimens now growing in California. The animal remains are rhinoceroses, camels, and an extinct species of horse. The age of these gravels is, therefore, pronounced to be Pliocene. We would say in this connection that the auriferous gravels of California have been the object of a very careful research by Prof. Whitney. He adds to his conclusions that of another of the State geologists. We need not give in detail his arguments, but he reaches the conclusion that the auriferous gravels of the Pacific slope represent the whole of the Tertiary Age.[2]

We have seen that in the ancient gravels of European rivers archæologists have found the materials wherewith to build a fascinating story of man's appearance in Quaternary times. We have underneath the lava flow of California the gravel beds of rivers far antedating the gravels of the

[1] Dr. Newberry's "Geological Survey of California."
[2] Whitney's "Auriferous Gravels of California," p. 283.

Somme. It is therefore not a little interesting to learn from Prof. Whitney that he finds many proofs of the existence of man in the gravels of the Pliocene Age in California. Under the solid basalt of Table Mountain have been found many works of men's hands, as well as the celebrated "Calaveras Skull."

This skull was taken from a mining shaft at Altaville, at a depth of one hundred and thirty feet from the surface, beneath seven different strata of lava and gravel. Prof. Whitney was not present when it was found. He, however, made it his business to examine into the facts of the case, and he thus speaks of it: "That the skull was found in these old, intact, cemented gravels has been abundantly proved by evidence that can not be gainsaid." And again: "So far as human and geological testimony can at present be relied on, there is no question but that the skull was found under Table Mountain, and is of the Pliocene Age."[1]



Calaveras Skull.

This would seem to be pretty explicit, but, as we have said before, Prof. Whitney, in his formal report as the State geologist of California, reaches the conclusion that the auriferous gravels of the Pacific are all of the Tertiary Age. It is therefore not a little interesting to learn that numerous instances are recorded of the finding of human remains or the works of man in these gravels. Prof. Whitney men-

[1] Cambridge Lecture, 1878.

tions twenty such instances.[1] Mr. Bancroft furnishes us a list of such discoveries, giving as his authority Mr. C. D. Voy, of the California Geological Survey, of Oakland, California. He states that Mr. Voy personally visited most of the localities where the discoveries were made, and took all possible pains to verify their authenticity, and in many cases obtaining sworn statements from the parties who made them.[2]

Two stone mortars and spear-heads, six and eight inches long, were found in the gravel under Table Mountain, just mentioned. These relics were found about three hundred feet from the surface. A hundred feet and more of this depth was of solid lava. At another place a stone bead was found three hundred feet from the mouth of the tunnel, under a thick layer of lava. Many other instances might be given of such discoveries, not always under lava coverings, but always in such instances that we are compelled to assign to them an immense antiquity. As, for instance, at San Andreas, according to a sworn statement in Mr. Voy's possession, large stone mortars were taken from a layer of cemented gravel, overlain by one hundred and twenty-five feet of volcanic and gravel materials. Many similar instances are on record, but enough have been mentioned to serve the purpose of the chapter.[3]

As we have briefly gone over the ground on which the antiquity of man in America is, by some, referred to the Pliocene Age, it is but fair to notice some of the objections that have been raised. It is not necessary to point out that the only questions worthy to be considered are of a scientific nature.

---

[1] Cambridge Lecture," 1878. [2] "Native Races," Vol. IV, p. 698.

[3] In general, all about Sonora, in the auriferous gravels, are found bones of extinct animals, and, associated with them, many relics of the works of human hands. These are found at various depths down to one hundred feet. (Whitney's "Auriferous Gravels," p. 263.)

We must deny either the age of the gravels themselves or that the objects of human handiwork were found as claimed, or else that they are of the same age as the gravels. Prof. LeConte thinks, from the nature of the gravels and the peculiar circumstances which surround them, that they are not older than the close of the Pliocene Age. He thinks they, in fact, belong to the transitory period between that age and the Quaternary.[1] But as we are considering the question of Pliocene man, it makes but little difference if the gravels do belong to the very close of that period. They may still be called Pliocene.

One great trouble with those remains is that they were not discovered by professed geologists. We have to depend upon the statements of miners. But if their statements can be believed (and why should they not?), there is no doubt about their genuineness. The testimony, as Mr. Whitney says, "all points in one direction, and there has never been any attempt made to pass off on any member of the survey any thing out of keeping, or—so to speak—out of harmony with what has been already found, or might be expected to be found. It has always been the same kind of implements which have been exhibited to us, namely, the coarsest and the least finished, which one would suppose could be made, and still be implements at all."[2] This result would hardly be possible, where so many parties are concerned in furnishing the evidence, if the objects were not genuine.[3]

In opposition to this conclusion it has been urged that the stone mortars, pestles, etc., have become imbedded in the gravel by the action of streams, or slips from the

[1] *American Journal of Science*, Vol. XIX, p. 176, 1880.

[2] "Auriferous Gravels," p. 279.

[3] Wright's "Studies in Science and Religion," p. 289.

mountain side in modern times, or are the results of interments or mining operations.[1] As an illustration of how they might become buried by the action of streams, reference is made to somewhat similar discoveries in the tin-bearing streams of Cornwall (Wales). We know with considerable certainty that at a very early date the Phœnicians worked in the gravels of these streams for tin ores. Implements made use of by them and others—such, for instance, as shovels, mortars, pick-axes, stone bowls, and various dishes—have been found at all depths in this gravel, by more modern miners.[2]

This may explain the presence, in some instances, of similar remains in California, but it utterly fails to do so, where the remains have been buried underneath a lava flow or a bed of volcanic materials, as is the case in many of the instances we have cited. Manifestly no water has disturbed their strata since the volcanic materials were laid down. Neither can we think of a land-slide carrying these remains into the heart of a mountain, or burying them underneath a hundred feet of lava. The peculiar position in which they were often found is surely lost sight of by those who think they might have been placed there by interment. We can not think of a savage people digging a grave in such a position.

It has been urged with considerable force that these relics have been left behind by ancient miners when they mined for gold. Dr. Wilson is cited as authority for the statement that the Mexicans obtained "silver, lead, and tin from the mines of Tasco, and copper was wrought in the mountains of Zacotollan by means of galleries and shafts, opened with persevering toil where the metallic veins were imbed-

[1] Dawkins, in Southall's "Pliocene Man," p. 18.
[2] Southall's "Pliocene Man," p. 19.

ded in the solid rock." Prescott, the historian, also testifies to the same fact.

We need only add to this, that wherever these ancient galleries were opened in the solid rock, they still exist. Schoolcraft mentions finding one two hundred and ten feet deep.[1] The chances are not worth considering, that these old mines would be overlooked. If, for instance, the Calaveras skull is that of a prehistoric miner, killed in an old mining gallery only a thousand years or so ago, it is inconceivable that all evidence of this mine should have disappeared. Or, if in one case it should have done so, it would surely have been detected in other instances. The variety and explicitness of the testimony brought forward makes all such supposition improbable.[2]

It is best, in this matter, to hold the judgment in suspense. We have stated Mr. Whitney's position, and the objections that have been raised to it. The amount of thought bestowed on the antiquity of man will doubtless soon clear up the whole matter. We can not do better than to consider his surroundings, supposing that he was really present. The country must have been very different from the California of to-day. Dr. Cooper says, "The country consisted of peninsulas and islands, like those of the present East Indies; resembling them also in climate and productions."[3] The probabilities are that to the west and southwest of California, instead of watery expanse of the Pacific, only

---

[1] Schoolcraft's "Archæology," Vol. I, p. 105.

[2] As bearing on the question of Pliocene man, we might refer to the impression of human (?) foot-prints in the sand-stone quarry of the State prison at Nevada. At one time this area was the bottom of a lake, and we can plainly see the tracks of various animals that came down to drink. A huge mammoth visited the place; so also did horses and other animals. Among these is one series of tracks evidently made by a biped. Some think they are the sandaled foot of a human being. This question is still under discussion.

[3] "Geographical Survey West of the 100th Meridian," Vol. VII, p. 11.

broken here and there by an ever-verdant islet, there was either a continental expanse of land or, at any rate, a vast archipelago. We know that over a large part of the Northern Pacific area the land has sunk not less than six thousand feet since late Tertiary times.[1]

We are certain the ocean area must have presented a vastly different aspect before that depression commenced. It is not unreasonable to suppose that communication between North America and Asia was much easier than in subsequent epochs. It might have been an easy matter for man to pass back and forth without losing sight of land. It is therefore reasonable to suppose that if Pliocene man was in existence, he would have occupied both sides of the Pacific at this early time.[2] These last conclusions are very important ones to reach, and as there is reasonable foundation for them, we must bear them in mind in the subsequent pages.

It will be remembered that the races of men who inhabited Europe in the Paleolithic Age had only very rudely formed, unpolished implements. It is not until we arrive at the Neolithic stage of culture that we meet with specimens of polished stone implements. To judge from the specimens of early Californian art, the beautifully polished pestles, beads, plummets or sinkers, spear-heads, etc., Pliocene man in California must have been in the Neolithic stage of culture. Though they were not acquainted with the potter's art, yet from their skill in working vessels of stone, they had undoubtedly passed entirely through Savagism, and had entered the confines of Barbarism,[3] as far advanced, in fact, as many of the Indian tribes the Spaniards found in possession of the country.

[2] Putnam, in "Geographical Survey West of the 100th Meridian," Vol. VII, p. 11.

[3] Ibid., p. 18.

It must be confessed, this seems very singular. It is this statement that causes many to shut their eyes to what would be otherwise at once admitted and refuse to believe the genuineness of the discovery. If the implements brought to light had been of the rude River Drift type—celts but little removed from nodules of flint—scholars would not be so cautious about accepting them. But when we learn they are Neolithic, we at once see why they hesitate, and ask for more conclusive proofs; yet this is no reason to disregard the discoveries. They may be a great surprise, they may be an unwelcome discovery to the holder of some theories, yet the only question is, whether they are true or not, and if true, theories must be modified to fit the facts. Prof. Putnam thus speaks, in reference to them: "As the archæologist has no right to be governed by any pre-conceived theories, but must take the facts as he finds them, it is impossible for him to do otherwise than accept the deductions of so careful and eminent a geologist as Prof. Whitney, and draw his conclusions accordingly, notwithstanding the fact that this Pliocene man was, to judge by his works in stone and shell, as far advanced as his descendants were at the time of the discovery of California by the Spaniards."[1]

Perhaps a partial explanation of this matter may be found when we consider all the circumstances of the case. The origin of man is generally assigned to some tropical country. Sir John Lubbock thus speaks of it: "Our nearest relatives in the animal kingdom are confined to hot, almost tropical climates; and it is in such countries that we are, perhaps, most likely to find the earliest traces of the human race."[2] This is also the opinion of other eminent scholars. M. Quatrefages thinks that man probably origi-

[1] "Geographical Survey West of the 100th Meridian," Vol. VII, p. 12.
[2] "Prehistoric Times," p. 436.

nated in Asia. He points out, however, that, during Tertiary times, the climate was much milder, and man might have originated in Northern Asia.[1] Now, if it be true that a great mass of land has disappeared beneath the waves of the Pacific, why may we not suppose that, if this sunken land was not the original home of man, it was at a very early time inhabited by him; that here he passed through his experience in savagism?[2] We know how suited the islands of the Pacific are to the needs of a savage people; and we must not lose sight of the probable ease with which they could reach the coast of California—and also of what Dr. Cooper has told us of the climate and geographical surroundings of California at that early time. So it may not be unreasonable to suppose that man reached California long ages before he wandered into Europe, and so reached the Neolithic stage of culture much earlier than he did in other parts of the world.[3]

It might be objected, that if a people in the Neolithic stage of culture lived in California in the Pliocene Age, they ought to have reached a very high stage of culture indeed when the Spaniards invaded the country. This is what we would expect had they been left to develop themselves. The great geographical changes that took place near the close of the Pliocene would cut off the primitive Californians from the Asiatics. Not only was the land connection—if it indeed existed—now destroyed, but causes were changing the climate. Ice and snow drove from the north life of both animals and plants, and for an entire geological

[1] "Human Species," p. 147.

[2] The researches of Mr. Dall in the Aleutian Islands demonstrate the long-continued occupation of them by a savage people, and a gradual advance of the same in culture—though this apparent advance may have been simply the inroads of more advanced tribes. U. S. Geographical Survey W. of 100th M., p. 12.

[3] Wright's "Studies in Science and Religion," p. 292.

period communications with Asia by way of the north must have been very difficult, if not cut off altogether. Who can tell what changes now came to the Asiatic branch of these people? We are but too familiar with the fact that nations and races sicken and die: many examples could be given. The natives of the Sandwich Islands seem doomed to extinction. In a few centuries, the Indians of America will live only in tradition and song.

Such may have been the fate of the early inhabitants of the Pacific continent: certainly it would not be surprising, if the immense climatic and geographical changes which then took place would produce that result. Or it may be that but a scanty remnant lived on, absorbed by more vigorous, though less highly cultivated stocks of the same people, whose homes had been on the main-land of Asia—and the remnant left along the Pacific coast must have lived on under vastly different circumstance. The interior of North America was largely a dreary expanse of ice and snow down to the 39th parallel of latitude. It is quite true, this great glacier did not reach the Pacific Slope; but it must have exerted a powerful influence on the climate: and the evidence points, that the Sierra Nevada were occupied by local glaciers which reached down into the fertile expanse of the plains.

This was certainly a far different climate, and a far different country, than that which sustained a vegetation of a tropical growth. It may well be that the people should, as a result of their changed conditions, have deteriorated in culture; or, at any rate, their progress toward civilization may have been stopped, and many thousands of years may have passed with no perceptible improvement. It may be objected, that man will improve under any state of existence, give him time enough. This is, doubtless, in the main true.

But a race may early reach its limit of culture; in which case, as a race, it will not improve: we may do much with the individual, but nothing, or but very little, for the race.

In these considerations which have been advanced we may find some reason for the early appearance of Neolithic man, as well as the fact that he advanced no farther in culture. But whether man first arrived in California in Pliocene times or not, he continued to inhabit the land to the present day. He would, however, be exposed to assault after assault from invading tribes. We do not wish to examine the question of the origin of the native Americans. It is held, by the best authorities, that at least a portion of them came from Asia, using the Kurile Islands as a stepping stone. Reaching the main-land of America, and passing down the coast, they would, sooner or later, reach the Valley of the Columbia—which has been characterized as the most extraordinary region on the face of the earth in the variety and amount of subsistence it afforded to tribes destitute of a knowledge of agriculture. At certain seasons of the year the rivers are crowded with fish, and they are then caught with the greatest ease. As a mixture of forest and prairie, the country is an excellent one for game. A species of bread-root grew on the prairies; and, in the Summer, there was a profusion of berries. To these advantages must be added that of a mild and equable climate.[1]

These combined advantages would make this valley one of the centers of population, from whence would issue successive bands of invading people. A portion of these, passing over into California, would come in contact with the descendants of Pliocene man. The result would be, that the primitive inhabitants, unable to escape to the west, would come in contact with wave after wave of invading tribes.

[1] Morgan's "Ancient Society," p. 108, note.

This is not altogether theory. All inquirers into the customs, arts, and languages of the primitive Californians have been struck with the remarkable commingling of the same. We are driven to the conclusion that here has been the meeting ground of many distinct tribes and nations. "From such a mixture, and over-population of the most desirable portions of the country, would naturally result the formation of the hundreds of petty tribes that existed in both Upper and Lower California when first known to the Spaniards."[1]

In view of these facts, it is not strange that no advance in culture is noticeable; and the grounds just mentioned may go far to explain why we catch sight, here and there, of bits of customs, habits, and manners of life which strangely remind us of widely distant people—though it will not explain the presence of words of Malay or Chinese origin which are claimed to exist.[2] What is known as the Eskimo trace is quite marked in the physical characters and in the arts of the Californians.[3] It is, probably, the continuance of the type of the primitive American race.

It would naturally be interesting to know whether any date can be given for the Pliocene Age, and so give us some ideas as to the antiquity of man, if he were really here during that epoch. This, however, is one of the most difficult questions to answer, and in the present state of our knowledge incapable of solution. Approximations have, of course, been made, and, as might be expected, vary greatly in results. When it was acknowledged on all hands that on geological grounds the age of the earth was certainly very great, many times the few thousand years hitherto relied on, it is not strange that popular thought swung to

[1] "Geographical Survey West of the 100th Meridian," Vol. VII, p. 3.
[2] Bancroft's "Native Races," Vol. III, pp. 646, 647.
[3] "U. S. Geographical Survey West of the 100th Meridian," Vol. VII, p. 12.

the other extreme, and hundreds of millions of years were thought necessary to explain the series of changes which the geologists unfolded. This demand for a greatly extended time was strengthened when the law of the gradual evolution of life was expounded by the modern school of naturalists, and as great a lapse of time as five hundred millions of years was not deemed an extravagant estimate. Sir William Thompson has, however, demonstrated that the time that has elapsed since the crust of the earth became solidified can not be far from one hundred millions of years, and consequently we know the time since the appearance of life must be greatly less than that number of years.

Attempts have been made to estimate the length of time required to form the sedimentary crust of the earth. The results are so divergent on this point that it is best not to adopt any standard at present. Our views on this matter are also dependent on the time that has elapsed since the close of the Glacial Age, which, as we have seen, is not yet a settled point. If it be true that the islands of the Pacific commenced to sink during late Tertiary times, then we have a measure of that time in the growth of coral, which has required at least four hundred thousand years to form reefs the thickness of some that are known to exist.[1]

But here, again, it seems we are not certain when this depression commenced.[2] In a previous chapter we have gone over the Glacial Age, and have seen when, according to Mr. Croll's theory, it commenced. This was probably not far from the close of the Pliocene Age. We might as well leave the matter here. There are so many elements of uncertainty that it is doubtful if we will ever be able to assign satisfactory dates to the epoch.[3]

[1] Dana's "Man'l of Geology," p. 591. [2] LeConte's "Elements of Geology."
[3] Prof. Winchell, in his last work, "World Life," p. 363, *et seq.*, goes over

In bringing to a conclusion this somewhat extended notice of early man in California we have to admit that much of it is speculative; still it is an endeavor to explain known facts. The main statement is that man lived in California in the Pliocene Age, in the Neolithic stage of culture. Whether the arguments adduced in support of this statement are sufficient to prove its accuracy must be left to the mature judgment of the scientific world. There is no question but that the climate and geography, the fauna and the flora, were then greatly different from those of the present. Starting with these known facts, so strange and fascinating, it need occasion no surprise if the pen of the enthusiastic explorer depict a scene wherein facts and fancy are united.

In this case truth is certainly stranger than fiction, and when, in imagination, we see the great Pacific archipelago emerge from the waves, and, in place of the long swell of the ocean, we picture the pleasing scenes of tropic lands, the strange floral growth of a past geological age, the animal forms which have since disappeared, with man already well advanced in culture: when we recall all this, and picture forth the surprising changes which then took place, the slowly subsiding land, the encroaching waters, and the resultant watery waste, with here and there a coral-girt island, the great volcanic uplift on the main-land, the flaming rivers of molten lava, which come pouring forth, followed by the night of cold, ice, and snow: when we consider these, and the great lapse of time necessary for their accomplishment, how powerless are mere words to set forth the grandeur and

---

the entire subject. As might be expected, no decisive results are obtained. He sums up the arguments to show that in this country the close of the Glacial Age is not more than seven thousand years ago (p. 375). The student who reads these pages and then Mr. Geikie's work, "Prehistoric Europe," will be sorely puzzled to know what conclusions to adopt. We can not do better than refer to the chapter on Antiquity Paleolithic Age.

the resistless sweep of nature's laws, and to paint the insignificance and trifling nature of man and his works!

The discoveries in California are not the only instances of the relics of man and his works found under such circumstances that they are relied on by some to prove the great age of man in America. But on account of the rarity of these finds, and the contradictory statements and opinions respecting them, the scientific world has until lately regarded with some distrust the assertion of a great antiquity for man on this continent; but a review of the evidence on this point, and especially of Dr. Abbott's discoveries in New Jersey, must impress on all the conclusion that tribes of men were living here at the close of the Glacial Age, and probably long before that time.

It need occasion no surprise to learn that several of the discoveries of former years, relied on in this connection, have since been shown to be unreliable. They have not been able to stand a careful examination at the hands of later scholars. They were made when European savants were first communicating to the world the results of the explorations of the river gravels and caves of that country. The antiquity of man being amply proven there, may afford some explanation why more discriminating care was not employed. Of this nature were some of the discoveries in the valley of the Mississippi; such, for instance, as the portion of the human skeleton found mingled with the bones of extinct animals a few miles below Natchez, and the deeply buried skeleton at New Orleans, in both of which cases a simple explanation is at hand without the necessity of supposing a great flight of years.

Some of these discoveries yet remain an unsettled point. Such is the discovery of flint arrow-heads in connection with the bones of a mastodon found in Missouri. Dr. Koch,

who made the discovery, draws from the facts of the case such a suggestive picture that we will give his own words. After describing where found, he says: "The greater portion of these bones had been more or less burned by fire. The fire had extended but a few feet beyond the space occupied by the animal before its destruction, and there was more than sufficient evidence that the fire had not been an accidental one, but, on the contrary, that it had been kindled by human agency, and, according to all appearance, with the design of killing the huge creature which had been found mired in the mud, and in an entirely helpless condition. All the bones which had not been burned by the fire had kept their original position, standing upright and apparently quite undisturbed in the clay, whereas those portions which had been extended above the surface had been partially consumed by the fire, and the surface of the clay was covered, as far as fire had extended, by a layer of wood ashes, mingled with larger or smaller pieces of charred wood and burnt bones, together with bones belonging to the spine, ribs, and other parts of the body, which had been more or less injured by the fire. It seemed that the burning of the victim and the hurling of rocks at it had not satisfied the destroyers, for I found also, among the ashes, bones, and rocks, several arrow-heads, a stone spear-head, and some stone axes."

Such is Dr. Koch's very interesting statement of this find. "It was received by the scientific world," says Foster, "with a sneer of contempt," and, it seems to us, for very insufficient reasons. It is admitted that his knowledge of geology was not as accurate as it should have been. He made some mistakes of this nature, which have been clearly shown.[1] Still, he is known to have been a diligent collector, and we are told "no one who knew him will question but

[1] Dana's *Am. Journal of Science*, May, 1875.

that he was a competent observer."[1] It seems to us useless to deny the truth of his statements. There is, however, nothing to necessitate us believing in an immense age for these remains. This is not to be considered a point against them, for there is no reason for supposing that the mastodon may not have lingered on to comparatively recent times, and that comparatively recent men may not have intercepted and destroyed helpless individuals. Indeed, we are told there are traditions still extant among the Indians of these monsters.[2]

We have other facts showing that, in this country as in Europe, man was certainly living not far from the time when the land was covered with the ice of the Glacial Age, whatever may be true of still earlier periods. We are told that, when the time came for the final breaking up of the great glaciers, and while they still lingered at the head waters of the Platte, the Missouri, and the Yellowstone rivers, a mighty lake—or, rather, a succession of lakes—occupied the greater portion of the Missouri Valley. The rivers flowing into them were of great size,[3] and heavily freighted with sediment, which was deposited in the still waters of the lakes, and thus was formed the rich loess deposits of Nebraska.

From several places in this loess have been taken rude stone arrows, buried at such depths and under such circumstances, that we must conclude they were deposited there when the loess was forming. But this requires us to carry them back to a time when elephants and mastodons roamed over the land, for bones of these huge creatures[4] are quite

[1] Foster's "Prehistoric Races," p. 62.

[2] See Lockwood, in *Popular Science Monthly* for 1883, for account of beaver dam built on a mastodon skeleton and evidence of contemporaneity of Indians and mastodons.

[3] "The Missouri was a stream thirty miles wide." [4] "Hayden," p. 255.

frequently found. This arrow-point—or, it may be, spear-head—was found twenty feet from the surface; and almost directly above it, and distant only thirteen inches, was a vertebra of an elephant. "It appears, then, that some old races lived around the shores of this lake, and, paddling over it, accidentally dropped their arrows, or let them fly at a passing water-fowl;" and, from the near presence of the elephant's bone, it is shown that "man here, as well as in Europe, was the cotemporary of the elephant, in at least a portion of the Missouri Valley.[1]

Implement found in Loess.

Other examples are on record. In Greene County, Illinois, parties digging a well found, at the depth of seventy-two feet, a stone hatchet. Mr. McAdams carefully examined the well, to see if it could have dropped from near the surface. He tells us the well was dug through loess deposits; and from the top down was as smooth, and almost as hard, as a cemented cistern.[2] The loess was, as in Nebraska, deposited in the still waters of the lake which once occupied the Valley of the Illinois.[3] And we need not doubt but that it dates from the breaking up of the glacial ice. The position of this hatchet, then, found at the very bottom of the loess deposits, shows that, while yet the glaciers lingered in the north, and the flooded rivers spread out in great lakes, some tribes of stone-using folks hunted along the banks of the lakes, whose bottoms were to form the rich prairies of the West.

Previous to this discovery, Mr. Foster had recorded the

[1] For the facts on which this paragraph rests, see Report of Samuel Aughey, Ph. D., in "U. S. Survey of the Territories, for 1874," p. 243, *et seq.*

[2] "American Assoc. Rep.," 1880, p. 720.

[3] "Illinois Geological Reports," Vol. III, p. 123.

finding, in this same formation, distant but a few miles, a rude hatchet. There was in this case a possibility that the stone could have been shaped by natural means, and so he did not affirm this to be a work of man; but he says, "had it been recovered from a plowed field, I should have unhesitatingly said it was an Indian's hatchet."[1] We think it but another instance of relics found under such circumstances, that it points to the presence of man at the close of the Glacial Age.

No doubt many similar discoveries have been made, but the specimens were regarded as the work of Indians; and though the position in which they were found may have excited some surprise, they were not brought to the attention of the scholars. Nor is it only in the prairie regions of the West where such discoveries have been made. Col. C. C. Jones has recorded the finding of some flint implements in the drift of the Chattahoochee River, which we think as conclusively proves the presence of man in a far away time as do any of the discoveries in the river gravels of Europe. It seems that gold exists in the sands of this river, and the early setlers were quick to take advantage of it. They dug canals in places to turn the river from its present channel—and others, to reach some buried channel of former times. These sections passed down to the hard slate rock, passing through the surface, and the underlying drift, composed of sand, gravel, and bowlders. "During one of these excavations, at a depth of nine feet below the surface, commingled with the gravels and bowlders of the drift, and just above the rocky substratum upon which the deposit rested, were found three [Paleolithic] flint implements."[2]

He adds that, "in materials, manners of construction, and

[1] "Prehistoric Races," p. 69.

[2] Jones's "Antiquities of the Southern Indians," p. 293.

in general appearance, so nearly do they resemble some of the rough, so-called flint hatchets, belonging to the drift type, as described by M. Boucher De Perthes, that they might very readily be mistaken, the one for the other." "They are as emphatically drift implements, as any that have appeared in the diluvial matrix of France." On the surface soil, above the flints, are found the ordinary relics of the Indians. The works of the Mound Builders are also to be seen. Judging from their position, the Paleolithics must be greatly older than any of the surface remains. Many centuries must go by to account for the formation of the vegetable soil above them

Speculating on their age, Mr. Jones eloquently says, "If we are ignorant of the time when the Chattahooche first sought a highway to the Gulf; if we know not the age of the artificial tumuli which still grace its banks; if we are uncertain when the red Nomads who, in fear and wonder, carried the burdens of the adventurous DeSoto, as he conducted his followers through primeval forests, and, by the sides of their softly mingling streams, first became dwellers here, how shall we answer the question as to the age in which these rude drift implements were fashioned and used by these primitive people?"[1]

The examples we have quoted, even though the case of California be not considered, are all suggestive of a great antiquity for man, taking us back in time to when the glaciers still "shone in frigid splendor" over the northern part of the United States. When European savants had established the science of Archæology, and shown the existence of separate stages of culture, it was but natural that those interested in the matter on this side of the Atlantic should turn with renewed energy to investigate the archæology of this coun-

[1] Jones's "Antiquities of the Southern Indians," p. 295.

try, to see if here, too, they could find evidence of a Paleolithic Age. But the scholar in this country is confronted with a peculiar difficulty. Owing to the very multiplicity and variety of relics of prehistoric times, it is difficult to properly classify and understand them. The field is of great extent, the time of study has been short, and the explorers few; so it is not strange that but few localities have been thorougly searched. But, until this is done, we can not hope to reach definite conclusions.

The peculiar culture of the Indians, prevailing among them at the time of the discovery, proved a hinderance, rather than a help, in this matter. The Indians are certainly not Paleolithic, many of their implements being finely wrought and polished; but their arrow-heads, hatchets, and celts were sufficiently rude to spread the conviction that all weapons and implements of stone should be referred to them. This belief has done much to hinder real progress. It is not to be wondered at that some difference of opinion has prevailed, among our scholars, whether the different stages of culture, discovered in Europe, have any existence here.

On one hand, it is denied that different stages can be detected. Says Prof. Whitney: "It is evident that there has been no unfolding of the intellectual faculties of the human race on this continent similar to that which has taken place in Central Europe. We can recognize no Paleolithic, Neolithic, Bronze, or Iron Ages."[1] Others assure us, that if present, the ages stand in reverse order. "The relics last used were by far the rudest, and the historic races, which are the survivors of the prehistoric, are the wildest of the two; the lower status remaining, while the higher has passed away."[2] In still another place we read: "The Neolithic and

[1] Quoted by Abbott's "Primitive Industry," p. 3.

[2] Peet's "Archæology of Europe and America," p. 11.

Bronze Ages preceded the Paleolithic, at least in the Mississippi basin."[1]

Notwithstanding these quotations, we think it will yet be shown that in this country, as in Europe, there was a true Paleolithic Age, and that there was no such inversion as is here spoken of. In some places sedentary tribes may have been driven away and their territory occupied by more warlike, but less highly cultivated tribes. But take the whole Indian race, and they were steadily advancing through the Neolithic stage of culture. They were acquainted with copper, and were drawing near to the discovery of bronze and metals, and, indeed, the discovery had been made of bronze in the far south. But lying back of the true Indian Age, long preceding it in time, to which probably belong the relics mentioned in the preceding discoveries, is a true Paleolithic Age.

We are indebted for the facts on which the above conclusion rests more to the writings of Dr. C. C. Abbott, of Trenton, New Jersey, than any other individual, and his results are based on an extensive study of the relics themselves and the position in which found. In a collection of stone implements of this country arranged in a cabinet, we find rude and unpolished specimens, as well as those of a finely wrought Neolithic type. Now the Indians, when first discovered, frequently made use of very rudely formed implements, and from a knowledge of this fact, it came about that but little attention was paid to the position in which the relics were discovered. They were all classified as Indian relics. But the greatest and most valuable discoveries in science have occurred as a result of the attention paid to little things; in this case by carefully scrutinizing the position in which they occurred.

[1] Short's "North Americans of Antiquity," p. 27.

Dr. Abbott commenced by gathering a very extensive collection, carefully searching his section of country and gathering all specimens of artificially shaped stones. These must have existed there in considerable quantities, as, in three years' time, he collected over nine thousand specimens,[1] carefully examining them as they came from the soil.[2] As a result of this extensive and careful research, he is able to present us some general conclusions. The surface specimens, including in this classification also those specimens turned up by the plow,[3] are characteristically Indian. The material is jasper and quartz, and they are generally carefully made. They used other varieties of stone as well. Like the Neolithic people of Europe, they sought the best varieties of stone for their purpose. But his collection also included rude Paleolithic forms, and he found by taking the history of each specimen separately, that just in proportion as the relics were rude in manufacture and primitive in type the deeper were they buried in the soil.[4] Writing in 1875, he says: "We have never met a jasper (flint) arrow-head in or below an undisturbed stratum of sand or gravel, and we have seldom met with a rude implement of the general character of European drift implements on the surface of the ground.[5]

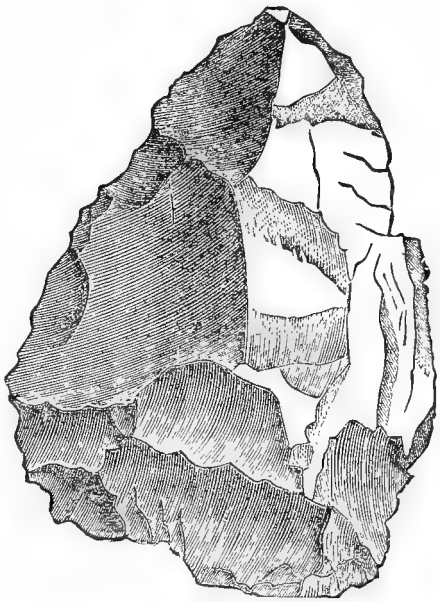
These are not theoretical opinions, but are deductions drawn from a very extensive experience. From figured specimens of these rudest formed implements, we see they are veritable Paleolithic forms, resembling in a remarkable manner the rude implements of the old world, whether collected in France or in India. We learned that the Paleo-

[1] Up to the present time (1884) Dr. Abbott has collected over 20,000 specimens of stone implements, and all his more recent "finds" but confirm the opinion he expressed as to their significance ten years ago. His collection is at the Peabody Museum of Archæology, at Cambridge, Mass. (See last Peabody Report.)

[2] "Nature," Vol. XI, p. 215. [3] Ibid. [4] "Nature," Vol. XI, p. 215.

[5] Ibid.

lithic people of Europe utilized the easiest attainable stone for their implements. They contented themselves with such pieces of flint as they could gather in their immediate vicinity. The easiest attainable rock in the valley of the Delaware is not flint, but argillite, and such is the material of which the Paleolithic implements are formed. Thus it is shown that the first appearance of a stone-using folk in the valley of the Delaware was in the Paleolithic stage of their culture. Judging from the depths of their buried implements, this long preceded the Neolithic stage.



Spear-shaped Paleolithic Implement.

These conclusions have been sustained in a very marked manner by late discoveries in the valley of the Delaware, to which we will now refer. After reaching the conclusion that the relics of the Stone Age in New Jersey clearly pointed to a Paleolithic beginning, when argillite, the most easily attainable stone, was utilized in the manufacture of weapons and implements, Dr. Abbott made the further discovery that in the ancient gravels of the Delaware River Paleolithic implements only were to be found. We must remember that it was in the gravels of European rivers that the first discoveries were made which have since resulted in so wonderfully extending our knowledge of the past of man.

The city of Trenton, New Jersey, is built on a gravel

terrace whose surface is between forty and fifty feet above the flood plain of the Delaware. We are told that this gravel is clearly a river deposit, and must have been laid down by the Delaware at some former time in its history. It is in this gravel deposit that quite a large number of Paleolithic implements have been found.

This cut is a representation of one of them, found under such circumstances that there can be no question about its antiquity. We are told it was taken from the face of the bluff fronting the river. Owing to heavy rains, a large section off of the front of the bluff became detached just the day before this specimen was discovered. It was found in the fresh surface thus exposed, twenty-one feet from the surface, almost at the bottom of the gravel. Immediately above it, and in contact with it, was a bowlder estimated to weigh over one hundred pounds. Immediately above this last was a second and much larger bowlder. It is manifest the implements could never have gotten in the place found after the gravel had been deposited.[1]

Paleolithic Implement.
Argillite.

This is only one of the many examples that could be given. But it is to be noticed that implements of the Neolithic type do not occur in the gravel, except on the surface. Dr. Abbott is not the only one who has found those implements. Many of our best American scholars have visited the locality and secured specimens, amongst others, Prof.

[1] "Primitive Industry," Abbott, p. 506.

Boyd Dawkins, of England, who is so familiar with this class of relics in Europe. We may consider it proven, then, that in this country there was also a Paleolithic Age. Our present information in regard to it is only a beginning.

Since this interesting discovery was made in New Jersey we have received news of similar discoveries in Minnesota. A lady, Miss Frank Babbitt, has found in the modified drift of the Mississippi River, at Little Falls, Minnesota, evidence of the existence of Paleolithic man. The implements are made of quartz, and not argillite, but closely resemble implements made of this later material as described by Dr. Abbott. It is, to say the least, an interesting coincidence that one of a very few flint implements found in the Trenton gravel by Dr. Abbott should be identical in shape with some of the flint implements in Minnesota.[1]

This point being determined, others at once spring up asking solution. Among the very first is the question of age. The river terrace on which Trenton is built is a geological formation, and if we can determine its age we shall also determine at least one point in the antiquity of man, for we know the implements are as old as the gravels. It is not necessary for our purpose to give more than the results of the careful labors of others in this direction. We may be sure that this question has been carefully studied. When the implements were first discovered, the gravels were considered of glacial origin, and to that period they were assigned by Dr. Abbott. Subsequently Prof. Lewis, a member of the Pennsylvania State survey, decided that they were essentially post-glacial—that is, more recent in time than the Glacial Age.[2] Still more recently Prof. Wright, of Oberlin, but also of the State survey of Pennsylvania, con-

[1] Seventeenth Report Peabody Museum, p. 354 and note.
[2] "Primitive Industry," p. 551.

cludes that they are, after all, a deposit made at the very close of the Glacial Age.[1]

He thinks the sequence of events were about as follows: When the ice of the Glacial Age reached its greatest development, and came to a pause in its southward march, it extended in an unbroken wall across the northern part of New Jersey, crossing the Delaware about sixty-five miles above Trenton. In front of it was accumulated the great terminal morain—a long range of gravelly hills still marking its former presence.

It is certain that the close of the Glacial Age was comparatively sudden, and marked by floods far exceeding any thing we are acquainted with at the present day. For, when the formation of the ice ceased, we must bear in mind that the country to the north of the terminal morain was covered with a great glacier, in some places exceeding a mile in thickness. When glacial conditions were passing away, and the ice commenced to melt faster than it was produced, the thaw would naturally go on over the entire field at an increasing rate, and hence would result floods in all the rivers.

He considers the gravels in question to have been deposited near the close of this flooded period, when the land stood at about its present level and the glaciers had retreated perhaps to the Catskill Mountains. The rivers were still swollen and would be heavily charged with coarse gravel brought from the morains and lying exposed on the surface of the ground vacated by the glaciers.[2]

Probably but few geologists will take exceptions to these views. Thus we have very satisfactory reasons for connecting these Paleolithic people with the close of the Glacial Age—a conclusion to which the scattering discoveries men-

[1] "Studies in Science and Religion," p. 324. [2] Ibid., p. 324.

tioned in the preceding pages also points. But as regards Dr. Abbott's discoveries, they are on such a scale, and vouched for by so many eminent observers, that we need no longer hesitate to accept them, or complain of the scattering nature of the finds.

But we might inquire whether this is the earliest period to which the presence of man can be ascribed in this country? Excepting, of course, California, we do not know of any well established fact on which to base a greater antiquity for man. However, this subject is very far from being as closely studied as in Europe. Believing that in Europe man was living before the Glacial Age, and that in all probability he was living in California at the same early time, we would naturally expect to find some evidence of his presence in the Mississippi Basin and along the Atlantic seaboard. But no explorer has yet been fortunate enough to make such discoveries.[1]

It is scarcely necessary to point out that we have only the relative age of these gravel deposits. We have not yet arrived at an answer in years. This we are not able to do. As we have several times remarked, our American scholars, as a rule, do not think many thousands of years have elapsed since the Glacial Age, and yet they are not all agreed on that point. From the depths in the gravel and loess deposits that the stone relics are found, we may suppose that man was present during the entire series of years their formation represents. Prof. Aughey, to whose discoverias in loess deposits in Nebraska we have referred, estimates the length of time necessary to produce those de-

[1] We believe that similar results will attend the careful exploration in other sections. As bearing on this subject, it is interesting to know that Paleolithic implements are reported from one locality in Mexico. Our information in regard to them is very slight. (Brit. Assoc. Reports, 1881; Pres. Address, Count De Saporte, *Popular Science Monthly*, Sept., 1883.)

posits as between nineteen and twenty thousand years, and this he considers a low estimate. So we see that, at any rate, the date of man's first appearance in America was certainly very far in the past.

In forming a mental picture of the conditions of life at that early time, it is not necessary to imagine a dreary scene of Arctic sterility. This is not true of the time when the Glacial Age was at its greatest severity. But at the time we are now considering, the glaciers had retreated over a large part of the country, though they still lingered in northern and mountainous regions. Great lakes and majestic rivers were the features of the country. The St. Lawrence was still choked with ice, and the great lakes must have discharged their waters southward.[1] The Mississippi, gathering in one mighty stream the drainage of the Central Basin, sped onward to the Gulf, doubtless many times larger than its present representative. The animals then living included several species that have since become extinct. Mastodons and elephants must have been numerous, as their remains are frequently found in loess deposits.[2] They have also been found in the gravels of New Jersey, in connection with the rude implements already mentioned. Probably keeping close to the retreating glaciers were such animals as the moose, reindeer, and musk-ox, while the walrus disported itself in the waters off the coast. At any rate those animals now only found in high northern latitudes were living during Glacial times as far south as Kentucky and New Jersey.[3]

A good deal of interest is connected with the finding of one mastodon's tooth. It was found in the gravel deposit,

[1] Dana's "Manual of Geology," p. 540.
[2] "Geographical and Geological Survey," 1874, p. 254.
[3] Abbott's "Primitive Industry," p. 483.

about fourteen feet beneath the surface. It must have been washed to the position where found when the great floods from the melting glacier, with their burden of sand and gravel, were rolling down the valley. We can either conclude that the climate was such as to permit the existence of such animals, or that the animal to which it belonged lived in some far away pre-glacial time. But our interest suddenly increases when we learn that, but a few feet away, under exactly similar circumstances, was found the wisdom tooth of a human being. It, too, was rolled, scratched, and polished, and had evidently been swept along by the tumultuous flood. "The same agency that brought the one from the Upper Valley of the Delaware brought the other, and, after long years, they come again to light, and jointly testify that, in that undetermined long ago, the creatures to which they respectively belonged were living together in the valley of the river."[1]

We must now consider the question of race. Who were the men that fashioned the implements? Were they Indians? or were they a different people? As far as we know the Indians, they were Neolithic. Their implements and weapons are often polished, pecked, and finely wrought; and, as before remarked, they employed the best kind of stone for their purpose. Dr. Abbott, who speaks from a very extensive personal experience, tells us, that it is not practical to trace any connection between the well-known Indian forms and the Paleolithic implements of the river gravels: "The wide gap that exists between a full series of each of the two forms is readily recognized when the two are brought together."[2] Besides this difference in form, there is also a difference in material. The ruder forms not being of

[1] Abbott: "Proceedings of the Boston Society of Natural History," Vol. XXII, p. 102. [2] "Primitive Industry," p. 512.

jasper and allied minerals, but are almost exclusively of argillite.[1] In addition to the foregoing, we must consider the different positions they occupy—the former being found only on or near the surface, the latter deeply buried within. These different reasons all point to the same conclusion: that is, that the Indians were preceded in this country by some other people, who manufactured the Paleolithic specimens recently discovered.

In Europe, Prof. Dawkins, as we have seen, maintains that the Cave-men were the predecessors of the Eskimos. This may serve us as a point of departure in the inquiry as to who the pre-Indian people were? It is manifest, however, that we must have some ground on which to base this theory. The Eskimo seem to belong to the Arctic region, as naturally as the white bear and the walrus. At the early time we are considering in America, glaciers had not retreated very far. So his climatic surroundings must have been much the same as at present. But the Eskimo may not live where he does now by choice: we may behold in him a people driven from a fairer heritage, who found the ice-fields of the North more endurable than the savage enemy who envied him his possession. It seems very reasonable to suppose that the Eskimos long inhabited this country before the arrival of the Indians, if it was not, in fact, their original home.

Mention has been made of the Eskimo traits still to be observed among the tribes of California. Prof. Putnam thinks that this fact can best be explained on the supposition that these tribes came in contact with primitive Eskimo people.[2] Dr. Rink, from investigation of the language and traditions of the different Eskimo tribes, thinks they are of

[1] "Primitive Industry," p. 512.

[2] "U. S. Survey West of the 100th Meridian," Vol. VII, p. 12.

American origin, and must once have lived much farther south.[1] He says, "The Eskimos appear to have been the last wave of an aboriginal American race, which has spread over the continent from more genial regions—following principally the rivers and water-courses, and continually yielding to the pressure of the tribes behind them until they have at last peopled the sea-coasts."[2] Mr. Dall, in his explorations of the Aleutian Islands, comes to the same conclusion as Dr. Rink. He says his own conclusions are, "that the Eskimos were once inhabitants of the interior of North America—have much the same distribution as the walrus, namely, as far south as New Jersey."[3]

All this tends to prove that the Paleolithic people of New Jersey were ancestors of the Eskimos. This becomes highly probable when we pursue the subject a little farther. Dr. Abbott has shown, from the similarity of implements, position in which found, and so forth, that the Paleolithic people continued to occupy the country down to comparatively recent times, when Indian relics took their place.[4] This is such an important point that we must give his reasons more in detail. Remember that Dr. Abbott speaks from the experience gained by gathering over twenty thousand specimens of stone implements, and paying especial attention to the position in which they were found. The surface soil of that section of New Jersey, where he made his explorations, was formed by the slow decomposition of vegetable and forest growth. In this layer he found great numbers of undoubted Indian implements. The number, however, rapidly decreases the deeper we go in this stratum. This would show that the Indians were late arrivals. Be-

[1] Abbott's "Primitive Industry," p. 520. [2] "Ibid., p. 519.

[3] "U. S. Geographical Survey of the Rocky Mountain Region," Vol. I, p. 102, quoted from "Primitive Industry," p. 519.

[4] *Popular Science Monthly*, Jan., 1883.

low this surface soil is a stratum of sand, overlying the gravelly beds below and passing into the surface soil just mentioned. In this layer were found great numbers of implements inferior to the Indian types found on the surface, but superior to the Paleolithic specimens described. They are not only inferior in finish to the Indian specimens, but are of different material. They are always formed of argillite. It was further noticed that the number of these rapidly decreased in the layer of surface soil, and are but rarely found on the surface.

Now it might be said that these rude forms were fashioned by Indians when in a rude state of culture, and, as they became more advanced, they learned the superior qualities of flint, and so dropped the use of argillite. But it so happens that we have found several places where were veritable manufactories of Indian implements. It is very significant that we never find one where the workman used both flint and argillite. He always used flint alone. Every thing seems to point to the fact, that the tribes who fashioned the argillite implements were different from the Indian tribes who made the flint implements. It is Dr. Abbott's conclusions that the former, the descendants of the Paleolithic tribes, were the Eskimos, who, according to these views, must have inhabited the eastern portion of the United States to comparatively recent times.

In further support of these views, we think we have grounds for asserting that we have veritable historical accounts of the Eskimo people slowly retiring before the aggressions of their Indian foes. It is no longer doubted but that Norsemen, as early as the year 1000, made voyages of discovery along the coast of North America, as far south as Rhode Island: they called the country Vineland. It is true that the Icelandic accounts of these expeditions

contain some foolish and improbable statements; but so do the writings of Cotton Mather, made many years later.

These accounts refer but very briefly to the inhabitants they saw, but enough is given to show that the people were not Indians, but Eskimos. The language used is: "The men were small of stature and fierce, having a bushy head of hair, and very great eyes, and wide cheeks."[1] Their small size is frequently referred to, which would surely not be the case if they were describing the Algonkins that the English colonists found in the same section of country many years later. To the same effect is the assertion that the Eskimos did not reach Greenland until the middle of the fourteenth century.[2] The traditions of the Tuscarawas Indians that place their arrival on the Atlantic coast in the year 1300, also refer to a tribe of people that were at least much like the Eskimos.[3]

Thus we are led, step by step, to the recognition of a Paleolithic Age in America, and finally to the belief that the descendants of these people were Eskimos. We at once notice the coincidence of these results with some of the conclusions of Prof. Dawkins, of England, and it is desirable to trace a little further the points of resemblance and difference between this age in America and in Europe. In this latter country we have seen the Paleolithic Age can be divided into two stages, or epochs, during which different races inhabited the country. The first, or the epoch of the men of the River Drift, long preceded the epoch of the Cave-men. It was those latter tribes only that Mr. Dawkins connects with the Eskimos.

We have not yet found evidence in this country that points to such a division of the Paleolithic Age. We have

[1] DeCosta's "Precolumbian Discovery of America," p. 69.
[2] Winchell's "Preadamites," p. 389.
[3] Brinton's "Myths of the New World," p. 23. Note.

no relics of Cave-men as distinguished from the men of the River Drift. It is true, we are not lacking evidence of the use of caves by various tribes,[1] but there is nothing to show that such use was very ancient, or that the people were properly Paleolithic. We can not say what future discoveries will unfold, but as yet we have only implements of the River Drift type, and these are the men Dr. Abbott considers to be the ancestors of the Eskimos. In this country, then, we have shown the existence of but one race of men in the same stage of culture as the men of the River Drift, but of the same race as the men of the cave. These results may be cited as an argument in favor of those scholars who think that the men of the River Drift and the men of the Cave were in reality the same people.[2]

In Europe there was apparently a long lapse of time between the disappearance of the Paleolithic tribes and the arrival of the Neolithic people, but we have no evidence of such a period in America. The Paleolithic people remained in possession until driven away by the Neolithic ones. All evidence of Paleolithic man in Europe terminated with the Glacial Age, and there is little doubt but what they date from preglacial times. Our present knowledge does not carry us any farther back in this country than the close of Glacial times. If we consider that the Glacial Age in America coincides in time with the same age in Europe, then the last statements would imply that the Paleolithic Age here was later than in Europe; in fact, that Paleolithic man had run his course in Europe before he appeared in America, and some might even go further, and say that he migrated from Europe to America. There are, however, no good grounds for such conclusions. We believe that future discoveries will

[1] Prof. DeHass's "Paper read before Am. Assoc., 1882.

[2] See chapter, "Cave-men," p. 113. Note.

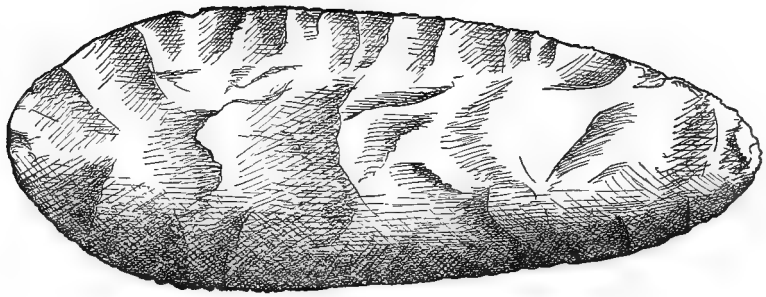
show that in America also Paleolithic man was living in Glacial and preglacial times.[1]

We feel that we have done but scant justice to this subject, but we assure our readers that this question has been but little studied in this country. Referring all relics of stone to the Indians, our scholars have been slow to recognize traces of an earlier race in America. Our sources of information are as yet but few, and much remains to be done in this field. In Europe as in America, scholars are still hard at work on the Paleolithic Age, and we are to hold ourselves in readiness to modify our opinions, or to reject them entirely and adopt new ones as our knowledge increases.

There is one thought that occurs to us. From the combined investigations of both European and American scholars, the Eskimo is seen to be one of the oldest (if not the oldest) races of men now living. They afford a striking illustration of the fact that a race may early reach a limit of culture beyond which, as a race, they can not pass. Should the American discoveries establish the fact that the River Drift tribes are also Eskimos, then we are fairly entitled to consider them the remnant of a people who once held possession of all the globe, but who have been driven to the inhospitable regions of the North by the pressure of later people. What changes have come over the earth since that early time? In the long lapse of years that have gone by newer races, advancing by slow degrees, have at last achieved civilization. The fiat of Omnipotent power could have created the world in a perfected form for the use of man, but instead of so doing, Infinite Wisdom allowed slow-acting causes, working through infinite years, to develop the globe from a nebulous mass. Man could, indeed, have been created a civilized being,

[1] See remarks of Prof. Boyd Dawkins quoted on page 97.

but instead of this, his starting-point was certainly very low. He was granted capacities in virtue of which he has risen. We are not to say what the end shall be, but we think it yet far off.



Stone Implement.

# CHAPTER X.

## THE MOUND BUILDERS.[1]

MEANING of "Mound Builders"—Location of Mound Building tribes—All Mounds not the work of men—Altar Mounds—Objects found on the Altars—Altar Mounds possibly burial Mounds—Burial Mounds—Mounds not the only Cemeteries of these tribes—Terraced Mounds—Cahokia Mound—Historical notice of a group of Mounds—The Etowah group—Signal Mounds—Effigy Mounds—How they represented different animals—Explanation of the Effigy Mounds—Effigy Mounds in other localities—Inclosures of the Scioto Valley—At Newark, Ohio—At Marietta, Ohio—Graded Ways—Fortified Inclosures—Ft. Ancient, Ohio—Inclosures of Northern Ohio—Works of unknown import—Ancient Canals in Missouri—Implements and Weapons of Stone—Their knowledge of Copper—Ancient mining—Ornamental pipes—Their knowledge of pottery—Of Agriculture—Government and Religion—Hard to distinguish them from the Indians.

THE PAST of our race is irradiated here and there by the light of science sufficiently to enable us to form quite vivid conceptions of vanished peoples. As the naturalist, from the inspection of a single bone, is enabled to determine the animal from which it was derived, though there be no longer a living representative, so the archæologist, by the aid of fragmentary remains, is able to tell us of manners and times now long since removed. In the words of another: "The scientist to-day passes up and down the valleys, and among the relics and bones of vanished people, and as he

[1] The manuscript of this chapter was submitted to Prof. F. W. Putnam, curator of the Peabody Museum of Archæology and Ethnology, Harvard University, for criticism.

touches them with the magic wand of scientific induction, these ancient men stand upon their feet, revivified, rehabilitated, and proclaim with solemn voice the story of their nameless tribe or race, the contemporaneous animals, and physical appearance of the earth during those prehistoric ages."

We have already learned that the world is full of mysteries, and though, by the exertion of scholars, we begin to have a clearer idea of some topics, yet our information is after all but vague and shadowy. The amount of positive knowledge in regard to the mysterious tribes of the older Stone Age, or the barbarians of the Neolithic period, or the struggling civilization of the early Metallic Ages, is lament ably deficient. On our Western Continent we have the mysterious remains in the gold-bearing gravels of the Pacific coast, the significance of which is yet in dispute. We have the Paleolithic Age of Europe, represented by the remains found in the gravels of the Delaware at Trenton, New Jersey. When deposited there, and by what people used, is, perhaps, still enshrouded in doubt.

Leaving now the past, expressed by geological terms, or by periods of thousands of years, we draw near to our own tribes, near, at least, comparatively speaking, and behold, here, also, we discern evidence that an ancient culture, as marked as that which built its cities along the fertile watercourses of the Old World, had its seat on the banks of our great rivers; that here flourished in full vigor for an unknown length of time a people whose origin and fate are yet in doubt, though, thanks to the combined efforts of many able men, we begin to have clearer ideas of their social organization. We know them only by reason of their remains, and as these principally are mounds, we call them the "Mound Builders."

[1] Conant's "Footprints of Vanished Races," p. 122.

The name is not a distinguishing one in every sense, since mankind, the world over, have been mound and pyramid builders. The pyramids of Egypt and the mound-dotted surface of Europe and Asia bear testimony to this saying, yet nowhere else in the world are they more plainly divided into classes, or marked with design than here. In some places fortified hills and eminences suggest the citadel of a tribe or people. Again, embankments of earth, mostly circular or square, separate and in combination, generally inclosing one or more mounds, excite our curiosity, but fail to satisfy it. Are these fading embankments the boundaries of sacred inclosures, or the fortification of a camp, or the foundations on which to build communal houses? Here graded ways, there parallel embankments raise questions, but suggest no positive answer. We are equally in doubt as to the purposes for which many of the mounds were built. Some seem to have been used as places of sepulcher, some for religious rites, and others as foundation site of buildings. Some may have been used as signal mounds, from which warning columns of smoke, or flaming fires, gave notice of an enemy's approach.

Before coming to details let us, at a glance, examine the picture as a whole. This country of ours, with its wide plains, its flowing rivers and great lakes, is said by scholars to have been the home of a people well advanced in the arts of barbarian life. What connection, if any, existed between them and the Indians, is yet unsettled. We are certain that many years before the Spanish discovery of America they made their settlements here, developed their religious ideas, and erected their singular monuments. That they were not unacquainted with war, is shown by their numerous fortified inclosures. They possessed the elements of agriculture, and we doubt not were happy and contented in their homes. We

are certain they held possession of the fairer portions of this country for many years.

We must now seek to gather more particular knowledge of them, and of the remains of their industry. We must not forget that these are the antiquities of our own country; that the broken archæological fragments we pick up will, when put together, give us a knowledge of tribes that lived here when civilization was struggling into being in the East. It should be to us far more interesting than the history of the land of the Pharaohs, or of storied Greece. Yet, strange to say, the facts we have just mentioned are unknown to the mass of our people. Accustomed to regard this as the New World, they have turned their attention to Europe and the East when they would learn of prehistoric times. In a general way, we have regarded the Indians as a late arrival from Asia, and cared but little for their early history. It is only recently that we have become convinced of an extended past in the history of this country, and it is only of late that able writers have brought to our attention the wonders of an ancient culture, and shown us the foot-prints of a vanished people

We must first try and locate the territory occupied by the remains of the mound builders. They are not to be found broadcast over the whole country. We recall, in this connection, that the early civilization of the East arose in fertile river valleys. This is found to be everywhere the case, so we are not surprised to learn that the broad and fertile valley of the Mississippi, with its numerous tributaries, was the territory where these mysterious people reared their monuments and developed their barbarian culture. Throughout the greater portion of this area we find numerous evidences of a prolonged occupation of the country. We are amazed at the number and magnitude of the remains. Though this sec-

tion has been under cultivation for many years, and the plow has been remorselessly driven over the ancient embankments, yet enough remain to excite our curiosity and to amply repay investigation.

This portion of the United States seems to have been the home, the seat of the mound building tribes. We can not expect to find one type of remains scattered over this entire section of country. Indeed, to judge from the difference of the remains, they must have been the work of different people or tribes, who were doubtless possessed of different degrees of culture.[1] We will notice in our examination how these remains vary in different sections of the country. But it is noticeable that these remains become scarce and finally disappear as we go north, east, and west from the great valley. Although they are numerous in the Gulf States, yet they are not to be found, except in a few cases, in States bordering on the Atlantic.[2] Some wandering bands, perhaps colonies from the main body of the people, established works on the Wateree River, in South Carolina.[3] In the mountainous regions of North Carolina occur mines of mica, which article was much prized by the mound builders; and here also are to be found traces of their early presence.[4] We do not know of any authentic remains in New England States. In Western New York there exists a class of remains which, though once supposed to be the work of these people, are now generally considered as the remains of works erected by the Indians,[5] and of a similar origin

[1] Force: "Some Considerations on the Mound Builders," p. 64; "Am. Antiquarian," March, 1884, pp. 93–4; "10th Annual Report, Peabody Museum," p. 11.

[5] Squier's "Aboriginal Monuments of New York," Smithsonia Contribution No. 11, p. 83.

appears to have been the singular fortification near Lake Winnipiseogee, in New Hampshire.[1]

We have no record of their presence north of the great lakes. Passing now to the western part of the valley, we do not find definite traces of their presence in Texas. On this point, however, some authors state the contrary, apparently basing their views on a class of mounds mentioned by Prof. Forshey.[2] But the very description given of these mounds, and the statements as to the immense number of them,[3] seem to show they are not the work of men.[4] We do not think the West, and especially the North-west, has been carefully enough explored to state where they begin. It is certain that the head waters of the Mississippi and the Missouri were thickly settled with tribes of this people, and some writers think that they spread over the country by way of the Missouri Valley from the North-west. Mr. Bancroft quotes from the writings of Mr. Dean, to show the existence of mounds and inclosures on Vancouver Island, and in British Columbia. And the statement is made that a hundred miles north of Victoria there is a group of mounds ranging from five to fifty yards in circumference, and from a few feet to fifty feet in height.[5]

The inclosures, however, are described as being very similar to those in Western New York, and are probably simply fortified sites, common among rude people the world over, and such as were often erected by Indians. The remains on the upper Missouri and its tributaries are very numerous, and to judge from the brief description given us

[1] Squier's "Aboriginal Monuments of New York," Smithsonia Contribution No. 11, p. 87.

[2] Foster's "Prehistoric Races," p. 121.

[3] "They are numbered by millions." Ibid.

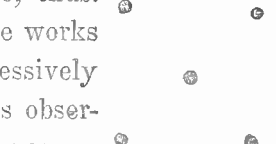
[5] "Native Races," Vol. IV, pp. 739 and 740.

of them, they must be very interesting.[1] This section has, however, been too little explored to speak with confidence of these works.

As showing how much care should be exercised in this matter, we refer to the account given by Capt. Wilkes in his journal of the United States exploring expedition. Speaking of the mounds on the gravelly plains between the Columbia River and Puget Sound, he tells us that the Butte Prairies are covered with small mounds at regular distances asunder. Some of them are thirty feet in diameter, six or seven feet above the level of the ground, and many thousands in number. He opened some of them and found a pavement of round stones, and he thought he could detect an arrangement of the mounds in groups of five, thus. It was his impression that they were the works of men, and had been constructed successively and at intervals of several years.[2] This observation of Capt. Wilkes is referred to by many as evidence of the former existence of Mound Builders in this section.



More careful research in recent times has established the fact that these mounds were certainly not erected by human hands, and no one else has been able to discover the supposed arrangement in groups of five. The pavement of round stones is common to the whole prairie.

But the greatest objection is the number of the mounds. A population larger than could have found a living in the country must have been required to erect them, unless we assume that a great length of time was consumed in this work. Some other explanation must be given for these mounds, as well as for those mysterious ones mentioned by

[1] Smithsonian Rep., 1870, p. 406.

[2] Narrative of U. S. exploring expedition during the year 1838–42, Vol. IV, p. 334.

Prof. Forshey. This cut gives us a fair idea of the scenery of this section and the mounds.[1]

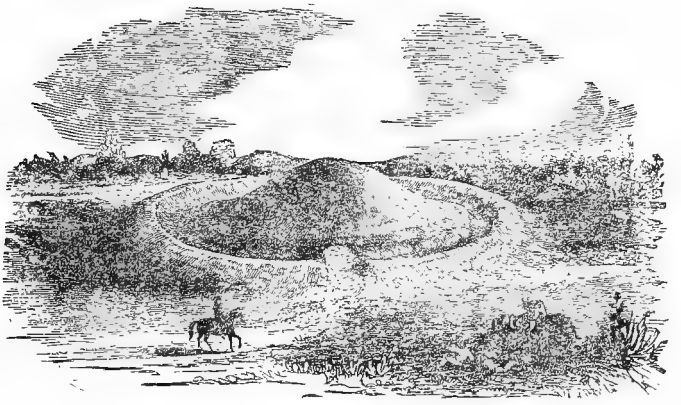
Within the area we have thus defined are located the works of the people we call the Mound Builders. What

Mound Prairie.

we wish to do is to learn all about these vanished people. A great many scholars have written about them, and large collections of the remains of their handiwork have been made. There is, however, a great diversity of opinion respecting the Mound Builders and their culture. So we see we have a difficult subject to treat of. In order to gain a clear understanding of it, we must describe the remains more closely. About all we can learn of these people is from a study of their monuments. We can not call

[1] Prof. Gibbs in Frank Leslie's Monthly, August, 1883.

to our aid history or tradition, or rock-carved inscription, but must resort to crumbling mounds, broken down embankments; study their location, and observe their forms. To the studies in the field we must add those in the cabinet, and examine the many objects found in and above the mounds and earth-works, as well as the skeletons of the builders of the works. Rightly used, we can draw from these sources much valuable information of a people whose council-fires



Mound and Circle.

blazed all along the beautiful valleys of the Ohio and Mississippi rivers in times far removed from us.

We will first speak of the simplest form of these works, the ordinary conical mound. This is the one form found all over the extensive area designated. They exist in great numbers on the banks of the upper Missouri, as well as the river bottoms of the South. This cut represents a very fine specimen of a mound, in this instance surrounded by a circular embankment. We must not forget that mounds are found all over the world. "They are scattered over India, they dot the steppes of Siberia and the vast region north of the Black Sea; they line the shores of the Bosphorus and

the Mediterranean; they are found in old Scandinavia, and are singularly numerous in the British Islands."[1]

The principle in human nature which leads to the erection of mounds is living and active to-day. The shaft which surmounts Bunker Hill is but a modern way of memorizing an event which in earlier ages would have led to the erection of a mound, and the polished monument which marks the resting place of some distinguished man was raised for the same purpose as the mounds heaped over the chiefs and warriors of another age. The feeling which moves us to crown with steeples or spires our houses of worship is evidently akin to that which induced older races to erect a mound on which to place their temples, their idols, and altars of sacrifice.

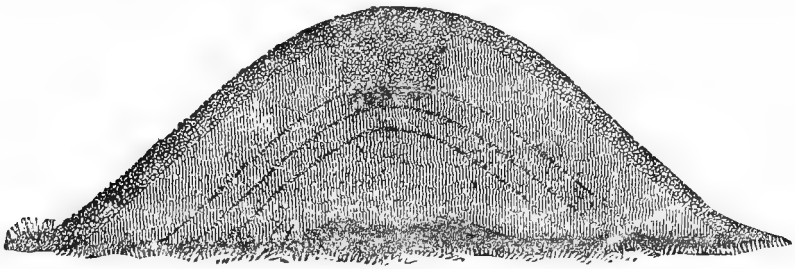
If mounds were the only works remaining of these ancient people, we would not take so great an interest in them, and, as it is, we are not to suppose that all the mounds are the works of those people we call the Mound Builders. Recent investigation and historical evidence unite in showing that some comparatively recent Indian tribes formed and used mound structures. Early explorers have left abundant testimony to show that in many cases the Indians resorted to mound-burial. Thus, it seems that it was the custom of the Iroquois, every eighth or tenth year, or whenever about to abandon a locality, to gather together the bones of their dead and rear over them a mound. To this custom, which was not confined to the Iroquois, are doubtless to be ascribed the barrows and bone mounds which have been found in such numbers in various parts of the country.[2] Although it is well to bear these facts in mind, yet it is not doubted that the larger number, and especially the more massive ones, were erected

[1] "Ancient Monuments," p. 139.

[2] Jones's "Explorations in Tennessee," p. 15.

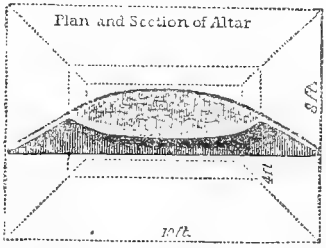
by the same people who built the other mysterious works, and so it is necessary that they be carefully studied.

In the valley of the Ohio there have been found a class of mounds known as Altar Mounds. These, it should be stated, nearly always occur in or near inclosures. This cut gives us a good idea of mounds of this kind. Near the top



Altar Mound.

is seen an instance of what is called "intrusive" burial. After the mound was completed it had been dug into and a body buried near the surface. This burial was evidently later in time, and had no connection with the purpose for which the mound was originally built. We also notice in this mound the different layers of which it was composed. These layers are of gravel, earth, and sand, the latter being only a few inches thick. Mounds made in this manner are called stratified mounds, and all altar mounds are probably of this kind. The lines of stratification have been described as curving so as to correspond with the shape of the mound, and such we are told is the general rule.[1]



The peculiar feature, however, is the altar at the bottom of the mound, directly above the natural surface of the

[1] "Ancient Monuments," p. 143. Explorers for Bureau of Ethnology so report it in the South. Prof. Putnam, who has certainly had great experience, says he has always found the layers to be horizontal.

ground. The small cut gives us a clear idea of the altar, the light lines running around it showing the plan. These altars are almost always composed of clay, though some of stone have been discovered. They are of various shapes and sizes. We notice the dish-shaped depression on the top of the altar. The clay of which they are composed seems to have been moulded into shape directly over the surface of the ground. Sometimes a layer of sand was put down as a foundation. They are nearly always thoroughly burned, the clay being baked hard, sometimes to the depth of fifteen or twenty inches. This must have required intense and long continued heat.

We are at once curious to know the object of this altar. Within the basin-shaped depression are generally found all manner of remains. Sometimes portions of bones, or fragments of wood, arranged in regular order; pieces of pottery vessels, and implements of copper and stone; spear-heads, arrow-heads, and fragments of quartz and crystals of garnet. Pipes are a common find, carved in miniature figures of animals, birds, and reptiles. Two altar-mounds but recently examined near Cincinnati had altars about four feet square that were loaded down with ornaments.

One especially contained quantities of ornaments of stone, copper, mica, shells, the canine-teeth of bears and other animals, and thousands of pearls. They were nearly all perforated, as if for suspension. Several of the copper ornaments were covered with native silver which had been hammered out into thin sheets and folded over the copper. One small copper pendant seems to have been covered with a thin sheet of hammered gold, as a small piece was still clinging to it. This is the first example of finding native gold in the mounds.[1] On this altar were also found masses

[1] "Sixteenth Annual Report Peabody Museum," p. 171. An ornament shaped to resemble the head of a wood-pecker, made of gold, derived from

of meteoric iron, and ornaments of the same material. One piece of mica showed the profile of a face.[1]

In all cases the articles found on the altars show the action of fire. We seem justified, then, in supposing that after the altar was formed, fires were lit on them, and into this fire were thrown the various articles just enumerated. But what was all this for? This will probably never be very clear to us, beyond the fact that it was a religious rite. Portions of the human skeleton have been found on these altars, and it has been suggested that human victims were at times part of the sacrifice; but as it is known that this people practiced cremation, it may be that the altars were sometimes used for that purpose, the remains being afterwards gathered and buried elsewhere.

After the offerings had been flung into the fire, while it was yet glowing on the altar, earth or sand was heaped over them for a few inches, then successive layers of earth and sand, or ashes, clay, or gravel. Sometimes the altars were used several different times, in which case a layer of clay several inches thick was laid over the old altar. In one case three layers had been burned in before the final addition of earth and sand were heaped over it. These strange monuments of a by-gone people hint to us of mysterious rites. We wish we had more positive knowledge of the ceremonies they commemorated; but at present we must rest satisfied with conjecture.

The next class of mounds are known as burial mounds, some of which are stratified, and resemble the so-called altar

---

some Spanish source, was found in a mound in Florida. This particular mound must have been erected after the discovery of America. ("Smithsonian Report," 1877, p. 298, *et seq.*)

[1] "Sixteenth and Seventeenth Report Peabody Museum." These ornaments were made of hammered iron. This is the first time that native iron has been found in the mounds. (Putnam.)

mounds. A mound explored in Butler County, Ohio, had in the center a layer of clay an inch thick, which had been burned until it was red. Underneath this was another layer of clay, beneath which was found charcoal, burnt cloth, and charred bones. Mr. Foster thinks that in this mound the body was placed on a rude altar, fires were lit, and that while yet burning, clay was thrown over it all, and that then fires were built all over the mound, sufficient to burn the clay for an inch in thickness.[1] We have also a description of a group of mounds explored near the Mississippi River, in which there were evident signs of cremation. At least in several mounds fires had been built close above the bodies. But in cremation other victims may have been burned to accompany the departed chiefs or warriors. In one mound evidence of such a custom was observed.

In another mound the center was found to be a mass of burned clay interspersed with calcined human bones. No less than ten or fifteen bodies had been burned here. "They must have worshiped some fierce ideal deity, and the ceremony must have been considered of great importance to have required so many victims." This may have been, however, nothing more than simple cremation.[2]

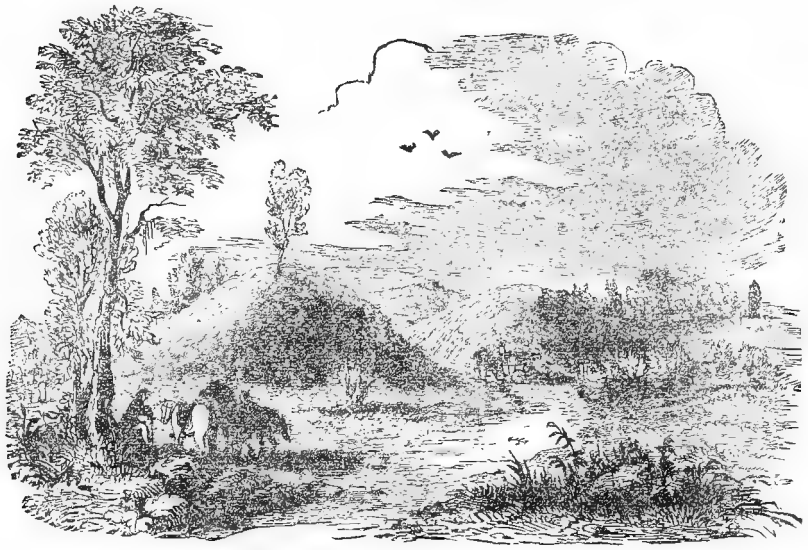
Pidgeon has described mounds in Minnesota, in many respects like the altar mounds. In one case he mentions there was an altar or pavement of stone on the original surface of the ground, a few feet above which was a layer of clay, showing the action of fierce and long-continued fires. We furthermore are told that cremation, especially of chiefs, was more or less common among the Village Indians of North America, that similar usage was observed among many of

[1] "Prehistoric Races," p. 178.

[2] J. E. Stevens's Paper, read before the Muscatine Academy of Science, Dec., 1878.

the tribes of Mexico, and that the Mayas, of Yucatan, burnt the bodies of their lords, and built temples over their remains. So it may be that the altar mounds are but varieties of funeral mounds, the remains of the bodies burned here being buried elsewhere.[1]

The nations that celebrated their mysteries around these mounds have long since departed; the altar fires long since burned low. We are not sure that we understand their



Burial Mounds.

purport, but we are certain they were regarded as of great importance, and we can readily imagine that when the fires were lit on the altars, gathering crowds stood round, and participated in the religious observance, throwing into the fire their most valued ornaments, in this manner paying their last respects to the departed chiefs and great men of their tribe.

The true burial mounds are very numerous, and com-

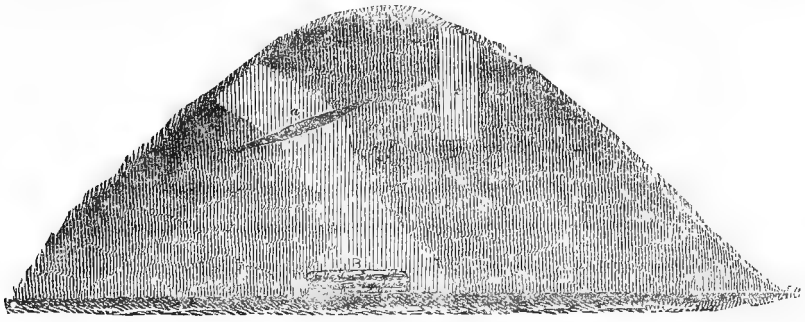
[1] That this was at any rate sometimes the case See "Ancient Monuments," p. 159.

prise by far the larger number of mounds. They are to be found all over the Mound Builder's territory, and are about the only class of remains found in the prairie regions of the West. From the upper waters of the Missouri and the great lakes on the north to the Gulf States on the south, and from west of the Mississippi to the Alleghenies of the East, in all this vast region they are the prevailing class of remains, and occur by hundreds, and even thousands, along the valleys. The mounds themselves are often not very conspicuous; as a rule they are simply heaps of dirt raised above the surface and rounded over, and from two or three to fifteen or twenty feet high, although many are of much larger size. They are seldom found on the lower or recent river terrace, but are common on the upper terrace, and are often built upon the high bluffs bordering the streams, where a wide stretch of country is exposed to view. Black-bird, an Omaha chief, who died about the year 1800, desired to be buried on a high bluff overlooking the Missouri, so that he might see the boats passing up and down the river. Perhaps from a similar superstitious wish the Mound Builders sometimes chose the sites of their burial mounds where they could watch over their country; or it may be that the monuments over the dead were placed in such conspicuous positions that they might be readily seen by the people.

The next cut represents an ordinary burial mound, which was explored by tunneling in from one side. We notice there are no different layers or stratifications in this case. In some cases, at least, the building of such a mound occupied several years. We can see where the dirt was thrown down in small quantities, averaging about a peck, as if from a basket. In one case grass had started to grow on the unfinished surface of the mound, to be covered up by fresh dirt.[1]

[1] "Peabody Museum Reports," Vol. II, p. 58.

In the majority of cases the mounds contain the remains of but one individual, with various relics of a rude and barbarous people. Where but one body was buried, the usual mode of procedure seems to have been to first clear a space on the surface of the ground; the body was then placed in the center of this prepared place, and often a rude framework of timber was placed around it, sometimes a stone



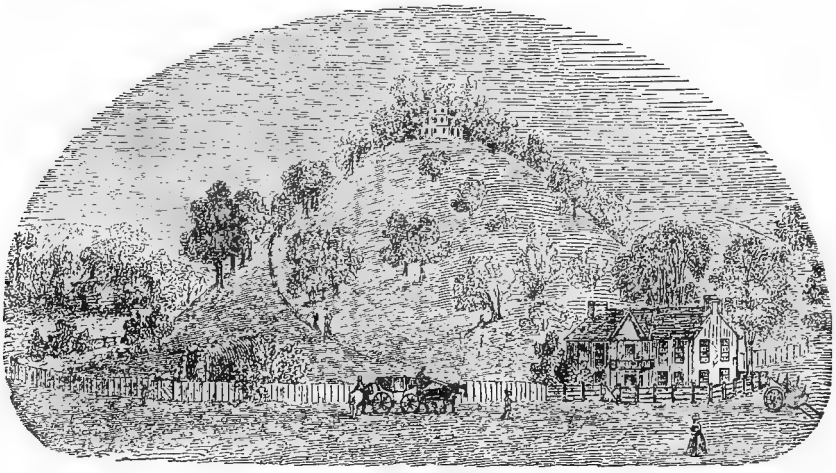
Burial Mounds.

chamber was built up. Over this the mound was erected to the desired height. This description would apply to nearly all of the many thousands of burial mounds in the country.

In the cut a layer of charcoal is noticed near the top. Naerly all mounds show evidence of the existence of fire during some period of their construction. In some cases these fires were fierce and long continued, as if the object had been to cremate the body. It may have been a part of their religious belief that it was necessary to keep fires blazing on the mound for a short length of time to keep off evil spirits, or to comfort the soul of the departed. Such at any rate was the custom among some Indian tribes. We are told that among the Iroquois, a "fire was built upon the grave at night to enable the spirit to prepare its food."[1]

[1] Jones's "Explorations in Tennessee," p. 15. See also "First An. Rep. Bureau of Ethnology," p. 198.

In some cases, many individuals were buried in the same mound. These may be communal burials, such as we have already referred to. Mounds of this kind have been examined near Nashville, Tennessee. One mound alone was the burial place of over two hundred persons. Pidgeon describes some triangular burial mounds in Minnesota, differing in shape only from the ordinary circular mounds that belong to this division. In general, burial mounds are not very high, yet there are exceptions to this rule.



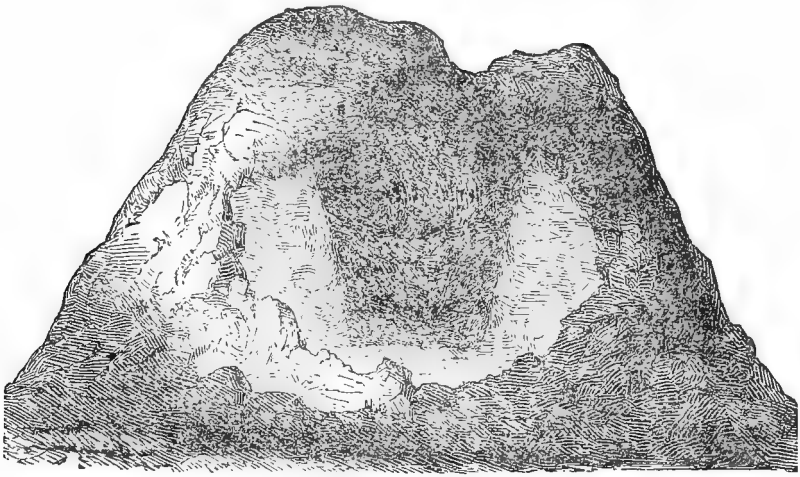
Grave Creek Mound.

This cut represents one of the largest of these mounds. It is situated at the junction of Grave Creek and the Ohio River, twelve miles below Wheeling, in West Virginia. It measures seventy feet in height, and its base is nearly one thousand feet in circumference. An excavation made from the top downward, and from one side of the base to the center, disclosed the fact that the mound contained two sepulchral chambers, one at the base and one near the center of the mound. These chambers had been constructed of logs, and covered with stone. The lower chamber contained two skeletons, one of which is supposed to have been a female.

The upper chamber contained but one skeleton. In addition to these, there were found a great number of shell beads, ornaments of mica, and bracelets of copper.[1]

A moment's thought will show us what a great work such a mound must have been for a people destitute of metallic tools and domestic animals. The earth for its construction was probably scraped up from the surface and brought thither in baskets. A people capable of erecting such a monument as this, with only such scanty means at their command, must have possessed those qualities which would sooner or later have brought them civilization.

Another very interesting mound of this class once stood in the city of St. Louis. The rapidly growing city de-



Cross-section St. Louis Mound.

manded its removal in 1869. It was an oblong mound, one hundred and fifty feet long by thirty in height. In its removal it was shown that it contained a burial chamber seventy-five feet long, from eight to twelve feet wide, and from eight to ten feet high, in which about thirty burials had

[1] "Ancient Monuments," p. 169. See also note on same page for another account of a larger number of skeletons.

taken place. The surface of the ground had first been leveled, then the walls raised to the desired height, made firm and solid, and plastered with clay. Timbers formed the roof, over which the mound had been raised to the desired height.

In process of time the roof decayed and fell in, thus giving a sunken appearance to the top of the mound. This view is a cross section of the mound as it was revealed by the workmen. We notice where the roof has fallen in, and the outline of the interior chamber. This burial chamber was perhaps an exact model of the cabins in which the people lived. Can it be that this mound was the final resting place of some renowned chief, and that the other bodies were those of his attendants sent to accompany him to the other world? This is perhaps as reasonable a conjecture as any. Certain it is that this tumulus and that at Grave Creek were fit pyramids for the Pharaohs of the New World.

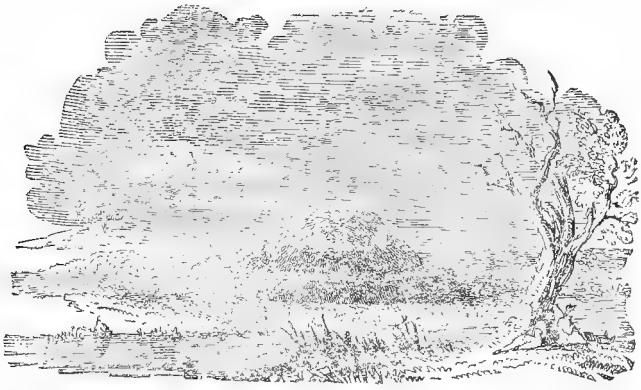
It is not to be supposed that the mounds were the sole cemeteries of the people who built them. Like the barrows of Europe, they were probably erected only over the bodies of the chiefs and priests, the wise men, and warriors of the tribe. The amount of work required for the erection of a mound was too great to provide one for every person. The greater number of the dead were deposited elsewhere than in mounds, but it is doubtful whether we can always distinguish the prehistoric burial places from those of the later Indians. An ancient cemetery, discovered near Madisonville, Ohio, proved to be a most interesting find, as it was thought to be a burial place of the Mound Builders,[1] but it seems there is strong doubt on this point. One writer thinks this was a cemetery of the Erie tribe of Indians, and not very ancient in date.[2]

[1] Short's "North Americans of Antiquity," App. A.

[2] James's "Popular Science," File 1883, p. 445.

In Tennessee are to be found numerous burial places known as the stone-grave cemeteries. Stone graves of a similar character are found in Kentucky, Ohio, and Missouri. These are as yet but few facts which can be used as indicating that all the stone graves are of one people. Many of these cemeteries are of great antiquity, while similar stone graves are of quite recent date. In some places the cemeteries cover very large areas.

We have now to describe a class of mounds that are



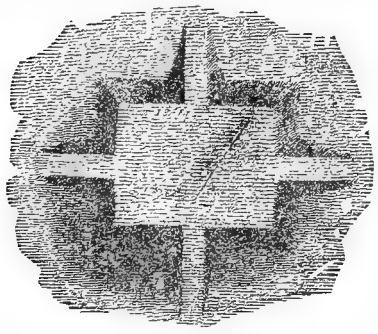
Terraced Mound.

always regarded with great interest, as a number of our scholars think they see in them the connecting link between the remains in this country and those of Mexico and the South. These are generally known as "temple mounds," from the common impression that they were sites of temples or public buildings. In general terms, mounds of this class are distinguished by their large size and regularity of form, and they always have a flat or level top. On one side there is generally a graded way leading up to the summit, in some instances several such methods of approach. Sometimes the sides of the mound are terraced off into separate stages.[1]

[1] "Ancient Monuments," p. 173.

We have already noticed that different sections of country are distinguished by different classes of mound remains. In the present State of Ohio are found many altar mounds and inclosures. In the West are large numbers of burial mounds, but the so-called temple mounds are most numerous in the South. At one place in Wisconsin is found a low embankment inclosing four low mounds with leveled tops. But the resemblance between these and the regular temple mounds is certainly slight. Only a few instances of these flat-topped mounds are found in Ohio. Of these the still existing "elevated squares" at Marietta are good examples.

This cut represents the mound preserved in the park at Marietta. It is ten feet high, one hundred and eighty-eight feet long, by one hundred and thirty-two feet wide. The platform on the top has an area of about half an acre. Graded ways lead up on each of the four sides. These grades are twenty-five feet wide, and sixty feet long.[1]



Elevated Square, Marietta.

As we approach the Gulf States, these platform mounds increase in number. The best representative of this class, the most stupendous example of mound builder's work in this country, is situated in Illinois, not far from St. Louis. The mound and its surroundings are so interesting that they deserve special mention. One of the most fertile sections of Illinois is that extending along the Mississippi from the Kaskaskia to the Cahokia river, about eighty miles in length, and five in breadth. Well watered, and not often overflowed by the Mississippi, it is such a fertile and valuable

[1] "Ancient Monuments," p. 74.

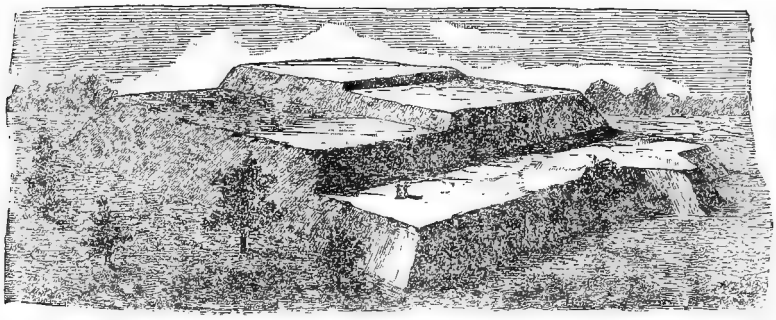
tract that it has received the name of the "Great American Bottom." It is well known that the Mound Builders chose the most fertile spots for their settlements, and it is therefore not surprising to find the evidence that this was a thickly settled portion of their territory. Mr. Breckenridge, writing in 1811, says: "The great number of mounds, and the astonishing quantity of human bones everywhere dug up or found on the surface of the ground, with a thousand other appearances, announces that this valley was at one time filled with habitations and villages. The whole face of the bluff, or hill, which bounds it on the east, appears to have been a continuous burying ground."[1]

Mounds are numerous in this section. We learn that there are two groups of mounds or pyramids, one about ten miles above the Cahokia, and the other about the same distance below it, more than one hundred and fifty in all. Speaking of the group above the Cahokia, Mr. Breckenridge says: "I found myself in the midst of a group of mounds mostly of a circular shape, and, at a distance, resembling enormous hay-stacks scattered through a meadow. One of the largest which I ascended was about two hundred paces in circumference at the bottom, the form nearly square, though it had evidently undergone considerable alteration from the washing of rains. The top was level, with an area sufficient to contain several hundred men." He represents the view from the top of the mound to be a very extensive and beautiful one. From this elevation he counted forty-five mounds or pyramids, besides a great number of small artificial elevations. This group was arranged in the form of a semicircle, about a mile in extent, the open space being on the river.

Three miles above occurs the group in which is found

[1] "Views of Louisiana."

the famous big mound.[1] This cut gives us a good idea of the mound as it was in its perfect state. All accounts given of this mound vary. From a cut of the model, as prepared by Dr. Patrick, the area of the base is a trifle over fifteen acres.[2] The ascent was probably on the south side of the mound, where the little projection is seen. The first platform is reached at the height of about fifty feet. This platform has an area of not far from two and four-fifth acres. Large enough for quite a number of houses, if such was the purpose for which this mound was erected. The second platform is reached at about the height of seventy-five feet,



Cahokia Mound.

and contains about one and three-fourth acres. The third platform is elevated ninety-six or ninety-seven feet, while the last one is not far from one hundred feet above the plain. The area of the last two is about three-fourths of an acre each. The areas of all the platforms are not far from six acres. We require to dwell on these facts a moment before we realize what a stupendous piece of work this is. The base is larger than that of the Great Pyramid,[3] and we

[1] This cut represents the mound as it probably was before the outlines were destroyed by cultivation. It is based on a model prepared by Dr. Patrick for the Peabody Museum.

[2] "Peabody Museum Report," Vol. II, p. 473. As this may include some of the wash from the mound, perhaps it would be better to give the real area of the base as over twelve acres.

[3] That is, if we follow the plan.

must not lose sight of the fact that the earth for its construction was scraped up and brought thither without the aid of metallic tools or beasts of burden, and yet the earth was obtained somewhere and piled up over an area of fifteen acres in one place to a height of one hundred feet, and even the lowest platform is fifty feet above the plain. Some have suggested that it might be partly a natural elevation. There seems to be, however, no good reason for such suggestions.

What motive induced the people to expend so much labor on this mound? It is not probable that this was a burial mound, though it may ultimately prove to be so. The most probable supposition is that the mound was erected so as to secure an elevated site, perhaps for purpose of defense, as on these platforms there was abundant room for a large village, and an elevation or height has always been an important factor in defenses. In this connection, Prof. Putnam has called our attention to a fact which indicates that a very long time was occupied in the construction of the mound, and further, that a numerous population had utilized its platforms as house sites—that is, that "everywhere in the gullies, and over the broken surface of the mounds, mixed with the earth of which it is composed, are quantities of broken vessels of clay, flint chips, arrow-heads, charcoal, bones of animals, etc., apparently the refuse of a numerous people." The majority of writers, however, think that this elevated site, obtained as the result of so much labor, was utilized for important public buildings, presumedly the temple of their gods, and no one can help noticing the similarity between this structure and those raised by the ancient Mexicans for both religious purposes and town sites.

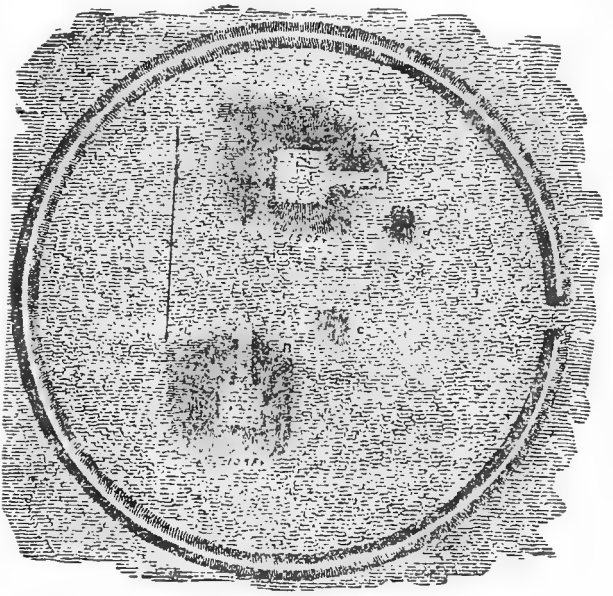
Mr. Foster thinks that "upon this platform was reared

a capacious temple, within whose walls the high-priests gathered from different quarters at stated seasons, celebrated their mystic rites, while the swarming multitudes below looked up with mute adoration.[1] Mr. Breckenridge, whose writings we have already referred to, at the time of his first visit, "everywhere observed a great number of small elevations of earth, to the height of a few feet, at regular distances apart, which appeared to observe some order: near them pieces of flint and fragments of earthen vessels." From this he concludes that here was a populous town, and that this mound was a temple site. It is doubtful whether we shall ever pierce the veil that lies between us and this aboriginal structure. The pyramids of the Old World have yielded up their secret, and we behold in them the tombs of Egypt's kings. But this earthen pyramid on the western prairie is more involved in mystery, and we do not know even its builders. If the result of religious zeal, we may be sure that a religion which exacted from its votaries the erection of such a stupendous piece of work was one of great power.

As before remarked, "temple mounds" increase in numbers and importance as we go south. "In Kentucky they are more frequent than in the States north of the Ohio River, and in Tennessee and Mississippi they are still more abundant.[2] We also learn that they are often surrounded, or nearly so, with moats or ditches, as if to fortify their location. Our noxt cut illustrates such an arrangement—a circular wall of earth four feet high and two thousand three hundred feet in circumference, incloses four mounds, two of which are temple mounds. According to the late Prof. Forshey, temple mounds abound in Louisiana. He described a group situated in Catahoola County, in which the principal

[1] "Prehistoric Races," p. 107. [2] "Ancient Monuments," p. 174.

mound has a base of more than an acre, a height of forty-two feet, and the upper platform an area of nearly one-third of an acre. The smaller mounds are arranged around this larger one. This group is defended by an embankment. From this point for a distance of twenty miles along the



Temple Mounds Inclosed in a Circle.

river, are scattered similar groups of mounds; in all cases the smaller ones arranged around the larger one, which is presumably the site of a temple.

A digression right here may not be devoid of interest. We are not sure but that the dim, uncertain light of history falls on the origin of this group of mounds. When the French first commenced their settlement in the lower Mississippi Valley, the Natchez Indians was the most powerful tribe in all that section. In the course of time, wars ensued between them and the French, and in the year 1730 they fled into Upper Louisiana, and settled at the place where these mounds are now found. But the French fol-

lowed them a year or so afterwards, and nearly exterminated them. Some of our scholars think that they erected these mounds.[1] The historian of that epoch simply says they had "built a fort there." It is however questioned whether they had time to build works of such magnitude. But they were both a mound-building and a mound-using people, and we are not prepared to say how long it would take them to do the work, until we know the number engaged, methods employed, and other considerations.[2] If they did not build these works, they doubtless cleared them of trees and utilized them; and this place was therefore the scene of the final downfall of the Natchez—a people we have every reason to regard as intimately connected with the prehistoric mound-building tribes.

The largest temple mound in the South is near Seltzertown, Mississippi. Its base covers about six acres, and it rises forty feet. This slope was ascended by means of a graded way. The summit platform has an extent of nearly four acres. On this platform three other mounds had been reared—one at each end, and a third in the center. Recent investigation by the Bureau of Ethnology have shown that the base of this mound is a natural formation. Lumps of sun-dried, or partially burnt clay, used as plastering on the houses of the Mound Builders, gave rise to a sensational account of a wall of sun-dried bricks two feet thick, supporting the mound on the northern side.[3] The famous Messier Mound, in Georgia, is said to reach a height of ninety-five feet. But a large part of this elevation is a natural eminence; the artificial part is only a little over fifty feet.

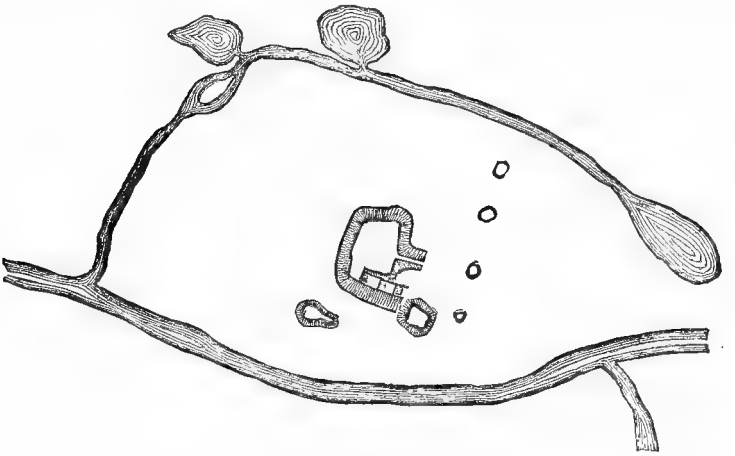
---

[1] Pickett's "History of Alabama," Vol. I., p. 301.

[2] Carr's "Mounds of the Mississippi Valley," pp. 91, 92; note, 103.

[3] "Ancient Monuments," p. 117. Note.—For the statement made in this text we are under obligation to Prof. Thomas, of the Bureau of Ethnology, who, in answer to a letter of inquiry, kindly furnished the information.

A work of unusual interest occurs on the Etowah River, Georgia. This cut gives us a plan of the work. We notice, first of all, the moat or ditch by which they fortified their position. The ditch is still from five to



Etowah Mound, Georgia.

twenty-five feet deep, and from twenty to seventy-five feet wide. It connects directly with the river at one end, but stops short at the other. It surrounds nearly fifty acres of land. At two points we notice reservoirs, each about an acre in size, and an average depth of not less than twenty feet. At its upper end is an artificial pond. This ditch, with its reservoirs and pond, is no slight work. The large mound seen in the center of the space is one of the largest of the temple mounds. Its shape is sufficiently shown in the cut. The height of the mound is sixty-five feet. We call especial attention to the series of terraces leading up the south side of the mound. Graded ways afford means of access from one terrace to the other. A pathway is also seen on the eastern side.

To this group of works an interest attaches similar to that of the group of works mentioned in Louisiana. We

are not certain but that we catch a glimpse of it while it was yet an inhabited Indian town. This is contained in the brief accounts we have of the wanderings of the unfortunate De Soto and his command. One of the chroniclers of this expedition, La Vega, describes one of the towns where the weary Spaniards rested, and which we are sure was somewhere in Northern Georgia, in such terms, mentioning the graded way leading to the top, that Prof. Thomas, who has spent some time in this investigation, thinks his description can apply only to the mound under consideration.[1] Whether this conclusion will be allowed to stand, remains to be seen. But, if true, then the darkness which rests upon this aboriginal structure lifts for a moment and we see around it a populous Indian town, able to send five hundred warriors to battle. The Spaniards marched on to sufferings and death, and darkness again closed around the Etowah Mound. When the Europeans next beheld it around it was the silent wilderness; the warriors had departed; the trees of the forest overspread it.

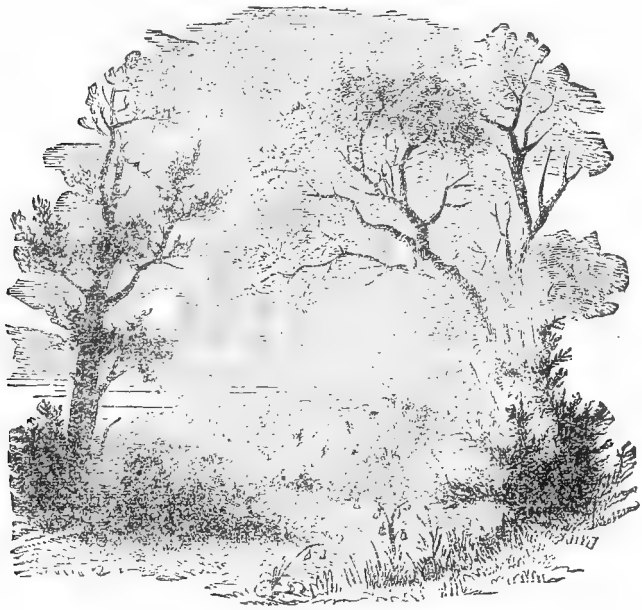
We have now described the principal mound structures, and shown the different classes into which they are divided. But a large class of mounds are found scattered all through the Mound Builders' territory that were probably used as signal mounds. Burial mounds were also often used for this purpose.[2] This was because their location was always very favorable for signal purposes. Signaling by fire is a very ancient custom. The Indians on our western plains convey intelligence by this means at the present day. Some tribes

---

[1] "*Am. Antiquarian*," March, 1884, p. 99.

[2] It may be that no mounds were built for signaling purposes alone. The work of erecting mounds was so great that it is quite likely they were always erected for some other purpose, and used only secondarily for signal purposes. Such is shown to be the case with many of the signal mounds in Ohio. Such is the opinion of Mr. MacLean, who has made extensive researches.

use such materials as will cause different shades of smoke, using dried grass for the lightest, pine leaves for the darkest, and a mixture for intermediate purposes. They also vary the signal by letting the smoke rise in an unbroken column, or cover the fire with a blanket, so as to cause puffs of smoke. The evidence gathered from the position of the

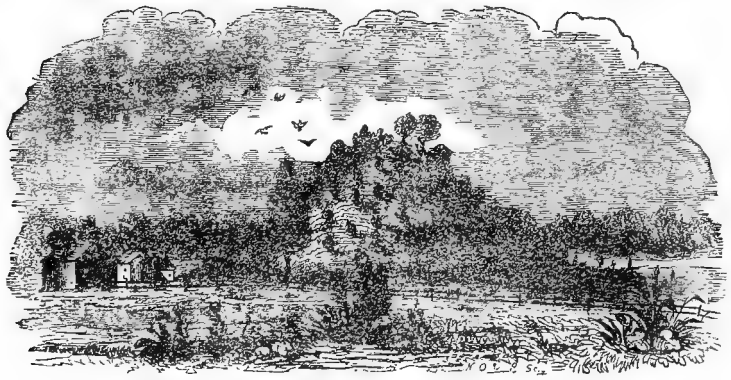


Hill Mounds.

mounds, and traces of fire on their summit, is that the Mound Builders had a very extensive system of signal mounds.

To illustrate this system, we would state that the city of Newark, Ohio, was the site of a very extensive settlement of the Mound Builders. This settlement was in a valley, but on all the surrounding hills were located signal mounds. And it is further stated that lines of signal mounds can be traced from here as a center to other and more distant points. The large mound at Mt. Vernon, twenty miles

to the north, was part of this system. As the settlements of the Mound Builders were mostly in river valleys, we would expect to find all along on the bluffs fronting these valleys traces of signal mounds. In the Scioto Valley, from Columbus to Chillicothe, a distance of about forty miles, twenty mounds "may be selected, so placed in respect to each other that it is believed, if the country was cleared of forests, signals of fire might be transmitted in a few minutes along the whole line." Some think the chain is much more extensive than this, and that the whole Scioto Valley,



Miamisburg Mound.

from Delaware County to Portsmouth, was so provided with mounds that signals could be sent in a very few minutes the whole distance.[1]

The valley of the Miami River was equally well provided with signal mounds. This great mound, at Miamisburg, Ohio, rising to the height of sixty-eight feet, was one of the chain by which signals were transmitted along the valley. Not only was each river valley thus provided, but there is evidence that communication was established between different river systems, so we can easily see how quickly the invasion of their country by an enemy from any quarter

[1] Force's "Some Consideration of the Mound Builders," p. 65.

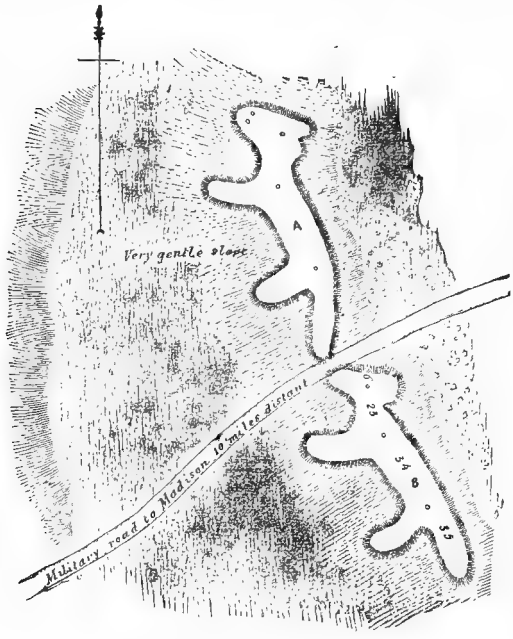
would become known in widely scattered sections. Immediately across the river from Chillicothe, Ohio, on a hill nearly six hundred feet high, was located a signal mound. A fire built upon it would be visible twenty miles up the valley, and an equal distance down. It would be also visible far down the valley of Paint Creek. Some think that such a system of lofty observatories extended across the whole State of Ohio, of Indiana, and Illinois, the Grave Creek mound, on the east, the great mound at Cahokia, on the west, and the works in Ohio filling up the line. We do not believe, however, it is safe to draw such conclusions. It is doubtful whether there was any very close connection between the tribes in these several sections.

In the State of Wisconsin are found some of the most interesting remains of the Mound Builders. They are so different from the ordinary remains found elsewhere that we must admit that the people who built them differed greatly from the tribes who built the great temple mounds of the South, or the earthworks of Ohio. The remains in Wisconsin are distinguished not by their great size or height, but by their singular forms. Here the mound building instincts of the people were expressed by heaping up the earth in the shape of animals. What strange fancy it was that led them to mould the figures on the bluffy banks of the rivers and the high lands about the lakes of their country, we shall perhaps never know. That they had some design in this matter is, of course, evident, and if we would try and learn their secret, we must address ourselves to a study of the remains.

Effigy mounds are almost exclusively confined to the State of Wisconsin. We, indeed, find effigy mounds in other sections, but they are of rare occurrence.[1] They, however,

[1] Similar effigy mounds have been recently observed in Minnesota, but they have not yet been described. (Putnam.)

show that the same reasons, religious, or otherwise, exists in other localities, while in the area covered by the southern portion of the State of Wisconsin it found its greatest expression. This cut affords us a fair idea of effigy mounds.



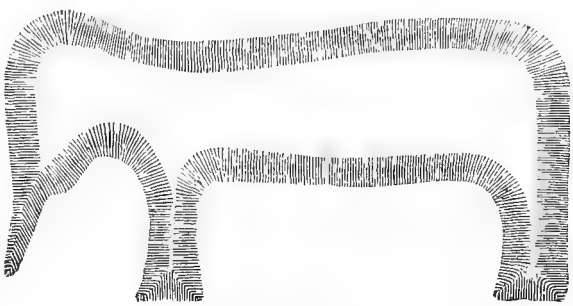
Effigy Mounds.

Here are seen two animals, one behind the other. On paper we can readily see the resemblance. Stretched out on the ground, and of gigantic proportions, the resemblance is not so marked, and some might fail to notice it at first sight. Either of those figures is over one hundred feet long, and about fifteen feet wide. With few exceptions, effigy mounds are inconsiderable in height, varying from one to four feet. These mounds have been carefully studied of late years, and there is no doubt that in many instances we can distinguish the animals represented.

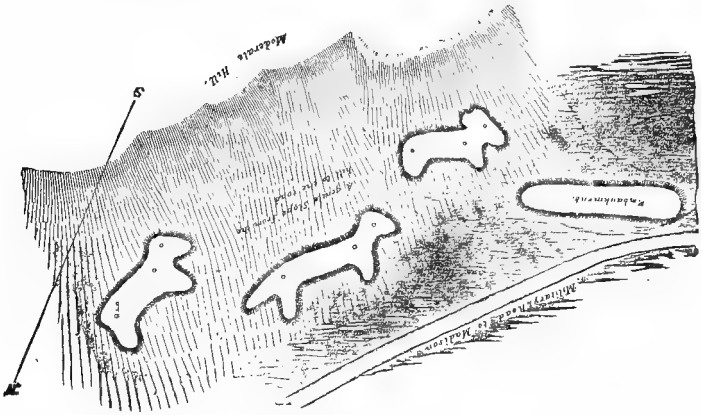
We learn, then, that tribes formerly living in Wisconsin had the custom of heaping up the earth in the shape of the various animals peculiar to that section.. But no effigies are found of animals that have since become extinct, or of animals that are to be found only in other lands.

Our next cut represents the famous elephant mound of Wisconsin, on the strength of which a number of fair theories

have been given relating to the knowledge of the mastodon by the builders of the mound, and its consequent antiquity. It now bears some resemblance to an elephant, but we learn that the trunk was probably produced by the washing of the banks, and, from the same cause, a projection above the head, supposed to represent horns, has disappeared. Taking these facts into consideration, it is quite as likely that it represented a buffalo.[1] One writer even thinks he found a representation of a



Elephant Mound.



Emblematic Mounds.

camel, but the fact is, the more these effigy mounds are studied, the more certain are we that they are representations of animals formerly common in that region.

The manner in which they represented the various ani-

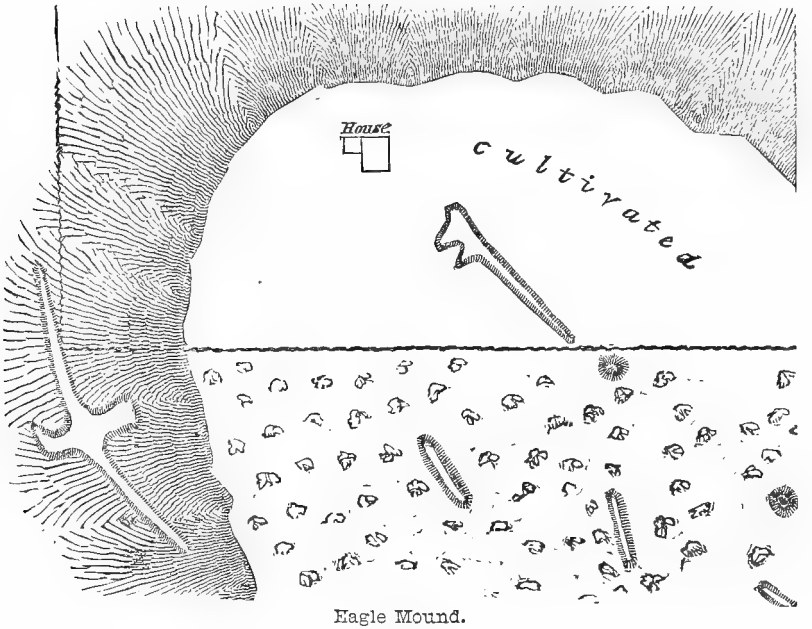
[1] Peet's *American Antiquarian*, May, 1884, p, 184.

mals is full of interest to us. It has been discovered that they worked on a system. The last cut represents a group of three animals discovered a few miles from the Blue Mounds in Dane County. We notice at once a difference between the central animal, with a tail, and the other two. It will also be observed that the animals are represented in profile, with only two projections for legs. They are never separated so that we can distinguish the two front and the two hind feet. Animals so figured are the bear, fox, wolf, panther, and others. Grazing animals, such as the buffalo, elk, and deer, are represented with a projection for horns. In the last cut the other two animals are buffaloes. In various ways the particular kind of animal can nearly always be distinguished.[1]

Grazing Elks. Fox in the Distance.

[1] Peet's *American Antiquarian*, January, 1884. We are indebted to the writings of Mr. Peet in this periodical for the months of January, May, and

The preceding cut represents two elks grazing, and a fox in the distance. The long embankments of earth at one side are considered by Mr. Peet as in the nature of game drives. But we call attention to the expressiveness with which these figures are delineated. What could be more natural than the quietly grazing elks, with the suspic-

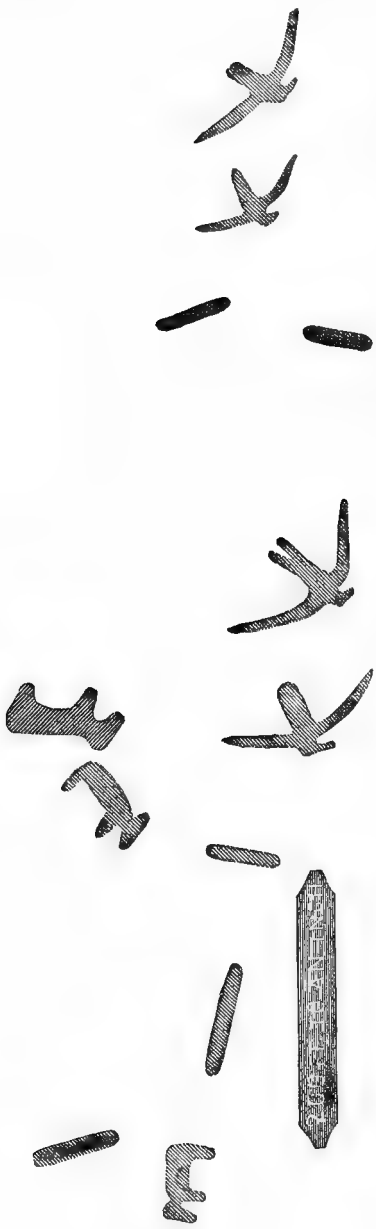


Eagle Mound.

ious prowling fox in the distance. In the cut we also see two cross-shaped figures. This was their method of representing birds, a projection on each side of a central body denoting wings. These figures are often very expressive.

In this cut we have no difficulty in recognizing an eagle It is represented as soaring high in the air. On the bluffs above it is a wolf effigy, and several conical and long mounds. In the cut preceding this the eagle and the hawk are hov-

July, 1884, for many interesting facts in reference to the effigy mounds. He has studied them more than any other person, and his conclusions are consequently of great value.



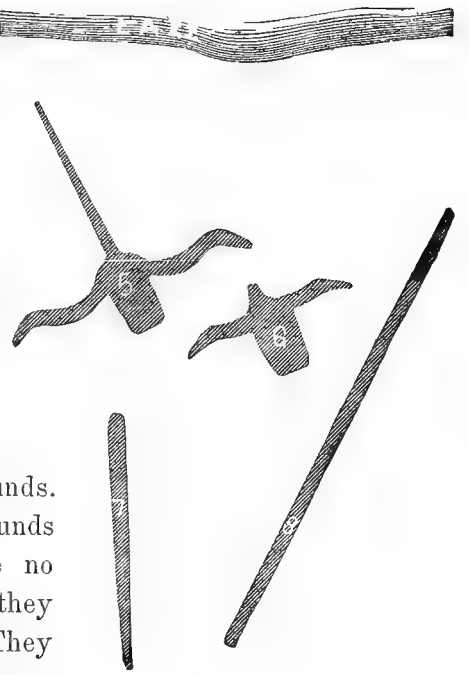
Hawks and Buffaloes.

ering over the feeding elks, while in this cut a flock of hawks are watching some buffaloes feeding in the distance. This group of effigies was found on the banks of the Kickapoo River Our next cut represents a wild goose with a long neck and beak followed by a duck with a short neck, flying towards the lake.

Water-loving animals, such as salamanders and turtles, are represented. in still another way, two projections on each side of a central figure. The next following cut represents a turtle. The tail was not always added. The salamander closely resembles the turtle, but notice the difference in the body, and still different is the cut of the musk-rat (page 346). Fishes are figured as a straight embankment of earth tapering to a point.

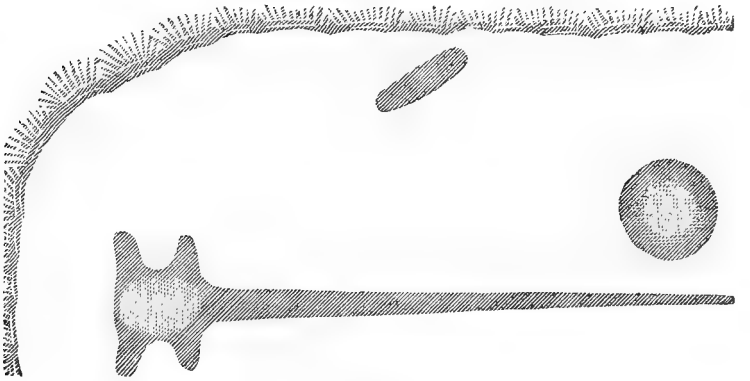
The same system that was observed in the location of signal mounds is to be noticed in the arrangements of these groups of effigy mounds. They are not alone. One group answers to another on a distant hill, or is in plain view of

another group in the valley below. Distant groups were so related, each commanding a wide extent of country, and thus group answers to group, and mound to mound, for miles away, making a complete system throughout the region.



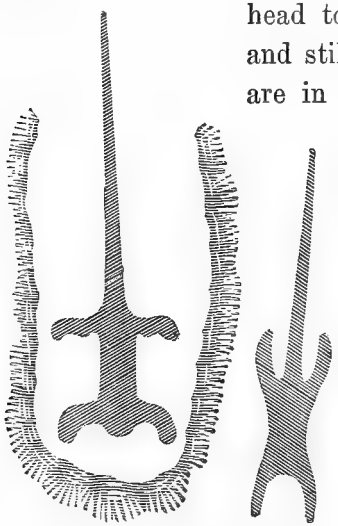
Goose and Duck.

We notice this as to the location of the mounds. When we examine the mounds themselves, we observe no little skill in the way they represent the animals. They often impressed on them something more than mere animal resemblances. "There are groups where the attitudes are expressive of a varied action. Certain animals, like the weasel or mink, being seen with a



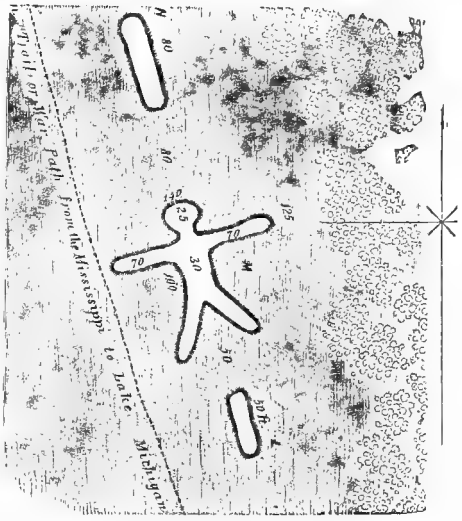
Turtle.

bird so near that, apparently, it might be caught by a single spring; and still others, like the wolf or wild-cat, are arranged head to head, as if prepared for combat; and still others, like the squirrel or coon, are in the more playful attitudes, sometimes apparently chasing one another over hill or valley; and again situated alone, as if they had just leaped from some tree, or drawn themselves out of some den or hole."[1]



Salamander and Musk-rat.

Nor is the effigy of the human form wanting. It is found in several localities throughout the State. This cut shows us one such effigy. This was the beginning of a long train of animal mounds, presumably representing bears, found near the Blue Mounds, Wisconsin.[2] We can not observe that any more importance was ascribed to the effigy of a human being than to that of an animal.

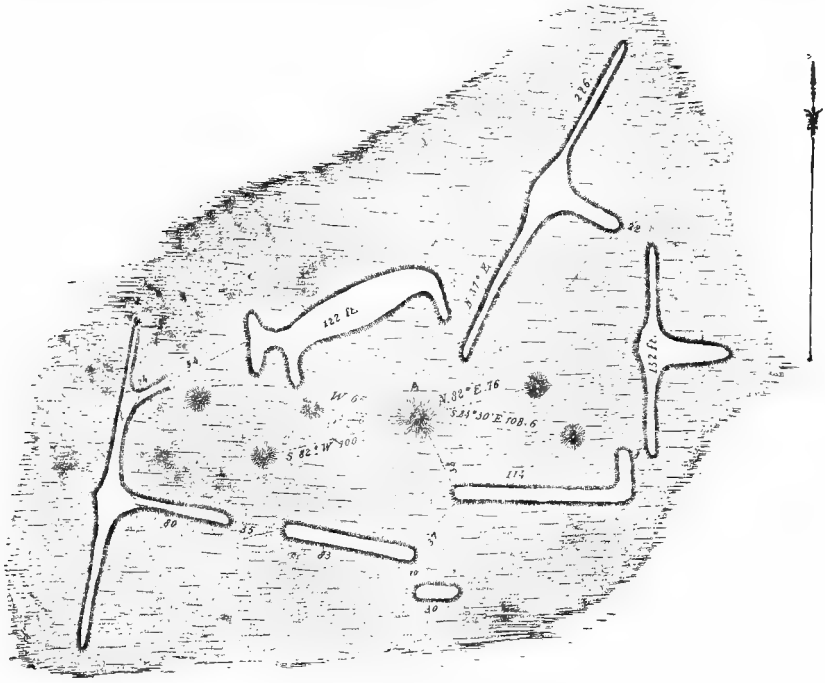


Man-shaped Mound.

In casting about for a suitable explanation for the erection of these animal mounds, we find ourselves lost in conjecture as to the motive which

[1] Peet's: "Emblematic Mounds and Totem System of the Indian Tribes."
[2] "Ancient Monuments," p. 40.

induced these people to prepare these earthen effigies. We may be sure that it was for some other reason than for amusement, or to give exercise to an artistic feeling. Only in very few instances do we detect any arrangements which would imply that they were in the nature of defenses. In some cases the effigies are so arranged as to form a sort of inclosure, some portion of the figure being prolonged to an unusual extent, and thus inclosing a space that may have been utilized for a vil-



Emblematic Mound Inclosure.

lage site. This group on the Wisconsin River illustrates this point. Here the area thus partially inclosed, is about an acre. It is a singular fact that these inclosures are almost always triangular in shape.[1] But it is manifest that

[1] *American Antiquarian*, January, 1883.

a simple earth wall would serve for defense much better than these forms. They probably were not burial mounds, as few contain human remains, and it is not yet certain that these remains were not intrusive burials.[1] It seems, therefore that they must have been in some manner connected with the religious life of the people.

If we examine the various groups scattered throughout the State, this belief is strengthened. It is found, for instance, in nearly every group, that some one effigy is the principal one, and is placed in a commanding position, about which the other forms are arranged. It is also thought that the same effigy is the principal or ruling effigy over a wide district. In illustration of this, it can be stated that in the south-eastern part of the State the turtle is always the ruling effigy. In any group of effigies it is the principal one. It seems to watch over and protect the others. In subordination to it are such forms as the lizard, hawk, and pigeon. Passing to the North, the turtle is no longer the important figure. It is replaced by the wolf, or wild-cat. This is now the principal form, and if the turtle is sometimes present, it is of less importance.

So marked is the fact we have just stated that Mr. Peet says, "that sometimes this division assumes almost the character of a river system, and thus we might trace what seems to be the beginning in this country of that which prevailed on classic soil and in Oriental regions—namely, river gods and tutelar divinities of certain regions, each tribal divinity having its own province, over which it ruled and on which it left its own form or figure as the seal of its power and the emblem of its worship."[2]

Looking for some explanation of this, we may find a

[1] Putnam, in "Proceedings of American Antiquarian Society," 1884.

[2] Peet's "Emblematic Mounds and Totem System of the Indian Tribes."

key in the known customs of various Indian tribes, and the lower races of men. It is known that a tribe of Indians is divided into smaller bands, which are called gens or clans. A gens may consist of several hundred persons, but it is the unit of organization. It takes the place of a family among civilized people. These various bands are generally named after some animal. In the beginning these names may have been of no special significance, but in course of time each band would come to regard themselves as descendants of the animal whose name they bore. Hence the animal itself would be considered sacred in their eyes, and its life would seldom be taken by members of that gens.

The animal thus honored by the gens was, in the Indian dialect, the totem of the clan. This organization and custom we find running all through the Indian tribes. In many tribes the Indians were wont to carve a figure of their totem on a piece of slate, or even to carve a stone in the shape of the totem, which carved or sculptured stone they wore as an ornament, or carried as a charm to ward off evil and bring them good luck.[1] We need only suppose that this system was very fully developed among the Mound Builders of Wisconsin, to see what important bearing it has on these effigy mounds.

A tribe located on one of the fertile river valleys of Wisconsin was composed of various gens or clans. On some common point in proximity to their villages, or some spot which commanded a wide view of the surrounding country, each gens would rear an effigy of its totem, the animal sacred to them. In every tribe some gens would be the most powerful, or for some cause the most respected, and its totem would be given in the largest effigy, and would be placed in the most commanding position. In a different lo-

[1] Abbott's "Primitive Industry," p. 383.

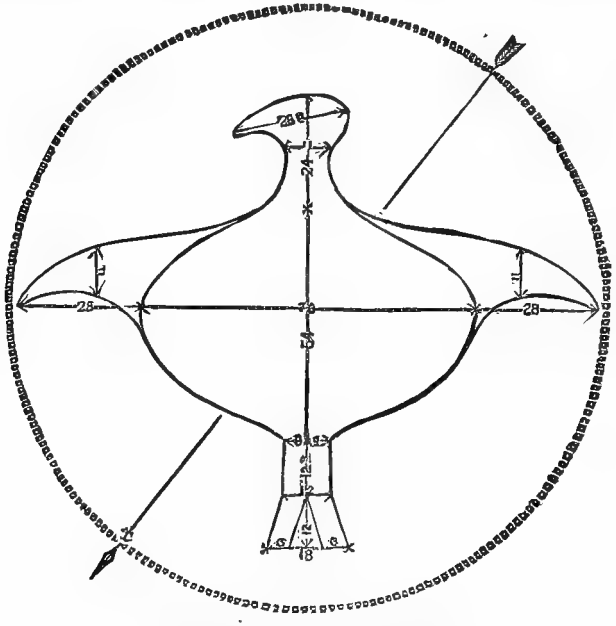
cality some other tribe would be located, and some other totem would be regarded as of the most importance.

In this light effigy-mounds are not mere representatives of animal forms. They are picture-writings on a gigantic scale, and are the source of much true history. They tell us of different tribes, the clans which composed them, the religious beliefs, and the ruling gens of the tribe. Contemplating them, we seem to live again in the far-off past. The white man disappears; waving forests claim their ancient domain, and the rivers, with a more powerful current, roll in their olden channels. The animals whose forms are imaged here, go trooping through the forest or over the fertile bottom lands. The busy scenes of civilization give place to the placid quiet of primeval times, and we seem to see peaceful tribes of Mound Builders paying a rude veneration to their effigy-gods, where now are churches of a more soul-satisfying religion.

But there is still another point to be learned from an examination of these ancient mounds. Not only are they totems of the tribes, but they were looked on in some sense as being guardian divinities, with power to protect the homes of the tribe. This is learned by studying the location in which they are placed. They occupy all points of observation. In other parts of the Mound Builders' country, wherever we find signal-mounds we find corresponding positions in Wisconsin occupied by groups of effigy-mounds, or if one only is present, it is always the one which, from the considerations we have stated, was regarded as the ruling effigy of that section. It is as if their builders placed them as sentinels to guard the approaches to their homes, to give warning of the arrival of hostile bands. This is further borne out by finding that mounds placed in such positions frequently show evidence of the action of intense fire,

and so we conclude they were used as signal stations also. So we need not doubt but that the region thus watched over by these effigy-mounds, group answering to group along the river banks, or in the valleys below, was at times lit up by the signal fires at night; or the warning column of smoke by day betokening the presence of danger.[1]

Before leaving the subject of effigy-mounds, we must refer to some instances of their presence in other localities.



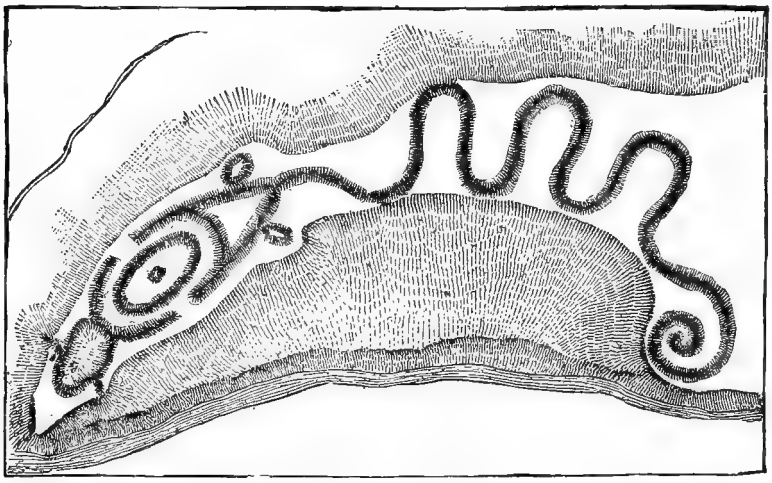
Bird Mound, Surrounded by a Stone Circle.

This cut is an eagle effigy discovered in Georgia. Only one other instance, also occurring in Georgia, is known of effigy-mounds in the South. Measured from tip to tip of the wings, the bird, in this case, is one hundred and thirty-two feet. This structure is composed of stones, and a singular feature is the surrounding circle of stone.[2]

[1] Peet's "Military Architecture of the Emblematic Mound Builders."

[2] "Smithsonian Report," 1877, p. 278, *et seq.*

Several examples of effigy-mounds are found in Ohio. The most notable one is that known as the Great Serpent Mound, in Adams County. We give an illustration of it. The entire surrounding country is hilly. The effigy itself is situated on a tongue of land formed by the junction of a ravine with the main branch of Brush Creek, and rising to a height of about one hundred feet above the creek. Its form is irregular on its surface, being crescent-shaped, with the point resting to the north-west. We give in a note



Big Serpent Mound.

some of the dimensions. The figure we give of this important effigy is different from any heretofore presented. We are indebted for the plan from which the drawing was made to Rev. J. P. MacLean, of Hamilton, Ohio. Mr. MacLean is a well-known writer on these topics. During the Summer of 1884, while in the employ of the Bureau of Ethnology, he visited the place, taking with him a thoroughly competent surveyor, and made a very careful plan of the work for the Bureau. All the other figures published represent the oval as the end of the works. Prof. Putnam,

who visited the locality in 1883, noticed, between the oval figure and the edge of the ledge, a slightly raised, circular ridge of earth, from either side of which a curved ridge extended towards the sides of the oval figure. Mr. MacLean's researches and measurements have shown that the ridges last spoken of are but part of what is either a distinct figure or a very important portion of the original figure. As figured, it certainly bears a very close resemblance to a frog, and such Mr. MacLean concludes it to be.

There is both a similarity and a difference between this work and those of Wisconsin. The fact that it occurs isolated, the other effigies in Ohio being many miles away, shows that some special purpose must have been subserved by it. There the great numbers gave us a hint as to their purpose. In this case, however, nearly all observers conclude that it was a religious work. Mr. MacLean, after describing these three figures, propounds this query: "Does the frog represent the creative, the egg the passive, and the serpent the destructive power of nature?" Not a few writers, though not acquainted with the presence of the frog-shaped figure, have been struck with the combination of the egg and the serpent, that plays such an important part in the mythology of the Old World. We are told that the serpent, separate or in combination with the circle, egg, or globe, has been a predominant symbol among many primitive nations. "It prevailed in Egypt, Greece, and Assyria, and entered widely into the superstitions of the Celts, the Hindoos, and the Chinese." "Wherever native religions have had their scope, this symbol is sure to appear."[1]

Even the Indians have made use of this symbol. On Big Medicine Butte, in Dakota Territory, near Pierre, is a train of stones arranged in the form of a serpent, which is

[1] "Ancient Monuments," p. 97; *American Antiquarian*, January, 1883, p. 77.

probably the work of the Sioux Indians. Around about on the hill is the burying-ground of their chiefs. This was to them sacred ground, and no whites were allowed near. The stones are about the size of a man's head, and are laid in two rows, from one to six feet apart. The length in all is three hundred and fifty feet, and at the tail, stones, to represent rattles, are rudely carved. The eyes are formed by two big red bowlders. No grass was allowed to grow between the two rows of stone.[1]

It seems reasonable to suppose that the few isolated effigy mounds we have outside of Wisconsin were built to subserve a different purpose than those in that State. Mr. Peet has made some remarks on their probable use that seem to us to cover the ground, and to do away with any necessity of supposing on the part of its builders an acquaintance with Old World mythologies. Nature worship is one of the earliest forms of worship. The prominent features of a landscape would be regarded as objects of worship. Thus, for example, the island of Mackinâc resembles in its outline the shape of a turtle; so the island was regarded as sacred to the turtle, and offerings were made to it. A bluff on the same island at a distance resembles a rabbit; accordingly, it was called by that name, and offerings were made to it. It is quite natural that the effigy-mound builders should seek to perpetuate by effigy some of these early traditions.

In the case of the Big Serpent mound this point is worth considering. The ridge on which it stands is not only in the midst of a wild, rough region, but is so situated that it commands a wide extent of country. In shape this tongue of

[1] This information is communicated by Mr. L. N. Tower, a gentleman in the employ of C. & N. W. R. R., at Tracy, Minn., who, at the request of the writer visited this locality, made measurements, etc.

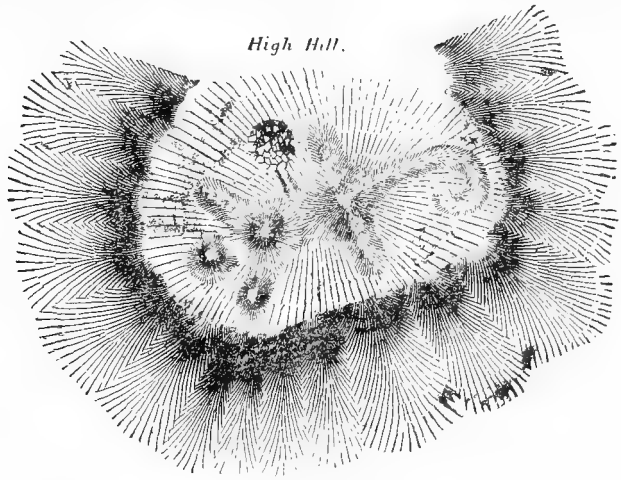
land is also peculiar. It is a narrow, projecting headland, and would easily suggest the idea of a serpent or a lizard. "This, with the inaccessibility of the spot, would produce a peculiar feeling of awe, as if it were a great Manitou which resided there; and so a sentiment of wonder and worship would gather around the locality. This would naturally give rise to a tradition, or would lead the people to revive some familiar tradition and localize it."[1] The final step would be to make an effigy.

It seems to us very hazardous to draw any conclusions as to the religious beliefs of the Mound Builders from this effigy or combinations of effigies. It also seems to us reasonable to suppose that but one figure was intended to be represented. A very slight prolongation of the serpent's jaws and the limbs of the frog would connect them, in which case we would have some amphibious creature with an unduly extended tail, or perhaps a lizard. We must remember that the whole figure has been plowed over once or twice, so that we are not sure of the original outlines. We can not tell why they should represent a portion of the body as hollow, but neither can we tell why the head of the supposed serpent should be represented as hollow. We do not find any important earth-works near here. The hill on which it is placed commands a very extensive view of the surrounding country. Within the oval a pile of stones showed evidence of a long-continued fire, which would indicate that this was also a signal-mound. Prof. Putnam thinks it probable that there was a burial place between it and the large conical mound not far away.[2]

[1] *American Antiquarian*, November, 1884, p. 403.

[2] The dimensions of this figure vary. Mr. MacLean's survey makes the entire length of the serpent part eleven hundred and sixteen feet; the distance between the extended jaws, one hundred feet. The oval figure is one hundred and thirteen feet long by fifty feet wide. The frog or head portion

In the vicinity of Newark, Ohio, are two examples of effigy mounds. This cut represents what is called the alligator mound, but it is probably the effigy of a lizard. The position which this mound occupies is significant. It is on the very brow of a hill about two hundred feet high, which projects out into a beautiful valley. The valley is not very



Alligator Mound.

wide. Directly across was a fortified camp, in the valley below it was a circular work, and a short distance below on another projecting headland was a strongly fortified hill. The great works at Newark were six miles down the valley, but were probably in plain view. That it was perhaps a signal station, is shown by the presence of traces of fire.

The length of this effigy is two hundred and five feet,

is fifty-five feet. Mr. Squier says, "The entire length, if extended, would be not less than one thousand feet." Mr. Putnam's measurements make it fourteen hundred and fifteen feet. The writer would state that he visited this effigy in the summer of 1884. Though there but a very short time, and not prepared to make careful measurements, he did notice some points in which the illustrations, previously given, are certainly wrong. The oval is not at the very extremity of the cliff. The little projections generally called ears of the serpent are not at right angles to the body, but incline backwards. The convolutions of the serpent's body bend back and forth quite across the surface of the ridge.

the breadth of the body at its widest part, twenty feet, average height about four feet.[1] The effigy mounds of Wisconsin, and the other few examples mentioned, are among the most interesting objects of aboriginal work. Except in a few favored instances, they are rapidly disappearing. To the leveling influence of time is added the assistance of man, and our knowledge of them will soon be confined to existing descriptions, unless something is at once done to preserve them from destruction. Interesting mementos of a vanished race, we turn from their contemplation with a sigh of regret that, in spite of our efforts, they are still so enwrapped in doubt.

Mounds and effigies by no means complete the description of Mound Builders' remains. One of the most interesting and mysterious class of works is now to be described. Early travelers in Ohio came here and there upon embankments, which were found to inclose tracts of land of various sizes. It was noticed that the embankments were often of the form of perfect circles, or squares, or sometimes octagons, and very often combinations of these figures. It was further evident that the builders sought level, fertile lands, along the various river courses. They very seldom built them on undulating or broken ground. Often have the very places where civilized man has laid the foundation of his towns proved to be the sites of these ancient works of the Mound Builders, and thus it has happened that many of the most interesting works of antiquity have been ruthlessly removed to make way for the crowded streets and busy marts of our own times.

The larger number of inclosures are circular, often of a small size. Where they occur separately they either have no gateway, or but one. Sometimes the circles are of very large size, surrounding many acres. Sometimes, though not very often, a ditch was also dug inside the embankment. This

[1] Schmuckers.

last circumstance is by many regarded as a strong proof that the primary object of these circles was not for defense.[1] But an inclosure of this kind, even with the ditch on the inside, if surmounted by a row of pickets or palisades, would prove a strong position against Indian foes armed with bow and arrow. The Mandans constructed defenses of this kind around their villages.[2] As to the original height of the walls, in the majority of cases it was not very great, generally from three to seven feet.

It is estimated that in Ohio alone there are fifteen hundred inclosures, but a large number of them have nothing especially worthy of mention. Some, however, are on such a large scale that they call from all more than a passing glance. In contemplating them, we feel ourselves confronted by a mystery that we can not explain. The ruins of the old world excite in us the liveliest feeling of interest, but we know their object, their builders, and their probable antiquity. The mazy ruins at Newark, and other places in Ohio, also fill the mind with astonishment, but in this case we are not certain of their antiquity, their builders are unknown, and we can not conjecture with any degree of certainty as to their use. Before so many uncertainties imagination runs riot, and we are inclined to picture to ourselves a scene of barbaric power and magnificence.

One beautiful specimen of this work is found in this cut. It occurs on the right bank of the Scioto river, five miles below Chillicothe. Here we notice a combination of the octagon and the circle. The areas of each are marked. The octagon is nine hundred and fifty feet in diameter, and nearly regular in shape. In 1846 its walls were eleven or twelve feet high, by about fifty feet base. It will be noticed that

there is a gate at or near each angle of the octagon except one, and in front of that angle was a pit, from which some of the earth to form the walls was taken. Facing each gateway a mound was placed, as if to guard the entrance.

The circle connected with the octagon is perfect in shape, and is ten hundred and fifty feet in diameter. Its walls were only about half the height of the octagon. We notice some other small circular works in connection with the main work. In this case the parallels are not very regular, and seem to be connected with one or more circular works. In a work situated but a few miles from the one here portrayed, the parallels extend in one direction nearly half a mile, only one hundred and fifty feet apart. They terminate on the edge of a terrace. The object of such parallels is as yet unknown. In some cases, after extending some distance, they simply inclosed a mound.

It is easy enough to describe this work and give its dimensions, but who will tell us the object its builders had in mind? The walls themselves would afford but slight protection, and if they were for defense, must have been surmounted with palisades. Works that were undoubtedly in the nature of fortified camps, are found in this same section, and one of the strongest was located not more than twelve miles away; but such defensive works differ very greatly in design from regular structures such as we are now describing. A very eminent scholar, Mr. Morgan, has advanced the theory that the walls were the foundations on which communal houses, like the Pueblos of the West, were erected.[1] But this is mere theory. All traces of such habitations (if they ever existed) are gone, the usual *débris* which would be sure to

[1] "Contributions North American Ethnology," Vol. IV, p. 210. A cut of this "restored" pueblo is there given.

accumulate around house-sites, is wanting, and the walls themselves seem unfit for such purpose.[1]

They may have been embankments surrounding towns and cultivated fields, but little has yet been found which can be cited as proofs of residence within the area so inclosed. We should not be surprised, however, if such would ultimately prove to be the case, since we now know that the Mound Builders of Tennessee did fortify their villages by means of embankments and ditches.[2] A number of writers think that these regular inclosures were in some way connected with the superstitions of the people. In other words, that they were religious in character. Mr. Squier remarks, "We have reason to believe that the religious system of the Mound Builders, like that of the Aztecs, exercised among them a great, if not a controlling, influence. Their government may have been, for aught we know, a government of the priesthood—one in which the priestly and civil functions were jointly exercised, and one sufficiently powerful to have secured in the Mississippi Valley, as it did in Mexico, the erection of many of those vast monuments, which for ages will continue to challenge the wonder of men. There may have been certain superstitious ceremonies, having no connection with the purpose of the mound, carried on in inclosures especially dedicated to them."[3] Another late writer to whom we have several times referred, tells us there is no doubt but what a "religious view" was the controlling influence in the erection of these works, and that they express a "complicated system of symbolism," that we see in them evidence of a most powerful and wonderful religious system.[4] Still such assertions are easier made than proven, and until we know somewhat the purpose

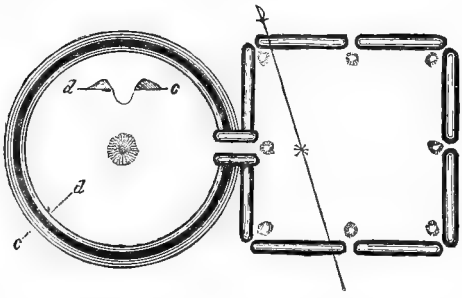
[1] See discussion of this subject in "Proceedings of Am. Antiq. Society," Oct., 1883. [2] "Peabody Museum Reports," Vol. II, p. 205.
[3] "Ancient Monuments," p. 47. [4] Peet: "The Mound Builders."

for which they were used, how are we to know whether they were sacred or not?

Casting conjectures, for the moment, aside, let us learn what we can from the works themselves. From their large extent they could only be reared by the expenditure of great labor. This implies some form of government sufficiently centralized and powerful to control the labors of large bodies of men. Moreover, they were sufficiently advanced to have some standard of measurement and some way of measuring angles. The circle, it will be remembered, is a true circle, and of a dimension requiring considerable skill to lay out. The sides of the octagon are equal, and the alternate angles coincident.

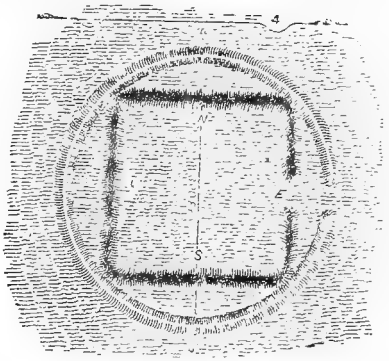
Every year the plow sinks deeper into these crumbling embankments, and the leveling forces of cultivation are continually at work, and the time is not far distant when the curious traveler will with difficulty trace the ruins of what was once, to the Mound Builders, a place of great importance.

The more usual combination was that of a square and a circle. An example is given in this cut, which is a plan on a very small scale, of works which formerly existed in Circleville. One peculiar feature about this work was that a double wall formed the circle, with a ditch between the two walls. In the next cut we notice a peculiar combination of these two figures. The square is inclosed within the circle. Whatever we may ultimately decide as to the larger works, it would seem as if this could only be explained as in the nature



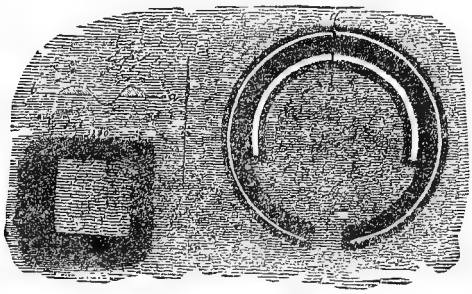
Square and Circle Embankment.

of a religious work. We can see no reason for constructing a defensive work, or inclosing a village, or erecting foundations for houses of such a shape as this. They must have been in some way connected with the superstitions of the people.



Square Inscribed in a Circle.

A peculiar feature is also noticed in reference to some of the smaller circles in this section. The cut below illustrates it. The circle has a ditch interior to the embankment, and also a broad embankment of about the same height with the outer wall, interior to the ditch, running about half-way around the circle. A short distance from the circle was one of those elevated squares, one hundred and twenty feet square at the base, and nine feet high.[1] It may be that this square was the foundation on which stood a temple, in which case the circle might have been dedicated to religious purposes also.



Circle and Ditch.

The great geometrical inclosures are especially numerous in the Scioto Valley. All the works we have described were in the near neighborhood of Chillicothe, and works as important as these are scattered all up and down the valley. We must also recall how well provided this valley was with signal mounds. All indications point to the fact that here

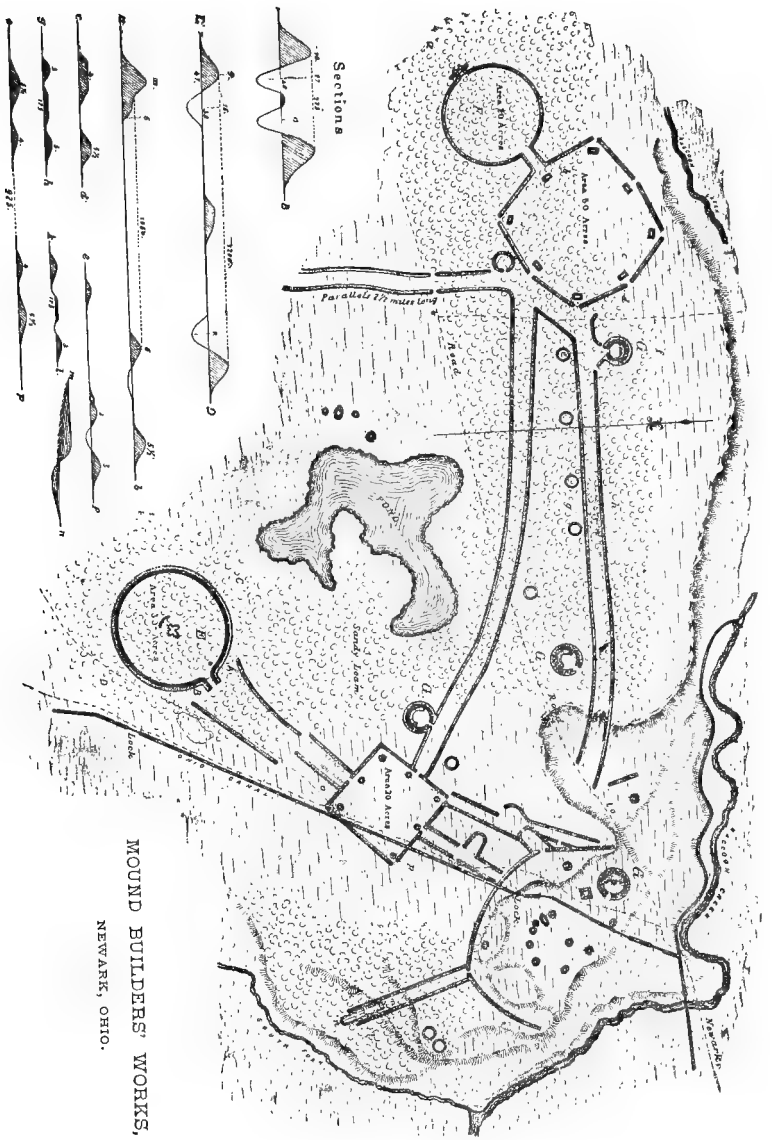
[1] "Ancient Monuments," p. 53.

was the location of a numerous people, ready to defend their homes whenever the warning fires were lit. Although Mound Builders' works are numerous in the valley of the two Miami Rivers, Cincinnati being the site of an extensive settlement, yet they were not such massive structures as those in the Scioto. This would seem to indicate that these valleys were the seats of separate tribes.[1] But this Eastern tribe must have occupied an extensive territory, since works of the most complicated kind are found at Newark.

All indications point to the fact that near this latter place was a very important settlement of the Mound Builders. Several fortified works exist a few miles up the valley; signal-mounds are to be seen on all heights, commanding a wide view, and the famous alligator mound is placed, as if with the design of guarding the entrance to the valley. No verbal description will give an idea of the works, so we refer at once to the plan. This will give us a good idea of the works as they were when the first white settlers gazed upon them. They have nearly all been swept away by modern improvements, excepting the two circular works and the octagon. Here and there fragments of the other works can still be traced.

Two forks of the Licking River unite near Newark; the bottom between these rivers comprising several square miles, was occupied by these ancient earth-works. By reference to the plan, we see the works consisted of mounds of various sizes, parallel walls, generally of a low elevation, small and low embankments, in the form of small circles and half-circles. There are also several large works consisting of a circle and octagon combined, one large circle, and a parallelogram. "The circular structure at 'E,' is undoubtedly one of the best preserved and most imposing in

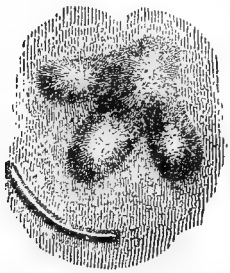
[1] Force: "Some Considerations on the Mound Builders," p. 64.



MOUND BUILDERS' WORKS,
NEWARK, OHIO.

the State. There are many inclosing larger areas, but none more clearly defined. As this is now included in the fair-grounds of Licking County, it is preserved from destruction,

and will remain a monument of aboriginal work long after all traces of the others have disappeared. "At the entrance, which is towards the east, the ends of the walls curve outwards for a distance of a hundred feet, leaving a passage way eighty feet wide between the deep ditches on either hand." From this point the work, even now, presents an impressive appearance. The walls are twelve feet in perpendicular height, and about fifty feet base. There is a ditch close around it on the inside, seven feet deep by thirty-five feet wide. The area inclosed is about thirty acres.



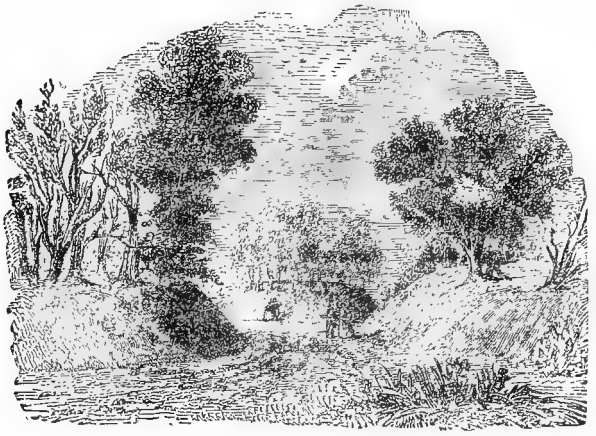
Eagle Mound.

In the center is an effigy-mound, represented by this cut. It represents a bird on the wing, and is called the Eagle Mound. The long mound in the body of the bird has been opened, and it was found to contain an altar, such as has been already described. Was this a place of sacrifice, and did this wall inclose a sacred area? Our question remains unanswered. We can dig in the mounds, and wander over the embankments, but the secret of the builders eludes us.

A mile to the north-west of the part of the work just described are the Octagon and works in connection with it. The Octagon is not quite regular, but the sides are very nearly equal. At each angle is a gateway, interior and opposite to which is a mound, as if to guard the opening. The cut gives a view of the Octagon, looking in through one of these gateways. At present, however, but a small portion is in the forest. Most of it is under cultivation, but the work can still be easily traced, and is one of the best preserved in the State. A portion of it, still in the forest, presents the same appearance to-day as it did to the

first explorer. When a stranger for the first time wanders along the embankment and ascends the mounds, he can not fail to experience sensations akin to those of the traveler when he comes upon the ruins of some Old World city. We wish that for a brief space of time the curtain of the past would up-roll, and let us view these works while yet their builders flourished here.

Connected with the Octagon by parallel walls three hundred feet long and placed sixty feet apart, is the smaller

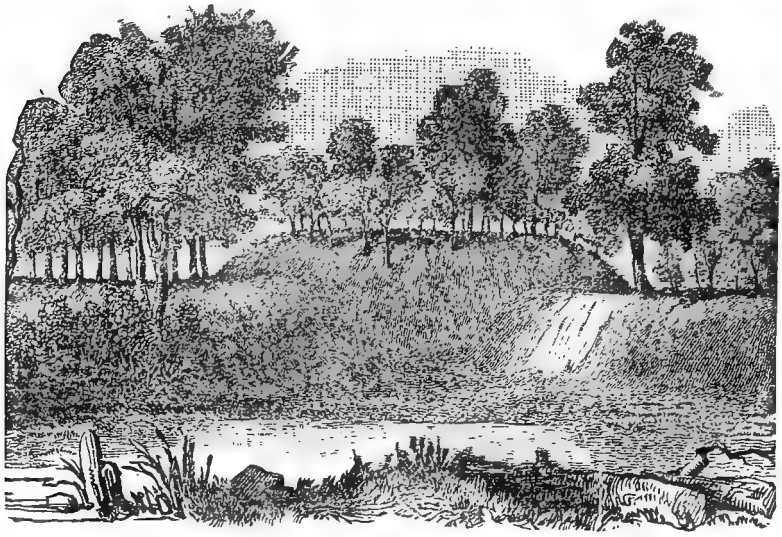


Gateway of Octagon.

circle, "F." This is a true circle, and is upwards of half a mile in circumference. A portion of it lying in the woods, still retains its primitive form, but the larger part is now under cultivation. There is no difficulty, however, in tracing its entire length. The most interesting feature in connection with this part of the work is immediately opposite the point of entrance from the octagon, and is represented in our next cut. At this point it seems as if the builders had started to make parallel walls, but afterwards changed their design and threw across the opening a large mound. From this mound a view of the entire embankment could be

obtained. It is called the Observatory Mound. It has been so often dug into that it is now really in ruins, but is still too steep to be plowed over.

It is scarcely necessary to describe the works further, except to state that three lines of parallel embankments lead away from the octagon. Those extending south have been



Observatory Mound, Newark Works.

traced for upwards of two miles, and are gradually lost in the plain. It was the opinion of Mr. Atwater, one of the earliest investigators, that these lines connected with other works thirty miles away, in the vicinity of Lancaster.[1] Small circles are numerous in connection with these works. It has been suggested by several that they mark the sites of circular dwellings. The larger ones, indicated by the letter "G," are more pretentious. They have the ditch and embankment, which we have already described. Many interesting coincidents in dimensions will be perceived between

[1] "Archæologia Americana," Vol I, p. 129.

portions of this work and those described in the Scioto Valley.[1]

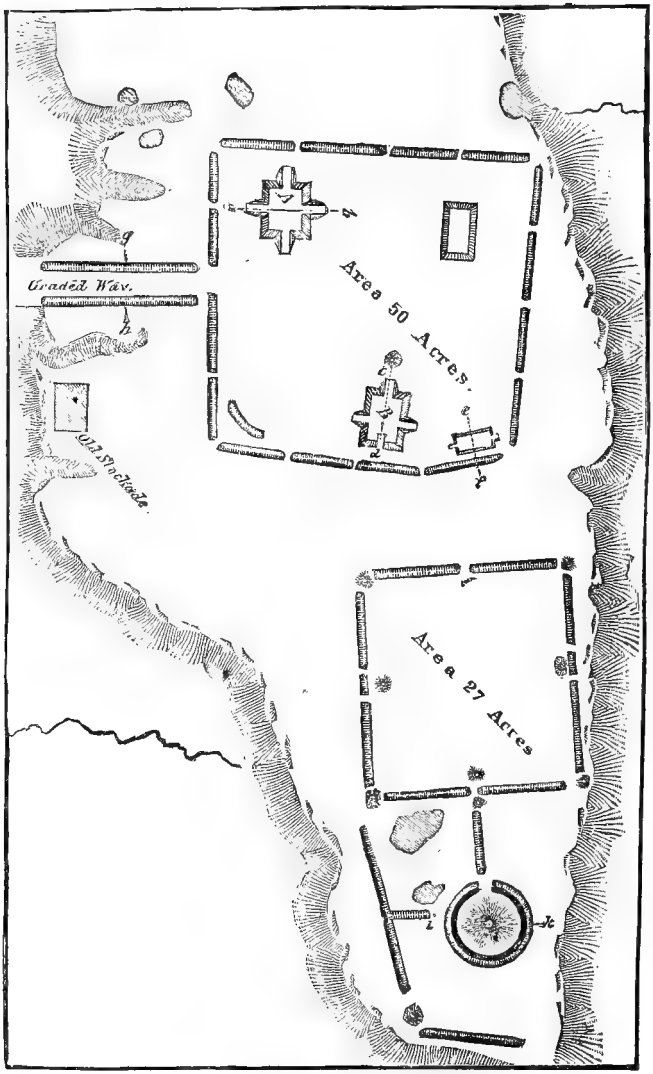
Although we have devoted considerable space to this branch of the Mound Builders' work, we must still find space to describe the works at Marietta, which possessed some singular features. This cut gives us a correct plan of the works as they were when in 1788 the first settlers arrived at the mouth of the Muskingum to lay out their town. The growth of the beautiful town of Marietta has completely destroyed these works, except the elevated squares, A and B, the large mound and inclosing circle at K, with a portion of the adjoining embankments, and a small fragment of the parallel walls forming what has been called the "Graded Way." The elevated squares are the finest examples of "temple" mounds remaining in the Ohio Valley. The circle and ditch with the conical mound inclosed is also a fine example of that class of works. From the summit of the mound an extensive view is to be had both up and down the Ohio.

The gateways of the smaller square were guarded by mounds, which were wanting in the larger one. We would call especial attention to the two embankments which led from the larger square towards the river. They were six hundred and eighty feet long, and one hundred and fifty feet apart.[2] Some have supposed these walls were designed to furnish a covered way to the river. But as Mr. Squier remarks, we would hardly expect the people to go to the trouble of making such a wide avenue for this purpose, nor one with such a regular grade. Besides, the walls did not reach the river. The work seems to be simply a passage way, lead-

[1] For words at Newark, consult "Ancient Monuments," p. 67, *et seq.* "*American Antiquarian*," July, 1882.

[2] Ancient Monuments, p. 74.

ing from one terrace to the other, but why the builders should have made such a massive work, we can not ex-

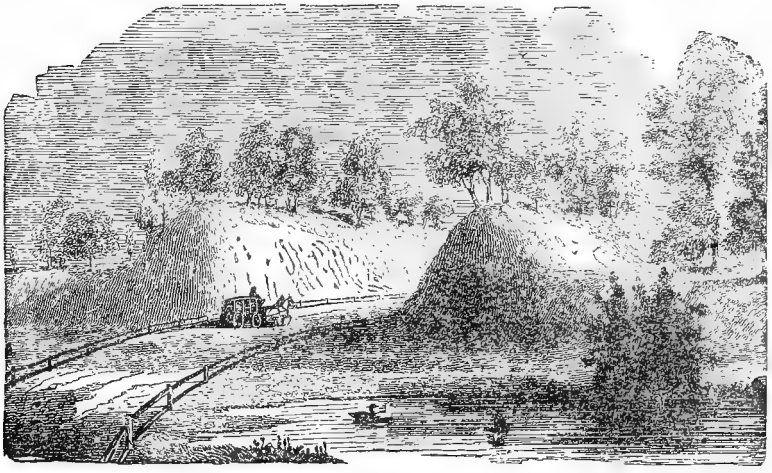


Works at Marietta, Ohio.

plain. It has been called the "Sacred Way," and this name may possibly be applicable, but it is only conjectural. Some

twenty years ago these two massive and beautiful embankments were still preserved, thanks to the care of the early settlers, who planned a street to pass between them, which was named the *Via Sacra*. These words still remain on a corner sign-board; but alas for sentiment! the banks, so long revered, have been utilized for brick-working.

Several instances of these graded streets or ways have been found in connection with the Mound Builders' works. Sometimes they lead from one terrace to another, sometimes directly to the water. One of the latter kind formerly ex-



Graded Way, Piketon, Ohio.

isted near Piqua, Ohio.[1] This cut is a view of a graded way near Piketon, Ohio. In this case, though the difference in level between the second and third terrace is but seventeen feet, these ancient people laid out a graded ascent some ten hundred and eighty feet long, by two hundred and ten feet average width. The earth was thrown out on either side, forming embankments. From the left hand embankments, passing up to the third terrace, there could formerly

[1] "Ancient Monuments," p. 88.

be traced a low embankment running for fifteen hundred feet, and connected with mounds and other walls at its extremity.

Some have supposed that formerly the river flowed at the extremity of this graded way, and a passage way to the water was thus furnished. Squier says, in this connection: "It is sufficient to observe that the river now flows half a mile to the left, and that two terraces, each twenty feet in height, intervene between the present and the supposed ancient level of the stream. To assent to this suggestion, would be to admit an almost immeasurable antiquity to the structure under consideration." The casual observer would say that it was intended to afford an ascent from one terrace to the other. But as the height was only seventeen feet, we can not see why it was so necessary to have a long passage way of easy grade from one terrace to the other. It was evidently built in connection with the obliterated works on the third terrace. This interesting remain is now utilized as a turnpike, and the passing traveler but little recks he is going over one of the most ancient causeways in the land. It may be that ceremonious processions, with stately tread, utilized this causeway in years long since elapsed. Speculation, always an unsafe guide to follow, is especially so in this case, and so we leave this memento of a vanished people as much an enigma to us as to its first explorers.

We have described but a few of the sacred inclosures of Ohio, but enough have been given to give us a fair idea of all. We wish now to call attention to another class of remains. We have seen how the works we have been describing are lacking in defensive qualities. This becomes more marked, when we learn there are works, beyond a doubt, defensive in character, in which advantage is taken of all circumstances which would render the chosen retreat more

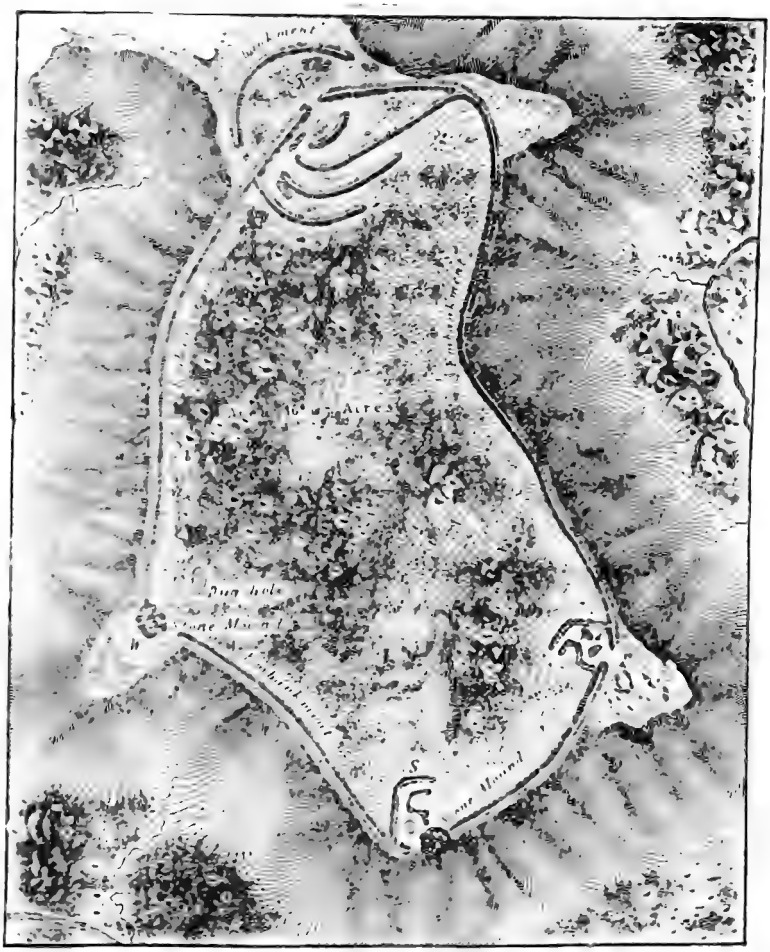
secure. In the first place, strong natural positions were selected. They chose for their purpose bluffy headlands leading out into the river plain. A people surrounded by enemies, or pressed by invaders, would naturally turn their attention to such heights as places susceptible of defense. Accordingly, it does not surprise us to find many heights occupied by strong and complicated works. Generally the approaches to them were rugged and steep on all but one or two sides, and there they are guarded by walls of earth or stone.

A fine example of a fortified hill was discovered in Butler County, Ohio, a few miles below the town of Hamilton. This hill is the highest one in the immediate vicinity. By reference to the figure, we see that on all sides, except towards the north, the approach was steep and precipitous, almost inaccessible.

The wall is not of regular shape. It runs around on the very brow of the hill, except in one or two places, where it cuts across a ridge. In 1843 this wall was still about five feet high and thirty-five feet base. The earth and stone of which the wall is made were evidently gathered up from the surface of the hill. In some places holes had been excavated, probably for the double purpose of securing materials for the wall, and providing reservoirs for water against a time of need. There are but four openings in the wall, and each is very carefully guarded. The complicated walls guarding the main entrance to the north are especially noticeable. There are no less than four inner walls besides the crescent shaped embankment on the outside. The signal mound was about five hundred feet to the north of the main opening. The stones on the surface of the mound all show the action of fire.

If we were uncertain of the uses of the other class of inclosures, which have been named Sacred Inclosures, we have

no need to hesitate as to the character of this work. Every thing in reference to it betokens that it was a defensive work. The valley of the Big Miami, in which it occurs,



Fortified Hill, Hamilton, Ohio.

was a favorite resort of the Mound Builders. On the opposite side of the river, to the south, was a square and an ellipse combined, and several other large works were ranged along the river in the course of a few miles. We need

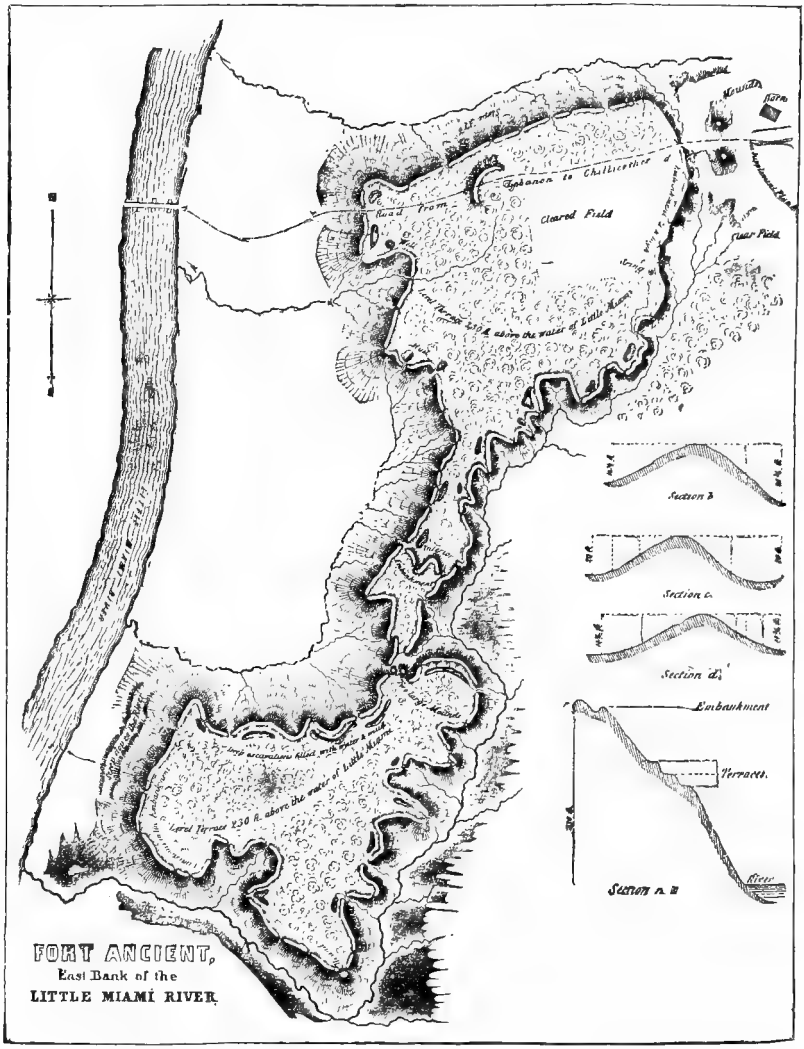
scarcely doubt that this was a citadel in times of need, and that when warning columns of smoke or flaming fires showed the approach of an enemy, the old and the sick, the women and the children, fled hither for protection, while the warriors went forth to battle for their homes.

We will call attention to but one more of these fortified hills, but this is on a magnificent scale. It is known as Fort Ancient, and is situated on the Little Miami River, about forty miles east of Cincinnati. It was not only a fort, but was also a fortified village site, and has some features about it which are regarded as of a religious nature. The hill on which it stands is in most places very steep towards the river. A ravine starts from near the upper end on the eastern side, gradually deepening towards the south, and finally turns abruptly towards the west to the river. By this means nearly the whole work occupies the summit of a detached hill, having in most places very steep sides. To this naturally strong position fortifications were added, consisting of an embankment of earth of unusual height, which follows close around the very brow of the hill. This embankment is still in a fine state of preservation, but is now annually exposed to cultivation and the inroads of cattle, so that it will not be long before it will be greatly changed if no effort be made to preserve it.

This wall is, of course, the highest in just those places where the sides of the hill are less steep than usual. In some places it still has a height of twenty feet. We notice the wall has numerous breaks in it. Some of these are where it crosses the ravines, leading down the sides of the hill. In a few cases the embankment may still be traced to within a few feet of a rivulet.

Considerable discussion has ensued as to the origin and use of these numerous gateways. Mr. Squier thinks that

these openings were occupied by timber work in the nature of block-houses, which have long since decayed. Others, however, think that the wall was originally entire except in



a few instances, and that the breaks now apparent were formed by natural causes, such as water gathering in pools, and musk-rats burrowing through the walls, and we are told

that such an opening was seen forming in the year 1847.[1] No regular ditch exists inside the wall, the material apparently being obtained from numerous dug holes.

It will be seen that the works could be naturally divided into two parts, connected by the isthmus. More than one observer has pointed out the resemblance in general outline of this work to a map of North and South America, but of course the resemblance, if any, is entirely accidental. Mr. Peet has called attention to the resemblance which the walls of the lower inclosure bear to two serpents, their heads being the mounds, which are separated from the body by the opening which resembles a ring around the neck. Their bodies are the walls, which, as they bend in and out, and rise and fall, much resembles, he thinks, two massive green serpents rolling along the summit of this high hill. If any such resemblance occurs, we think it purely accidental. In relation to the wall across the isthmus, it has been thought to have been the means of defending one part of the work should an enemy gain entrance to the other. It has also been supposed that at first the fort was only built to the cross wall on the isthmus, and afterwards the rest of the inclosure was added to the work.

The total length of the embankment is about five miles, the area enclosed about one hundred acres. For most of this distance the grading of the walls resembles the heavy grading of a railroad track. Only one who has personally examined the walls can realize the amount of labor they represent for a people destitute of metallic tools, beasts of burden, and other facilities to construct it.

[1] Mr. Putnam visited the work a few years since, and came to the conclusion that the larger and old openings were part of the original design, and that they were places where it was easier to put up log structures than earthen walls. Just such openings occur in the massive stone wall around Fort Hill, in Highland County. A few of the openings at Fort Ancient he thinks are unquestionably of recent origin, in order to drain the holes inside the embankments.

Now, what was the object of this work? We think it was not simply a fort, but rather a fortified village. That it must have required the work of a numerous body of people, is undoubted, and if they lived elsewhere, where are the works denoting such a fact? We would further suggest that, if this was the seat of a tribe, each of the two divisions might have been the location of a phratry of the tribe, by a phratry, meaning the subdivision of a tribe. We would call especial attention to the two mounds seen just outside of the walls at the upper end. From these mounds two low parallel walls extended in a north-easterly direction some thirteen hundred and fifty feet, their distant ends joining around a small mound. As this mound was not well situated for signal purposes, inasmuch as it did not command a very extensive view, and as the embankments would afford very little protection, unless provided with palisades, it seems as if the most satisfactory explanation we have is that it was in the nature of a religious work.

Mr. Hosea thinks he has found satisfactory evidence that between these walls there was a paved street, as he discovered in one place, about two feet below the present surface, a pavement of flat stones.[1] From this, as a hint, he eloquently says: "Imagination was not slow to conjure up the scene which was once doubtless familiar to the dwellers at Fort Ancient. A train of worshipers, led by priests clad in their sacred robes, and bearing aloft the holy utensils, pass in the early morning, ere yet the mists have risen in the valley below, along the gently swelling ridge on which the ancient roadway lies. They near the mound, and a solemn stillness succeeds their chanting songs; the priests ascend the hill of sacrifice and prepare the sacred fire. Now the first beams of the rising sun shoot up athwart the ruddy sky, gilding the

[1] *Cincinnati Quart. Journal Science*, 1874, p. 294.

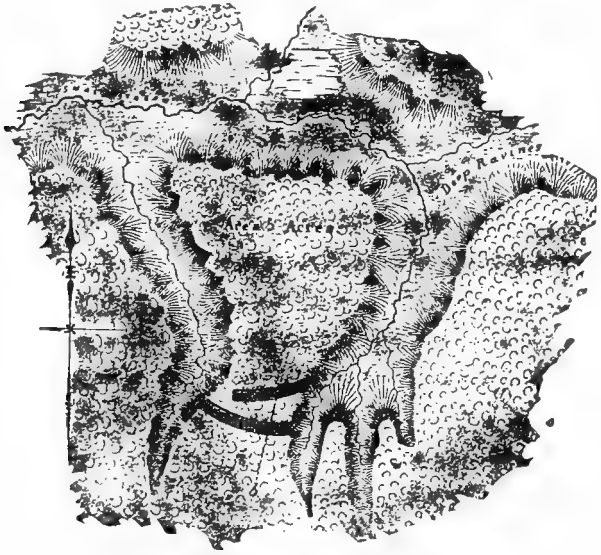
topmost boughs of the trees. The holy flame is kindled, a curling wreath of smoke arises to greet the coming god; the tremulous hush which was upon all nature breaks into vocal joy, and songs of gladness bursts from the throats of the waiting multitude as the glorious luminary arises in majesty and beams upon his adoring people. A promise of renewed life and happiness. Vain promise, since even his rays can not penetrate the utter darkness which for ages has settled over this people." Thus imagination suggests, and enthusiasm paints a scene, but, from positive knowledge, we can neither affirm nor deny its truth.

Most of the works of the Mound Builders are noticeable for their solidity and massiveness. We see this illustrated in the great walls of Fort Ancient. Some of our scholars think this is a distinguishing feature of the Mound Builders' work.[1] It seems to us that it is difficult to make this a distinguishing feature, as we have no means of knowing how much "massiveness" is required in a work to entitle it to be considered a work of the Mound Builders. Should this distinction be established, however, we have to notice that while in the western part of the State of Ohio the Mound Builders' inclosures are more often of the defensive sort, the type changes to the eastward, where, as in the Scioto Valley, we find the so-called sacred inclosures in larger numbers. In the State of Ohio, then, there were at least two well defined types of works by the Mound Builders. But if we split the Mound Builders up into tribes, where shall we draw the line between them and our later Indians?

Scattered through Ohio, but especially abundant in the northern part of the State, is a class of works which has excited considerable comment. This cut illustrates a work of this kind. It was located near where Cleveland now

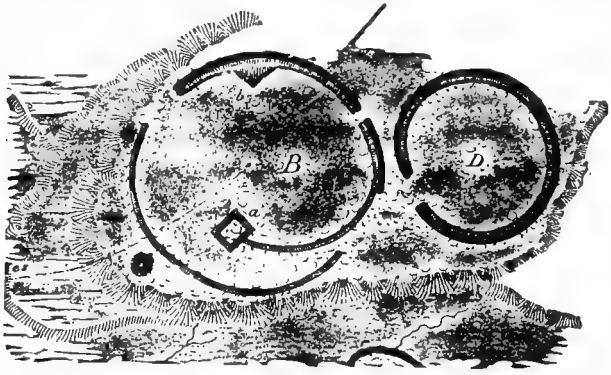
[1] Peet: "The Mound Builders."

stands. The defense consists mainly in the location. The wall seems to have been rather of a secondary affair. The



Fortified Headland, Northern Ohio.

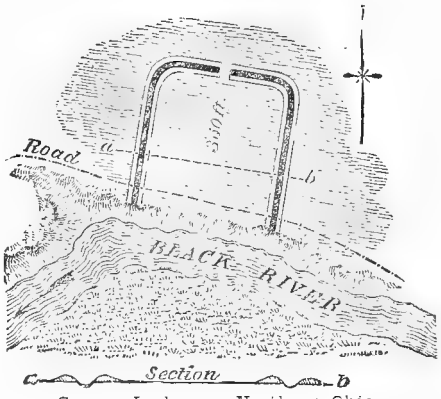
hill was too steep to admit approach to it except from the rear, where the double wall was placed. With both of



Inclosures, Northern Ohio.

these works a ditch was dug outside the wall. These works did not always consist simply of fortified headlands. This cut is of a portion of the works formerly existing near Nor-

walk, Ohio. The circular work, D, is shaped much like the sacred inclosures, though not on so large a scale. In the larger work, at B, we notice a truncated mound. The ditch is on the outside of the circles. This cut is of a work formerly on the banks of the Black River. Here we have a square inclosure, defended by two embankments and a ditch.



Square Inclosure, Northern Ohio.

This class of works was formerly common not only in Ohio and Western New York, but they were also to be observed in other sections of the country. They existed alike in the valley of the two Miami Rivers, and in that of the Scioto. They were also found throughout the South. Even Wisconsin, the home of the effigy Mound Builders, is not destitute of this class of remains. The peculiar interest attaching to them arises from the fact that in some places, at least, we have good reason to assign their construction to Indian tribes. Those of Western New York were very thoroughly studied by Mr. Squier. When he commenced his investigations, he was under the impression that he was dealing with the remains of a people very similar, at least, to those who built the massive works in the Ohio Valley and elsewhere, but he was led to the conviction that they were the works of the Iroquois Indians, and as further proof that such was the case, we are told that since the palisades that once inclosed places known to be villages of the Iroquois have disappeared, there is no difference to be observed between the appearance of the ruins of such a village site and any of

the earthworks in Western New York. But we have just stated that the remains last mentioned are identical with those found in Northern Ohio, and indeed over a wide extent of country. The conclusion seems to be, then, that one large class of works, in many points resembling Mound Builders' works, found widely distributed throughout the Mississippi Valley, were really the works of Indians.[1] But we are approaching a subject we do not wish to discuss just yet. We simply point out that not all the remains of prehistoric people in the Mississippi Valley are referable to the Mound Builders.

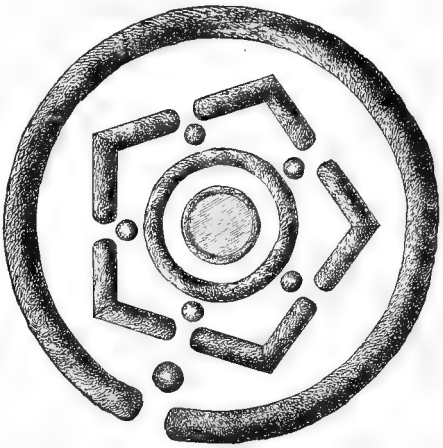
We have tried to point out the more important works that are ascribed to them. It must of necessity occur in a work of this nature that the review should be very brief, yet we have touched on the different classes of their works. But before leaving this part of our field we must mention some anomalous works, and refer to others which, if they can be relied on as works of the same people, certainly imply a great advance on their part.

Our next cut is named by Mr. Pidgeon the "Sacrificial Pentagon." Writing in 1850, he states, "This remarkable group . . . has probably elicited more numerous conjectures as to its original use than any other earth-work yet discovered in the valley of the Mississippi. . . . It is situated on the west highlands of the Kickapoo River, in Wisconsin."[2] Mr. Pidgeon claims to have discovered two of these pentagons. We are not aware that any one else has verified these discoveries, and it is difficult to decide what value

[1] Peet's "Mound Builders:" "If the reader will compare some of these last cuts with that of the fortified camp at Cissbury, Eng., p. 183, he will see how similar this last work is to those just mentioned. Perhaps the real lesson to be learned is that rude people, whether Indians, Mound Builders, or Celts, resorted to about the same method of defense."

[2] "Antiquarian Research," p. 89.

to give to his writings. He claims to have made extensive researches around the head-waters of the Mississippi as early as 1840, and there to have met an aged Indian—the last of his tribe—who gave him many traditions as to the mounds in that locality. Most of our scholars think his writings of no account whatever, and yet Mr. Conant says, "He seems to have been a thoroughly conscientious and careful observer, faithfully noting what he saw and heard."[1]



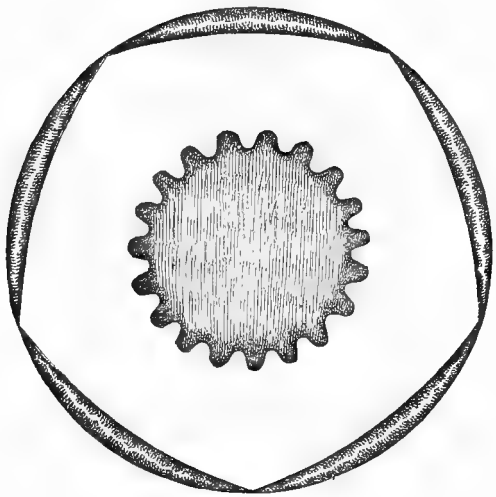
Sacrificial Pentagon.

We will briefly describe a few of the earth-works he mentions, notice their singular form, and give an outline of the traditions in regard to them, leaving the reader to draw his own conclusions. Of this work the outer circle is said to have been twelve hundred feet in circumference, the walls being from three to five feet in height; width on the ground from twelve to sixteen feet. The walls of the pentagon were from four to six feet high. The inner circle was of very slight elevation. The central mound was thirty-six feet in diameter. This singular arrangement of circle, pentagon, and mounds, is traditionally represented to have been a sacred national altar—the most holy one known to tradition—and no foot, save that of a priest, might pass within the sacred walls of the pentagon after its completion. The

[1] Conant's "Footprints of Vanished Races," p. 15, *et seq.* Mr. Conant refers to Mr. Pidgeon's work in such a way as to give the impression that he was convinced of the genuineness of his account.

sacrifice offered on this altar was that of human life. Twice each year the offering was made.[1]

The work represented in the figure below is stated to have been in the near neighborhood of the former, and to have been intimately connected with it. Mr. Pidgeon claims to have found five of these circles and two pentagons. So far as we know, he is the only authority for their occurrence, no one else having been so fortunate as to have found them. This is surely a singular work, and we can not fail to recognize in it a representation of the sun and the moon. In excavating in the central mound, we are assured that small pieces of mica were found abundantly mixed with the soil. "Had the surface-soil been removed with care, and the stratum beneath been washed by a few heavy showers of rain, so thoroughly studded was it with small particles of mica, that under the sun's rays it certainly would have presented no unapt symbolic representation of that luminary."[2]

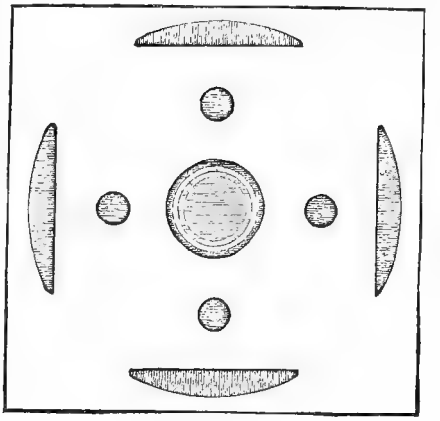


Festival Circle.

Our next figure is another singular arrangement of crescent-shaped works and mounds. Lapham says that crescent-shaped works are found in Wisconsin. Pidgeon says that crescent works are found in Illinois, but works arranged as shown in this wood-cut he found in but four places in Wis-

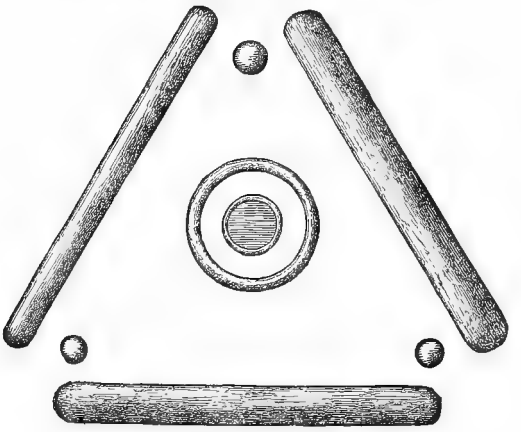
[1] "Traditions of Decodah," p. 89, *et seq.* [2] "Antiquarian Research," p. 190.

consin. Could we verify this author's statements, this illustration and the preceding one would be very good evidence of the prevalence of sun-worship among the effigy Mound Builders of Wisconsin. This would be nothing singular, since the Indian race almost universally reverenced the sun.[1]



Crescent Works.

The figure below represents a group of works which, we are told, were of a class formerly abundant in Missouri and Iowa. The embankments are stated to be of varying heights, but all of the same length. They do not quite meet, but a mound defends the opening. Sometimes a square is so represented, and sometimes but two walls.



Triangular Works.

A singular statement is made in reference to a nice proportion said to be observed between the heights of the embankments and walls. In this case, for instance, the heights of the embankments are, three, four, and five feet; the sum of these, twelve feet, was the exact

[1] "The American Indian, so far as known, without the exception of a single tribe, worshiped the sun." Carr's "Mounds of the Mississippi Valley," p. 56.

height of the central mound. Furthermore, the square of the sum of the heights of three embankments gives us one hundred and forty-four feet, which is the length of the embankments. We are gravely assured that this same nice proportion is always observed in works of this kind. The embankments being always of equal length, but of varying heights, still the sum of these heights, whether three or four sides, being always equal to the height of the central mound.[1] We do not know of any specimen of this class of works now existing. If this early explorer's account be reliable, then we have in works of this class very good evidence that some of their inclosures were in the nature of sacred inclosures. The trouble is to verify Mr. Pidgeon's account. There is a good deal that is strange and marvelous in reference to the Mound Builders, and we must use judgment as to what is told us, unless we are sure there is no mistake, or unless the reports are vouched for by many observers.

We wish to call attention to some singular works in Missouri, which would imply that the Mound Builders were possessed of no little engineering skill. We have every indication that near New Madrid was a very extensive settlement. The works consist of inclosures, large and small mounds in great numbers, and countless residence sites. One of fifty acres was noticed, which had evidently been inclosed by earthen walls. In some places in the forest, where this wall had been preserved, its height was found to be from three to five feet, and its base width fifteen feet.[2] But the suggestive features about these works are noticed along the edge of the swamp near which they stood. This swamp in 1811 was a lake, with a clear, sandy bottom. It

[1] Conant's "Footprints of Vanished Races," p. 60.

[2] Ibid., p. 32. If the explorers are really satisfied this was a walled town, it ought to throw some light on the inclosures in the Ohio Valley.

is not at all doubted but that it was at one time the bed of the Mississippi River, and probably this town stood on its banks. The river is now some eighteen miles away. It must suddenly have changed its course, leaving behind it a lake, which, in course of time, became a swamp.

But along the shores of this ancient lake, "in front of the inclosure, small tongues of land have been carried out into the water, from fifteen to thirty feet in length, by ten or fifteen in width, with open spaces between, which, small as they are, forcibly remind one of the wharfs of a seaport town. The cypress trees grew very thickly in all the little bays thus formed, and the irregular, yet methodical, outlines of the forest, winding in and out close to the shore of these tongues of land, is so marked as to remove all doubt as to their artificial origin.[1] The suggestion is made in view of these wharfs, that the Mound Builders must have had some sort of boats to navigate the waters of the lake.

And the singular part is, that right in this neighborhood are many evidences of a system of canals. A glance at the map will show that the portion of Missouri around New Madrid, and to the south of it, is dotted with swampy lakes and sluggish bayous. The evidence is to the effect that the ancient inhabitants connected these bayous and lakes with artificial canals, so as to form quite an extended system of inland water-ways. Right east of the town of Gayoso, we are told that a canal had been dug that now connects the Mississippi with a lake called Big Lake. A bayou running into this lake was joined by a canal with Cushion Lake.

From this last lake, by means of bayous and lakes, a clear course could be pursued for some miles north, where finally another canal was cut to join with the Mississippi a

[1] Conant's "Footprints of Vanished Races," p. 35.

few miles below New Madrid. The entire length of this water way was some seventy miles, but we are not told how much of it was artificial, neither are the dimensions given. Prof. Swallow speaks of a canal "fifty feet wide, and twelve feet deep." Whether this was one of this series or not, we do not know.[1] This is indeed a singular piece of work. It would be more satisfactory if we had more definite information in regard to the same.

With our present knowledge of the state of society among the Mound Builders, as made evident by the remains of their implements and ornaments, we are not justified in believing this part of a system of internal navigation. We have already seen that further south they sometimes surrounded their village sites with a wide and deep moat or ditch, as was observed around the inclosure containing the great mound on the Etowah. We are inclined to believe that a more careful survey would greatly modify the accounts we have of these canals, if it did not, in fact, show that they were the works of nature. According to a writer in the *American Antiquarian*,[2] the whole lower part of the Mississippi Valley was abundantly supplied with canals, irrigating ditches, and evidences of a high intelligence. He speaks of observing the presence of an extensive canal a little north of the section we have described. He asserts they were dug to convey the surplus waters of the Mississippi in times of flood to the White and St. Francis Rivers, thus preventing disastrous overflows. It is needless to caution the reader against such conclusions. Our information in regard to those canals is far too limited to support the views advanced.

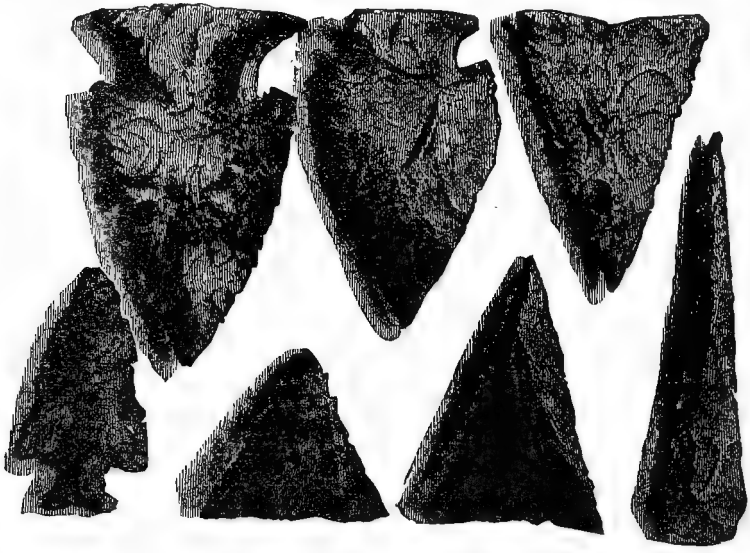
This finishes our examination of the works of the Mound

[1] Conant's "Footprints of Vanished Races," p. 77.
[2] Vol. III, p. 290, *et seq.*

Builders. Except in the case of the more massive works, they have become obliterated, but here and there are left traces of the former presence of these now vanished people. The antiquary muses over the remains of their inclosures, their fortified places, their effigies and mounds. By the combined efforts of scholars in many departments, we may yet hope that the darkness now enshrouding this race may be dissipated, but at present our positive knowledge is very limited indeed. It is as if we were asked to reconstruct a picture which had faded in the lapse of time so that only traces here and there are visible. Here, perhaps, a hand is seen; there a piece of foliage; in one place something we think representing water, in another a patch of sky, or a mountain peak. Until a key is found which shall show us how to connect these scattered parts, our efforts are useless, since many pictures could be formed, but we have no surety we are right. So we may form mental conceptions of the Mound Builders, but they are almost as varied as the individual explorers. Science may yet discover the key which will enable us to form a clear mental conception of the race which flourished here many years ago, and left their crumbling memorials to excite the curiosity of a later people.

We must now turn our attention to another branch of inquiry and learn what we can of the culture of the Mound Builders. This is to be determined by an investigation of the remains of their implements, weapons, and ornaments. When we know the skill with which they manufactured these articles, and gain an insight into some of their probable customs, we shall know where to place them in the scale of civilization. What we have learned of their works has already convinced us that we are dealing with a people considerably above the scale of Savagery. The nice proportion between the parts, the exact circles and coincident angles show con-

siderable advance in mechanical skill. The character of the works indicates that the people had permanent places of abode, and were not subject to the vicissitudes of a hunter's state of life for subsistence. This implies that we are dealing with a people living in village communities, practicing agriculture and many other arts, and therefore entitled to rank in the middle status of Barbarism corresponding to the Neolithic inhabitants of Europe.[1] We will now see how far



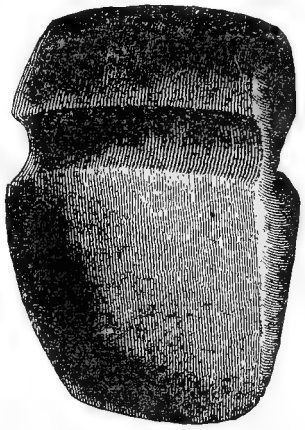
Arrow Points.

this conclusion is sustained by an examination of the remains of the handiwork of the people.

Implements of stone are of course abundant. But men, when in the culture of the Stone Age, having a common material to work upon, and under the pressure of common needs, have everywhere provided similar forms. For this reason it is hard to find distinctive points of difference between implements of stone of Mound Builders' work and a series of similar implements the work of Indians. We are

[1] Morgan's "Ancient Society," p. 11.

assured, however, that when examining a series of each, those of the Mound Builders display a superior finish.[1] The preceding wood-cut represents a collection of arrow-points found in the mounds, but they are not particularly so distinguishable from specimens found on the surface. Great numbers of arrow-points are occasionally found on altars. Here we have a view of one of the stone axes fashioned by the hands that heaped the mounds. It is certainly a very fine specimen.



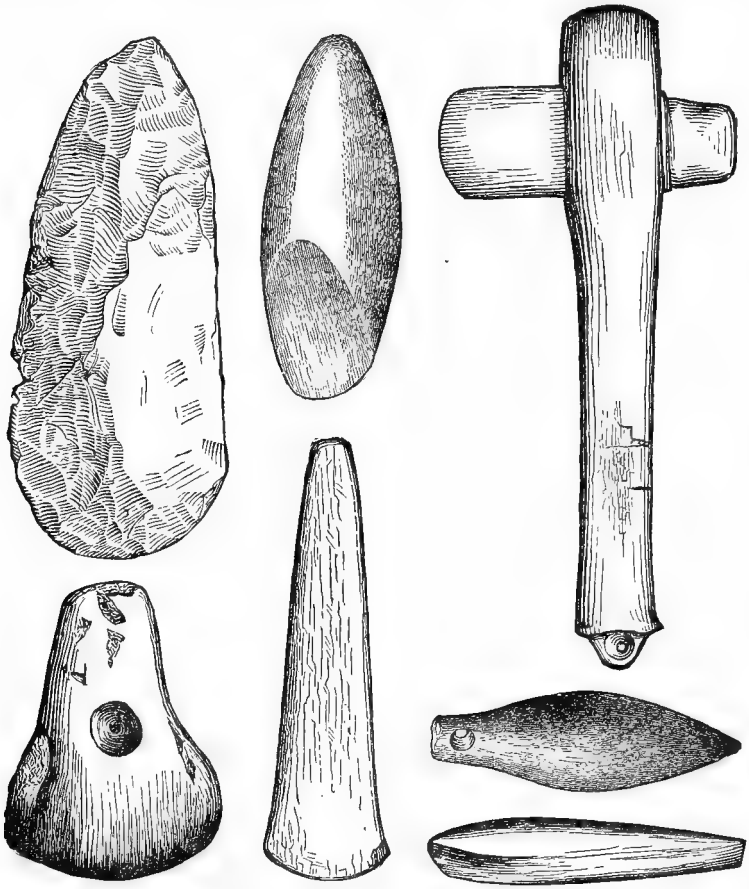
Ax found in a Mound.

The Mound Builders must have had all the varieties of stone implements common to people in their stage of culture, such as axes, fleshers, and chisels. They also must have possessed mortars and pestles for grinding corn, and some implements did duty as hoes and spades. We represent in a group a collection of weapons and implements from the mounds and stone graves of Tennessee. All these articles are finely finished. One of the axes has a hole bored through it. One of them is further provided with a stone handle, and is characterized as being the "most beautiful and perfect stone implement ever exhumed from the aboriginal remains within the limits of the United States."

People in the culture of the Stone Age make but very rare use of metal, as metals are to them simply varieties of stone, much less useful for their purpose than the different kinds of flints, except for ornaments. From the altar mounds, near Cincinnati, were taken ornaments of silver, copper,

[1] "Ancient Monuments," p. 210; also Peet: "The Mound Builders." "Their relics are marked by a peculiar finish."

iron, and traces of gold, all of which had been worked into their present shape by simply hammering. The iron, it should be remarked, was meteoric iron, which can be hammered as easily

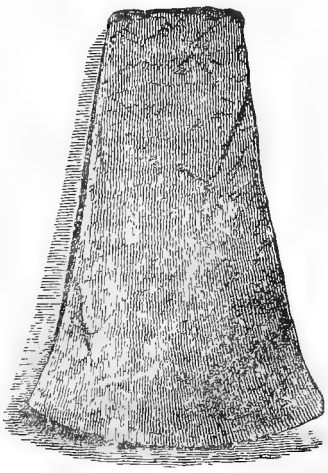


Weapons of Stone from Tennessee. (Smith Inst,)

as native copper. We have already remarked that about the only native iron is obtained from such sources. Copper was utilized for a great variety of purposes.

We give a cut of a copper ax found in one of the Ohio mounds. Copper axes have lately been found quite frequently in mounds near Davenport, Iowa, and in most cases

before being deposited in the mounds, they had been wrapped in cloth. Copper ornaments are a more common find. Bracelets, beads, and ear ornaments are numerous. Our next cut represents some very fine bracelets found in a mound near Chillicothe, Ohio. Copper tools and weapons have been found quite frequently on the surface, but we are not sure in this case whether they are not the work of recent Indians. The early explorers noticed the presence of copper ornaments among the Indians. "When Henry Hudson discovered, in 1609, the magnificent river that bears his name, he noticed among the Indians of that region pipes and ornaments of copper." The account says: "They had red copper tobacco pipes, and other things of copper they did wear about their necks."[1] De Soto also noticed among the Southern Indians axes of copper. Other accounts could be quoted showing that the Indians were well acquainted with copper.[2] The fact is, in this matter also, it is impossible to draw a dividing line between relics of the Mound Building tribes and the Indians. However, the Mound Builders were certainly acquainted with copper, but to their minds it was only a singular stone, one that they could hammer into a desired shape.



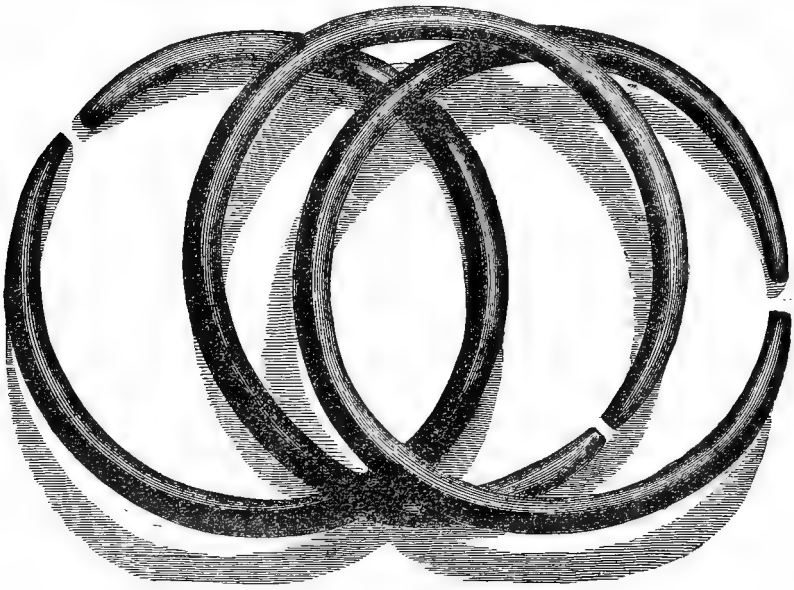
Copper Ax.

Where did they obtain their copper? We are all aware that in this country great supplies of pure copper exist near the southern shore of Lake Superior, and there is a pe-

[1] Rau's "Anthropological Research."

[2] "Proceedings Am. Antiq. Society," April, 1877, p. 61.

culiarity about the copper found there, that is, the presence of small pieces of silver with the copper. This is a very singular mixture, and we are not aware of its occurrence elsewhere It would trouble the best chemists to explain it. From this fact we are enabled to identify articles of copper derived from that source, and to that region we can trace the copper from which are formed most of the copper implements and ornaments found in this country. It is also



Copper Bracelets.

noticeable that the nearer we get to this region the more numerous are the finds of articles of copper. More are reported from Wisconsin than the rest of the United States put together.

This leads us to a very interesting subject. In 1848 Mr. S. O. Knapp, agent of the Minnesota Mining Company on the northern peninsula of Michigan, discovered that the modern miners were but following in the footsteps of some ancient people who had mined for copper there some time

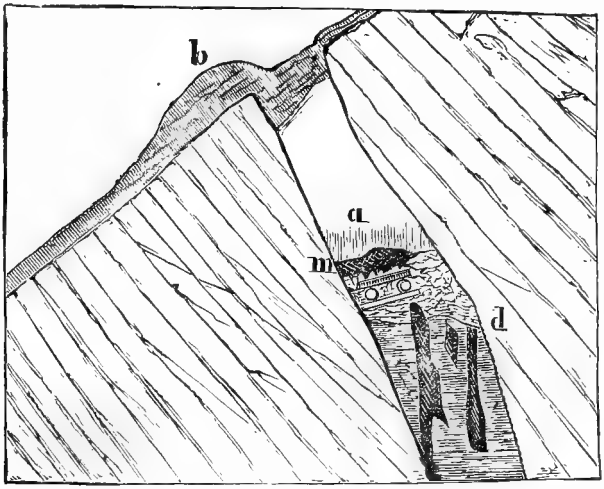
now far past. The general conclusion is that these old miners were Mound Builders, but here the evidence of their presence is not found in the existence of mounds and earthworks, but of pits and excavations, which, by the slow accumulation of years, had become filled to near the surface with *debris* of various kinds. Many had noticed these little pits and depressions without suspecting they had aught to do with the presence of man. The hollows made by large trees, overturned by the wind, frequently left as well marked depressions as these excavations.

We have abundant proof that these old miners were practical workmen. They evidently did not neglect the most trifling indication of metals. They made thorough research and discovered the principal lodes. Our present day miners have long since learned to regard the presence of these ancient pits as excellent guides in this matter. With modern appliances they penetrate far beyond the power of the old workmen. At the Waterbury mine there is in the face of the vertical bluff an artificial opening, which is twenty-five feet wide, fifteen feet high, and twelve feet deep. The materials thrown out in digging had accumulated in front, and on this forest trees common to that region were growing of full size. Some of the blocks of stone which were removed from this recess would probably weigh two or three tons, and must have required the use of levers to move them. Beneath the surface rubbish was discovered the remains of a cedar trough, by which the water from the mines was conducted away. Wooden bowls were found, which were probably used to dip the water from the mine into this trough.

Near the bottom of the pit, shovels, made of cedar, were found, shaped much like a canoe paddle, but showing by their wear that they were used as shovels. Although they appeared solid while in water, yet, on drying, they shrunk

up, and were with difficulty preserved. A birch tree, two feet in diameter, was observed growing directly over one of these shovels. No marks of metallic tools were observed anywhere about this large pit.

In this case they constructed a sort of a cave, but in many cases they mined open to the air, that is, they simply



Ancient Mine, Michigan.

dug trenches or pits. A row of these ancient pits, now slight depressions, indicate a vein. What they seem to have especially sought after was lumps of copper that they could easily manage and fashion by hammering. They had not discovered the art of melting. When they found an unusually large piece, they broke off what they could by vigorous hammering. In one case they found a mass weighing about six tons of pure copper. They made an attempt to master this piece. By means of wedges they had got it upon a cob-work of round logs or skids, six or eight inches in diameter, but the mass was finally abandoned for some unknown reason after breaking off such pieces as they could until the upper surface was smooth. This mass rested on

the framework of logs while the years came and went, until, after the lapse of unknown time, the white men once more opened the old mine.

On the rubbish in front of this mine was standing the stump of a pine tree ten feet in circumference. These ancient mines are found not only on the main-land, but on the islands off the coast as well. The only helps they seem to have employed was fire, traces of which are found everywhere, and stone mauls and axes. The mauls consist of oblong water-worn bowlders of hard tough rock, nature having done every thing in fashioning them except to form the groove, which was chiseled out around the middle. Some copper implements were also found.

Col. Whittlesey, from whose writings we have drawn the foregoing, concludes that these mines were worked by the Mound Builders. As he finds no traces of graves or houses, or other evidence of a protracted stay, he thinks they were worked only through the Summer season of the year by bands of workmen from the south.

As to what caused the abandonment of the works we do not know. It might have been an impulse of their race hurrying them on to some distant migration; or, more probably, pressed by foes from without, they were compelled to abandon their ancient homes. Whatever the cause was, nature resumed her sway. Forest trees crept up to and grew around the mouths of the deserted mines. Col. Whittlesey concludes from the group of trees growing on the top of the rubbish heap that at least five hundred years passed away before the white man came from the south to resume the work of his ancient predecessor.[1]

It is not, however, proven that the Mound Builders were the sole workers of these ancient mines. It

[1] "Smithsonian Contribution to Knowledge," Vol. XIII.

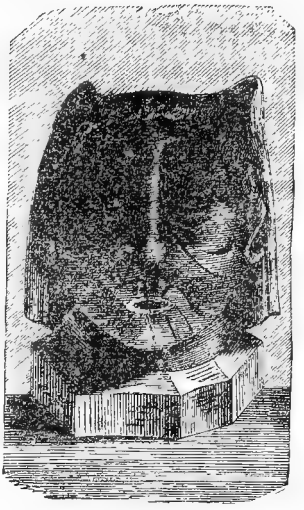
is known that the Indians mined for flint. Some of the excavations for this purpose, in what is known as Flint Ridge, in Muskingum County, Ohio, are as marked as the traces of ancient mining in Michigan. Similar appearances are recorded in Missouri. As copper was in demand among the Indians, and as it is probable that they obtained much of it from the North, they may have continued to work the ancient copper mines until comparatively recent times. Mr. Lapham believes that the progenitors of the Indian tribes found dwelling in the regions near these mines, carried on mining operations there. Dr. Rau thinks it probable that small bands of various Northern tribes made periodical excursions to the locality, returning to their homes when they had supplied themselves with sufficient quantities of the much-desired metal. The fact that many of the modern Indian tribes knew nothing about these mines is not of much weight, when we reflect how easily a barbarian people forget events, even those of a striking nature.

We are apt to judge the culture of a people by the skill they display in works of arts. The article on which the Mound Builder lavished most of his skill was the pipe. This would show that with them, as with the modern Indians, the use of the pipe was largely interwoven with their civil and religious observances. In making war and in concluding peace, it probably played a very important part. "To know the whole history of tobacco, of the custom of smoking, and of the origin of the pipe, would be to solve many of the most interesting problems of American ethnology."[1]

The general decoration consisted in carving the bowl of the pipe into the shape of some animal or bird. In some instances we have carved representations of the human

[1] Abbott's "Primitive Industry," p. 315.

head. Such as these are of particular interest and value, as they are probably faithful representations of the features of the Mound Builders. This is a fine specimen found in one of the altar mounds in Ohio. The method of wearing the hair is worthy of notice. The holes placed in a row encircling the forehead and coming down as low as the ears, were once filled with pearls. In some they still remained when found, though they had been burned in the fire. The lines upon the face obviously imitate the custom of tattooing the countenance.

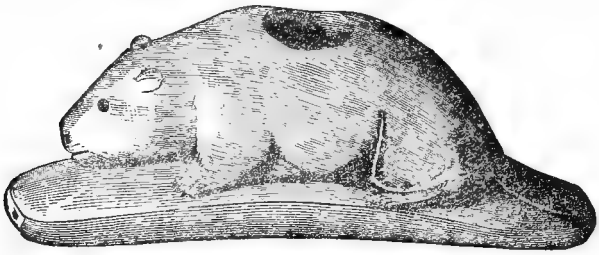


Sculptured Face.

Scholars have called attention to the fact that Humboldt discovered in Mexico a small statue which he supposed represented an Aztec priestess. This statue had sculptured upon its forehead a row of pearls, worn in the same manner as is represented in this pipe. This is another pipe of great interest, and is supposed to represent the head of a woman. The countenance is expressive, the eyes prominent, and the lips full and rounded. We must notice again the head-dress. While the faces are of Indian type, the method of wearing the hair is different from that of the typical Indian of the North.

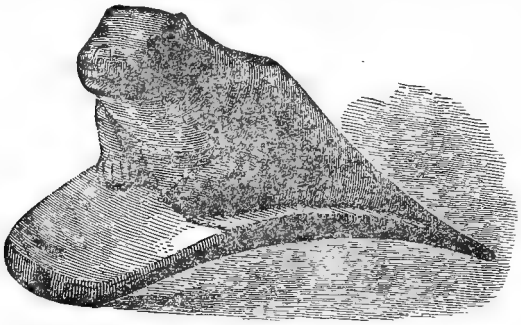
Face of a Female.

The animal forms into which the pipe-bowls are carved, are also full of interest. This is not so much on account of animal forms themselves as the insight we gain as to



Beaver.

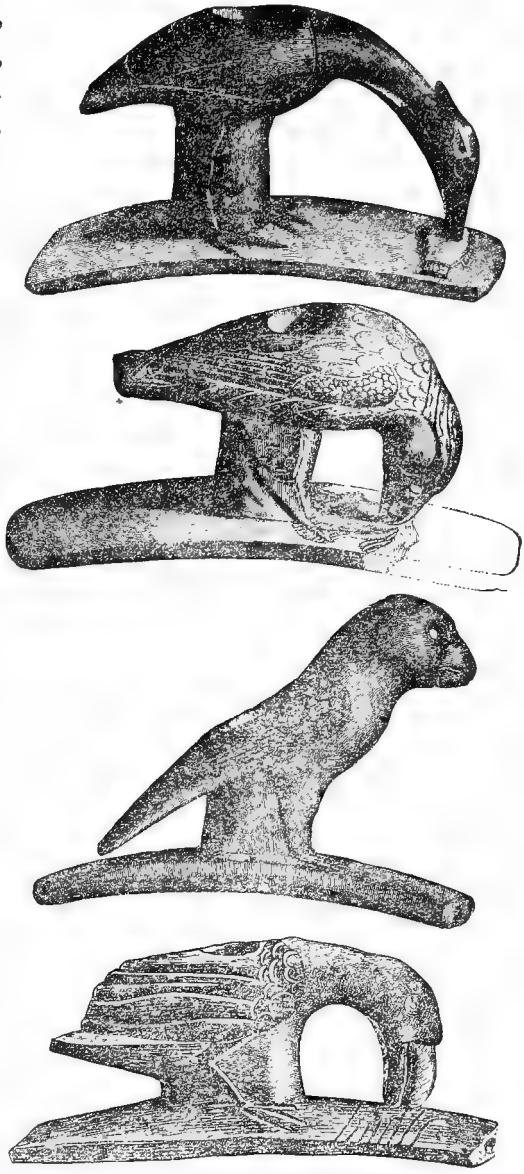
the artistic skill of the people who fashioned the pipes, and in various ways learn of bits of customs and manners peculiar to them. Here we have figured a pipe, the bowl of which is carved to represent a beaver. No one need hesitate as to the animal which the carver had in mind. It is represented in a characteristic attitude, and has the broad, flat tail of its species. It must have required no little skill and patient labor to work a rough stone into this finished pipe, especially when we remember that the maker had no edged tools with which to work.



Otter.

We can not always determine the animal which the artist had in mind. In this illustration we have figured such a pipe. Considerable discussion has arisen as to the animal represented. Some cases of this nature have been thought to show either migration from a distant country on the part of the maker or else an extended system of trade.

Squier and Davis, who first figured it, supposed it to represent a manatee, or sea-cow. This animal is essentially a tropical species, the only known place where it was found in the United States being Florida. From the presence of this carved specimen, found a thousand miles to the north, some interesting queries, as the origin of the mound-building tribes, and the state of life among them, were raised. It is almost certain, however, that the animal intended to be represented was the otter.[1] The most general form of sculpture was that of birds, and we find specimens of almost all the common varieties. In this group we recognize



Birds on Pipes.

[1] "Annual Report of Bureau of Ethnology," 1880–1, p. 123, *et seq.*

the tufted heron striking a fish; the eagle, or hawk, tearing a smaller bird; the swallow, apparently just ready to fly; and in the last figure, one that has given rise to a good deal of discussion. Some think from the circumstance of its having a very large bill, toes pointing behind as well as before, that it represents a toucan, which, if true, would make it a most interesting specimen. But cautious scholars conclude that the "figure is not of sufficient distinctness to identify the original that was before the artist's mind." And therefore it is not wise to make this specimen the subject of a far-reaching speculation.[1]

It may be of interest to inquire whether the Indians made pipes as tastefully ornamented as those we have described. We should notice that all the pipes here described are from one very limited locality in Ohio, and that is the valley of the Scioto, the same section of country where were found the great inclosures of a mathematical shape. We have no reason for supposing that the Mound Builders generally throughout the Mississippi Valley had this artistic skill. We have seen nowhere any thing to show a superiority for them in this respect. Whatever conclusion can be drawn from those pipes, applies only to the tribe in the Scioto Valley. It is believed they do constitute a peculiar class by themselves. As works of arts, there are but few aboriginal relics of North American origin their equal.[2]

We would also refer to the fact that most of these speci-

[1] In the "Annual Report of Bureau of Ethnology," for 1880–1, Mr. Henshaw has very fully discussed these mound-pipes, and shown that Messrs. Squier and Davis were mistaken in a number of their identifications of the animal forms. He concludes there "are no representations of birds or animals not indigenous to the Mississippi Valley."

[2] The recent discoveries by Putnam and Metz, in the Altar-mounds in the Little Miami Valley, have brought to light many interesting and important sculptures in stone and terra-cotta, which, as works of art, are in some respects superior to those from the Scioto Valley, but as they have not yet been figured, we can only refer to them here in this brief note.

mens were obtained from one altar-mound.[1] We do not know what ceremonies were performed around this altar, but if it were a place of burial or cremation, they might have been the obsequies of some distinguished maker of pipes. That such a person would be the recipient of honor, is not singular, for "the manufacture of stone pipes, necessarily a painful and tedious labor, may have formed a branch of aboriginal industry, and the skillful pipe carver probably occupied among the former Indians a rank equal to that of the experienced sculptor in our times." Among the Ojibway Indians, we are told, are persons who possess peculiar skill in the carving of pipes, and make it their profession, or at least the means of gaining, in part, their livelihood. One "inlaid his pipes very tastefully with figures of stars, and flowers of black and white stones. But his work proceeded very slowly, and he sold his pipes at high prices."[2] So we see how cautious we must be about drawing inferences from this peculiar class of pipes found in one limited locality.

The knowledge of how to manufacture pottery is justly regarded as a turning point in the advance of primitive man along the weary road that brings him at last to civilization. At this point he ceases to be a savage, and enters the confines of Barbarism.[3] The skill shown in using this knowledge is one of the many things we have to take into consideration in determining the rank of a people in the scale of enlightenment. The Mound Builders were evidently quite well along in the potter's art; and as they have left behind them many examples of their work, we must try and acquaint ourselves with some of the more important varieties.

[3] Morgan's "Ancient Society," p. 12.

This illustration is of a group of clay vessels of the bowl pattern, found in mounds in different parts of the Mississippi Valley. In one of these we see a good example of

Group of Clay Vessels.

the style of ornamentation by means of incised lines. In the duck-headed vessel we have a representation of a class of vessels common in Missouri and Tennessee. Not unfrequently one or both of the handles of vessels of this class is in the form of a human head instead of that of an animal. Our next illustrations represent a group of such specimens. Judging from the skill with which they imitated animals, it is not unreasonable to believe that in these faces we have rude likenesses of the people who made them.

The two bottle-shaped vessels here figured, are from

mounds in Louisiana. As will be noticed, the ornamentation is quite artistic. The ware is of a good quality, and they are good examples of the Mound Builders' art. The form with a long neck is perhaps a water-cooler. When filled with water, and allowed to stand, some of the water passes through the pores, and evaporating, keeps the surface of the vessel cool.

Bowls with Human Faces.

They also made some vessels of large size to serve for cooking purposes. On some of the larger vessels the imprint of woven weeds and willows of a basket on the outer surface leads to the belief that such vessels were formed or moulded within baskets. Many large pots and urns, however, were made without this aid. Some large urns were used for burial purposes. In a Michigan mound an urn about three feet in height had been so used. It was standing upright,

Bottle-shaped Vessels. (Smith. Inst.)

and into it the whole skeleton of a man had been compressed, and a closely-fitting lid covered the top.[1] Very large, shallow vessels were used to manufacture salt—that is, they were filled from some salt-spring, and then the water was evaporated, leaving the salt. In localities near salt-springs, thick fragments of rude earthenware have been found that must have come from vessels as large as barrels.

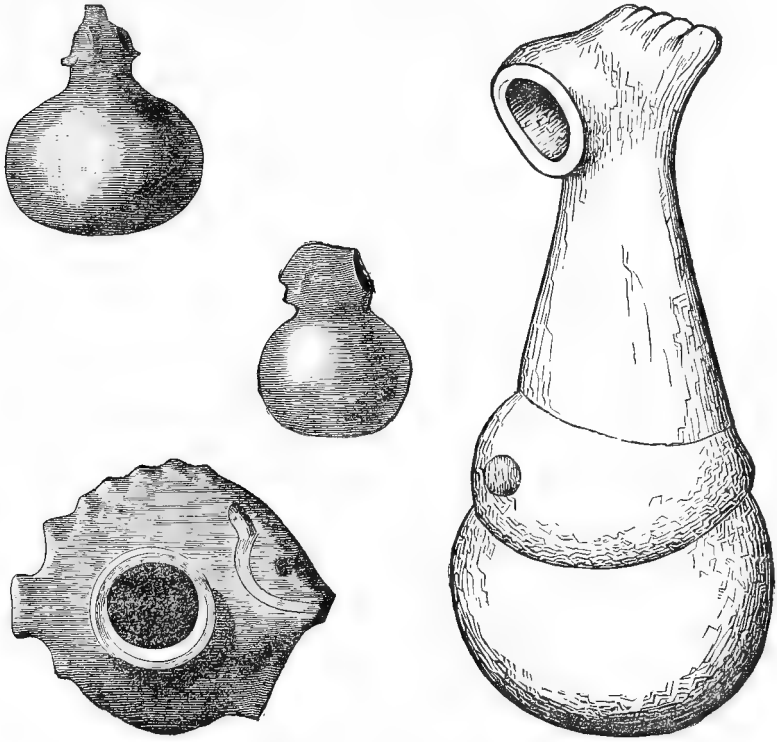
Water Cooler.

In the next group we have representations of a singular class of vessels. In some cases the mouth and neck of the vessel is shaped in imitation of animals. In the smallest one we recognize the head of a man, with an opening in the back of the head. Many vessels of this form are known, and a great many different animal heads are represented. The fish-shaped vessel is a curious one. The one figured evidently represents a sun-fish. The long vase or jug is in the shape of a child's leg, with an opening in the heel.

Some very beautiful vessels of the character of those we have figured, have been found in Missouri. One enthusiastic explorer says, "Perhaps we have very few modern artists who could equal those ancient pottery makers in taste, skill, curious design, and wonderful imitation of nature. Birds, beasts, fishes, even the shells on the river shore, have an exact counterpart in their domestic utensils." "While digging in one of these pottery mounds in Missouri, we unearthed a large tortoise. We thought it was alive, and seizing it, to cast it into the woods for its liberty, we

[1] *American Antiquarian*, 1879, p. 64.

were suddenly surprised to find our tortoise was an earthen vessel in that shape. In the same mound we uncovered a huge shell—the single valve of a unio. Closer inspection revealed that it was a perfect earthen vessel. Following these came a perfect fish, exhibiting, to our astonishment,



Pottery Vessels. (Smith. Inst.)

the scales, fins, and peculiarities of that species of fish in detail."[1]

We must leave this interesting part of our subject. An entire volume would scarcely do justice to it, but for the sake of comparison, we must inquire as to the state of this art among the Indian tribes. It seems that before the arrival of the whites, the Indian tribes throughout North America,

[1] McAdams: *American Antiquarian*, 1880, p. 140.

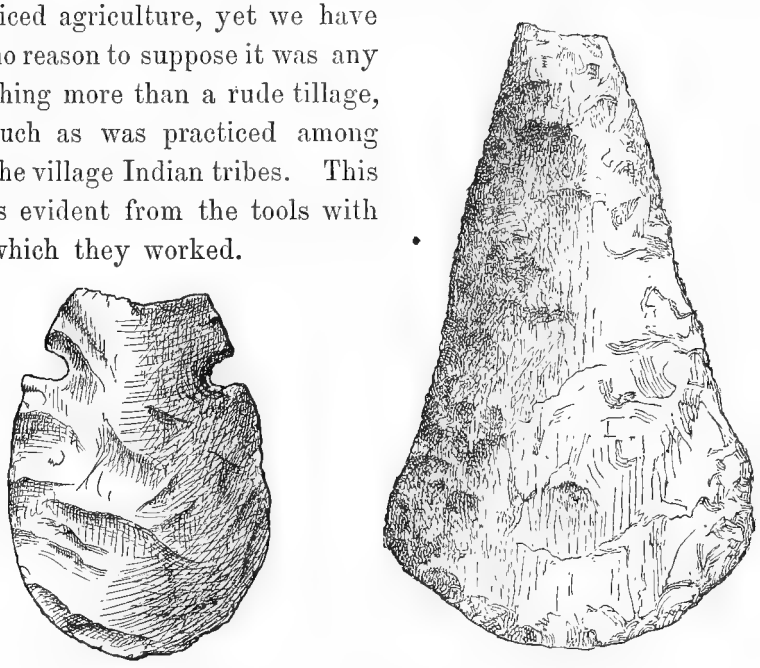
with few exceptions, were apt potters. The whites, however, soon supplied them with superior utensils of metal, so that the majority of the Eastern tribes soon lost the knowledge of the art. It lingered longer among the tribes of the South, and of the interior, and even to this day the Pueblo tribes of New Mexico and Arizona make an excellent article of pottery. Early travelers wrote in high terms of the skill of the Southern Indians in this matter. Du-Pratz thought so highly of the work of the Natchez Indians that he had them make him an entire dinner set.

Catlin, speaking of the Mandan Indians, says the women of that tribe made great quantities of dishes and bowls, modeled after many forms. He says they are so strong and serviceable that they cook food in them by hanging them over the fire, as we would an iron pot. "I have seen specimens," he continues, "which have been dug up in Indian mounds and tombs in the Southern and Middle States, placed in our Eastern museums, and looked upon as a great wonder, when here this novelty is at once done away with, and the whole mystery: where women can be seen handling and using them by hundreds, and they can be seen every day in the summer, also, moulding into many fanciful forms, and passing them through the kilns, where they are hardened."

Dr. Rau, speaking of the artistic skill of the Indian potters, as shown by numerous remains gathered in Illinois, does not hesitate to assert, after personal examination of Mound Builders' pottery, that the Indian relics were in every respect equal to those specimens exhumed from the mounds of the Mississippi Valley.[1] Lapham, speaking of fragments of Mound Builders' pottery in Wisconsin, says, "They agree in every respect with fragments found about the old Indian villages."

[1] "Smithsonian Report," 1866. We have gathered these points for comparison from Dr. Rau's article in that report.

The culture of a people is also determined by their knowledge of agriculture. The savage depends entirely upon hunting and fishing for subsistence. A knowledge of horticulture, of domestic animals, and of agriculture, even though rude, are each and all potent factors in advancing man in culture. So we must inquire as to the traces of agricultural knowledge observable among the remains of the Mound Builders. Some writers speak in quite glowing terms of the enormous crops they must have raised for their populous cities. The fact is, that while it is doubtless true that they practiced agriculture, yet we have no reason to suppose it was any thing more than a rude tillage, such as was practiced among the village Indian tribes. This is evident from the tools with which they worked.



Agricultural Implements. (Smith. Inst)

In a few cases copper tools have been recovered which may have served for digging in the ground, but in most cases their art furnished them nothing higher than spades, shovels, picks, and hoes made of stone, horn, bone, and probably wood. In this cut are specimens of such agricul-

tural tools. These were doubtless furnished with handles of wood. The notched one was perhaps provided with a handle at right angles to it, so as to constitute a hoe. That we are right in regarding these implements as agricultural tools, is shown not only by their large size, but also by the traces of wear discovered on them. We must admit, however, that agriculture carried on with such tools as these, must have been in a comparatively rude state.

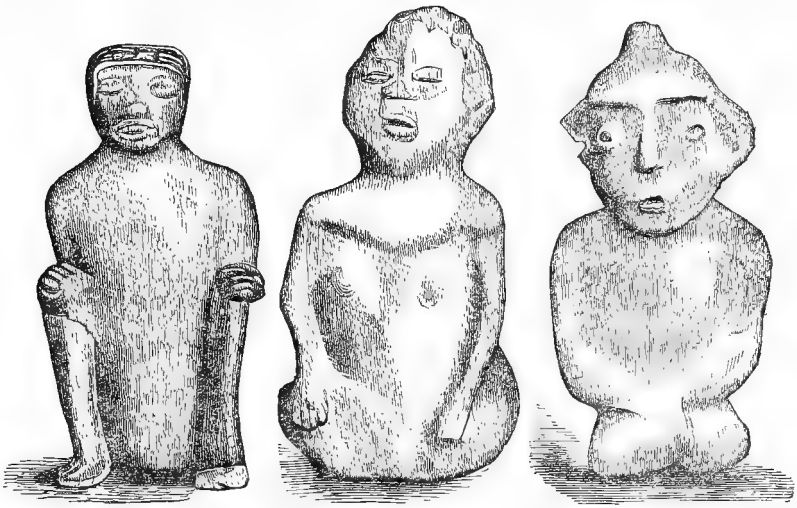
In this connection we must refer to the garden beds noticed in some places. We read that in Western Michigan the so-called garden beds are a distinguishing feature of the ancient occupation, often covering many acres in a place, in a great variety of forms, both regular and grotesque.[1] These seem from the above account to be very similar to the garden beds of Wisconsin. Dr. Lapham tells us that in the latter State they consist of low, broad, parallel ridges, as if corn had been planted in drills.

They average four feet in width, and the depth of the walk between them is six inches. Traces of this kind of cultivation are found in various parts of the State. We are also referred to the presence of garden mounds in Missouri, but in this case the low mounds are of the same mysterious class that Prof. Forshey says occur by millions in the Southwest, and may not be the work of man. Just what the connection is between the garden beds and the Mound Builders is hard to determine. Mr. Lapham thinks that those in Wisconsin were certainly later in date than the mounds. He observed that they were frequently constructed right across the works of the Mound Builders. This would seem to imply that the makers were not one and the same people.

As to the government and religion of the Mound Builders, all is conjecture. On both of these points a great deal has

[1] Bella Hubbard, *American Antiquarian*, 1876, p. 219.

been assumed, but when we try to find out the grounds on which these theories rest we quickly see how little real foundation there is for any knowledge on this subject. If we are right in our views as to the effigy mounds of Wisconsin, then a sort of animal worship prevailed. Whether the great inclosures in the Scioto Valley were of a religious nature or not is very doubtful. The great serpent mound was probably an object of worship. The assertion is quite frequently made that the Mound Builders were sun worshipers, which may be correct, but we must observe that we have no proofs of it in the works they have left. We judge it to be true only because sun-worship was probably a part of the religion of a large proportion of the Indian race, and because



Idols. (Smith. Inst.)

we find special proofs of its existence among some of the Southern Indians who are supposed to be closely related to the Mound Builders.

As we approach the South, we meet with what are supposed to be rude and uncouth idols, but they have not been found under such circumstances as to make it positive that

they belonged to the Mound Builders. In this illustration we have two idols, considered to be genuine relics of the stone-grave people of Tennessee. The first one is an Aztec idol found at Cholula, and introduced here simply for comparison. What position these idols held in connection with the religion of the race, we are not prepared to say.

Similar remarks might be made as to the system of government. A number of writers, taking into account the immense labor involved in constructing some of the works, have insisted that the people must have lived under a despotic form of government, one in which the state had unlimited power over the lives and fortunes of its subjects.[1]

There is no real foundation for such views, and we think they are misleading. No one doubts but that the Mound Builders were living in a tribal state of society. If so, they doubtless had the usual subdivisions of a tribe. This point we remember afforded us some insight into the meaning of the effigy mounds of Wisconsin.

This would imply the government by the council, and while the rulers may have been hereditary, the officers of the tribe were probably elective, and could be deposed for cause. We do not mean to assert that this is an exact picture of the state of government of the Mound Builders, because our knowledge on this point is not sufficient to make such a positive statement, but it is far more likely to be true than the picture of a despotic government, ruling from some capital seat a large extent of country, holding a court with barbaric pomp and circumstances such as some writers would have us believe.

We hope our readers have not been wearied by this somewhat extended investigation of the Mound Builders. Every storm that beats upon their works tends to level them. The

[1] Foster's "Prehistoric Races," p. 346.

demands of our modern life are fast obliterating the remaining monuments, and, indeed, it is now only those which are situated in favorable localities, or are massive in construction, that are left for our inspection. But these nearly obliterated records of the past are of more than passing interest to us as monuments of the prehistoric times of our own country. We wander over these ruins and find much to interest us, much to excite our curiosity. The purposes of many are utterly unknown. Some, by their great proportions, awaken in us feelings of admiration for the perseverance and energy of their builders. But when we investigate the objects of stone, of clay, and of copper this people left behind them, we notice how hard it is to draw a dividing line between them and the Indians.

In fact, there is no good reason for separating them from the Indian race as a whole. We do not mean to say that they were not, in many respects, different from the tribes found in the same section of the country by the early explorers, though, we ought, perhaps, to confine this remark to the central portion of the country occupied by these ancient remains. But the American of to-day differs from the American of early Colonial times. The miserable natives of Southern California were Indians, but very different indeed from the ambitious, warlike Iroquois, who displayed so much statesmanship in the formation of their celebrated league. In another chapter we shall discuss this part of our subject, as well as the question of the antiquity of the ruins.

# CHAPTER XI.

## THE PUEBLO COUNTRY.[1]

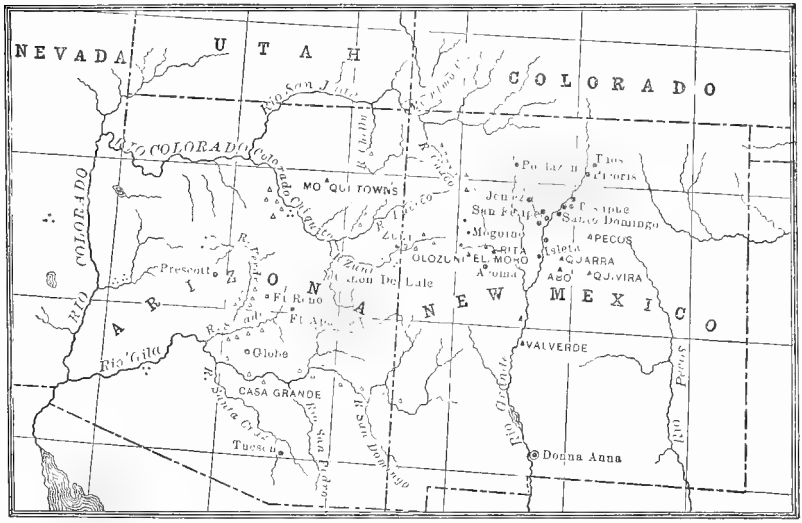
DESCRIPTION of the Pueblo Country—Historical outline—Description of Zuñi—Definition of a Pueblo—Old Zuñi—Inscription Rock—Pueblo of jemez—Historical notice of Pecos—Description of the Moqu tribes—The Estufa—Description of the San Juan country—Aztec Springs—In the Cañon of the McElmo—The Ruins of the Rio Mancos—On Hovenweep Creek—Description of a Cliff-house—Cliff Town—Cave houses—Ruins on the San Juan—Cave Town—The Significance of Cliff-houses—Moqui traditions—Ruins in Northern New Mexico—Ruins in the Chaco Cañon—Pueblo Bonito—Ruins in South-western Arizona—The Rio Verde Valley—Casa Grande—Ruins on the Gila—Culture of the Pueblo Tribes—Their Pottery—Superiority of the Ancient pottery—Conclusion.

HAVE hitherto been describing people and tribes that have completely vanished. We have peered into the mysterious past and sought as best we could to conjure back the scenes of many years ago. The line between the known and the unknown, between the historic and prehistoric, is not far removed form us in the new world. Not yet four centuries have passed since the veil was lifted, and America, with her savage tribes of the North, and her rude civilization of the South, was revealed to the wondering eyes of Europe. But with a knowledge of this new land came also wondrous stories of wealth, and in conse-

[1] The manuscript of this chapter was submitted to Mr. Ad. F. Bandelier, of Highland, Illinois. As agent for the Archæological Institute of America, he spent three years in explorations in the Pueblo country.

quence an army of adventurers were soon on her shores. Then follows a short period of war and conquest. The Indian race could not withstand the whites. European civilization, transplanted to America, has thriven. But whatever advance the native tribes have made since the discovery, has been by reason of contact with the whites.

There was no single birthplace of American culture. Advance took place wherever the climate was mild and the soil fertile, and thus an abundant supply of food could be obtained. One such locality was the valley of the San Juan,



Map of the Pueblo Country.

in what is now the south-western part of the United States. It is quite allowable to suppose that here the mild climate and bountiful soil suggested agriculture, and with a knowledge of this, rude though it was, a beginning was made in a culture which subsequently excited the admiration of the Spaniards. However that may be, we know this section contains abundant ruins of former inhabitants. And yet again we find in this same country the remnants of this

former people, doubtless living much the same sort of life as did their forefathers. American scholars, with the best of reason, think this section affords the best vantage ground from which to study the question of native American culture. It presents us not only with ruins of past greatness, but in the inhabited pueblos, gives us a picture of primitive times, and invites us, by a careful study of their institutions, to become acquainted with primitive society.

Travelers and explorers describe the scenery of the Pueblo country as a very peculiar one. It is bleak without being absolutely barren. The great mountain chains form picturesque profiles, which in a measure compensate for the lack of vegetation. No country on the face of the globe bears such testimony to the power of running water to wear away the surface. The rivers commenced by wearing down great cañons. They occur here on a grand scale. The cañon of the Colorado River, having a length of two hundred miles, and through the whole, nearly vertical walls of rock, three to six thousand feet in height. Nearly all the tributary streams of the Colorado empty into it by means of gorges nearly as profound. What is true of the Colorado is true, though in a lesser degree of the Rio Grande and of the Pecos, as only portions of these streams are cañon-born. But, besides digging out these cañons, the entire surface of the country has in places been removed to the depth of several hundred feet, leaving large extent of table-lands, called mesas, with generally steep, or even precipitous, sides, standing isolated here and there.

Though thus bearing evidence of more extended rainfall, and of the action of water in the past, it is essentially an arid country now. Most of the minor water-courses laid down on the map are dry half of the year, or have but scattered pools of water; so a description of the surface of

the country would tell us of deep river valleys, in many cases narrow and running through rocky beds, in which case we call them cañons; in other cases very wide, but having generally precipitous sides; the country often mountainous, and great stretches of table-land, but generally dry and desolate, except in the immediate vicinity of rivers. The river valleys themselves are generally very fertile.

Such is the country where we are to investigate native American culture. The history of the country since its first occupation by the Spaniards is not devoid of interest. It did not take the Indians of Mexico long to learn that what the Spaniards most prized was gold, and that the surest way to curry favor with them was to relate to them exaggerated stories of wonderful wealth to be gained in distant provinces. About 1530 the viceroy of New Spain (Mexico) learned from an Indian slave of seven great cities somewhere to the north; and of their wealth it was said they had streets exclusively occupied by workers in gold and silver.

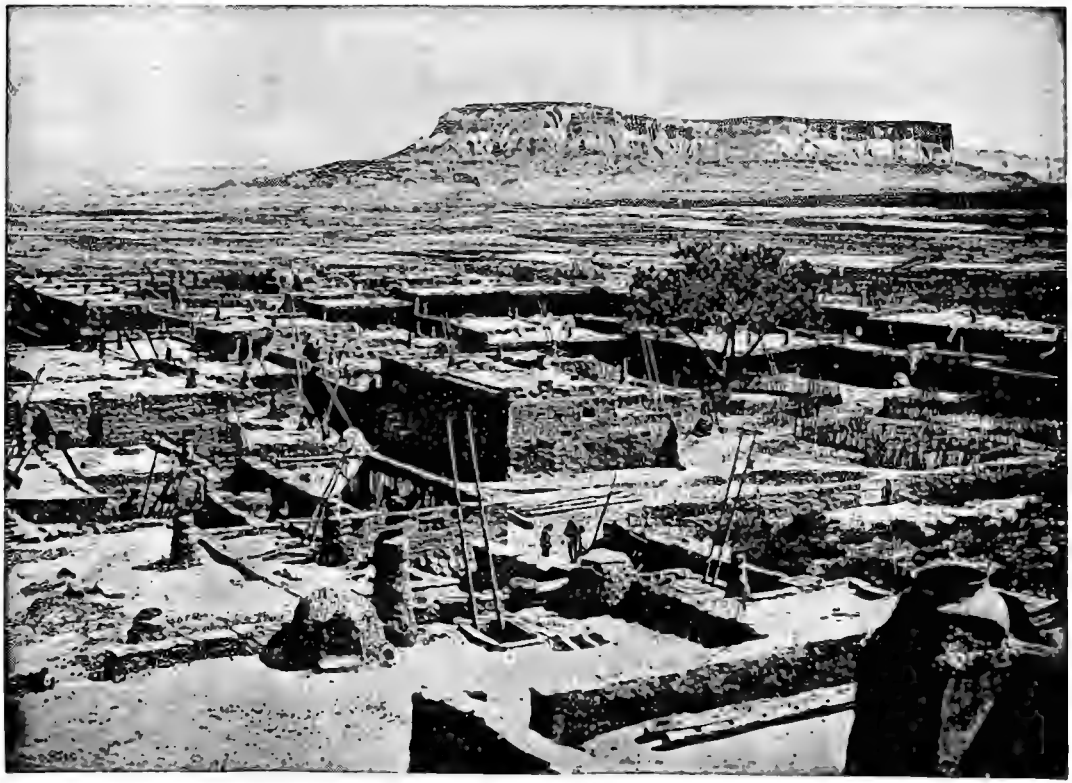
Though expeditions to the northern provinces of Mexico speedily dispelled the illusions in regard to them, the wonderful story of the Seven Cities flitted further north. Six years later these stories were invested with new life by the arrival in Mexico of Cabeza De Vaca and three companions. The story of their remarkable wanderings reads like an extract from a work of fiction. They were members of the unfortunate Spanish expeditions to the coast of Florida in 1528. After the shipwreck and final overthrow of the expedition, these four men had wandered from somewhere on the coast of the Gulf of Mexico, first north, and then west, passing through, probably, portions of Texas and New Mexico, until finally they were so fortunate as to meet with their own countrymen near Culiacan, in Mexico. The story they had to tell fell on willing ears. They stated to the

viceroy that they had carefully observed the country through which they had passed, and had been told of great and powerful cities containing houses of four and five stories, with the usual accompaniments of great wealth.

The next incident was the journey of three Franciscan friars and a negro (who, by the way, had been with De Vaca in his wanderings), sent out by the Governor Coronado, with orders to return and report to him all they could learn by personal observation of the Seven Cities. This expedition did not accomplish much. Arriving near Cibola (the Spanish name for the country of the Seven Cities), they sent the negro on ahead to gain the good will of the Indians. Instead of this, he was killed by them. On hearing which, the monks contented themselves with gazing on the pueblo (which they describe as "more considerable than Mexico") from a safe distance, and then hurriedly returned to Culiacan. They gave Coronado a most glowing account of all they had discovered.

Coronado now thought the time had come for decisive action. Accordingly, with the viceroy's permission, he organized his forces, and in 1540 set out on his memorable march in search of the Seven Cities of Cibola. We do not propose to give in detail the series of conquests beginning with this expedition and finally ending with the subjection of New Mexico in 1598. It is needless to say that the Spanish forces found no cities teeming with wealth. What they did find was a country much the same as at present. The cities were the communal houses, or combination of houses, known as pueblos. The pueblo of Zuñi is the remaining one of the mystical seven. The ruins of at least six other pueblos are known to be in the immediate vicinity.[1]

[1] See an excellent historical account by Bandeliers: "Papers of the Archæological Institute of America." American series No. 1.



PUEBLO OF ZUÑI

This historical account, short and imperfect as it is, introduces us to a most interesting people. If we would know more of them we can not do better than to adopt the advice of Hosta, ex-governor of Jemez, to Dr. Loew: "If you wish to see what a great people we once were you must go upon the mesas and into the cañons of the vicinity, where ruins of our forefathers are numerous."

One of the most important pueblos yet remaining inhabited, and one of the first that Coronado encountered in his expedition, is Zuñi. The present pueblo is considered as the remaining one of the Seven Cities—at least, by the majority of Americanists. Whipple describes Zuñi as follows: "Treading an opening between rocky bluffs, . . . we entered the valley, several miles in width, which leads to Zuñi. The soil seemed light, but where cultivated it produced fine crops without the aid of irrigation. . . . Within the valley appeared occasional towers, where herders and laborers watch to prevent a surprise from Apaches. Near the center of this apparent plain stood, upon an eminence, the compact city of Zuñi.[1] By its side flowed the river which bears the same name. It is now but a rivulet of humble dimensions, though sometimes said to be a large stream. . . . Passing beneath an arch, we entered a court, . . . entirely surrounded by houses of several receding stories, which were attained by means of ladders leading from one to another. . . . From the top the pueblo reminds one of an immense ant-hill, from its similar form and dense population. . . . Going down from its outer side into the street, we encounter five stories of descent."[2]

In order to prevent confusion, we will state that a pueblo, which is the Spanish name for these old Indian towns, may

[1] The term "City of Zuñi" is scarcely correct; it should be Pueblo of Zuñi.
[2] Pacific Railroad Report; Whipple, Vol. III., pp. 67 and 68.

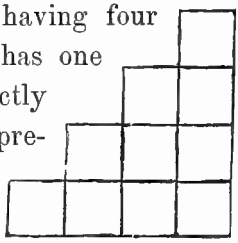
be one of several different types. A common form of village consists of but one or two, seldom three, large buildings, so arranged as to surround an interior court. Sometimes there is but one large building, which is nearly in the shape of a half circle; instead of being really circular, it has a number of different sides. In some cases a village consists of a number of these large houses irregularly arranged. But the tendency is always to inclose a square.[1]

In the modern villages the buildings forming the square do not meet, but in some cases are connected by bridges or covered gangways, and in some instances the houses project over the streets below, which, being narrow, are thus given an underground appearance.[2]

The buildings, or communal houses, for one house contained sometimes five hundred rooms, are generally from three to four hundred feet long and about one hundred and fifty feet in width at the base.

Ground Plan.

The lower story is divided by cross-walls into a mass of cell-like rooms, as shown in the illustration, which represents the ground plan of a pueblo having four ranges of rooms. Each story in height has one less range of rooms, so that, looking directly at the end of this building, it would present the appearance shown by this cut: The only means of getting from one terrace to the other is by the aid of ladders.



End View.

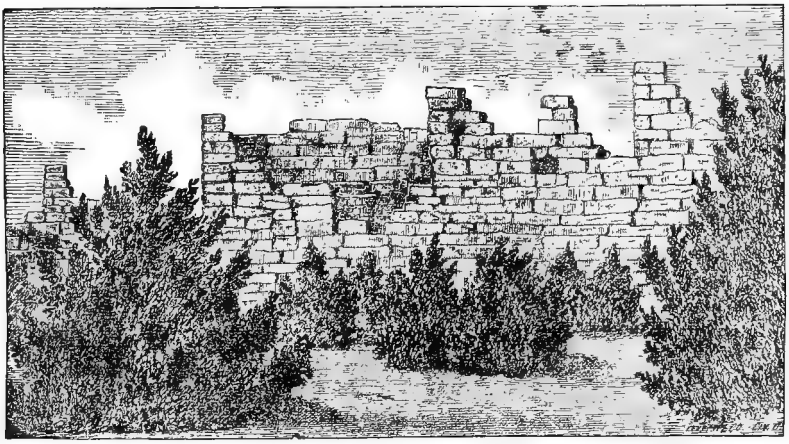
In some cases these terraces run from both sides of the building; in others they face the inclosed space; and in others still they face outside. Most of the inhabited pueblos are

[1] "Archæological Institute of America," Fifth An. Rep., pp. 55 and 56.

[2] Bancroft's "Native Races," Vol. I., p. 534.

built of adobe—that is, sun-dried bricks. The majority of the ancient ruins were built of stone set in adobe mortar. With this digression, we will now return to Zuñi.

Ruins testifying to the former greatness of these people are scattered around them. Three miles to the east of the present pueblo of Zuñi, on the bluff seen in the cut, are the ruins of a larger pueblo, which is called Old Zuñi. Mr. Whipple, who explored this field of ruins, thus describes his visit: "The projecting summit of the cliffs seemed inaccessible. . . . We followed a trail, which, with great



Old Zuñi.

labor, had been hammered out from seam to seam of the rocks along the side of the precipice. At various points of the ascent, where a projecting rock permitted, were barricades of stone walls, from which the old man[1] told us they had hurled rocks upon the invading Spaniards. Having ascended one thousand feet, we found ourselves upon a level surface, covered with thick cedars. . . . The top of the mesa was of an irregular figure, a mile in width, bounded upon all sides by perpendicular bluffs. . . . The guide hur-

[1] His guide.

ried us on half a mile further, where appeared the ruins of a city, indeed. Crumbling walls, from two to twelve feet in height, were crowded together in confused heaps, over several acres of ground. . . . Upon examining the pueblo, we found the standing walls rested upon ruins of greater antiquity.[1] The primitive masonry, as well as we could judge, must have been about six feet thick. The more recent was not more than a foot or a foot and a half, but the small sandstone blocks had been laid in mud mortar with considerable care."[2]

The descriptions of ruins have so much that is similar that repetitions become tiresome. We will not, therefore, delay much longer with Zuñi. A few miles east of Old Zuñi we come to Pescado Springs, near which are the ruins of several pueblos. "This spring bursts from a broken point of the lava bed, and at once becomes a pretty stream, glittering with great numbers of the finny tribe, which gives name to it. The circular wall which once inclosed the fountain-head is now partly broken down. Upon each side, and almost tangent, are ruins of pueblos so ancient that the traditions of present races do not reach them. They are nearly circular in form, and of equal dimension. One measured three hundred and fifteen short paces, about eight hundred feet, in circumference. They were of stone; but the walls have crumbled, leaving only a heap of rubbish."[3]

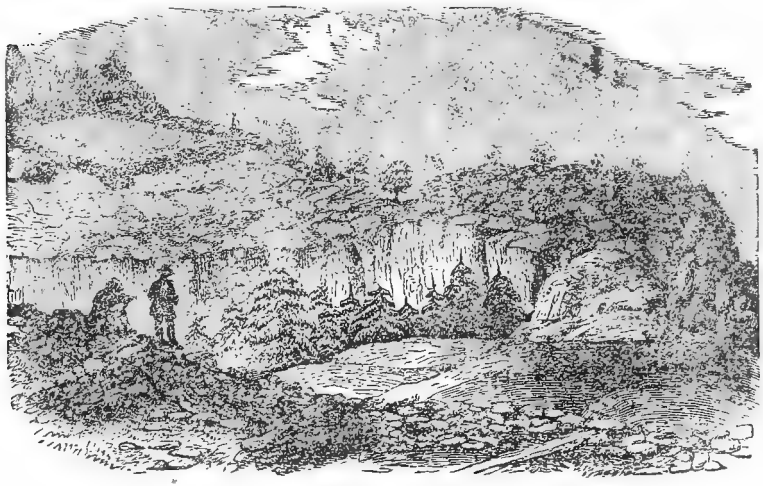
Following up this stream, other ruins were found. It seems, then, that in the pueblo of Zuñi we have left a pitiful remnant of a numerous people. When the Spaniards

[1] The ruins on the top were, however, built after 1680, when the inhabitants of Flavona, the Spanish "Alvona," fled to the top of the mesa to escape the forays of the Navajos. The ruins were abandoned before 1705. Zuñi is partly built on the ruins of Flavona, which is still its aboriginal name. (Bandelier.)

[2] Pacific Railroad Reports, Whipple, Vol. III., p. 69.

[3] Pacific Railroad Reports, Whipple, Vol. III., p. 65.

first appeared on the scene they were apparently prosperous. The rapid decrease of the Pueblo tribes was owing to several causes. In 1680 they made an attempt to throw off the Spanish yoke. At first this was successful. But inter-tribal warfare at once set in. At this time also the inroads of the Apaches and Navajos became so troublesome that the Pueblo tribes could not successfully cultivate their land. At this time also a succession of dry years set in, and famine was the result. Their customs and manners we will describe



Inscription Rock.

in another place. There are many reasons for supposing that the country had been inhabited for a very long period, even before the Spaniards invaded it. Some places must have been even then in ruins, or, if inhabited, it is very strange that the Spanish records do not mention them. Such, for instance, is Inscription Rock, about fifteen miles east of Old Zuñi, which the Spaniards must have passed when on their way back and forth to Zuñi.

The small mesa here ends with a bold front of white sandstone rock, rising almost vertically two hundred and

fifty feet high. This cut gives us a view on the top of the table-rock, We see here the foundations of two old buildings. A deep ravine nearly divides this little plateau into two portions. As we have said, this rises with a bold, precipitous front from the plain. At one place this front is completely covered with inscriptions. Here the Indians, unknown years ago, made their strange hieroglyphics which, presenting to our eyes only a senseless combination of forms of animals and men and meaningless figures, may have conveyed to them knowledge of important events. A great many Spanish inscriptions have also been carved on the rock. Whipple calls attention to the fact that though Spanish inscriptions placed there nearly two hundred years ago, seem but slightly affected by atmospheric action, still some of the Indian hieroglyphics are "almost wiped out by the fingers of time." A number of centuries have probably rolled away since they were inscribed.

It may be interesting to know the reading of some of these old inscription. A translation of one of the earliest and longest is here given, with the exception of a few words which could not be made out: "Bartolome Narrso, Governor and Captain-general of the province of New Mexico, for our lord, the king, passed by this place on his return from the pueblo of Zuñi, on the 29th of July, of the year 1620, and put them in peace, at their petition, asking the favor to become subjects of his majesty, and anew they gave obedience; all of which they did with free consent, knowing it prudent as well as very Christian, . . . to so distinguished and gallant a soldier, indomitable and famed; we love . . ."[1]

It is somewhat strange to meet thus in the interior of the United States with the record of a military expedition some

[1] "Simpson's Report," p. 124.

months before the Puritans landed at Plymouth. There seems to be nothing especial to describe about the ruins. Both Simpson and Whipple notice that the masonry seems to be unusually good. As it must have been very difficult to procure water, the location must have been chosen solely for the protection it afforded. The early Spanish accounts contain the names of one hundred and twenty-six pueblos. Some are, however, mentioned two or three times. Mr. Bandelier has succeeded in identifying every one. The Rio Puerco Valley was never a very prosperous one, and the river is scarcely a permanent one. At present a few ruins at Poblazon, for instance, are to be seen, and the valley looks poor and barren.

The valley of the Rio Grande River was occupied by a number of Pueblo tribes, and there are at present eight inhabited pueblos along this river, in New Mexico, and one in Texas. The region around Bernalillo was a prosperous section. At intervals, up and down the river, and along its tributaries, we can still trace low crumbling ruins, evidence of an old pueblo. If the statements of the Spanish writers are to be believed, the number of inhabited towns, at the time of the conquest, was at least ten times that now existing. The population could never have exceeded forty thousand. At present it contains about nine thousand. Still making all allowance for Spanish exaggeration, we are convinced that it was a thickly populated country at the time of the conquest.

One of the most interesting pueblos in New Mexico is Jemez, on a river of that name, sixty miles west of Santa Fe. We speak of it here because it is the center of a most interesting group of ruins. Like the pueblo of Zuñi, it is a remnant only of a prosperous people. The reports of Coronado's expedition frequently mention Jemez, though it may

be doubtful whether they refer to the pueblo of that name now, or to one of the numerous ruined ones in the immediate vicinity. Jemez is a prosperous pueblo, having fine fields, large irrigating ditches, and extensive flocks of sheep.

Simpson describes it in 1849 as follows: "The pueblo of Jemez is an Indian town of between four and five hundred inhabitants, . . . and is built upon two or three parallel streets, the houses being of adobe construction, and having second stories disposed retreatingly upon the first, to which access is had by means of ladders. . . About the premises are probably a dozen acres covered with apricot and peach trees. . . The Rio de Jemez, upon which the pueblo lies, is an affluent of the Rio Grande, varies from thirty to fifty feet in breadth, is of a rapid current. . . . Patches of good corn and wheat skirt it here and there along its banks, and the extent of cultivable land bordering it may be estimated at about a mile in breadth."

We are more interested, however, in ruins testifying to past greatness. "Six miles up the river you come to the union of two cañons—the Guadalupe and San Diego. Where the mesa between these cañons narrows itself to a point, are the ruins of two pueblos, one upon the lower prominence of the mesa, the other upon the mesa proper, and only approachable by two narrow, steep trails, the mesa everywhere else being nearly perpendicular, and seven hundred and fifty feet high. The view from the mesa is picturesque and imposing in the extreme. Far beneath, to the right and left, a stream makes its way between the colossal walls of the sandstone upon the narrow width of the mesa; near frightful precipices are the ruins of a town of eighty houses, partly in parallel rows, partly in squares, and partly perched between overhanging rocks, the rim and surfaces

of which formed the walls of rooms, the gaps and interstices being filled in artificially."

"Nearly every house had one story and two rooms. The building material was trachytic rock as found upon the mesa. Broken pottery, charred corn, and millstones for grinding corn, were found in some of the rooms. The roofs had all fallen in, and so also had many of the side walls, in the construction of which wood was but little used. Piñon trees have taken root within many of the former rooms. Upon asking my Indian guide whether the former inhabitants of this town were obliged to descend the steep and dangerous pathway every day to the creek to procure water, he replied there were cisterns upon the mesa, in which rain, formerly plentiful, was caught. He then called my attention to some conical heaps of stones along the rim of the precipice, which was the material for defense."[1]

This description introduces us to another class of ruins—that is, detached separate houses, different from the great communal structures we have already described. What connection exists between these two forms of houses will be studied in another place. As a rule, the rooms in the detached houses are larger than in the communal houses. Exceptions occur in some of the inhabited pueblos.[2] This is only one of many towns in ruins thereabouts. According to Dr. Loew there are no less than twenty-five or thirty.

It is not our purpose to describe any more of the pueblos of this section of New Mexico than is required to enable us to understand the customs, manners, and habits of the Pueblo tribes. We learn that in New Mexico we are brought face to face with feeble remnants of former tribes, and that these were probably in their most flourishing con-

[1] Dr. Loew, in "U. S. Geographical Survey West of the 100th Meridian," Vol. VII, p. 343. [2] "Fifth An. Rep. Archæological Inst. of America," p. 61.

dition when the Spaniards first invaded the country, and though in a few instances the ruins imply a great antiquity, as at Inscription Rock, still we may be reasonably sure that the majority of them date but a few centuries back. The ruins of Catholic churches established by the Franciscan monks in the sixteenth century occur in several places, five being found around Jemez.

The story of the decline of the Pueblo tribes may be illustrated by the history of Pecos. This pueblo was situated on the Rio Pecos, about twenty-five miles south-east of Santa Fe. With the exception of the present inhabited town of Taos, it was the most eastern point reached by the pueblo building tribes. This, though a very large pueblo, has nothing especial to attract attention, except that the entire mesa was inclosed by a stone wall about six feet and a half high, and twenty inches thick, having a total length of three thousand, two hundred and twenty feet.[1] Its history is, however, interesting and instructive. Coronado, with his army, visited Pecos before he abandoned the country in 1543. His reports mention it as a prosperous pueblo. Several raids were made into New Mexico by Spanish parties, but the conquest proper occurred in 1598, when the Pecos pledged fidelity to the crown of Spain.

The Catholic Church at once set about establishing missions at various pueblos. The Pecos Church was established in 1629, though missionary work had been done here before that time. One of the priests who accompanied Coronado remained behind at Pecos. He was never afterwards heard from. This church became one of the most renowned in New Mexico. The inhabitants became herders as well as agriculturists. It was prosperous. In 1680 the pueblo of Pecos sheltered two thousand Indians. "But a storm was brew-

[1] Bandelier's "Papers of the Archæological Inst." p. 46.

ing from whose effects the Pueblo tribes never recovered." In 1680 the Indians rose against the Spanish and drove them from New Mexico. The priests were murdered, the churches were sacked. From this time doubtless date the ruins of the churches seen around Jemez. At Pecos and many other places intertribal warfare set in. Bloody battles were fought.

Neither were the Spaniards idle. In 1682 one expedition was made, and at least two pueblo towns were destroyed by them. In 1689 the entire country was reconquered. Some tribes were nearly exterminated, and all more or less weakened, and a great many ruins date from that time. It was the beginning of a decline for the Pueblo tribes, and this decline was hastened by intertribal warfare, by drought, and by ravages from wild Indians. As to the drought, it is sufficient to state that some ruins are now fifteen, and even twenty, miles from permanent water. The Comanches were the scourge of the Pecos. On one occasion they slaughtered all the young men but one. This was a blow from which they never recovered. Finally reduced by sickness to but five adults, the Pecos sold their lands and, at the invitation of their brethren at Jemez, went to live with them, and the pueblo of Pecos speedily became the ruins we now find it.[1]

No doubt a similar history could be written of many other ruins. "Our people," said Hosta, "were a warlike race, and had many fights, not only with the Spaniards, but also with other Indian tribes the Navajos and Taos, for instance and were thus reduced to this pueblo of Jemez, which now forms the last remnant." New Mexico is now becoming rapidly "Americanized," and it will soon be brought to a test whether the Pueblo tribes can withstand this new influence and retain their peculiar civilization, or whether,

[1] These facts are drawn from Mr. Bandelier's article already referred to

like many other races, their life force is nearly spent, in which case they will live only in history.

We must not overlook the Moki Pueblos in Arizona. They are situated one hundred miles northwest of Zuñi. The

Wolpi. (Maj Powell)

Spaniards discovered them, and called their province Tusayan. They are much like the Pueblo tribes of New Mexico, only they have been much less disturbed by outside influence. There are a number of ruined towns in this vicinity. We

wish to refer to them because of their intimate connection with the ruins to the North. Their houses are built of stone on precipitous mesas.

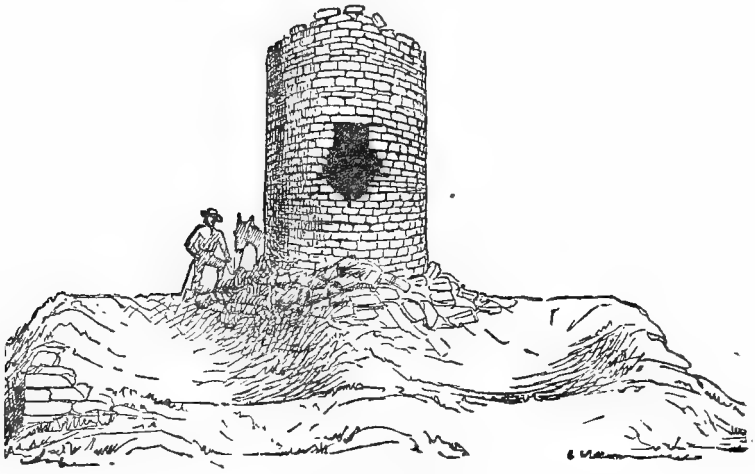
Lieut. Ives, who visited them in 1858, has left quite a full description of them. He states that "each pueblo is built around a rectangular court, in which, we suppose, are the springs that furnished the supply to the reservoirs. The exterior walls, which are of stone, have no openings, and would have to be scaled or battered down before access could be gained to the interior. The successive stories are set back, one behind the other. The lower rooms are reached through trap-doors from the first landing. The houses are three rooms deep, and open upon the interior court."[1] He was much pleased with the manner in which they had terraced off the bluffs of the mesas into little garden patches, irrigating them from the large reservoirs from the top.

There is one feature common to all the Pueblo tribes which is necessary to refer to here, from its connection with the ruined structures further north. In all of the inhabited pueblos there is a structure known as an Estafa, some pueblos having several. They are usually circular, but occasionally (as at Jemez) rectangular. They are generally subterranean, or mostly so. They are great institutions among the Pueblos. "In these subterranean temples the old men met in secret council, or assembled in worship of their gods. Here are held dances, festivities, and social intercourse."

Another common feature, represented in this cut, is the watch-tower. It is either round, as in this case, or rectangular. It may be interesting to recall in this connection the signal mounds of the Mound Builders. They were not always in the immediate vicinity of other ruins. Neither can we state that there was a system in their arrangement, one an-

[1] "Colorado River of the West," p. 119, *et seq.*

swering to another at a distance, and yet it was noticed where the ruins were numerous that several were in view from one point.[1] In dimensions these towers range from ten



Watch Tower.

to fifteen feet in diameter, and from five to fifteen feet in height, while the walls are from one to two feet thick. They are in many cases connected with structures rectangular in form.

We will now leave the inhabited pueblos and the ruins in their immediate vicinity and, going to the north, explore a section of country that shows every evidence of having sustained a considerable population some time in the past. To understand this fact clearly, it will be necessary to fix the location of the places named by means of the map. From time to time confused reports of the wonders to be seen in the San Juan section of Colorado had appeared in the East, but the first clear and satisfactory account is contained in the reports of Messrs. Jackson and Holmes, members of the U. S. Geographical and Geological survey of the territories under Dr. Hayden for 1874 and 1876.

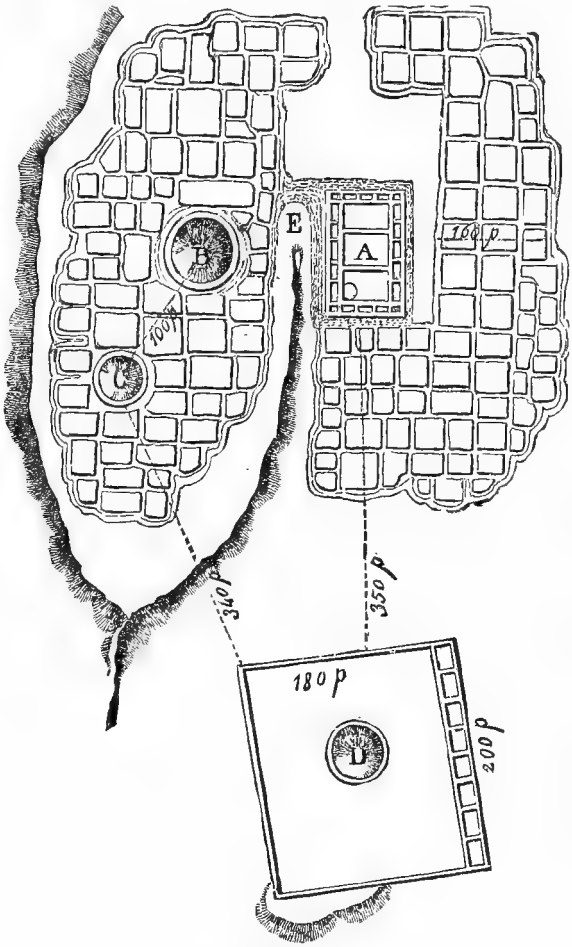
[1] U. S. Survey, Hayden, 1876, p. 390.

In the south-western portion of Colorado is a range of mountains known as the San Juan. Stretching from their base west to the Sierras is a great plateau region, drained by the numerous tributaries of the San Juan River. It would, perhaps, be more in keeping with the facts of the case to say "had been drained some time in the past," for this is now such an arid, semi-desert country that the majority of the streams are dry, or have but scattered pools of water in them, during a large portion of the year; and yet, at times, great volumes of water go sweeping through them. This whole plateau is cut up with long, cañoned valleys, presenting, in effect, the same surface features that we have already described in New Mexico. Yet this precipitous, cañon-marked section of country is literally filled with the crumbling ruins of a former people. The situation in which they occur is in many cases very singular, and the whole subject is invested with great interest to us, because we see in them the remains of a people evidently the same as the Pueblo people to-day.

One of the most extensive ruins in this section is situated at Aztec Springs. This, it will be seen, is about midway between the Rio Mancos and the McElmo. Mr. Holmes found the site of the spring, but it contained no water. He was told, however, by those familiar with the locality that there had been a living spring there up to within a few years. It was evidently a place of considerable importance once. Mr. Holmes describes the ruins as forming the most imposing pile of masonry found in Colorado. They cover an area of over ten acres. This includes only the ruins around the springs. But all about this central portion are scattered and grouped the remnants of smaller structures. So that nearly a square mile is covered with the ruins of this ancient pueblo. Most of the stone used was brought

form the Mesa Verde (Green Plateau), a mile away, and must have been a great work for a people so totally without facilities.

It will be seen that immediately to the right of the Springs is a large rectangular ruin in better preservation than the rest. This now "forms a great mound of crumbling rock from twelve to twenty feet in height, overgrown with artemisia, but showing clearly, however, its rectangular structure, adjusted approximately to the four points of the compass." This house, from its massive walls, must have had an original height of at least forty feet. "The walls seem to have been doubled, with a space of seven feet between; a number of cross-walls at regular intervals indicate that this space has been divided into apartments, as seen in the plan." Two low lines of rubbish cross the square, probably partition walls.



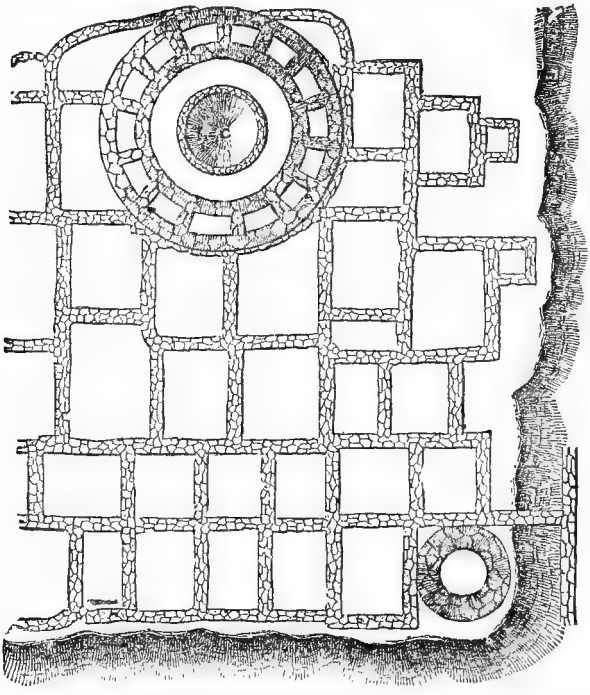
Ruins at Aztec Springs.

Surrounding this house is a net-work of fallen walls, so completely reduced that none of the stones seem to remain in place. Mr. Holmes was at a loss to know whether to call them a cluster of irregular apartments, having low, loosely built walls, or whether they are the remains of imposing pueblos. In the group of ruins to the left of the spring are two well-defined, circular estufas. Below the main mass of ruins, connected by low walls of ruins, is another great square, nearly two hundred feet in dimensions. One wall seems to have consisted of a row of apartments; the other walls served to simply inclose the square, near the center of which was another large estufa.

Several important conclusions can be drawn from a study of this locality. The spring, now dry, was once evidently the source of a considerable stream. Whether the group of low ruins were collections of small houses, or remains of imposing pueblos, we need not doubt that the walls of the square inclosures were composed of pueblo houses. The estufas were probably in all respects similar to those of the present inhabited pueblos. The country around, now so dry and barren, must once have supported considerable population. As to the period of abandonment, we have nothing to guide us. Being an agricultural settlement, it was probably abandoned at an earlier date than the cave-dwellings and cliff-houses of the cañons of the vicinity. The reason for this will appear subsequently. The site of this ruin, as well as for a long distance around, is covered with pieces of broken pottery. We notice that the spring has only lately gone dry. This illustrates the changes now taking place all through the country. It is drying up, and this process has been in operation for a long while.

Many groups of ruins are now in localities where the people could not hope for subsistence. About six miles to

the north of these ruins, about a mile from the McElmo, is the group of ruins here represented, which may throw some light on the remains at Aztec Springs. The principal feature is the triple walled tower, of which a plan is given. The tower has a diameter of about forty-three feet, and a circumference of about one hundred and thirty-five feet. The walls are traceable nearly all the way around, and the



Ruins in the McElmo Cañon.

space between the two outer ones, which is about five feet, contains fourteen apartments or cells. The walls about one of these cells were still standing at the time of Mr. Holmes's visit, but the cell was filled with rubbish from the fallen walls. A door-way, opening into this apartment, could still be seen. The inner wall was probably never very high. It simply inclosed the estufa.

The ruins surrounding this tower consist of low, fallen walls, scarcely traceable. The apartments number nearly one hundred, and were generally rectangular. They are not of a uniform size, and were certainly not arranged in regular order. Now, as Mr. Holmes observes, it would certainly seem that, if they are the ruins of such structures as the pueblos of the south, there would be some regularity of size, and some systematic arrangement. He says that, in reality, they are more like a cluster of pens, such as are used by the Moqui tribes for keeping sheep and goats.

Since these surveys were made, Mr. Bandelier, as agent for the Archæological Institute, has made important researches. He finds that the small, detached houses, such as we described in the ruined village near Jemez, are found in Arizona, with a small court-yard or inclosure attached to them. If we understand the description of the ruins just mentioned, and those at Apache Springs, they are villages of these small houses and their inclosures. In such villages the inclosures meet each other, so as to form a checker-board of irregularly alternating houses and courts. The houses are easily discernible from the fact of little rubbish mounds having accumulated where they stood. Around these parts of the wall can still be traced. This combination makes a strong, easily defended position. Each of such villages contains one or more open spaces of large size, but they are irregularly located.

We must notice one point more: Each village of this nature, that was of any size, contained a larger ruin in the center. This was noticed in the ruins at Aztec Springs. This larger building was in the nature of a citadel, and there the inhabitants could retire when the approaches were carried by the enemy. This central building ultimately swallowed up all the others, and so developed into the pueblo

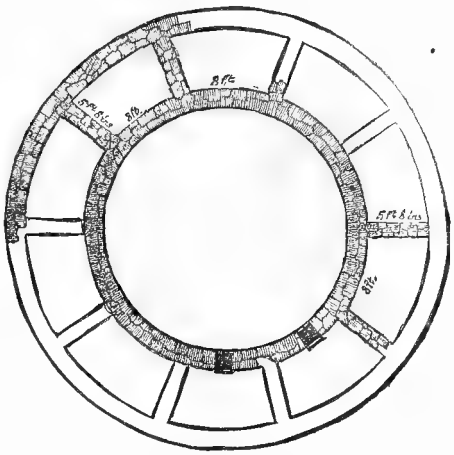
structures we have noticed. The little walled inclosures surrounding the houses were largely in the nature of defenses. Trrdition asserts that in many cases they were garden plats, and appearances sometimes confirm this. "They may also have been the yard proper for each family, in which the latter slept, cooked—in, fact, lived—during the heat of the Summer months."[1]

Referring once more to the ruins near the McElmo, we are told that every isolated rock and bit of mesa within a circle of miles of this place is strewn with remnants of ancient dwellings. We presume these were small, separate houses. They may have been outlying settlements of the tribe whose main village was at Aztec Springs. We must also notice the small tower in the corner. This was a watch tower. It was fifteen feet in diameter, walls three and a half feet thick, and in 1876 was still five feet high, It overlooked the surrounding country. The rainfall in the past must have been more abundant, to support the population we are justified in thinking once lived there. The nearest water is now a mile away, and during the dry season some fifteen miles to the north, in the Rio Dolores, and yet we have every reason to believe these old inhabitants were very saving of water. They built cisterns and reservoirs to store it up against the time of need.

We give a cut of the tower of the ruins of a similar village, or settlement, to the one just described, which occurs twenty miles to the south-east, in the cañon of the Rio Mancos. Being so similar, we will mention it here. In this case the tower had only two walls. Mr. Holmes says the diameter of the outer wall is forty-three feet, that of the inner twenty-five feet. The space between the two circles is divided by

[1] Bandelier, "Fifth Annual Report Archæological Inst. of America," pp. 62, 63, and 65.

cross-walls into ten apartments. This tower is placed also in the midst of a group of more dimly marked ruins or foundations, extending some distance in each direction from it. Mr. Holmes, however, states that there are no ruins of importance in connection with this tower, but that there are a number of ruins in the immediate vicinity. In this case, then, the citadel (if such it was) was not directly connected with other ruins.



Tower on the Rio Mancos.

The Rio Mancos, that we have just mentioned, was a favorite place of resort for these old people. This stream, rising in the La Platte Mountains, flows through beautiful valleys to a great table-land known as the Mesa Verde. Mr. Jackson explored this valley in 1874, and he reports as follows: "Commencing our observation in the park-like valley of the Mancos, between the mesa and the mountains, we find that the low benches which border the stream upon either side bear faint vestiges of having at some far away time been covered with dwellings, grouped in communities apparently, but so indistinct as to present to the eye little more than unintelligible mounds. By a little careful investigation, however, the foundation of great square blocks of single buildings and of circular inclosures can be made out, the latter generally of a depressed center, showing an excavation for some purpose."

From this description we can not quite make out whether these ruins are great communal buildings, like the modern

pueblo, or clusters of separate houses. We incline to the latter opinion, however. The circular depressed area was doubtless used as an Estufa, the place of religious meetings for men alone. "The greater portion of these mounds are now overgrown with artemisia, pinion-pine, and cedar, concealing them almost entirely from casual observation." "We found the surest indication of their proximity in the great quantity of broken pottery which covered the ground in their neighborhood. The same curiously indented, painted, and glazed ware, was found throughout New Mexico and Arizona. It was all broken into very small pieces, none that we could find being larger than a silver dollar." Specimens of this pottery will be figured in its appropriate place.

"Nowhere among these open plane habitations could we discover any vestige of stone-work, either in building material or implements. It is very evident that the houses were all of adobe, the mound-like character of the remains justifying that belief." In this last respect we note a difference between these remains and those already described. The mesa verde is one of those elevated plateaus we have so often described. Through this the Mancos has cut a cañon nearly thirty miles in length, and from one to two thousand feet deep. The description we have already given is of the valley of the river before coming to the cañon.

Entering the cañon, Mr. Jackson continues: "Grouped along in clusters, and singly, were indications of former habitations, very nearly obliterated, and consisting mostly, in the first four or five miles, of the same mound-like forms noticed above, and accompanied always by the scattered, broken pottery. Among them we find one building of squared and carefully laid sandstone, one face only exposed of three or four courses, above the mass of *débris* which covered every thing. This building lay within a few yards

of the banks of the stream, was apparently about ten feet by eight, the usual size, as near as we could determine, of nearly all the separate rooms or houses in the larger blocks, none larger, and many not more than five feet square. The stones exposed are each about seven by twelve inches square, and four inches thick, those in their original position retaining correct angles, but, when thrown down, worn away by attrition to shapeless bowlders."

"As we progressed down the cañon the same general characteristics held good. The great majority of the ruins consisting of heaps of *débris* a central mass considerably higher and more massive than the surrounding lines of subdivided squares. Small buildings, not more than eight feet square, were often found standing alone apparently, no trace of any other being detected in their immediate neighborhood." We would call especial attention in this description to the character of the ruins, the central, higher mass surrounded by other ruins; also to the houses found occasionally standing alone. We notice they are of the same general character as the ruins at Aztec Springs.

We are finding abundant evidence that this section was once thickly settled. Going back to the triple-walled tower on the McElmo, Mr. Jackson says of the immediate vicinity: "On the mesa is group after group upon the same general plan, a great central tower and smaller surrounding buildings. They cover the whole breadth and length of the land, and, turn which way we would, we stumbled over the old mound and into the cellars, as we might call them, of these truly aborigines." We believe, however, that no excavation for cellar purposes are found in the entire region covered by these ancient ruins.

"Starting down the cañon (the McElmo), which gradually deepened as the table-land rose above us, we found

upon either hand very old and faint vestiges of the homes of a forgotten people, but could give them no more attention than merely noting their existence."

Mr. Morgan has shown the existence of regular large houses in the valley of Aminas River, east of the Mancos;[1] and he also speaks of the ruins at the commencement of McElmo Cañon as being large communal buildings. We should judge from Mr. Jackson's report just given that these ruins were rather small clusters of houses of the same design as the ruins at Apache Springs.

Near the Utah boundary line we notice the Havenweep Creek joining the McElmo from the north. The mesa, narrowing to a point where the two cañons meet, is covered with ruins much like what we have described already. The Hovenweep is appropriately named, meaning "deserted valley."

Further west still is the Montezuma Valley. Mr. Jackson's party found the ruins so numerous as to excite surprise at the numbers this narrow valley must have supported. He says, "We camped at the intersection of a large cañon coming in from the west. . . At this point the bottoms widen out to from two to three hundred yards in width, and are literally covered with ruins, evidently those of an extensive settlement or community, although at the present time water was so scarce (there not being a drop within a radius of six miles) that we were compelled to make a dry camp. The ruins consist evidently of great solid mounds of rock *débris*, piled up in rectangular masses, covered with earth and a brush growth, bearing every indication of extreme age—just how old is about as impossible to tell as to say how old the rocks of this cañon are. This group is a mile in length, in the middle of the valley

[1] "Contributions to North American Ethnology," Vol. IV, p. 172, *et seq.*

space, and upon both sides of the wash. Each separate building would cover a space, generally, of one hundred feet square; they are seldom subdivided into more than two or four apartments. Relics were abundant, broken pottery

Ruins in the Hovenweep Cañon.

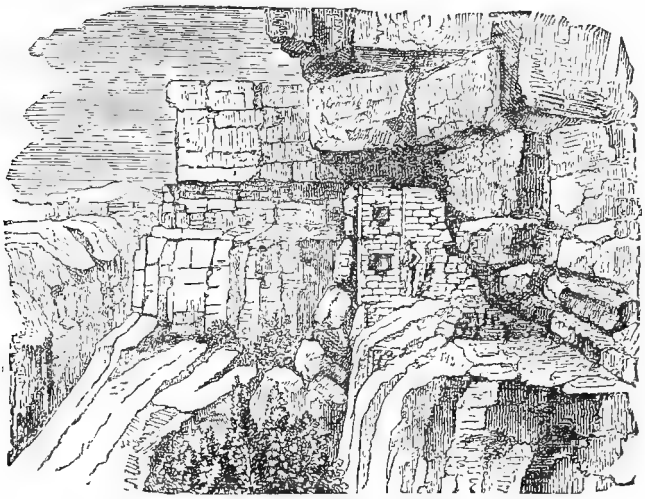
and arrow-points being especially plenty. At one place, where the wash had partially undermined the foundation of one of the large buildings, it exposed a wall of regularly laid masonry, extending down six feet beneath the superincumbent rubbish to the old floor-level, covered with ashes and the remains of half-charred sticks of juniper."

Lower down, the valley was noted for little projecting tongues of rock extending out into the cañon, sometimes connected with the main walls of the cañon by narrow ledges of rock, and in cases even this had disappeared, leaving detached masses of rock standing quite alone. "Within a distance of fifteen miles there are some sixteen or eighteen of these promontories and isolated mesas of different height, every one of them covered with ruins of old and massive stone-built structures."

We have been somewhat full in our description of these ruins, yet their importance justifies this course. So far we see but very little to remind us of the pueblo towns. On the other hand, the buildings seem to be often single houses, or a few houses grouped together. In some locations they were built of stone, in others of adobe. It is to be observed, however, that the houses are very small—not larger than the rooms in the modern pueblos. We evidently have here quiet scenes of agricultural life. They of course had enemies, and guarded against their attacks by the watch-towers, of which an example is given in the McElmo ruins. The country must have been better watered that now, the soil productive, the seasons kind; and who can tell how long these agricultural tribes held the land? Under these conditions, time must have been rapidly bringing them civilization. But we must now turn to a sorrowful chapter in their history, and trace the dispersion of these tribes, their unavailing attempts to hold their own against a savage foe, and the desperate chances they took before leaving the land of their fathers.

This brings us to a consideration of cliff-houses—that is, houses so placed that manifestly the only reason the people would have for putting them where found would be of a defensive nature; and, for a similar reason, we may be

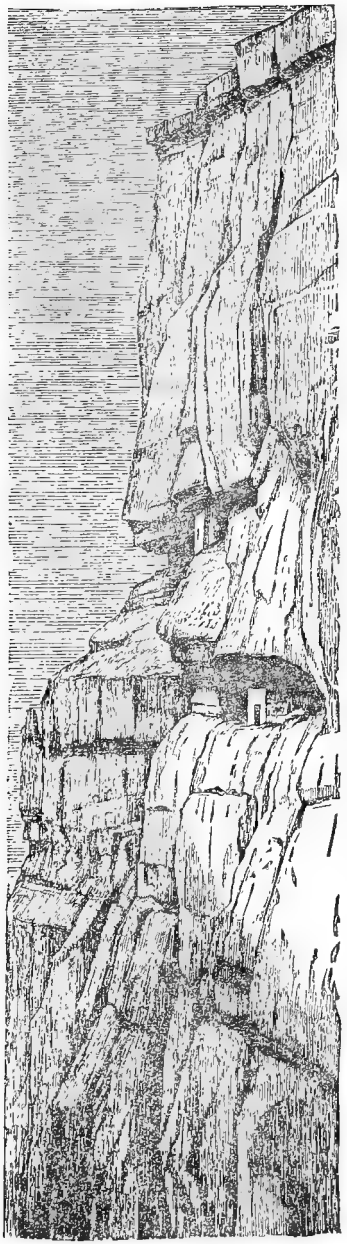
very sure they are of a later date than the majority of the ruins in the valley or in the cañons. People would never have settled in the valley in the first place if they had felt the necessity of seeking inaccessible places in which to build shelters as a resort in time of need. We can not do better than to refer once more to Mr. Jackson's exploration in the valley of the Rio Mancos. We have already referred to it in reference to the larger ruins.



Two-storied House in the Mancos Cañon.

This cut gives us a general view of the first cliff-house discovered in this valley. This was far up on the cliff. Mr. Jackson says, "We had no field-glass with the party, and to this fact is probably due the reason we had not seen others during the day in this same line, for there is no doubt that ruins exist throughout the entire length of the cañon, far above and out of the way of ordinary observation." Subsequently Mr. Holmes proved this supposition to be true. The sides of this cañon have nearly all their ledges occupied by these houses.

Every advantage was taken, both natural and artificial,



View of Cliff in which the House is Situated.

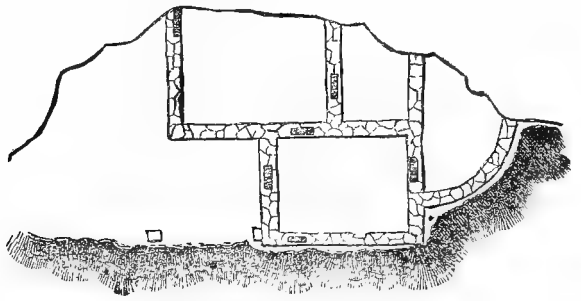
to conceal them from view. "Cedars and pines grew thickly along the ledges upon which they are built, hiding completely any thing behind them. All that we did find were built of the same materials as the cliffs themselves, with but few, and then only the smallest, apertures toward the cañon, the surface being dressed very smooth, and showing no lines of masonry. It was only on the very closest inspection that the houses could be separated from the cliff."

To illustrate the singular position in which this house was located, we introduce this cut. It is seven hundred feet above the valley. "Whether viewed from below or from the heights above, the effect is almost startling, and one can not but feel that no ordinary circumstances could have driven a people to such places of resort." As showing the difficulty an enemy would have to approach such a house, we give Mr. Jackson's account of his climb to it:

"The first five hundred feet of ascent were over a long,

steep slope of *débris*, overgrown with cedar, then came alternately perpendiculars and slopes Immediately below the house was a nearly perpendicular ascent of one hundred feet, that puzzled us for a while, and which we were only able to surmount by finding cracks and crevices into which fingers and toes could be inserted. From the little ledges occasionally found, and by stepping upon each other's shoulders, and grasping tufts of yucca, one would draw himself up to another shelf, and then, by letting down a stick of cedar or a hand, would assist the others."

"Soon we reached a slope, smooth and steep, in which there had been cut a series of steps, now weathered away into a series of undulating hummocks, by which it was easy to ascend, and without them almost an impossibility. Another short, steep slope, and we were under the ledge on which stood our house." By referring to the first cut, we see that the house stands on a very narrow ledge, and that the rocks overhang it so as to furnish a roof. It will also be noticed that the ledge is rounding, so that the outer

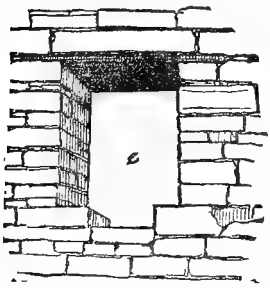


Plan of the House.

walls of the house rise from an incline. Piers, or abutments, had also been built along the ledge so as to form an esplanade.

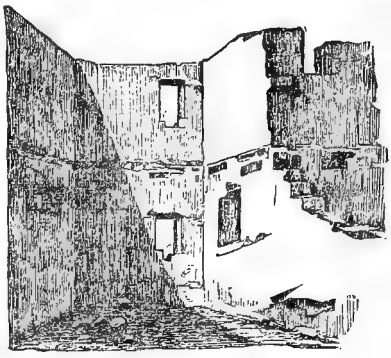
The house itself was only about twelve feet high, but this had been divided into two stories. Whether it ever

had any other roof than the overhanging walls of rock is doubtful. The plan is shown in the preceding cut. The curved apartment at the right is a reservoir, capable of holding about five barrels. A series of pegs were inserted in the wall, so as to form a means of descent from a window to the bottom. A number of doorways are seen in the plan; a cut of one is presented in this figure.



Doorway of the House.

We are, however, warned that the artist has represented the stone-work a little too regularly. The support for the top of the doorway is not clearly shown; a number of small beams of wood were laid across, on these the stones. This cut gives us a view of the front room. Looking in from the end window, we can see where the second story commenced. The doorway we have been describing was not a very handy mode of entrance. Its builders, however, did the best they could in their limited space. The house displays perseverance, ingenuity, and taste.



Room of the House.

It was plastered, both within and without, so as to resemble the walls of the cañon, but an ornamental border was added to the plastering of the interior rooms.

This cliff house could only have been used as a place of refuge in a time of need. We must observe the care with which it was hidden away. The walls were plastered on the outside, so as to resemble the cañon-walls. Then we must notice what a secure place of retreat it afforded the people.

No invading party could hope to storm this castle as long as there was any one to defend it. This house, with its four small rooms, could give shelter to quite a band of Indians. Then, besides, it was not alone. Ruins of half a dozen smaller houses were found near by. Some had been crushed by the overhanging walls falling upon them, and others had lost their foothold and tumbled down the precipice.

It needs but a glance to satisfy any one that only dire necessity would have driven a people to such resorts. When we consider how much labor it must have required to convey the materials to the almost inaccessible place, the many inconveniences the people must have been put to when they were occupied, we may imagine how the people clung to their old home. It is altogether likely that such resorts would be only used now and then. During seasons of war and invasion probably the women and old the men, with the little ones, went thither for protection.

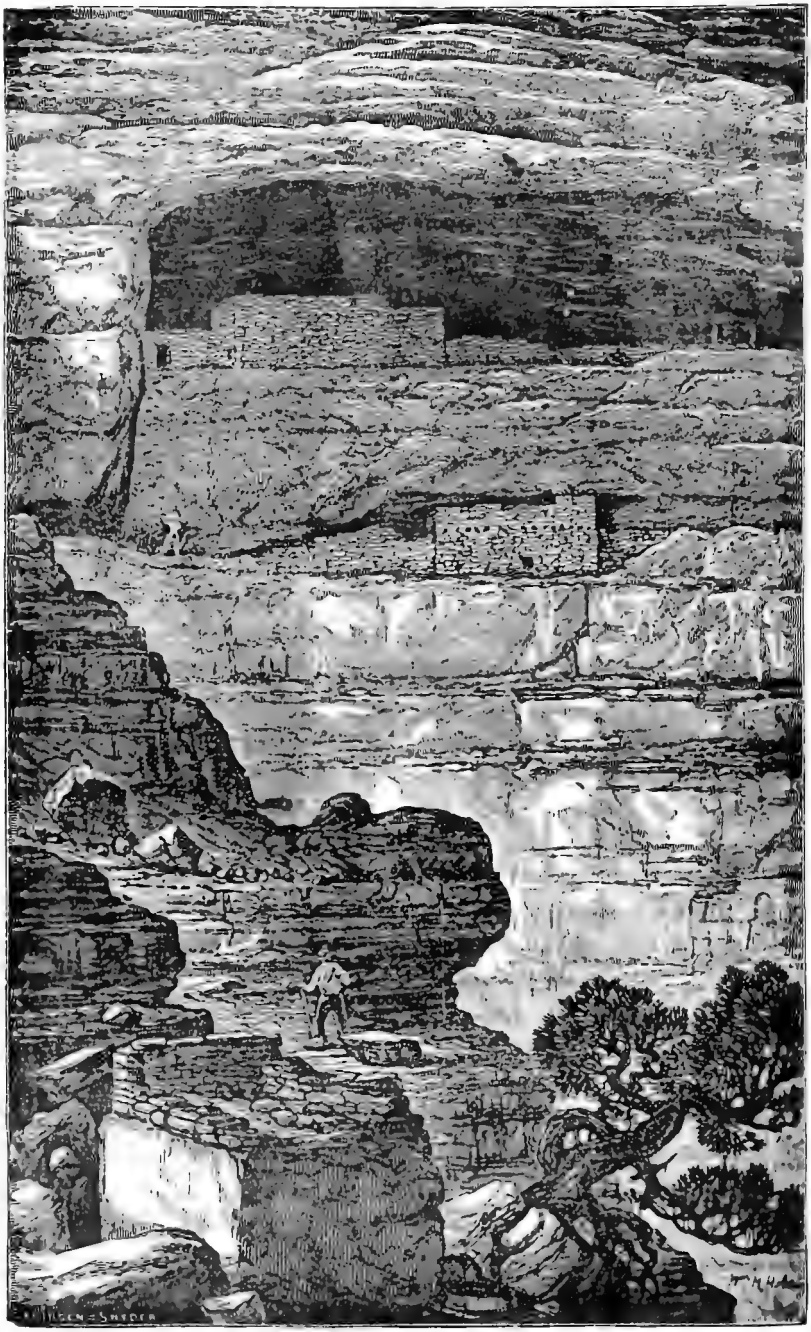
Mr. Holmes calls attention to one point bearing on the antiquity of this ruin. The buttresses, which probably support a balustrade, noticed in the figure on the house, were built on the sloping surface of the rock. It would take but very little weathering of the rocks to throw them to the bottom of the cañon; and, furthermore, the rock is a rough sandstone, and hence easily crumbles; and it is not well protected by the overhanging cliff; but no perceptible change has taken place since the buttresses were first built. The thickness of a sheet of paper has hardly been washed from the surface, and the mortar, almost as hard as the rock itself, lies upon it as if placed there within a dozen years. This structure is, evidently, not as old as the low mounds of crumbling ruins we have heretofore described. It is more than probable that such retreats as this were

not provided until near the close of their stay in the country.

A ruin further down the cañon, described by Mr. Holmes, is of great interest, as it shows how necessary the people considered it to be to construct an estufa. It will be observed that there are two houses. So nicely are these hidden away that Mr. Holmes had almost completed a sketch of the upper house before he noticed the lower one. They are both overhung by the rocks above so as to be protected from the weather. The upper house can only be approached by means of steps cut in the rock. It appears to be in an unfinished state, and, when we consider the great labor required for its construction, we can not wonder that they grew tired before its completion.

The lower house is some eight hundred feet above the bottom of the cañon, but is comparatively easy of approach. The interesting feature about it is the estufa. It was situated near the center of the main portion of the house. The entrance to this chamber shows the peculiar importance attached to it by the builders. Mr. Holmes says: "A walled and covered passage-way of solid masonry, ten feet of which is still intact, leads from an outer chamber through the small intervening apartments into the circular one. It is possible that this originally extended to the outer wall, and was entered from the outside. If so, the person desiring to visit the estufa would have to enter the aperture about twenty-two inches high by thirty wide, and crawl, in the the most abject manner possible, through a tube-like passage-way nearly twenty feet in length."

"My first impression was that this peculiarly constructed way was a precaution against enemies, and that it was probably the only means of entrance to the interior of the house, but I am now inclined to think this is hardly probable, and



CLIFF-TOWN, RIO MANCOS.

conclude that this was rather designed to render a sacred chamber as free as possible from profane intrusion." This illustrates the peculiar regard in which it was held. Even when sore pressed by their enemies, and obliged to flee to inaccessible heights, they still constructed their sacred place.

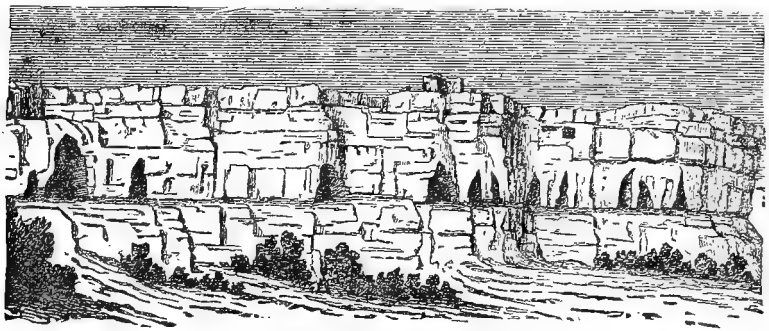
These cliff-houses, of which we give illustrations, are quite common in the Mancos. Our frontispiece shows an interesting group, about ten miles from the foot of the cañon. These are situated only about forty feet above the bed of the creek, but still in a secure position. Here a bed of shale had been weathered out of the sandstone, leaving a sort of horizontal groove four feet high and from four to six feet deep. In this a row of minute houses had been built. They had been made to occupy the full height and depth of the crevice, so that when one reaches it at the only accessible point he is between two houses, and must pass through these to get at the others.

Besides the cliff-houses, the explorers found that these people had made use of little cave-like openings in the cliffs, and, by walling up the openings, had converted them into houses. These were very common in the Mancos, and of all sizes. Some were evidently merely little hiding places, in which to store away provisions or other articles. In some places the cliffs were literally honey-combed with these little habitations. Sometimes the walls were quite well preserved and new-looking, while all about were others in all stages of decay.

"In one place in particular a picturesque outstanding promontory has been full of dwellings. . . . As one from below views the ragged, window-pierced crags, he is unconsciously led to wonder if they are not the ruins of some ancient castle, behind whose mouldering walls are hidden the dread secrets of a long-forgotten people; but a

nearer approach quickly dispels such fancies, for the windows prove to be only the doorways to shallow and irregular apartments hardly sufficiently commodious for a race of pigmies. Neither the outer openings nor the apertures that communicate between the caves are large enough to allow a person of large stature to pass, and one is led to suspect that these nests were not the dwellings proper of these people, but occasional resorts for women and children, and that the somewhat extensive ruins of the valley below were their ordinary dwelling places."[1]

On the San Juan, about ten miles above the mouth of the Mancos, is a significant combination of cave-dwellings and



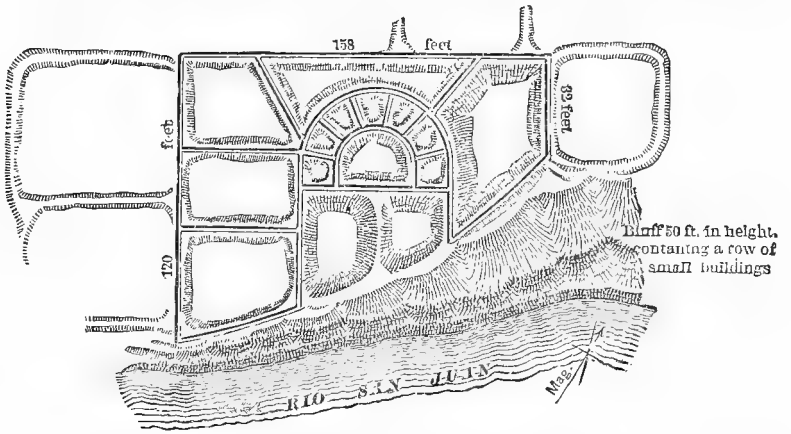
Caves Used as Houses, Rio Mancos.

towers. In this case, about half-way up the cliff, which is not more than forty feet high, excavations had been made in a soft bed of shale. They are now quite shallow, but were probably once deeper and walled up in front. Directly above these cave-openings, on the very brink of the cliffs, were the remains of two circular towers, in each case double-walled, and probably divided by cross-walls into partitions. The towers were probably their council chambers and places of worship. The caves, directly below, down a steep bank, were their fortresses, whither in times of danger they could

[1] Holmes.

flee. The little community, by means of ladders, could freely pass from their cave resorts to the towers and back.

The San Juan River does not seem to be as rich in ruins as some of its tributaries. Yet near the mouth of the Montezuma we came upon a ruin which shows considerable analogy to the pueblos. Mr. Jackson says upon the top of the bench (fifty feet high) overlooking the river are the ruins of a quadrangular structure of a peculiar design. It is arranged very nearly at right angles to the river. We see from the plan that we have the ruins of a larger build-



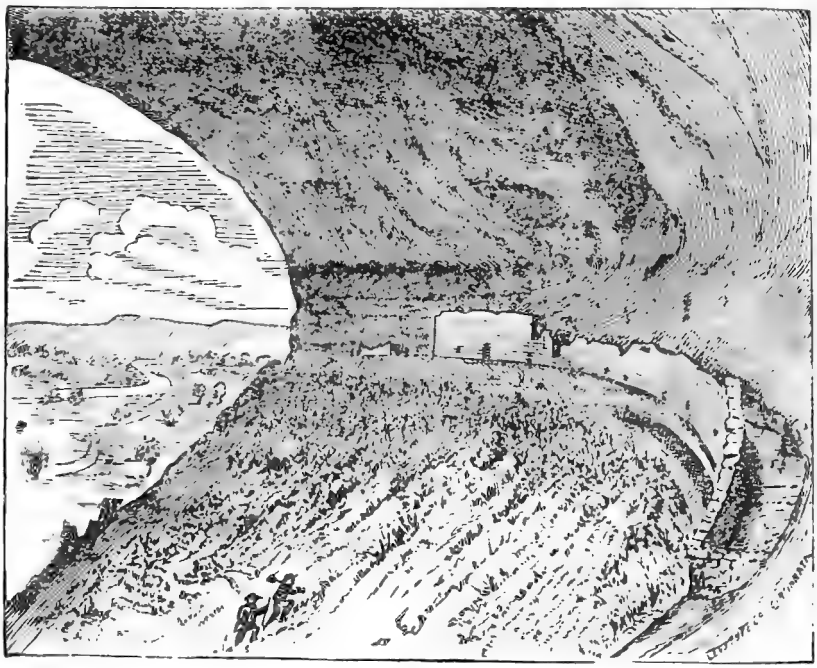
Ruins in the San Juan Cañon.

ing, arranged around an open court—at least, Mr. Jackson could detect no trace of a wall in front. We must notice the seven apartments, arranged in the form of a semicircle, back of the court. Extreme massiveness is indicated throughout the whole structure.

In the immediate vicinity of this ruin were found a number of little, cave-like dwellings. They were so small that doubts were raised as to whether they were suitable for human habitations, but the majority of them bore ample evidence in smoke-begrimed walls that such was their use. Twelve miles below the mouth of the Montezuma this group

of ruins was discovered. These were situated in a cave that was almost exactly a hemisphere in shape. Where the curve of the roof met the curve from the bottom a little projecting bench had been utilized as a foundation for a row of houses.

The little community that built their houses here seem to have practiced all the industries of a savage life. In



Cave-Town.

one place there was evidence that on that spot had been carried on the manufacture of stone implements. At another place holes had been drilled, as if for a loom. In the main building there were fourteen rooms or apartments, ranging from sixteen to nine feet in width. "In the central room of the main building we found a circular, basin-like depression, that had served as a fire-place, being still filled with the ashes and cinders of aboriginal fires, the surrounding

walls being blackened with smoke and soot. This room was undoubtedly the kitchen of the house. Some of the smaller rooms appear to have been used for the same purpose, the fires having been made in the corner against the back wall, the smoke escaping overhead. The masonry displayed in the construction of the walls is very creditable. A symmetrical curve is preserved throughout the whole line, and every portion perfectly plumb. The subdivisions are at right angles to the front. The whole appearance of the place and its surroundings indicate that the family or little community who inhabited it were in good circumstances, and the lords of the surrounding country. Looking out from one of their houses, with a great dome of solid rock overhead that echoed and re-echoed every word uttered with marvelous distinctness, and below them a steep descent of one hundred feet to the broad, fertile valley of the Rio San Juan, covered with waving fields of maize and scattered groves of majestic cottonwoods, these old people, whom even the imagination can hardly clothe with reality, must have felt a sense of security that even the incursions of their barbarian foes could hardly have disturbed." [1]

To describe the defensive ruins on Epsom Creek, Montezuma Creek, and the McElmo is simply to repeat descriptions already given. We meet with cave-houses, cliff-houses, and sentinel-towers in abundance. The whole section appears to have been thickly settled. Further explorations will doubtless make known many more ruins, but probably nothing differing in kind from what is already known. We think the defensive ruins belong to a later period of their existence than do the old and time-worn structures we have hitherto described along the river valleys and open plains, as at Aztec Springs. These structures plainly show that at

[1] U. S. Survey, Hayden, 1876, p. 419.

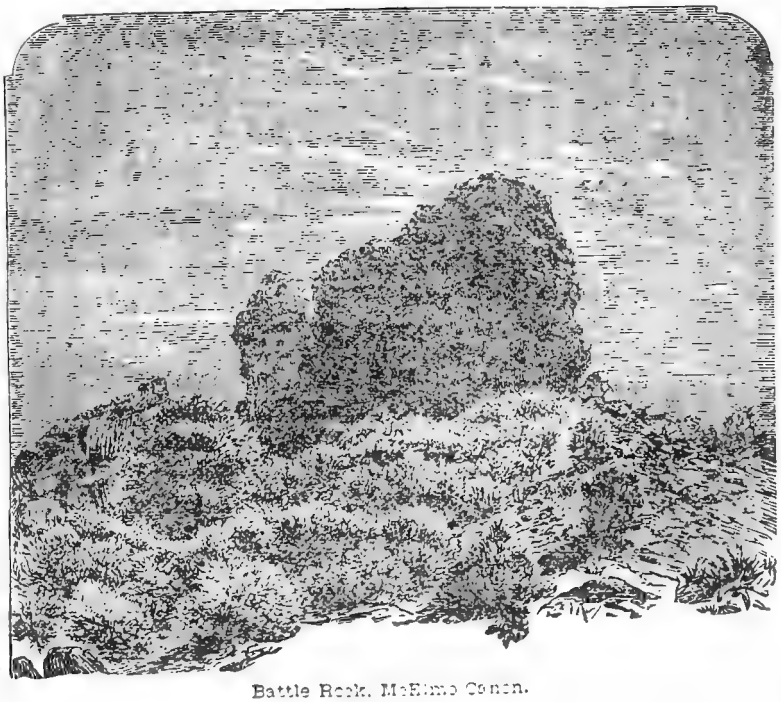
the time they were built the people were subject to an invasion from a stronger foe, one before whose approach they had to fly for protection to the almost inaccessible cliffs.

They would obviously never have settled there had they always had to contend with these savage tribes. It needs no great skill to read the story of the dispersion of these old people from the ruins we have described; the many watch-towers, which were also used as fortresses or citadels in which to find protection, testifying to the need of increased watchfulness. The cave-houses and cliff-fortresses, cunningly hidden away to escape detection, or so placed as to defy the assault of their enemies, show to what desperate straits they were driven; and imagination only can picture the despair that must have filled their hearts when the hour of final defeat came, and they must have realized that even these shifts would not allow them to stay in the lands of their fathers.

That this is the explanation of these ruins, we will cite the legendary stories given by an old man among the Moquis concerning some ruins in the cañon of the McElmo, just over the line in Utah. At this point the cañon widens out considerably, and in the center of the valley is still standing a portion of the old mesa, once filling the entire valley. It is now a mass of dark red sandstone, about one hundred feet high, and three hundred feet around, seamed and cracked, and gradually disappearing, as the rock has gone all around it. The top of this rock is covered with the ruins of some building; there are also ruins at the base and all around the immediate vicinity. There were watch towers and estufas, showing that this was a place of great interest.

The story is as follows: "Formerly the aborigines inhabited all this country as far east as the head-waters of the San Juan, as far north as the Rio Dolores, west some dis-

tance into Utah, and south and south-west throughout Arizona, and on down into Mexico. They had lived there from time immemorial, since the earth was a small island, which augmented as its inhabitants multiplied. They cultivated the valley, fashioned whatever utensils and tools they needed very neatly and handsomely out of clay, and wood, and stone, not knowing any of the useful metals; built their



Battle Rock, McElmo Canon.

homes and kept their flocks and herds in the fertile river bottoms, and worshiped the sun. They were an eminently peaceful and prosperous people, living by agriculture rather than by the chase. About a thousand years ago, however, they were visited by savage strangers from the north, whom they treated hospitably. Soon these visits became more frequent and annoying. Then their troublesome neighbors,

ancestors of the present Utes, began to forage upon them, and at last to massacre them and devastate their farms. So, to save their lives at least, they built houses high up on the cliffs, where they could store food and hide away until the raiders left.

"But one Summer the invaders did not go back to their mountains, as the people expected, but brought their families with them and settled down. So, driven from their homes and lands, starving in their little niches on the high cliffs, they could only steal away during the night and wander across the cheerless uplands. To one who has traveled these steppes such a flight seems terrible, and the mind hesitates to picture the sufferings of the sad fugitives. At the 'Creston' (name of the ruin) they halted, and probably found friends, for the rocks and caves are full of the nests of these human wrens and swallows. Here they collected, erected stone fortifications and watch-towers, dug reservoirs in the rocks to hold a supply of water, which in all cases is precarious in this latitude, and once more stood at bay. Their foes came, and for one long month fought, and were beaten back, and returned day after day to the attack as merciless and inevitable as the tide. Meanwhile the families of the defenders were evacuating and moving south, and bravely did their defenders shield them till they were all safely a hundred miles away.

"The besiegers were beaten back and went away. But the narrative tells us that the hollows of the rocks were filled to the brim with the mingled blood of conquerors and conquered, and red veins of it ran down the cañon. It was such a victory as they could not afford to gain again, and they were glad, when the long flight was over, to follow their wives and little ones to the south. There, in the deserts of Arizona, on well-nigh unapproachable, isolated

bluffs, they built new towns, and their few descendants, the Moquis, live in them to this day, preserving more carefully and purely the history and veneration of their forefathers than their skill or wisdom."[1]

Mr. Jackson thinks this legend arises from the appearance of the rocks. The bare floor of nearly white sandstone, upon which the butte stands, is stained in gory streaks and blotches by the action of an iron constituent in the rocks of another portion of the adjoining bluffs. That may well be true, but we believe that there are germs of truth in the story.

Driven from their homes, where did the fugitives go? Some of them may have gone east, but probably the body of the migration was to the south. It has been the tendency of all tribes, but especially of the sedentary tribes, to pass to the south and east, and this is also the traditions among the inhabitants of still existing pueblos.[2] We find that every available portion of New Mexico and Arizona bears evidence of having been once populated by tribes of Indians, who built houses in all respects like those already described. In northern New Mexico, Prof. Cope has described a whole section of country as being at one time more densely populated than the thickly inhabited portions of the Eastern States. He says: "The number of buildings in a square mile of that region is equal to, if not greater than the number now existing in the more densely populated rural districts of Pennsylvania and New Jersey."[3]

In one location he found a village of thirty houses, built of stone, and all in ruins. He found, over a large extent of country, that every little conical hill and eminence was

[1] Rendered by Ingersoll, in *N. Y. Tribune*, Nov. 3, 1874.
[2] Bandelier, in Fifth Ann. Rep., Arch. Inst., p 79.
[3] U. S. Survey West of 100th M., Vol. VII, p. 358.

crowned with ruins of old houses. We, of course, can not say that these ruins are necessarily younger than those to the north of the San Juan, and yet we think from Prof. Cope's description that they do not present such evidence of antiquity as do the crumbling ruins previously described. And then, besides, they were always located in easily defended positions.

The village spoken of was really a Cliff Village, being arranged along the very edge of a precipitous mesa, the only access to it being along a narrow causeway. Then again, although we have described many ruins near which no water is to be had, at least, in dry seasons, yet we have every reason to suppose water was formerly more plentiful and easily attained. But in this section it must always have been a serious question with them to obtain enough water for necessary purposes. They must have had to store away water in vessels of pottery, whose ruins are now so abundant. It is not such a country as we would suppose a people to choose for a place to settle in, only that they knew not where else to go.

It is also considered settled that all the inhabited pueblos, as well as those in ruins near the inhabited ones, were built by the descendants of these people whose houses we have described. This is proven by the similarity of pottery. Though some styles of ancient corrugated ware are found in the San Juan section not found near the inhabited pueblos, yet vast quantities of ware, similar to that now found in the inhabited pueblos, can be picked up all over the ruins to the north. Again, their religion must have been the same, as ruined estufas are common, in all respects similar to those now in use. In the modern pueblos we are struck with the small cell-like rooms, yet they are but little smaller than the ordinary single houses plentifully found over the

entire field of ruins. All the Pueblo tribes are agricultural, so were these old people. In fact, all evidence confirms the conclusion that the remnants of the Pueblo people that we have already described, are also the descendants of the people driven by hostile bands from north of the San Juan.

This statement may give false impressions, however. The traditions of the Pueblo Indians, of New Mexico, are to the effect that they came from the north, and also that their ancestors formerly lived in the small houses we have described. But we do not mean to say that all the small houses and pueblos in Arizona and New Mexico are later in date than the cliff-houses. The pressure has always been from the north to the south. Neither would we be understood as saying that all the sedentary tribes, both ancient and modern, belong to the same stock of people. There are several different stocks of people even among the present Pueblos.[1]

In the valley of the Rio Chaco, about midway between the Rio Grande and the San Juan, we meet a group of ruined pueblos whose style of masonry is thought to indicate a greater antiquity than the inhabited pueblo towns; these probably indicate another settlement of these people. As these are really remarkable ruins, we must briefly describe them. In the Chaco cañon, as indicated on the map, within the space of ten miles are the ruins of eight larger pueblos. Another is located at the very beginning of the cañon, and two more on the edge of the mesas just outside of the cañon. These are large communal houses of regular pueblo type, and, theoretically at least, they should be later in date than the majority of ruins throughout the area represented on the map. We think the development has been from small, separate houses, to a closely connected

[1] "First Annual Report of Bureau of Ethnology," p. 74.

cluster, with a central citadel, which finally drew to itself all the other buildings, and became the communal building we call a pueblo.[1]

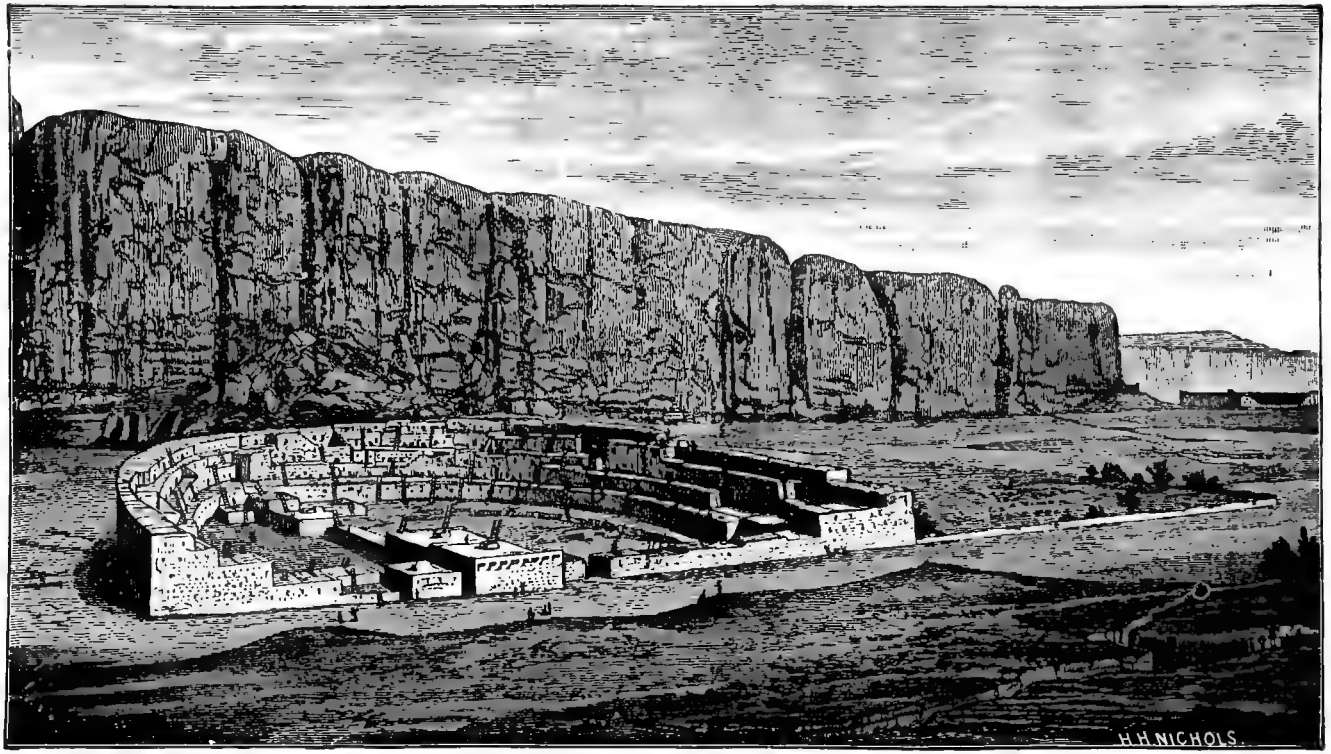
We give a restoration of one—the Pueblo Bonito—one of the largest and most important of the ruins. We can not doubt but what the restoration is substantially correct. It shows the open court, the terraced structure, and the system of defense. The circle itself is not as near a half-circle as we would imagine. The ground plan shows that it was really a many-sided building. This pueblo must have presented a striking appearance when it was in a complete state.

By comparing this structure with the views of some of the present pueblo towns, we will understand the remarks made on page 422, as to the different styles of pueblo structures. This building must have had not far from six hundred and fifty rooms. "No single edifice of equal accommodations has ever been found in any part of North America. It would shelter three thousand Indians."[2] This pueblo will compare favorably with some of the structures of Yucatan; though not so ornamental, yet for practical convenience, it must have met the wants of the builders fully as well. This may be given as a fair example of the entire class.

The evident plan on which they started to build their structures is shown in the following plan of the pueblo. But some of them were not fully completed. Two of them had but one wing. In the restoration the court is seen to be closed by a straight row of small buildings, but in most cases the wall inclosing the court was more or less circular. In one case the court was left open. We will

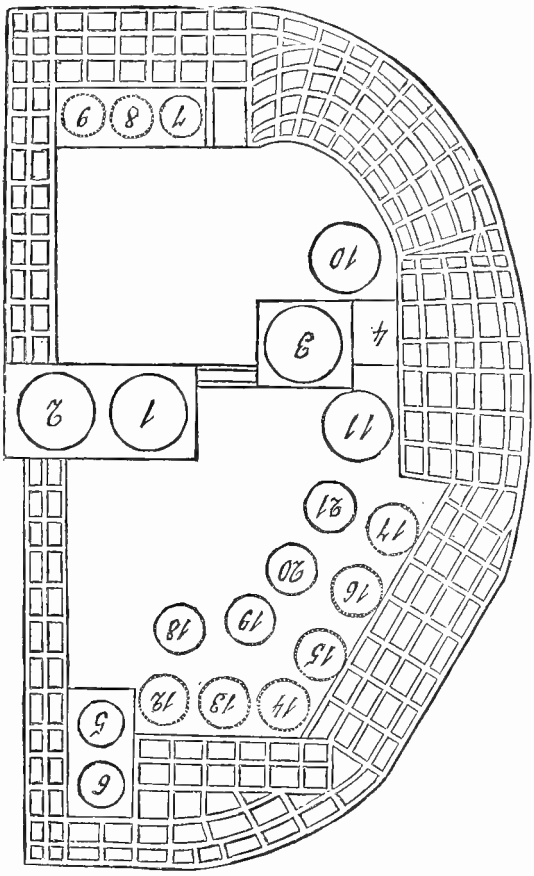
[1] "Fifth Annual Report Arch. Inst.," pp. 42, 78.

[2] Morgan: "Contribution to N. A. Ethnology," Vol. IV, p. 163.



RESTORATION OF PUEBLO BONITO.
(Bureau of Ethnology.)

only give general descriptions. It is now believed that these great structures were built only a part at a time; perhaps the main body, or a part of it, first. Afterwards, as the number of inhabitants increased, a wing would be added, and then the other; and so, many years would elapse before the pueblo would assume its completed form.

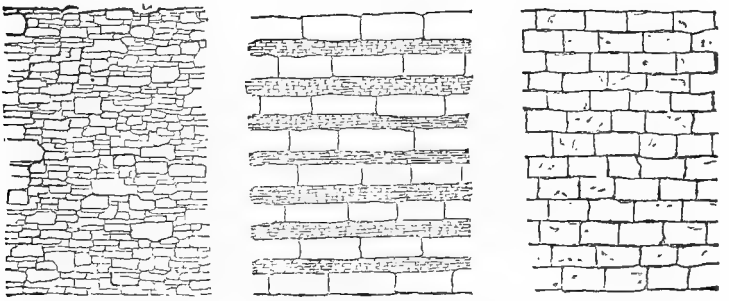


Plan of Pueblo Bonito.

These structures ranged in extent from about four hundred to twelve hundred feet in external measurement, and could furnish a home to from two hundred to eight hundred or a thousand Indians, and, in one case at least, many more.

In the next cut we have represented the different styles of masonry employed in the pueblos of this valley. It varied all the way from careful piling of big and little stones, and of alternate layers of such materials, to very good masonry indeed. Speaking of it, Mr. Jackson says, "It is the most wonderful feature in these ancient habitations, and is in

striking contrast to the careless and rude methods shown in the dwellings of the present pueblos. The material, a grayish-yellow sandstone, breaking readily into thin laminæ, and was quarried from the adjacent exposures of that rock. The stones employed average about the size of an ordinary brick, but as the larger pieces were irregular in size, the interstices were filled in with very thin plates of sandstone, or rather built in during its construction; for by no other means could they be placed with such regularity and compactness. So closely are the individual pieces fitted to each



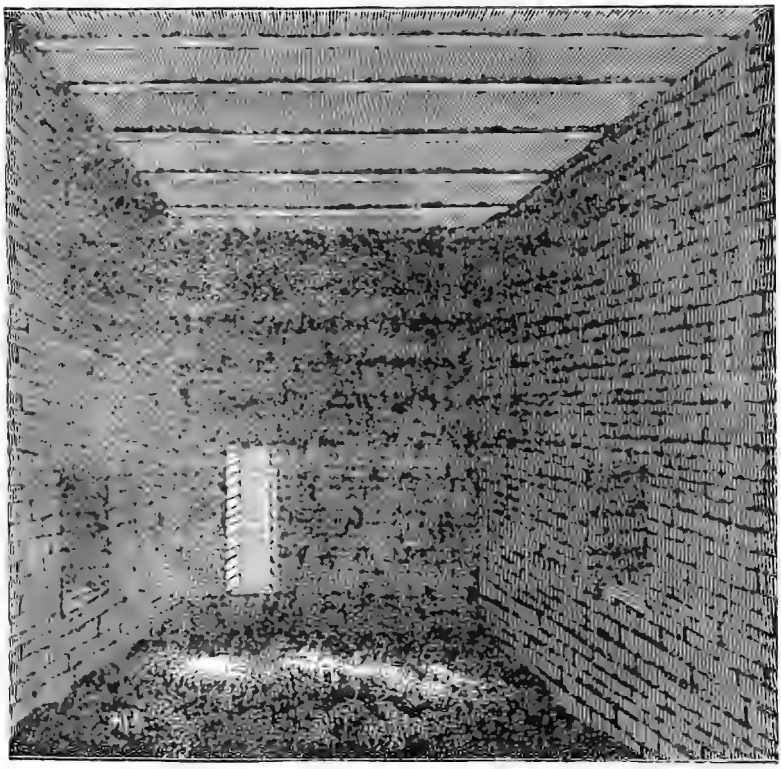
Different Styles of Masonry.

other that at a little distance no jointage appears, and the wall bears every indication of being a plain, solid surface."

Besides these important ruins, there are a great many others not especially different from those previously described. We can not state positively that these ruins are of a later date than those of the North; we think they are. From the character of the structures, we are more inclined to class them with the great pueblos of the Rio Grande, Puerco, and Zuñi. By examining the map we see that the Rio Chaco would afford a convenient route for them in their migration from the San Juan Valley.

It may be of some interest to notice one of the rooms in this pueblo. Simpson says it is walled up with alternate

layers of large and small stones, the regularity of the combination producing a very pleasant effect. Mr. Morgan thinks this room will compare not unfavorably with any of equal size to be found in the more imposing ruins of the South. We must notice the ceiling. The probabilities are that the Rio Chelly, further to the west, afforded another



Room in Pueblo Bonito. (Bureau of Ethnology.)

line of retreat. Some ruins are found scattered up and down the river or cañon, which we will not stop to describe. Off to the south-west are the inhabited towns or pueblos of the Moquis, who, as we have seen, have a tradition that they came from the north.

There are some ruins found in the south-western part of Arizona which must be described in a general survey of the ruins of the Pueblo country. The river Gila, with numerous tributaries, is the most important stream in that portion of the State. It is in just such a section as we would expect to find ruins, if anywhere. Coronado, as we have seen, invaded the country about three hundred and fifty years ago. At the time of his visit this was then a ruin, for his historian describes one ruin as "a single ruined and roofless house . . . the work of civilized people who had come from afar."[1] This gives us a point as to the antiquity of some of the ruins in the Gila Valley. As we shall see, there is every reason to suppose that this section was at one time a thickly inhabited one.

From the similar character of the remains, we conclude the original inhabitants to be of the same race of people as those we have already described, but what was the exact relation between them we can not tell, but we think a study of the ruins will only confirm the general truth of the traditions of the Pueblo tribes. In any one tradition there is doubtless much that is distorted. One form in which the traditions find expression is: "That they proceeded from the north-west to the upper waters of the Rio Colorado. There they divided, portions ascended by the San Juan, cañon De Chelly, or the more easterly branches of that stream towards the center of New Mexico. Others, passing over the waters of the Rio Verde (see map), descended its valley to the Rio Gila."[2]

One hundred and fifty miles southwest of Zuñi we notice the Verde River flowing into the Rio Salado, and the latter into the Gila. Besides these streams, there are other smaller

[1] "Smithsonian Report," 1863, p. 313.
[2] Whipple, Pacific R. R. Report, Vol. III.

ones, not marked on the map.[1] Mr. Bandelier found near the Cañon del Tule an improvement on the irrigating ditches, that was a lining of concrete; and in this section also was noticed the ruins of both pueblos and the small houses. Near Ft. Apache he found the ruins of the largest villages discovered in Arizona, but we have no details of it. The valley of the Rio Verde and Salado seems to have been a favorite resort.

As early as 1854 attention was called to ruins in the Rio Verde. Mr. Leroux reported to Mr. Whipple that the "river banks were covered with ruins of stone houses and regular fortifications, which appeared to have been the work of civilized men, but had not been occupied for centuries. They were built upon the most fertile tracts of the valley, where were signs of acequias (irrigating ditches) and of cultivation. The walls were of solid masonry, of rectangular form, some twenty or thirty paces in length, were of solid masonry, and yet remaining ten or fifteen feet in height. The buildings were of two stories, with small apertures or loop-holes for defence, when besieged."[2]

Mr. Bandelier confirms this account as to the number of ruins. The entire valley of the Verde is filled with ruins of every description. From the account of the valley itself, we can see how well suited it was to the needs of village Indians. Mr. Leroux speaks in high praise of its fertility. Wood, water, and grass were abundant. In the neighborhood of Fort Reno Mr. Bandelier discovered a new architectural feature of great interest to us. This is a raised platform, on which the buildings were supported. This raised platform is a very important feature, as we shall learn in the

[1] Wherever reference is made to Mr. Bandelier's discoveries, it is taken from the oft-quoted Fifth Annual Report, Archæological Institute.

[2] Whipple, Pacific R. R. Reports, Vol. III., p. 14.

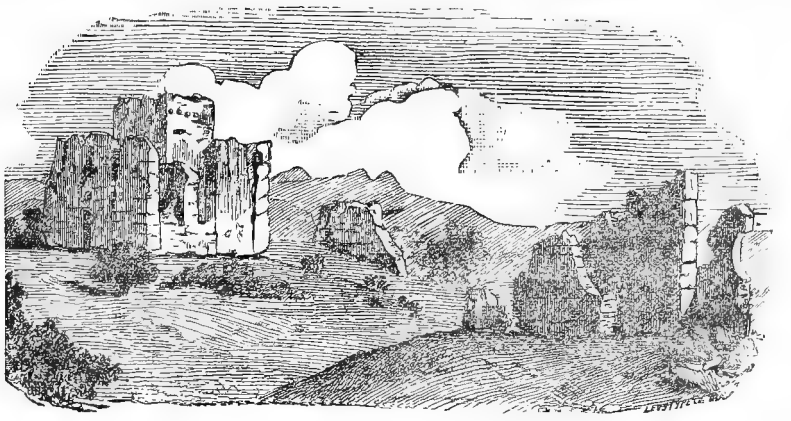
ruins of Mexico and Central America. We have already seen how it was employed by the Mound Builders.

In other words, the detached houses are seen to form villages, with a central stronghold, and the tendency is observed to raise an artificial foundation for this central house, which draws into itself the surrounding houses. This is but another modification of the same idea which, in other sections of this area developed into the communal pueblo. Near Tempe a still more significant arrangement was noticed. Here was a four-sided platform, three hundred and forty feet long by two hundred and eighty feet wide, and five feet high, supported a second platform measuring two hundred and forty by two hundred feet, and six feet high. Elevated platforms, as a general rule, were not very distinct. Mr. Bandelier thinks that, owing to the peculiar drainage of the country, these artificial foundations were required to preserve the buildings from being swept away by a sudden torrent. The settlement of the sedentary tribes in this region cluster on the triangle formed by the Rio Verde, Salado, and Gila Rivers. "This is a warm region, with a scanty rainfall, and but little timber, and the soil is very fertile when irrigated, and two crops a year can be readily raised. Mr. Bandelier regards it as exceedingly well adapted to the wants of a horticultural people, and even traces in it some resemblance to Lower Egypt."

A very celebrated ruin on the Gila River gives us a fair idea of what this central strong-hold of the village cluster, sometimes supported on a raised foundation, was like. This cut is a view of the principal ruin in this section, which, however, is only a portion of an extensive settlement, covering some five acres in all. The building is not very large, only fifty by forty feet, and four stories, of ten feet each, in height, with a possibility that the central portion of the

building rose ten feet higher. The walls are built of adobe, five feet thick at the base, but tapering slightly at the top.

This house was surrounded by a court-yard which inclosed about two acres. Shapeless mounds, presumably the ruins of houses, are to be seen in various parts of this inclosure. "If the ground plan of this great house," says Mr. Bandelier, "with its surroundings of minor edifices, courts and inclosures, is placed by the side of the ground plan of other typical ruins, the resemblance is almost perfect except in materials used." This settlement was separated into two



Casa Grandes, on the Gila.

divisions. In one place was noticed a large elliptical tank with heavy embankments, nearly eight feet deep.

As to other ruins on the Gila, Mr. Bartlett tells us: "One thing is evident, that at some former period the valley of the Gila was densely populated. The ruined buildings, the irrigating canals, and the vast quantities of pottery of a superior quality, show, that while they were an agricultural people, they were much in advance of the present semi-civilized tribes of the Gila." Speaking of the ruins of the Gila east of the San Pedro River, Emory says: "Whenever the

mountains did not infringe too closely on the river and shut out the valley, they were seen in great abundance, enough, I should think, to indicate a former population of at least one hundred thousand; and in one place there is a long wide valley, twenty miles in length, much of which is covered with the ruins of buildings and broken pottery. Most of these outlines are rectangular, and vary from forty to fifty feet to two hundred by four hundred feet."[1]

It is, however, necessary to be very cautious in judging population by the number of ancient ruins. Prehistoric people were naturally of a roving disposition. The multitude of ruins in Western New York is not regarded as evidence of dense population, but they were occasioned by the known customs of the Indians in changing the sites of their villages "every ten, fifteen, or thirty years; or, in fact, whenever the scarcity of firewood, the exhaustion of their fields, or the prevalence of an epidemic made such a step desirable."[2] Doubtless a similar remark may explain the difference of opinion as to the numbers of the Mound Builders.[3] And, finally, Mr. Bandelier concludes that the great number of ruins scattered through New Mexico and its neighboring territories is by no means evidence of a large population. The evidence of tradition is to the effect that a large number of villages were successively, and not simultaneously, occupied by the same people.[4]

We have about completed our survey of the Pueblo country. We might state that the large communal houses, known as pueblos, are found as far south on the Rio Grande as Valverde. Clusters of separate houses occur as far south as Dona Ana. A range of low mountains lies to the west

[1] Bartlett's "Personal Narrative."
[2] Carr's "Mounds of the Mississippi Valley."
[3] Morgan's "House and House Life," p. 218.
[4] Fifth Annual Report, p. 84.

of the Rio Grande; between it and the headwaters of the Gila evidences of ancient habitations were observed on the small streams. Though these occur sometimes in little groups, the court-yards are not connected so as to form a defensive village. Small inclosed surfaces, with no evidence that a house ever was connected with them, were also observed. Mr. Bandelier could only surmise that these were garden-plots, something like the ancient terrace garden-plots in Peru.

Take it all in all, this is, indeed, a singular region, and the Pueblo tribes were a singular people. Their architecture shows us a people in the Middle Status of Barbarism. That they practiced agriculture is shown by the presence of old irrigating ditches. Corn and corn-cobs are found in the rubbish-heaps of old settlements. Mr. Morgan thinks that the valley of the San Juan and its numerous tributaries was the place where the Indian race first rose to the dignity of cultivators of the soil.[1] Cotton cloth has been found in the ruins on the Salado River. "At the time of the Spanish conquests the Pueblo Indians along the Rio Grande used cotton mantles."[2]

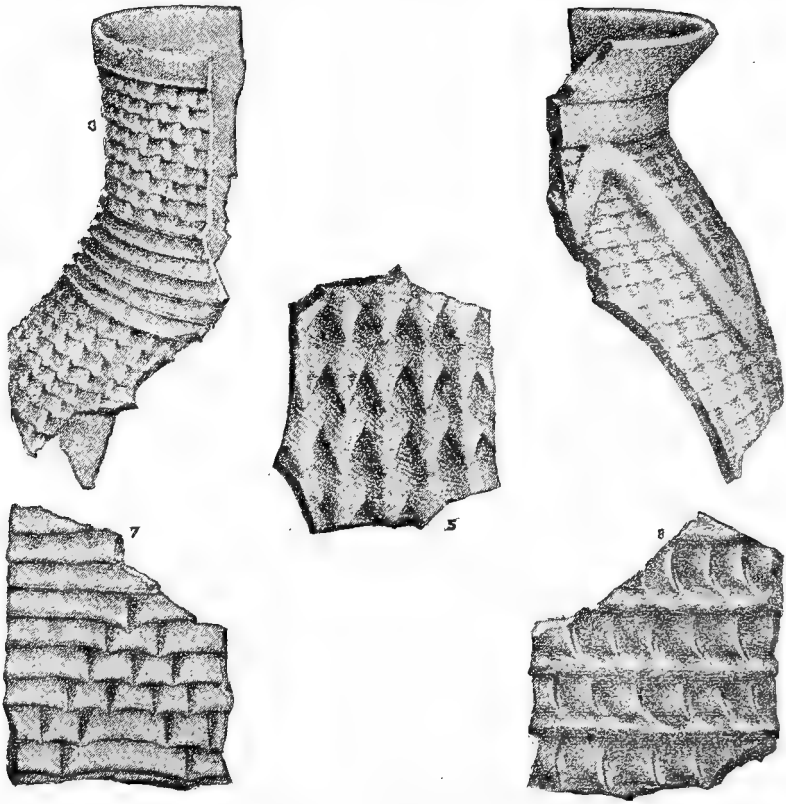
As we have devoted considerable time to the pottery of the Mound Builders, we must see how it compares with the pottery of this region. Fragments of pottery are very numerous all over the field of ruins. All explorers mention their abundance. Mr. Holmes on one occasion counted the pieces of pottery that by their shape evidently belonged to different vessels that he found in an area ten feet square. They numbered fifty-five, and we are led to believe they were not more numerous here than in other localities.

We recall that the ornamentations on the vessels of clay

[1] "Contributions to N. A. Ethnology," Vol. IV., p. 192.

[2] Bandelier's "Fifth Annual Report Arch. Inst.," p. 76.

made by Mound Builders were either incised lines or indentations on the surface of the vessels. And, still further, the clay vessels themselves were frequently molded in the shape of animals or heads of animals. In this plate we have fragments of indented and corrugated ware, from the San Juan valley. This ware is only found under such circumstances



Indented and Corrugated Ware.

that we are justified in considering it very ancient. The ware made at the time of the conquest was always painted.

At Zuñi and some of the other pueblos, at the present day, they make vessels in the form of various animals and

PAINTED PUEBLO POTTERY. 480

other natural objects. This is, however, a recent thing. Only one vessel is known that was found under such circumstances that we are justified in thinking it very old. That was molded into a shape resembling some kind of an animal. This was found on the Rio Gila, in New Mexico; and even that has some peculiarities about it that renders its age uncertain. Mr. Bandelier says: "No vessel of ancient date, of human or animal shape, has ever been found." This is a most important point for us to consider, when we recall how numerous were animal-shaped vessels among the Mound Builders.

In this plate we have specimens of the ordinary painted ware from the ancient ruins. The most of these are restorations, but so many fragments have been obtained of each vessel that we have no doubt of the accuracy of the drawings. They decorated their pottery by painting. Even in many cases where they were further ornamented by indentations they still painted it, showing that painting was regarded as of the most importance. We notice that the ornamentation consists almost entirely of geometrical figures, parallel lines, and scrolls. Over the entire field of ruins the body of the vessels is of one of two colors; it is either white or red. The color employed to produce the ornamentation is black. There is almost no exception to this rule, though sometimes the ornamentation is of a brownish color with a metallic luster. Along the Rio Grande and the Gila some changes are noticed. The ornamentation is not strictly confined to two colors. Symbolical representations of clouds, whirlwind, and lightning are noticed. The red ware has disappeared, and a chocolate-colored ground takes its place.

All have noticed the superiority of the ancient pottery over that of the present tribes. Says Prof. Putnam: "A comparison of this ancient pottery with that made by the

present inhabitants of the pueblos shows that a great deterioration has taken place in native American art, a rule which I think can be applied to all the more advanced tribes of America. The remarkable hardness of all the fragments of colored pottery which have been obtained from the vicinity of the old ruins in New Mexico, Colorado, Arizona, and Utah, and also of the pottery of the same character found in the ruins of adobe houses, and in caves in Utah, shows that the ancient people understood the art of baking earthenware far better than their probable descendants now living in the pueblos of New Mexico and Arizona."[1]

We have learned that the remnant of an aboriginal people, now living in the inhabited pueblos of the West, present us, in their primitive usage, with the fading outlines of a culture once widespread in the section of country we have examined. Many of the early sedentary tribes have vanished completely. Traditions state that other tribes have moved southward into regions unknown. "The picture which can be dimly traced to-day of this past is a very modest and unpretending one. No great cataclysms of nature, no wave of destruction on a large scale, either natural or human, appear to have interrupted the slow and tedious development of the people before the Spaniards came. One portion rose while another fell, sedentary tribes disappeared or moved off, and wild tribes roamed over the ruins of their former abode." At present but a few pueblos are left to show us what the people once were. But the fate of the Pueblo of Pecos hangs over them all. The rising tide of American civilization is rapidly surrounding them. Before many decades, possibly centuries, the present Pueblo tribes will yield to their fate. They, too, will be numbered among the vanished races of men.

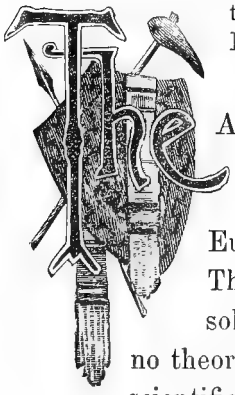
# CHAPTER XII.

## THE PREHISTORIC AMERICANS.[1]

DIFFERENT views on this subject—Modern system of government—Ancient system of government—Tribal government universal in North America—The Indians not wandering Nomads—Indian houses communal in character—Indian methods of defense—Mandan villages—Indians sometimes erected mounds—Probable government of the Mound Builders—Traditions of the Mound Builders among the Iroquois—Among the Delawares—Probable fate of the Mound Builders—The Natchez Indians possibly a remnant of the Mound Builders—Their early traditions—Lines of resemblance between the Pueblo tribe and the Mound Builders—The origin of the Indians—America inhabited by Indians from a very early time—Classification of the Indian tribes—Antiquity of the Mound Builders' works.



ATTEMPTS to explain the origin of the numerous tribes found in possession of America at the time of its discovery by Europeans have been many and various. There are so many difficulties attending the solution of this problem that even at this day no theory has received that full assent from the scientific world deemed necessary for its establishment as an ascertained fact. New interest has been thrown around this question by the discoveries of late years. In our south-western territories we have clearly established the former wide extension of the village Indians, remnants of which are still to be found in the inhabited pueblos; and, as we have seen, the wide expanse of fertile

[1] The manuscript of this chapter was submitted to Cyrus Thomas, Ph. D., of the Bureau of Ethnology, for criticism.

soil, known as the Mississippi Valley, has undoubtedly been the home of tribes who are generally supposed to have attained a much higher stage of culture than that of the Indians—at least, of such culture as we are accustomed to ascribe, whether justly or not, to Indian tribes. It becomes an interesting question, therefore, to determine what connection, if any, existed between the Mound Builders and the Indian tribes on the one hand, and the Pueblo tribes on the other.

As to the works of the Mound Builders, one class of critical scholars think they see in them the memorials of a vanished race, and point out many details of construction, such as peculiarities in form, in size, and position, which they think conclusively prove that the works in question could only have been produced by races or tribes far more advanced in culture than any Indians. This belief finds expression by a well-known writer in the following words: "A broad chasm is to be spanned before we can link the Mound Builders to the North American Indians. They were essentially different in their form of government, their habits, and their daily pursuits." This is substantially the opinion of a great many writers on this subject.[1]

But this conclusion has not been allowed to pass unchallenged. We have on record the convictions of a few careful investigators that there is no necessity for supposing that only an extinct or vanished race could have built the mounds and thrown up the embankments which we observe in the valley of the Ohio and elsewhere; that there is nothing, in fact, either in the construction of the mounds themselves or in the remains of art found in them, which we may

[1] Baldwin's "Ancient America," p. 58. Gallatin, Trans. Am. Ethnol. Soc., I., p. 207. Short's "North Americans of Antiquity," p. 65. Conant's "Footprints of Vanished Races," p. 120. Jone's "Antiquities of Tennessee," p. 146. MacLean's "The Mound Builders," Chap. xii.

not with safety ascribe to the ancestors of our present Indians.[1] It will be seen that we may, indeed, be at a loss to know what conclusion to adopt; hence, as an aid to us in this direction, it may be well to inquire into the organization of Indian tribes and their customs and manners at the time of their discovery.

It is not necessary to sketch their history, as this has been done many times. Moreover, it is but a dreary recital of the gradual encroachment of the Whites on the lands of the Indians, the vain eadeavors of the latter to repress them, and a record of many cruel acts of savage warfare, burning villages, midnight massacre, and scenes of terrible sufferings. The uniform result was that the Indian tribes were steadily driven away from their ancient homes, until we now find them but a sorry remnant on scattered reservations or grouped together in the Indian Territory. Their ancient institutions are nearly broken down, and it is with difficulty that we can gain an understanding of their early condition; and yet this seems to be necessary before we are prepared to decide on the origin of the mound-building people.

It seems necessary here to briefly describe the two great plans or systems of government, under one or the other of which mankind, as far as we know them, have always been organized, though, theoretically, there must have been a time, in the very infancy of the race, when there was either no government or something different from either of them. At the present day, in all civilized countries, government is

[1] Carr's "Mounds of the Mississippi Valley." Schoolcraft's "Archives of Aboriginal Knowledge," Vol. I., p. 66; Vol. II., p. 30. Powell: Transactions of Anthropological Society, 1881, p. 116.

founded upon territory and upon property. A person is described as living in such a township, county, and state.[1] This seems to be a very simple and natural division, but, like every thing else, it is the result of growth—of a development. It took nearly three centuries of civilization and a succession of able men, each improving on what the other had done, to fully develop this system among the Greeks.[2] This is the basis of the modern form of government. Whenever it was organized, it marked the termination of ancient government. The other plan of government is founded on personal relations.

A person would be described as of such a gens, phratry, and tribe. It is sufficient to state the words gens, and phratry simply denote subdivisions of a tribe.[3] This is the ancient system of government, and goes very far back in the history of the race. It is that state of society which everywhere preceded history and civilization. When we go

[1] Of course these words vary in different nations, but the meaning is the same in all. [2] Morgan's "Ancient Society," p. 269.

[3] The gens, phratry, and tribe were subdivisions of the Ancient Greeks. Of a similar import were the gens, curiæ, and tribe of the Roman tribes. The Irish sept and the Scottish clan are the same in meaning as the gens of other tribes. American authors, in treating of the Indians, have generally used the words tribe and clan as equivalent of gens. This is not correct. Almost all the tribes had a complete organization in gens and phratries, though of course they did not so name them. These terms are adopted by Mr. Morgan because they have a precise and historical meaning. As an example of Indian tribal-organization, we give an outline of the Seneca-Iroquois tribe:

| | | | |
|---|---|---|---|
| Tribe. | First Phratry, or Brotherhood. | Bear, Wolf, Beaver, Turtle | Gens. |
| | Second Phratry, or Brotherhood. | Deer, Snipe, Heron, Hawk | Gens. |

It is proper to remark that the phratries are not a necessary member of the series. Several of the Indian tribes had only gens and tribe. Mr. School-

back to the first beginning of history in Europe, we find the Grecian, Roman, and Germanic tribes in the act of substituting the modern system of government for the tribal state, under which they had passed from savagism into and through the various stages of barbarism, and entered the confines of civilization. The Bible reveals to us the tribal state of the Hebrews and the Canaanites.

Under the light of modern research, we can not doubt but what this form of government was very ancient, and substantially universal. It originated in the morning of time, and so completely answered all the demands of primitive society that it advanced man from savagism, through barbarism, and sufficed to enable him to make a beginning in civilization. It was so firmly established as one of the primitive institutions, that when it was found insufficient to meet the demands of advancing society, it taxed to the utmost the skill of the Aryan tribes to devise a system to take its place.

This was the system of government throughout North America when the Spaniards landed on its shores. This is true, at least as far as our investigations have gone.[1] In several cases tribes speaking dialects of the same stock-language had united in a confederacy; as, for instance, the celebrated league of the Iroquois, and in Mexico, the union of the three Aztec tribes. But confederacies did not change

craft uses the words totemic system to express the same organization. Totem, in the Ojibway dialect, signifies the symbol or devise which they use to designate the gens. Thus the figure of a bear would be the totem of the bear gens. We must remember that the tribes of to-day have, in many cases, lost their ancient organization. See Morgan's "Ancient Society," where this subject is fully treated. Also Powell, in "First Annual Report of Bureau of Ethnology;" Grote's "History of Greece," Vol. III, p. 55, *et seq.*; Smith's "Dictionary of Greek and Roman Antiquities," articles, gens, civitas, tribus, etc.; also Dorsey, in *American Antiquarian*, Oct., 1883, p. 312, *et seq.*

[1] The Mexican tribes form no exception to this statement. See this volume, Chapter XV.

the nature of tribal government. As there was but one general form or plan of government in vogue amongst the Aborigines of North America at the time of discovery, we ought certainly to find common features in the culture of the Pueblo Indians of the South-west, the Mound Builders of the Mississippi Valley, and the various Indian tribes; and if the lines of resemblance are sufficient to show a gradual progress from the rude remains of savage tribes to the more finished works of the Pueblos, and between these and the Mound Builders, then we may consider this fact as one more reason for believing that they constitute but one people in different stages of development.

The tribal state of society is always associated with village life. It makes no difference where we commence our investigations, we will soon be convinced that village life is the form in which people organized in tribes lived. This is true of the wild tribes in Africa, and of the hill tribes of India to-day.[1] The same was true of the early Greeks.[2] There must be a reason for this. It is found in their peculiar system of government. People divided into groups and clusters would naturally be drawn together into villages. We would expect, then, to find that the Indian tribes lived in villages. We are accustomed to speak of them as wandering nomads. This is scarcely correct; or rather, it is certainly wrong, if applied to the tribes east of the Mississippi, when first encountered by the whites. Some of them may have been in a state of migration, in search of better homes, or homes more secure from the attacks of too powerful enemies, as was the case with the Shawnees, and wandering bands on hunting or warlike expeditions were common enough. The Germanic tribes that overthrew the

[1] Lewis's "Wild Races of South-eastern India."
[2] Grote's "History of Greece," Vol. II.

Roman Empire, for a similar reason, were in a migrating state. But it is none the less certain that they established permanent villages wherever they found suitable places.

Nearly all the tribes claimed separate districts, in which they had permanent villages, often stockaded.[1] The site of Montreal was a famous Indian village,[2] and other villages were found in Canada. The Iroquois tribes had permanent villages, and resided in them the greater part of the year.[3] One visited in 1677 is described as having one hundred and twenty houses, the ordinary one being from fifty to sixty feet long, and furnishing shelter to about twelve families. In one case, at least, the town was surrounded by palisades.

In 1539 De Soto made his appearance on the coast of Florida. Four years later a feeble remnant of this expedition landed at Panuco, Mexico. His route has not been accurately traced, but it is certain he traversed the Gulf States and crossed the Mississippi. De Soto himself found a grave in the waters of this river, but under new leaders the expedition pushed on through Arkansas, and probably found its most western point on the prairies of the West, where, disheartened, it turned back to near where De Soto died, constructed some rude boats, and floated down the Mississippi, and so to Mexico. We have two accounts written by members of this expedition,[4] and a third, written by Garcilasso de La Vega from the statements of eye-witnesses and memoranda which had fallen into his hands.

From these considerable can be learned of the Southern Indians before they had been subjected to European influences. One of the first things that arrests attention is the description of the villages. They found, to be sure, some

[1] Mallery: "American Association Reports," 1877. [2] Hochelaga.
[3] Morgan: "Contribution to N. A. Ethnology," Vol. IV, p. 119.
[4] "Luis Hernando De Biedman," and "A Gentleman of Elvas," both translated in "Historic Collections of Louisiana," Vol. II.

desert tracts, but every few miles, as a rule, they found villages containing from fifty to three hundred spacious and commodious dwellings, well protected from enemies—sometimes surrounded by a wall, sometimes also by a ditch filled with water. When west of the Mississippi they found a tribe living in movable tents, they deemed that fact worthy of special mention. But in the same section they also found many villages.

One hundred and forty years afterward the French explorer, La Salle, made several voyages up and down the Mississippi. He describes much the same state of things as do the earlier writers. The tribes still dwelt in comfortable cabins, sometimes constructed of bark, sometimes of mud,[1] often of large size, in one case forty feet square, and having a dome-shaped roof. Nor was this village life confined to the more advanced tribes. The Dakota tribes, which include the Sioux and others, have been forced on the plains by the advancing white population, but when first discovered they were living in villages around the head-waters of the Mississippi. Their houses were framed of poles and covered with bark.[2]

Lewis and Clark, in 1805, found the valley of the Columbia River inhabited by tribes destitute of pottery, and living mainly on fish, which were found in immense quantities in the river. They describe them as living in large houses, one sometimes forming a village by itself. They describe one house capable of furnishing habitations for five hundred people. Other authorities could be quoted, showing that the Algonquin Indians, living in Eastern and Atlantic States, had permanent villages.[3] The idea, then, that the Indians are

[1] "Historical Collections of Louisiana," Vol. I, p. 61.

[2] Morgan's "Contribution to N. A. Ethnology," Vol. IV, p. 114.

[3] Read Capt. John Smith, "Hist. of Virginia;" also "Mass. Hist. Col.," Vol. VIII, of the third series.

nothing but wandering savages, is seen to be wrong. It is well to bear this in mind, because it is often asserted that the Mound Builders must have been a people possessing fixed habitations. While this is doubtless correct, we see that it is also true of the Indians.[1]

There is another feature of Indian life which we will mention here, because it shows us a common element in the building of houses, seen alike in the pueblo structures of the West and the long houses of the Iroquois. That is, the Indian houses were always built to be inhabited by a number of families in common. All nations in a tribal state possess property in common. It is not allowed to pass out of the gens of the person who possesses it, but at his death is supposed to be divided among the members of his gens; in most cases, however, to those nearest of kin within the gens.[2] This communism showed itself in the method of erecting houses.

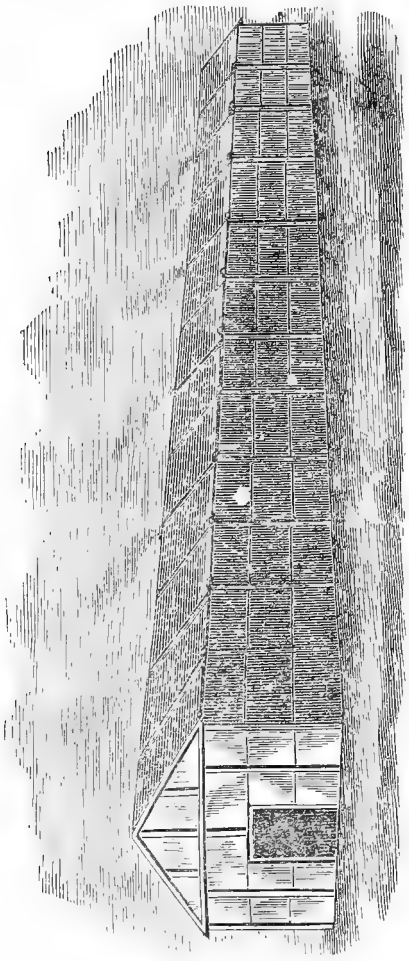
The long house of the Iroquois was divided into apartments so as to shelter from one hundred to two hundred Indians. A number of these houses gathered together composed a village. These were quite creditable structures of Indian art, being warm and comfortable, as well as roomy. Should we examine the whole list of writers who have mentioned Indian villages, we would find them all admitting that the houses were usually occupied by a number of families, one in the Columbia Valley, as we see, sheltering five hundred persons.

There is no question but the pueblos were built by people holding property in common. They were, of course, erected by a more advanced people, who employed better materials

[1] Consult "The Mounds of the Mississippi Valley," by Lucian Carr, of the Kentucky Geographical Survey, where this subject is fully treated, and copious quotations given.

[2] Morgan's "Ancient Society," p. 526.

in construction, but it is quite plain that they were actuated by the same instincts, and built their houses with the same design in view as the less advanced Indian tribes in other sections of the country. What we have described as the small houses in Arizona in the preceding chapter, in most cases includes several rooms, and we are told that in one section they "appear to have been the abode of several families."[1]



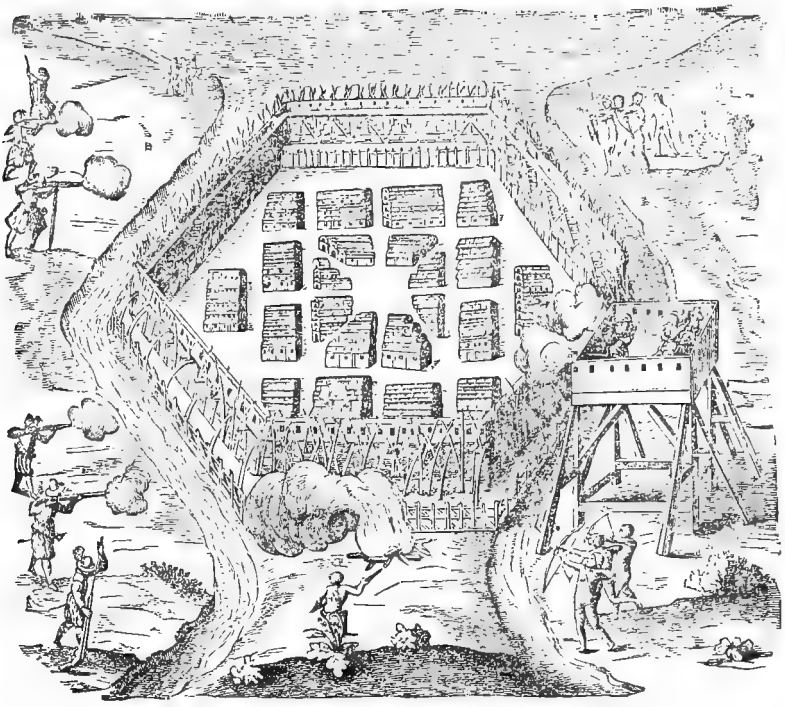
Long House of the Iroquois. (Bureau of Ethnology.)

One of the main points the Indians would have to attend to in the construction of their villages was how to defend them, and we can not do better than to examine this point. A French writer represents the villages of Canada as defended by double, and frequently triple, rows of palisades, interwoven with branches of trees.[2] Cartier, in 1535, found the village of Hochelaga (now Montreal) thus defended. In 1637 the Pequot Indians were the terror of the New England colonies, and Capt. Mason, who was sent to subject them,

[1] Bandelier's "Fifth Annual Report, Arch. Inst., p. 60.
[2] "Charlevoix's Travels in North America," p. 241.

found their principal villages, covering six acres, strongly defended by palisades.

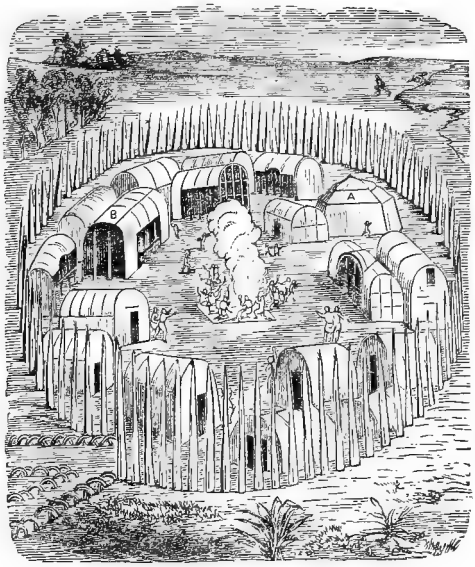
The Iroquois tribes also adopted this method of defense. In 1615 Champlain, with Indian allies, invaded the territory of the Iroquois. He left a sketch of his attack on one of their villages. This sketch we reproduce in this illustration,



Stockaded Onondaga Village.

which is a very important one, because it shows us a regularly palisaded village among a tribe of Indians where the common impression in reference to them is that they were a wandering people with no fixed habitations. The sketch is worthy of careful study. The buildings within are the long houses which we have just described. They are located near together, three or four in a group. The arrange-

ment of the groups is in the form of a square, inclosing a court in the center. This tendency to inclose a court is a very common feature of Indian architecture. Such, as we have seen, is the arrangement of the pueblos. Such was also the arrangement of the communal buildings in Mexico, Central America, and Peru. In this case the village covered about six acres also. The defense was by means of palisades. There seem to be two rows of them. They seem to have been well made, since Champlain was unsuccessful in his attack. In earlier times these fortified villages were numerous.



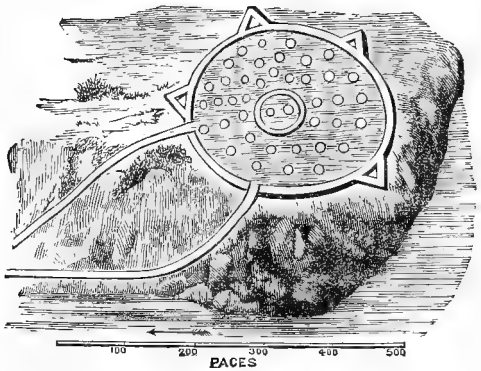
Pomeiock. (Bureau of Ethnology.)

Further south, this method of inclosing a village was also in use. In 1585 the English sent an expedition to the coast of North Carolina. An artist attached to this expedition left some cuts, one of which represents a village near Roanoke. It is surrounded, as we see, by a row of palisades, and contains seventeen joint tenement houses, besides the council house. The historians of De Soto's expedition make frequent mention of walled and fortified towns. "The village of Mavilla," from which comes our name Mobile, says Biedman, "stood on a plain surrounded by strong walls." Herrera, in his General History, states that the walls were formed by piles, interwoven with

other timber, and the spaces packed with straw and earth so that it looked like a wall smoothed with a trowel.

Speaking of the region west of the Mississippi, Biedman says: "We journeyed two days, and reached a village in the midst of a plain, surrounded by walls and a ditch filled by water, which had been made by Indians." This town is supposed to have been situated in the north-eastern part of Arkansas, and it is interesting to note that recent investigators find what are probably the remains of these walled towns, in the shape of inclosures with ditches and mounds, in North-eastern Arkansas and South-eastern Missouri.[1] The tribes throughout the entire extent of the Mississippi Valley were accustomed to palisade their villages—at least, occasionally.[2]

On the Missouri River we find some Indian tribes that have excited a great deal of interest among archæologists.



Mandan Village. (Bureau of Ethnology.)

It has been surmised that, if their history could be recovered, it would clear up a great many difficult questions. They were accustomed to fortify their villages with ditches, embankments, and palisades. This gives us a cut of one of their villages. It is to be observed that it has a great likeness to some of the inclosures ascribed to the Mound Builders.

[1] Fourth Annual Report of Peabody Museum, and from information furnished me by the U. S. Bureau of Ethnology.

[2] "The custom of palisading appears to have been general among the northern tribes."—Brackenridge's "Views of Louisiana," p. 182.

This has been noted by many writers. Says Brackenridge: "In my voyage up the Missouri I observed the ruins of several villages which had been abandoned twenty or thirty years, which in every respect resembled the vestiges on the Ohio and Mississippi."[1] Lewis and Clark, in their travels, describe the sites of several of these abandoned villages, the only remains of which were the walls which had formerly inclosed the villages, then three or four feet high. The opinion has been advanced that the inclosures of the Mound Builders were formerly surmounted by palisades. Mr. Atwater asserts that the round fort which was joined to a square inclosure at Circleville showed distinctly evidence of having supported a line of pickets or palisades.[2]

Should it be accepted that the inclosures of the Mound Builders represent village sites, and that they were probably further protected by palisades, it would seem, after what we have just observed of the customs of the Indians in fortifying their villages, to be a simple and natural explanation of these remains.

We have already referred to the fact that scholars draw a distinction between the more massive works found in the Ohio Valley and the low, crumbling ruins occupying defensive positions found in such abundance along Lake Erie and in Western New York, asserting the former to be the works of the Mound Builders proper, and the latter the remains of fortified Indian villages. This may be true, but it seems to us that there is such a common design running through all these remains that it is more reasonable to infer that the more massive works were constructed by people more advanced than those who built the less pretentious

[1] "Views of Louisiana," p. 183.

[2] "Archæology Americanæ," Vol. I., p. 145.

works, but not necessarily of a different race. We can not do better than to quote the remarks of Mr. Brackenridge in this connection: "We are often tempted by a fondness for the marvelous to seek out remote and impossible causes for that which may be explained by the most obvious."[1]

But inclosures and defensive works are only a small part of the Mound Builders' remains. We know that large numbers of mounds are scattered over the country, and we recall in this connection what was said as to the erection of mounds by Indian tribes in a preceding essay. Somewhat at the risk of repetition we will once more examine this question. It is generally admitted that it was the custom of Indian tribes to erect piles of stones to commemorate several events, such as a treaty, or the settlement of a village, but more generally to mark the grave of a chief, or some noted person, or of a person whose death occurred under unusual circumstances.[2] These cairns are not confined to any particular section of the country, being found in New England, throughout the South, and generally in the Mississippi Valley. From their wide dispersion, and from the fact that they do not differ from the structures built by Indian tribes within a few years past, it is not doubted but what they are the works of Indians.

Now, if we could draw a dividing line, and say that, while the Indians erected mounds of stone, the Mound Builders built theirs of earth, it would be a strong argument in favor of a difference of race. But this can not be done. When De Soto landed in Florida, nearly three hundred and fifty years ago, he had an opportunity of observing the customs of the Indians as they were before the introduction of fire-arms, and before contact with the Whites

[1] "Views of Louisiana," p. 182.

[2] Carr: "Mounds of the Mississippi Valley," p. 78.

had wrought the great change in them it was destined to. Therefore, what few notes his historians have given us of the ways of life they observed amongst the southern tribes are of great importance in this connection. At the very spot where he landed (supposed to be Tampa Bay) they observed that the house of the chief "stood near the shore, upon a very high mound, made by hand for strength."

Garcilasso tells us "the town and the house of the Cacique (chief) Ossachile are like those of the other caciques in Florida. . . . The Indians try to place their villages on elevated sites, but, inasmuch as in Florida there are not many sites of this kind where they can conveniently build, they erect elevations themselves, in the following manner: They select the spot, and carry there a quantity of earth, which they form into a kind of platform, two or three pikes in height, the summit of which is large enough to give room for twelve, fifteen, or twenty houses, to lodge the cacique and his attendants. At the foot of this elevation they mark out a square place, according to the size of the village, around which the leading men have their houses. To ascend the elevation they have a straight passage-way from bottom to top, fifteen or twenty feet wide. Here steps are made by massive beams, and others are planted firmly in the ground to serve as walls. On all other sides of the platform the sides are cut steep."[1]

Biedman, the remaining historian, says of the country in what is now (probably) Arkansas: "The caciques of this country make a custom of raising, near their dwellings, very high hills, on which they sometimes build their huts."[2] Twenty-five years later the French sent an expedition to the east coast of Florida. The accounts of this expedition

[1] Quoted from Brinton, *Am. Antiq.*, Oct., 1881.
[2] Hist. Col. of Louisiana, Vol. II., p. 105.

are very meager, but they confirm what the other writers have stated as to the erection of platform mounds with graded ways.[1] Le Moyne, the artist of this expedition, has left us a cut of a mound erected over a deceased chief. It was, however, but a small one.[2]

La Harpe, writing in 1720, says of tribes on the lower Mississippi: "Their cabins . . . are dispersed over the country upon mounds of earth made with their own hands." As to the construction of these houses, we learn that their cabins were "round and vaulted," being lathed with cane and plastered with mud from bottom to top, within and without. In other cases they were square, with the roof dome-shaped, the walls plastered with mud to the height of twelve feet."[3] It is interesting to observe how closely what little we do know about Mound Builders' houses coincides with the above.

Recent investigations by the Bureau of Ethnology have brought to light vestiges of great numbers of their buildings. These were mostly circular, but those of a square or rectangular form were also observed. In Arkansas their location was generally on low, flat mounds, but vestiges of some were also noticed near the surface of large mounds. In Southern Illinois, South-eastern Missouri, and Middle and Western Tennessee the sites of thousands were observed, not in or on mounds, but marked by little circular, saucer-shaped depressions, from twenty to fifty feet in diameter, surrounded by a slight earthen ring. We know the framework of these houses was poles, for in several cases the charred remains of these poles were found. We know they

[1] "Mounds of the Mississippi Valley," p. 90.

[3] Shea's "Early Voyages on the Mississippi," p. 135. "Historical Collections of Louisiana," Vol. I., p. 61. Quoted from Cyrus Thomas in *American Antiquarian*, March, 1884.

were plastered with a thick coating of mud, for regular layers of lumps of this burnt plastering are found. These lumps have often been mistaken for bricks, as in the Selzertown mound. In several cases the plastering had been stamped with an implement, probably made of split cane of large size.[1]

On the lower Mississippi we meet with the Natchez, a tribe that has excited a great deal of interest; but at present we only want to note that they also constructed mounds. They were nearly exterminated by the French in 1729. But before this Du Pratz had lived among them, and left a description of their customs. Their temple was about thirty feet square, and was situated on a mound about eight feet high, which sloped insensibly from its main front on the north, but was somewhat steeper on the other sides. He also states that the cabin of the chief, or great sun, as he was called, was placed upon a mound of about the same height, though somewhat larger, being sixty feet over the surface.[2] A missionary who labored among them, stated that when the chief died his mound was deserted, and a new one built for the next chief.[3]

Neither was this custom of erecting mounds confined to the Southern Indians. Colden states of the Iroquois: "They make a round hole in which the body is placed, then they raise the earth in a round hill over it."[4] It was the custom among a large number of tribes to gather together the remains of all who had died during several years and bury them all together, erecting a mound over them.[5] Mr. Jefferson, in

[5] Smithsonian Contribution to Knowledge, No. 259, p. 15; "Mounds of the Mississippi Valley," p. 87.

his notes on Virginia, describes one of these mounds, and relates this interesting fact in reference to it: "A party of Indians passing about thirty years ago through the part of the country where this barrow is, went through the woods directly to it, without any instructions or inquiry; and having staid about it some time, with expressions which were construed to be those of sorrow, they returned to the high road, which they had left about a half dozen miles to pay this visit, and pursued their journey."[1]

Coming down to our own times, the Indians had lost a great many of their ancient customs, yet, at times, this old instinct of mound burial asserts itself. About the first of the century Blackbird, a celebrated chief of the Omahas, returning to his native home after a visit to Washington, died of the small-pox. It was his dying request that his body be placed on horseback, and the horse buried alive with him. Accordingly, in the presence of all his nation, his body was placed on the back of his favorite white horse, fully equipped as if for a long journey, with all that was necessary for an Indian's happiness, including the scalps of his enemies. Turfs were brought and placed around the feet and legs, and up the sides of the unsuspecting animal, and so gradually the horse and its rider were buried from sight, thus forming a good-sized burial mound.[2] Another instance came under Mr. Catlin's observation at the pipe stone quarry in Dakota. He visited there about 1832 and saw a conical mound, ten feet high, that had been erected over the body of a young man accidentally killed there two years before.

Enough references have now been given to show that the Indian tribes certainly did [illegible] that there is every reason to suppose they [illegible] the authors of the

[1] "Notes on Virginia," p. 191.

[2] Catlin's "North American Indians," p. 95.

temple mounds of the South, or of some of them, at any rate. We have now shown that, according to early writers, the Indians did live in permanent villages, often stockaded, and knew very well how to raise embankments and mounds. It would seem as if this removed all necessity for supposing the existence of an extinct race to explain the numerous remains, collectively known as Mound Builders' works. Yet, as this is surely an important point, it may be well to carry the investigations a little further.

Taking in account the great amount of labor necessary to raise such structures as the mounds at Cahokia and Grave Creek, and the complicated works at Newark, some writers have asserted that the government of the Mound Builders was one in which the central authority must have had absolute power over the persons of the subjects, that they were in effect slaves;[1] and as this was altogether contrary to what is known amongst Indian tribes, they must have been of a different race.

If the Indians in a tribal state are known to have erected some mounds, and to have built temple-platforms and walled towns in the south, then all they needed was sufficient motive, religious or otherwise, to have built the most stupendous works known. We think the ruined pueblos in the Chaco Cañon represent as great an amount of work as many of those of the Mound Builders. A calculation has been made, showing that over thirty million pieces of stone were required in the construction of one pueblo,[2] besides an abundance of timber. Each piece of stone had to be dressed roughly to fit its place; the timbers had to be brought from a considerable distance, cut and fitted to their places in the wall, and then covered with other courses, besides other de-

[1] Foster's "Prehistoric Races of the U. S.," p. 346.

[2] Pueblo Chettro-kettle, Chaco Cañon.

tails of construction, such as roof-making, plastering, and so forth, and this is not the calculation of the largest pueblo either.[1] Yet no one supposes that the Indian tribes who erected these structures were under a despotic form of government.

We think, however, that it might be freely admitted that in all probability the government of the Mound Builders was arbitrary, but so was the government of a great many Indian tribes. Amongst the Natchez the chief was considered as descended from the sun. Nor was this belief confined to the Natchez, as the tribes of the Floridian Peninsula asserted the same thing of their chiefs. Among all these latter tribes the chief held absolute and unquestioned power over the persons, property, and time of their subjects.[2]

Amongst the Natchez the power of the Great Sun (their title for chief) seems to have been very great. This nation had a regularly organized system of priesthood, of which the chief was also the head. On the death of the chief a number of his subjects were put to death to keep him company. But we must notice that the subjects considered it an honor to die with the chief, and made application beforehand for the privilege. Bearing these facts in mind, it does

[1] Geographical and Geological Survey of the Territories," Hayden, 1876, p. 440. Calculations made by Mr. Holmes.

[2] Brinton's "Floridian Peninsula," p. 21. We think, however, this statement requires to be taken with some allowance. Personal liberty seems to have been the birthright of every Indian. ("Mounds of the Mississippi Valley," Carr, p. 24.) The council of the tribe is the real governing body of all people in a tribal state of society. ("Ancient Society," Morgan.) When the war-chief united in his person priestly powers also, he at once became an object of greater interest. This explains why the government of the chiefs among all the Southern Indian tribes appears so much more arbitrary than among the northern tribes. His real power was probably much the same in both cases, but superstition had surrounded his person with a great many formalities. The early explorers, acquainted only with the arbitrary governments of Europe, saw in all this despotic powers whereas there might not have been much foundation for this belief.

not seem improbable that in more distant days, when the Natchez or some kindred tribe were in the height of their power, the death of some great chief might well be memorialized by the erection of a mound as grand in proportion as that of Grave Creek.

In fact, the more we study the subject, the more firmly we become convinced that there is no hard and fast line separating the works of the Mound Builders from those of the later Indians. We therefore think that we may safely assert that the best authorities in the United States now consider that the mound building tribes were Indians, in much the same state of culture as the Indian tribes in the Gulf States at the time of the discovery of America, and we shall not probably be far out of the way if we assert, that when driven from the valley of the Ohio by more warlike people they became absorbed by the southern tribes, and, indeed the opinion is quite freely advanced that the Natchez themselves were a remnant of the "Mysterious Mound Builders."

If the Mound Building tribes were here at a comparatively late date, we ought to expect to find some traditions of their former existence. The statement is quite often made that the Indians had no tradition as to the origin or purpose of the mounds, and from this it is argued that the mounds are of great antiquity. But, instead of finding no traditions, we find nearly every tribe possessed of some, and often very full and distinct.[1] It makes no difference that a number of those traditions are childish, and that traditions are a very unsatisfactory sort of proof at best. Still, if we observe that the traditions, such as they are, are corroborative of other proofs, it is well to examine into them anyway.

[1] "Traditions of Decodah," Pidgeon. Carr, "Mounds of the Mississippi Valley," p. 70.

The Iroquois tribes have a tradition, that is given in the writing of Cusick, a Tuscaroa Indian. It is generally considered as a nonsensical production, but Mr. Hale points out that, "whenever his statements can be submitted to the tests of language, they are invariably confirmed."[1] Such, for instance, are the assertions that they formerly inhabited the country around the St. Lawrence River in Canada, and further, that the Mohawk was the oldest tribe, from whence the others separated in time.

The substance of the tradition supposed to refer to the Mound Builders, is as follows: South of the great lakes was the seat of a great empire. The emperor resided in a golden city. The nations to the north of the great lakes formed a confederacy, and seated a great council fire on the river St. Lawrence. This confederacy appointed a high chief as embassador, who immediately departed to the south to visit the emperor at the golden city. Afterwards, the emperor built many forts throughout his dominions, and almost penetrated to Lake Erie. The people to the north considered this an infringement on their territory, and it resulted in a long war.

The people of the north were too skillful in the use of bows and arrows, and could endure hardships which proved fatal to a foreign people. At last, the northern people gained the victory, and all the towns and forts were totally destroyed and left in ruins.[2] If this tradition stood alone, it would not be deserving of much attention, but we know the Iroquois tribes did originally live in the valley of the St. Lawrence. We also feel sure the Mound Builders were a

[1] "Indian Migrations," *American Antiquarian*, April, 1883.

[2] Mr. Hale suggests that copper was the gold of the North American Indians, and that the "golden city" simply means a city or town where they knew how to work copper. It is well known that the mound building tribes had such knowledge, at least they knew how to work native copper.

a powerful people, and lived in the Ohio Valley. What is there unreasonable, therefore, in supposing that the Iroquois came in contact with them, and that this tradition rests on facts?

But this tradition is very similar to one among the Delawares. This tribe spoke a different stock language than the Iroquois, and belonged to the Algonquin division of the Indian tribes. There were many wars between the Delawares and the Iroquois, but finally the latter were acknowledged masters. It is well to keep this in mind, because with this feeling between the two tribes, they would not be apt to have similar traditions unless there was a basis of fact.[1]

Mr. Gallatin informs us that the original home of the Algonquins was to the north of Lake Superior. The tradition states that the Delawares (they called themselves the Lenilenape) were living in a cold, fir-tree country—evidently the wooded regions north of Lake Superior. Getting tired of this country, they set out towards the East in search of a better place, and probably followed the lake shore around until they finally came to a great river—that is, the Detroit. The country beyond was inhabited by a numerous and powerful people, called the Allegewi,[2] who dwelt in great fortified towns. Here they found the Huron-Iroquois tribes. This was before the Iroquois had separated from the Hurons.

[1] This tradition was first made known by Heckwelder, a missionary among the Delawares, in his "History of the Indian Nations." It is repeated at much greater length, and with additional particulars, in a paper read by Mr. E. G. Squier, before the Historical Society of New York. Mr. Squier has simply translated a genuine Indian record known as the Bark Record. The two authorities here mentioned consider the Delawares as coming from west of the Mississippi. Mr. Hale points out that it was more likely the Upper St. Lawrence—that portion known as the Detroit River—that was the "Great River" of the traditions.

[2] From this word comes Alleghany Mountains and River.

Some treachery on the part of the Allegewi was made the occasion of war. The Leni-lenape and the Hurons united their forces. This is perhaps the Confederacy of Cusic. A long war resulted, but in the end the Allegewi were defeated, and, as the tradition states, "all went southward."[1] We see no reason to doubt but what we have here a traditional account of the overthrow of the Mound Builders. The remnant that fled south found the country inhabited by mound-building tribes, and doubtless became absorbed among them. In confirmation of this view it may be said that the languages of the tribes of the Gulf States, which belong to one stock language,[2] have all been greatly influenced by words derived from a foreign source.[3]

Perhaps a large body of them may have lived on as a fully organized tribe. As we have already stated, the opinion is quite freely advanced that this is the origin of the Natchez.[4] It seems advisable to inquire more particularly into the customs and traditions of this tribe. DuPratz, who lived among them in 1718, and claims to have enjoyed the confidence of their chiefs and principal men, has left the most complete account of them; though Father Charlevoix, a Jesuit priest, in his letters, also describes them fully.

A number of interesting statements in regard to them, at once arrest attention. Most of the tribes in the southern region of the United States spoke dialects of a common stock language (Chata-muskoki), showing a derivation from a common source. The Natchez spoke a different language.

---

[1] In this connection it is at least interesting to note that several authors—Squier, MacLean, and others—have contended, judging from the fortified hills and camps, that the pressure of hostilities on the Mound Builders of the Ohio Valley was from the north-east. [2] The Chata-muskoki family. (Brinton.)

[3] Hale: *American Antiquarian*, April, 1883.

[4] We are not at all certain but our scholars will shortly come to the conclusion that the Cherokees or Shawnees are quite as likely to be the descendants of the Allegewi as the Natchez.

Sun-worship seems to have been carried to a greater extent than among any other tribes we are acquainted with. As late as 1730 they still had their temples, where the eternal fire was kept burning, carefully watched; for they believed that should it become extinguished, it would surely bring great trouble on the tribe. Among the Natchez, if anywhere among Indian tribes, the power of the chief was absolute, and there seems to have been something like privileged classes amongst them. We have already referred to them as Mound Builders.

But most interesting is it to learn of their former wide extension and ancient power. Du Pratz says, "According to their traditions, they were the most powerful nation of all North America, and were looked upon by other nations as their superiors, and on that account were respected by them. To give an idea of their power, I shall only mention that formerly they extended from the River Manchas, or Iberville, which is about fifty leagues from the sea, to the River Wabash, which is distant from the sea about four hundred and sixty leagues; and that they had about eight hundred suns, or princes."[1] It is at least a reasonable supposition that that the Natchez were a remnant of the Mound Builders.

So far we have dwelt chiefly on the relations between the Indians and the Mound Builders. Let us now see if we can not detect some connection between the Pueblo tribes of the south-west and the Mound Builders. All the tribes in the Gulf States had traditions of a western and south-western origin. In regard to the Creek Indians, this tradition is very distinct. They relate, with many details,

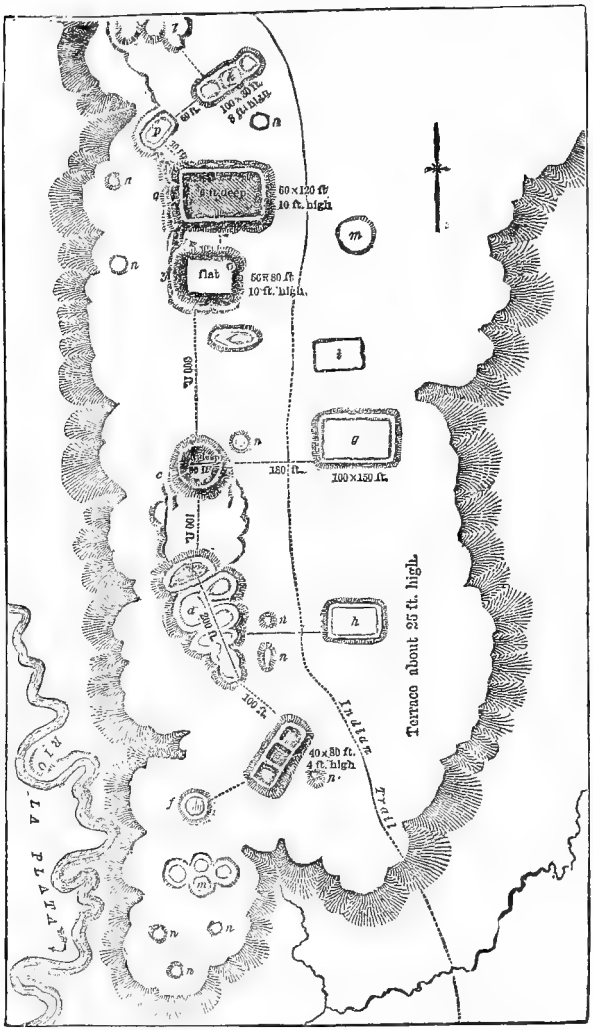
[1] It is scarcely necessary to caution the reader as to the value of this statement of ancient greatness. The chroniclers of De Soto's expedition had nothing to say about it.

their journey from the west, their fight with the Alabamas, etc.[1] In the Natchez tradition, as given by Du Pratz, they are seen, not only to come from the same western source, but distinctly preserve recollections of pueblo houses.

The substance of their traditions is that they came from a pleasant country and mild climate, "under the sun," and in the south-west, where the nation had lived for many ages, and had spread over an extensive country of mountains, hills, and plains, in which the houses were built of stone, and were several stories high. They further relate how, owing to increase of enemies, the great sun sent some one over to examine and report on the country to be found to the east. The country being found extremely pleasant, a large part of their nation removed thither; and, after many generations, the great sun himself came also. Speaking of the ancient inhabitants of the country they came from, the tradition states that "they had a great number of large and small villages, which were all built of stone, and in which were houses large enough to lodge a whole tribe."[2] We would offer the same suggestion on these traditions as on the others. They are of value only so far as supported by other testimony. The great objection to them is that the pueblo structures of the west are evidently of recent origin. So these traditions would prove that the Natchez Indians were quite recently connected with the Pueblo tribes, which is not at all probable. We have some slight evidence that does not rest on traditions. Mr. Holmes has given us a plan of an ancient village he discovered on the La Platte River, San Juan Valley. It will be seen by reference to the plate that the buildings were separated from each other. The forms are chiefly rectangles and circles, and one or two seem to

[1] Pickett's "History of Alabama," Vol. II.
[2] Du Pratz: "History of Louisiana," Vol. II.

have been elliptical. This description certainly reminds us of the circles and squares so common among the Mound Builders. But there is also a truncated mound, fifty by eighty feet, and nine feet high. "Its flat top and height give it more the appearance of one of the sacrificial mounds of the Ohio Valley than any others observed in this part of the West." Mounds are known to exist in Utah.[1]



Ruins near the La Platte Valley of the San Juan.

We need not expect to trace a continuous line of ruins from the San Juan Valley to that of the Ohio, granting the migration to have taken place, because a migrating race would not be

[1] Stone *metates*, or mills, have so far been found only in Missouri, not far from the Missouri River. As this is such an important implement among the Pueblo tribes, its presence in this locality is significant. (Thomas.)

apt to erect monuments until they reached the end of their line of migration. Those who take this view of it say that it is not at all strange that when these migrating tribes reached their new homes in the Mississippi Valley they erected structures differing from those they had formerly built, because all their surroundings would be different, and in the prairie sections they would find neither stone for building their pueblos nor clay suitable for adobe construction. So they would do the next best thing, and build a fortified village. This is the view of that eminent scholar, Mr. Morgan. It must be borne in mind, however, that the fortified villages of the southern Indians, including those of the Mississippi Valley, corresponded more nearly with those of the Atlantic shore, and more northern tribes, than with the pueblo structures.

There is another line of proof which we think has been read the wrong way, or, at least, applied too strongly, and made to do service in proving that the Mound Builders migrated from the valley of the Ohio to Mexico, and there laid the foundation of that wonderful civilization which is yet a riddle to the antiquarian.[1] This is derived from a study of the skulls procured from various sections of this country, Peru, and Mexico. It is sufficient to state that anatomists have made a careful study of the skulls of individuals of various nations, and instituted certain comparisons between them, and discoveries of great importance have been made by this means. Now, some of our best American scholars have insisted that the skulls of the Mound Builders and the ancient inhabitants of Mexico and the Inca Peruvians are so similar that they must have belonged to the same race.

[1] As the proof seems to be conclusive that the Indians of the south who were encountered by the Europeans first visiting that section were the builders of the mounds of that region, it brings these works down to a date subsequent to the entry of the civilized tribes into Mexico. (Thomas.)

This type of skull, however, is characteristic, not only of the Mound Builders, the ancient Mexicans, and the Peruvians, but of the Pueblos, and of such tribes as the Natchez, Creeks, and Seminoles. We think, with all due regard to the opinions of others, that in the present state of our knowledge of craniology we are not authorized in drawing very important conclusions therefrom. About all we are justified in stating is that the sedentary or village Indians, whether found in North or South America, have certain common features.

It is also hard to see any great resemblance between the works of the Mound Builders and the Pueblo tribes. The truncated mounds discovered by Mr. Holmes, we remember, were also used as foundations for house structures along the Gila. In this feature we, of course, see a resemblance to the platform mounds of the Mississippi Valley. But we must be careful in tracing connections on such a slim basis as this. We must remember also what a difference there is in the pottery of the two sections.[1] If we were to give an opinion, based on the present known facts, we should say the separation between the people who afterwards developed as the pueblo builders of the west and the Mound Builders of the Mississippi Valley took place at an early date.

But let us not suppose that this conclusion clears up all mysteries. A problem which has thus far defied the efforts of some of our best thinkers is still before us, and that is: "From whence came the Indians?" As we remarked at the beginning of this chapter, no one theory has yet received universal acceptance. In view of these facts, it is not best to present any theories, but content ourselves with such statements as seem reasonably well settled. On all

[1] Some of the pottery from South-eastern Missouri and Arkansas shows a strong resemblance to that of some Pueblo tribes. (Thomas.)

hands it is agreed that the Indians have been in America a long while, and whatever advance they were able to make in the scale of civilization has been achieved in this country.[1]

This statement implies that they were in undisturbed possession of this country long enough for some tribes of them to reach the middle status of barbarism, which means advancement sufficient to enable them to cultivate the ground by irrigation, and to acquire a knowledge of the use of stone and adobe brick in building.[2] More than half the battle of civilization had then been won. Look at it as we will, this demands an immense period of time for its accomplishment. In the arts of subsistence, government, language, and development of religious ideas the advancement they had been able to make from a condition of savagism to that in which the Mound Builders evidently lived, or the Aztecs in Mexico, represents a progression far greater than from thence to civilization.

We are, therefore, sure that the Indians have inhabited this country for an extended period. We can prolong the mental vision backwards until we discover them, a savage race, gaining a precarious livelihood by fishing and the chase. In America there was but one cereal, or grain, growing wild. That was maize, or Indian corn. We can not tell in what portion of the continent it was native, but, in whatever section it was, there, probably, first commenced permanent village life.

A settled residence, and being no longer dependent on hunting for a livelihood, would advance the Indians greatly in the scale of culture. So we can understand how in one section would arise Indian tribes possessed of quite complicated systems of government and religion and a knowledge

[1] Short's "North Americans of Antiquity," p. 202.

[2] Morgan: "Ancient Society," p. 12.

of agriculture. And from this as a center they would naturally spread out to other sections. The conclusion to which we seem driven is, that there is no necessity for supposing the Mound Builders to be any thing more than village Indians, in much the same state of development as the southern Indians at the time of the discovery. The Indian race shows us tribes in various stages of development, from the highly developed Pueblo Indians on the one hand to the miserable Aborigines of California on the other.

These various tribes may be classified as the wild hunting tribes and the sedentary, partially civilized tribes. To this last division belong the Mound Builders. We have seen how the partially civilized tribes in the valley of the San Juan were gradually driven south by the pressure of wild tribes. We need not doubt but such was the case in the Mississippi Valley. But we need not picture to ourselves any imposing movement of tribes. In one location a mound-building tribe may have been forced to abandon its territory, which would be occupied by bands of hunting tribes. In other cases they would cling more tenaciously to their territory. The bulk of them may have been forced south; some in other directions, and, like the Pimas on the River Gila, or the Junanos east of the Rio Grande, have retrograded in culture.[1] Some bands may even have reached Mexico, and exerted an influence on the culture of the tribes found there.[2]

It is only necessary to add a brief word as to the antiquity of the Mound Builders' works, or rather as to the time of abandonment. On this point there is a great diversity of opinion, and it seems to us almost impossible to come to any definite conclusion. The time of abandonment

[1] "Fifth Annual Report Archæological Institute," p. 85.
[2] "Short's "North Americans of Antiquity," p. 458.

may vary greatly in different sections of the country, and we have seen how apt Indian tribes, even in the same section, are to abandon one village site in order to form another a few miles away.[1] Fort Hill, in Ohio, that so strongly impressed its first explorers with a sense of antiquity,[2] may have been abandoned long before the Circleville works, where Mr. Atwater could still distinguish vestiges of the palisades that once helped to defend it.

We have said about all that can be said in a brief review of the prehistoric life in America north of Mexico. We have seen how much there is still for our scholars to work up before we can profess to as full and complete a knowledge as we have of the prehistoric life in Europe. We are just on the threshold of discoveries in regard to the Paleolithic Age in this country. The southern boundary of the great ice sheet is now known to us. Many scholars have pointed out to us the scattering bits of evidence going to show that the ancestors of the present Eskimos once inhabited the interior of this continent. Dr. Abbott has found unmistakable evidence of the presence of such a people in New Jersey. Our Indian tribes who came next, are not properly prehistoric, though many questions relating to them belong to that field.

We have examined the works of the people known as Mound Builders. They are indeed varied and full of interest, but our conclusion leaves their origin involved in the still deeper question of the origin of the Indian race. We are satisfied that they were village Indians and not tribes of a vanished people. We have also examined that section of country wherein the greatest development of village Indian life north of Mexico took place. It would be very satisfactory

[1] Carr: "Mounds of the Mississippi Valley," p. 97.

[2] "Ancient Monuments," p. 14.

could we show lines of migration from the valley of the San Juan, as a center, to the Mississippi Valley on the one hand, and to Mexico and the South on the other. We can find some lines of evidence, but not enough to positively state such an important truth.

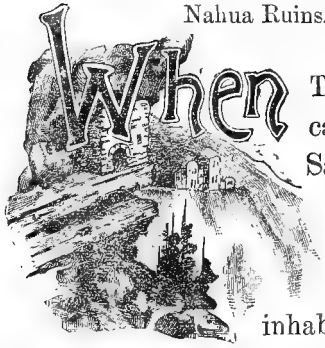
We must now leave this field of inquiry. We trust such of our readers as have followed us in these pages will have clearer ideas of the prehistoric life in North America. They must however regard this knowledge as simply a foundation, a starting-point, or as the shallows along the shore, while the massive building, the long journey, or the great ocean, is still before them. Our scholars are giving their time and attention to these problems. They are learning what they can of the traditions and myths of the tribes still existing. They are studying their languages and plan of government. They are also making great collections of the works of their hands. We will hope some day for clear light on all these topics, which will either confirm our present conclusions or show us wherein we must change them, or, perhaps, reject them altogether.

Stone Mask found in Tennessee.

# CHAPTER XVI.

## THE NAHUA TRIBES.

EARLY Spanish discoveries in Mexico—The Nahua tribes defined—Climate of Mexico—The Valley of Anahuac—Ruins at Tezcuco—The hill of Tezcocingo—Ruins at Teotihuacan—Ancient Tulla—Ruins in the province of Queratarо—Casa Grandes in Chihuahua—Ancient remains in Sinaloa—Fortified hill of Quemada—The Pyramid of Cholula—Mr. Bandelier's investigations at Cholula—Fortified hill at Xochicalco—Its probable use—Ruins at Monte Alban—Ancient remains at Mitla—Mr. Bandelier's investigations—Traditions in regard to Mitla—Ruins along the Panuco River—Ruins in Vera Cruz—Pyramid of Papantla—Tusapan—Character of Nahua Ruins.



THE ships of the Spanish admiral came to anchor before the Island of San Salvador, he had indeed discovered a "New World." It was inhabited by a race of people living in a state of society from which the inhabitants of Europe had emerged long before the dawn of authentic history. The animal and plant life were also greatly different from any thing with which they were acquainted. The Spaniards little suspected the importance of their discovery. Columbus himself died in the belief that he had simply explored a new route to Asia. A quarter of a century elapsed after the first voyage of Columbus before an expedition coasted along the shores of Mexico. This was the expedition of Juan De Grijalva, in 1518. He gave a glowing description of the country he had seen, which "from the beauty and verdure of its indented shores, and

the lovely appearances of its villages, he called 'New Spain.'"[1]

This was followed, in the year 1519, by the history-making expedition of Cortez. The scene of his first landing was about forty miles south of the present town of Vera Cruz, but to this place they soon removed. At his very first landing-point he learned of the existence of what he

Map of Mexico.

was pleased to call a powerful empire, ruled by a most valiant prince. The accounts the Indian allies gave him of the power and wealth of this empire inflamed the imagination of Cortez and his followers. This was an age, we must

[1] Gregory's "History of Mexico," p. 19.

remember, that delighted in tales of the marvelous; add to this the further fact that Cortez was not, at the beginning of his expedition, acting with the sanction of his royal master; indeed, his sailing from the island of Cuba was in direct violation of the commands of the governor. It was very necessary for him to impress upon the court of Spain a sense of the importance of his undertaking.

Certain it is that the accounts that have been handed down to us, though read with wonder and admiration, though made the basis on which many writers have constructed most glowing descriptions of the wonders of the barbaric civilization, which they would fain have us believe, rivaled that of "Ormus and of Ind," are to-day seriously questioned by a large and influential portion of the scientific world. We have another point to be considered that is of no little weight, as all candid men must admit that it would influence the opinions the Spaniards would form of the culture of the Indians. As the man of mature years has lost the memory of his childhood, so have the civilized races of men lost, even beyond the reach of tradition, the memory of their barbaric state. The Spaniards were brought face to face with a state of society from which the Indo-European folks had emerged many centuries before. They could not be expected to understand it, and hence it is that we find so many contradictory statements in the accounts of the early explorers; so much that modern scholars have no hesitation in rejecting.

The main tribe of the empire which Cortez is said have overthrown is known to us by the name of the Aztecs; but as this name properly denotes but one of many tribes in the same state of development, it is better to use a word which includes all, or nearly all, of the tribes that in olden times had their home in the territory now known as Mexico.

Careful comparisons of the various dialects of ancient Mexico have shown that, with the exceptions of some tribes in Vera Cruz, they all belonged to one stock-language; and so they are collectively known as the Nahua tribes.[1]

We wish now to inquire into the culture of this people, to see how much of the strange story that the Spaniards have to tell us has a reasonable foundation. We will state frankly that, though the literature on this subject is of vast proportions, yet it is very far from being a settled field. All accounts of the early explorers of the strange scenes, customs, and manners of the inhabitants, when they were first discovered, are so intermixed with self-evident fables, and statements that are undoubtedly exaggerations, that we have a most difficult task before us. We will first examine the antiquities of this section, compare them with those found in more northern regions, and then examine the statements of the early writers as to the customs of the people. We do not propose to do more than to follow after our leaders in thought, and try to make plain the conclusions to which they have arrived. We are not to deal wholly with a prehistoric people, though their origin is unknown. What we desire to do is to clear away the mists of three and a half centuries, and to catch, if possible, a glimpse of what was probably the highest development of prehistoric culture in North America just before the arrival of the Spaniards.

Mexico was surely a land well adapted to the needs of a prehistoric people. Along the coasts the ground is low. This constitutes what is known as the "Hot Country."[2] The greater part of Mexico consists of an elevated table-land, which rises in a succession of plateaus. As we leave the coast region and climb the plateau, we experience changes of climate. If it were level, it would have mainly a trop-

[1] Bancroft's "Native Races," Vol. II, p. 92.

[2] The *Tierra Caliente*

ical climate, but owing to the elevation we have just mentioned, it has mainly a temperate climate. The whole plateau region is cut up with mountains. The Sierra Madre, on the west, is the main chain, but numerous cross-ranges occur. The result is, a greater part of Mexico abounds in fertile, easily defended valleys—just such localities as are much sought after by a people in barbaric culture, constantly exposed to the assaults of invading foes.[1]

We may as well pass at once to the valley of Anahuac, the most noted in all the region, and learn of the antiquities of this central section. It is in this valley that the capital of the Mexican Republic is situated. All travelers who have had occasion to describe its scenery have been enthusiastic in its praise. The valley is mountain-girt and lake-dotted, and in area not far different from the State of Rhode Island. On one of the principal lakes was located the Pueblo of Tenochtitlan, the head-quarters of the Aztecs, commonly known as the City of Mexico. When Cortez first stood upon the encircling mountains, and gazed down upon the valley, he saw at his feet one of the most prosperous and powerful pueblos of the New World.

This is not the place to recount the story of its fall. Our present inquiry is concerned solely with the remains of its prehistoric age. The enthusiastic Spaniards would have us believe in a city of Oriental magnificence. We have no illustrations of this pueblo. It was almost completely destroyed by Cortez before its final surrender in August, 1521. It was then rebuilt as the capital city of New Spain. Of course, all traces of its original buildings soon disappeared. What we can learn of its appearance is derived from the accounts of the early writers, which we will examine in their proper place. After having surveyed the entire field of

[1] Ober's "Mexican Resources," p. 2.

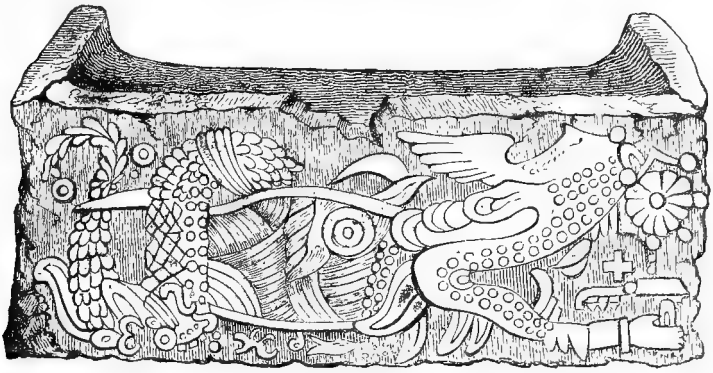
ruins, we will be much better qualified to judge of the vague statements of its former grandeur. A few relics have, indeed, been found buried beneath the surface of the old city. They illustrate the culture of the people, as will be noticed further on.

Directly across the lake from the Pueblo of Mexico was that of Tezcuco, the head-quarters of the second powerful tribe of the Aztec Confederacy. Traces only are recoverable of its former buildings. At the southern end of the modern town were found the foundations of three great pyramids. They were arranged in a line from north to south. Mr. Mayer says of these ruins: "They are about four hundred feet in extent on each side of their base, and are built partly of adobe and partly of large, burned bricks and fragments of pottery."[1] He tells us further that the sides of the pyramids "were covered with fragments of idols, clay vessels, and obsidian knives." From other discoveries, it would seem these pyramids were coated with cement. The suggestion is made that on one of these pyramids stood the great temple of Tezcuco, which, an early writer tells us, was ascended by one hundred and seventeen steps.

In another part of the town a sculptured block of stone was found, of which this cut is given. "It appears to be the remains of a trough or basin, and the sculpture is neatly executed in relief. I imagine that it was designed to represent a conflict between a serpent and a bird, and you can not fail to remark the cross distinctly carved near the lower right-hand corner of the vessel." Bullock, who traveled in Mexico in 1824, has left a brief description of the ruins of what he calls a palace: "It must have been a noble building. . . . It extended for three hundred feet, forming one side of the great square, and was placed on sloping ter-

[1] "Mexico As It Was," p. 221.

races raised one above the other by small steps. Some of these terraces are still entire and covered with cement. . . . From what is known of the extensive foundations of this palace, it must have covered some acres of ground."[1] This last statement is doubtless exaggerated. From what we



Bas-Relief, Tezcuco.

know of Indian architecture, these ruins were doubtless long, low, and narrow, and placed on one or more sides of a square, perhaps inclosing a court.

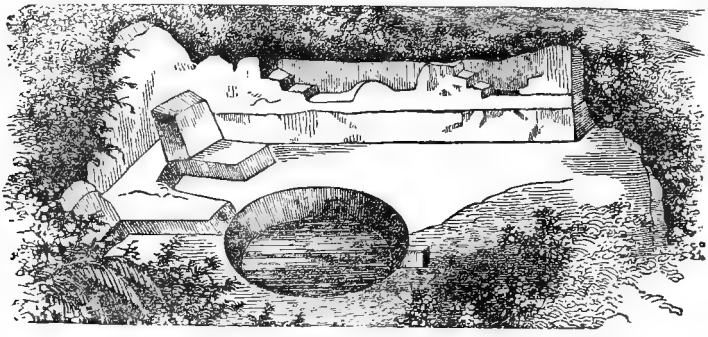
About three miles from the town of Tezcuco is a very singular group of ruins. This is the Hill of Tezcocingo This is very regular in outline, and rises to the height of about six hundred feet. A great amount of work has evidently been bestowed on this hill, and some very far-fetched conclusions have been drawn from it. Probably as notable a piece of work as any was the aqueduct which supplied the hill with water, and this is really one of the most wonderful pieces of aboriginal work with which we are acquainted.

The termination of the aqueduct is represented in our next cut. This is about half-way up the hill, right on the edge of a precipitous descent of some two hundred feet. "It

[1] "Six Months in Mexico," p. 386.

will be observed in the drawing that the rock is smoothed to a perfect level for several yards, around which seats and grooves are carved from the adjacent masses. In the center there is a circular sink, about a yard and a half in diameter and a yard in depth, and a square pipe, with a small aperture, led the water from an aqueduct which appears to terminate in this basin. None of the stones have been joined with cement, but the whole was chiseled from the mountain rock."[1] This has been called "Montezuma's Bath," simply from the custom of naming every wonderful ruin for which no other name was known after that personage; but this was not a bath, but a reservoir of water.

From this circular reservoir the side of the mountain is cut down so as to form a level grade, just as if a railroad

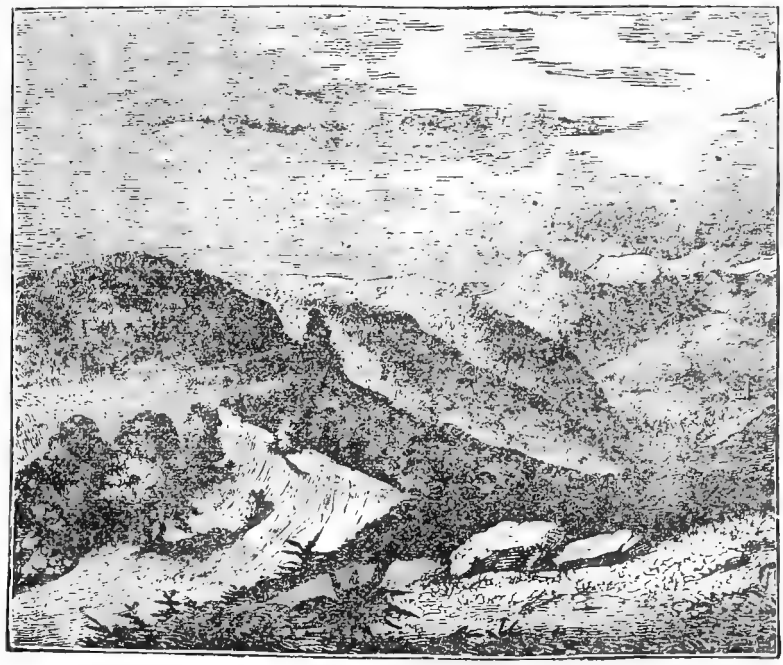


Montezuma's Bath.

had been made. This grade winds around the surface of the hill for about half a mile, when it stretches out across a valley three-quarters of a mile wide, an elevated embankment from sixty to two hundred feet in height. Reaching the second mountain, the graded way commences again, and is extended about half-way around the mountain, where it extends on another embankment across the plains to a range of mountains, from which the water was obtained.

[1] Mayer: "Mexico As It Was," p. 234.

This cut represents the embankment crossing the valley. Along the top of this way was laid the canals to transport the water, made of an exceedingly hard cement of mortar and fragments of pounded brick. It is estimated that nearly, if not quite, as much labor was expended on this aqueduct as on the Croton aqueduct that supplies New York City.[1] This last



Aqueduct, Tezcocingo.

statement is probably too strong, but, considering that this work was accomplished by a people destitute of iron tools, it is seen to be a most extraordinary work. From what we have already learned, this hill was evidently a very important place. On all sides we meet with evidences that the whole of the hill was covered with artificial works of one kind or another. On the side of the hill opposite this reservoir was

[1] Thompson's "Mexico," p. 144.

another recess bordered by seats cut in living rock, and leading to a perpendicular cliff, on which a calendar is said to have been carved, but was destroyed by the natives in later days.[1]

Traces of a spiral road leading up the summit have been observed. In 1824 Bullock (who, however, is not regarded as a very accurate observer) "found the whole mountain had been covered with palaces, temples, baths, hanging-gardens, and so forth." Latrobe, somewhat later, found "fragments of pottery and broken pieces of obsidian knives and arrows; pieces of stucco, shattered terraces, and old walls were thickly dispersed over its whole surface."[2] Mr. Mayer, after speaking of the abundance of broken pottery and Indian arrows, says: "The eminence seems to have been converted from its base to its summit into a pile of terraced gardens."

By one class of writers this hill is regarded as the "suburban residence of the luxurious monarchs of Tezcuco, . . . a pleasure garden upon which were expended the revenues of the state and the ingenuity of its artists."[3] Mr. Bancroft has gathered together the details of this charming story,[4] and tells us that the kings of Mexico had a similar pleasure resort on the Hill of Chapultepec, a few miles west of the city.[5] It is sufficient at present to state that an explanation much simpler and more in accord with our latest scientific information can be given. It is more likely that this hill was the seat of a village Indian community. Its location

[1] Bancroft: "Native Races," Vol. IV, p. 526.

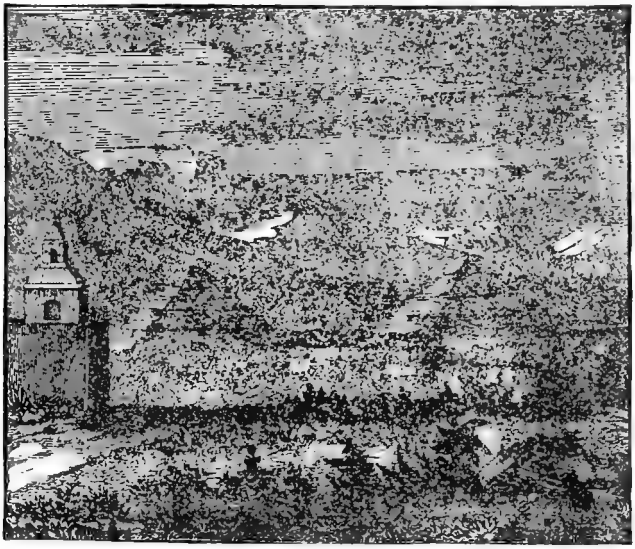
[2] "Rambles in Mexico," p. 140.

[3] Gratacap, in *American Antiquarian*, October, 1883, p. 310.

[4] "Native Races," Vol. II, pp. 168–173.

[5] As to this hill, Mr. Bandelier remarks: "As a salient and striking object, and on account of the fresh-water springs, Chapultepec was worshiped, but I find no trace among older authors of any settlement there—still less of a Summer palace—at the time of the conquest." "Report of an Archæological Tour in Mexico," p. 73.

was naturally strong. The water, brought with so much labor from a distance, furnished a supply for the purpose of irrigation, as well as bodily needs. The terraced sides show that every foot of ground was utilized, and the ruins of the palaces that Mr. Bullock mentions were the fast-disappearing ruins of their communal buildings. Owing to the cruel raids of the Aztec tribes, this place may have been deserted



Teotihuacan.

before the coming of the Spaniards, and thus no mention was made of it.

Still further to the north, about thirty miles from Mexico, is found another extensive field of ruins, which is called Teotihuacan, meaning "City of the Gods." The principal ruins now standing are the two immense pyramids (which are represented in this cut), which the natives call the "House of the Moon" and the "House of the Sun." We will describe the surroundings first. It is unquestioned but that here was a very extensive settlement in early times.

When the Nahua tribes entered Mexico they probably found it inhabited. One very recent writer thinks that "nowhere else in America can you find a more imposing mass of ruins."[1] He estimates that it was "a city upwards of twenty miles in circumference."

Other writers have also noticed its great extent. According to Thompson, "the ruins cover an area very nearly as large as that of the present City of Mexico, and the streets are as distinctly marked by the ruins of houses."[2] And in another place Mr. Charney tells us "the city was of vast extent; and, without indulging in any stereotyped reflections on the vanity of human greatness, I will say that a more complete effacement is nowhere else to be seen. The whole ground, over a space five or six miles in diameter, is covered with heaps of ruins, which, at first view, make no impression, so complete is their dilapidation."[3]

Of this mass of ruins we are told but little, beyond the general assertion that it consists of the ruins of buildings, temples, etc. But very recently M. Charney has uncovered the foundation of one of these houses. He calls it a palace. It was, in all probability, a communal building. It had two wings inclosing a court, and was located on a terraced pyramid. He found, on digging into the terrace in front of the ruins, a great number of sloping walls, covered with cement, containing small compartments, etc. M. Charney can not account for their presence.

In view of the discoveries further north, we would respectfully suggest that this was, in reality, the lower story of the building, whose flat roof formed the terrace in front

[1] Charney in *North American Review*, September, 1880, p. 190.

[2] "Recollections of Mexico," p. 140.

[3] We have several times remarked that it is not safe to judge prehistoric population by the amount of ruins. "Indians never rebuild on ruins or repair them."

of the second story, whose foundation M. Charney so happily discovered. But such suggestions as this are very unsafe to make, and must be supported by further discoveries before they are of any real value.

He found a large number of good-sized rooms, and speaks especially of one hall fifty feet square, in the center of which was six pillars, sloping from the base upwards. They, doubtless, served to support the roof. We regret that we have not been able to see M. Charney's ground plan of this ruin. Of the pyramids themselves we have quite full information. The larger one, that of the sun, is seven hundred and sixty feet square and two hundred and sixteen feet high. It will be seen that these dimensions throw the great mound at Cahokia into the shade. Though the base may not be quite as great, the height of the pyramid is over twice that of the mound. Three terraces are plainly visible. The surface was covered with cement, large slabs of which remain in their place. The moon pyramid is further north.

It is in all respects like that of the sun, but of smaller dimensions, being one hundred and fifty feet high. In early times these pyramids are said to have supported statues, but, if so, they have long since been thrown down. Their surface and the ground around is thickly strewn with fragments of pottery, obsidian knives, and other small relics. Running south from the House of the Moon, and passing a little to one side of the House of the Sun, are the remains of a wide, paved road. Its width is stated to be one hundred and thirty feet, and its length about two hundred and fifty rods.[1]

This road suddenly expands in front of the Moon, so as to suggest the idea of a Greek cross. Pieces of cement

[1] Bancroft: "Native Races," Vol. IV., p. 537.

(with which this road was covered) are still visible in places. It is lined with mounds on either side, and they stand so close together as to resemble continuous embankments in some places. Speculations are abundant as to the object of this graded way. Tradition calls it the "Path of the Dead." Small mounds are very numerous over the surface. They may have been for burial purposes, but sculptured stones are found in them, and specimens of hard cement. This group of ruins is regarded as of very great antiquity.

We can easily see that the growth of the soil formed by the decay and detrition of the stone slabs of the pyramids, temples, and other buildings would be slow, especially as the rainfall is light. But in some localities it is more than three feet thick. In places three separate floors are observed, one over the other, pointing to as many successive occupations of the same sections by men.

About sixty-five miles to the north of Mexico was located Tollan, or Tulla. According to tradition, this was the capital city of the Toltecs, a mysterious people who long preceded the Aztecs. We are told that "extensive ruins remained at the time of the conquest, but very few relics have survived to the present time."[1] M. Charney, whose labors we have referred to at Teotihuacan, succeeded also in making important discoveries here. He tells us that on the site of this ancient capital there is a hill, "about one mile long by half a mile broad, covered with mounds, plateaus, and ruins of all kinds."

He gives us the dimensions of two pyramids, as follows: The first is one hundred and ninety-six feet on each front, and forty-six feet high. The second is one hundred and thirty-one feet square, and thirty-one feet high. Both of these pyramids stood on raised foundations, which M. Char-

[1] Bancroft: "Native Races," Vol. IV, p. 547.

ney calls esplanades. As no other pyramids are mentioned, we are to suppose these are the two principal ones. Perhaps they are also pyramids of the sun and moon. Our chief interest is concerned with the remains of the habitations he discovered here. He says: "I set the men to work at one of the many mounds upon the ridge, and soon found that I had hit upon a group of habitations." A general idea of this group of buildings is given in this passage: "The dwellings were united together in groups, and erected on isolated mounds, one in the middle, the others around about, the whole forming a sort of honey-comb, with its cells placed at different elevations."

We can not help being struck with the general resemblance of the descriptions here given and that of the ruins in the vicinity of the River Gila. The general tendency is seen to gather together in clusters, with, probably, the most important house in the center. As to the materials used in this building, we are told "they used clay and mud for the inside of the walls, cement to coat them, dressed stone and brick for casings, bricks and stone for stairways, bricks for pilasters, and wood for roofing the edifice. The houses had flat roofs, consisting of timbers coated with cement. Of such timbers we find vast quantities."[1]

Of the arrangements of the rooms, he tells us, "The apartments that have been brought to light comprise a number of chambers, big and little, placed at different heights. We shall have no clear idea of the relation of these different chambers to one another, or of the mode of access to them through the labyrinthine passages and the numerous stairways, until the whole edifice has been unearthed."

This was not the only building he discovered. On dig-

[1] The ceilings in the pueblos of Arizona were often made of poles covered with cement. See page 471.

ging into a mound, supposed to be the support of a temple, he discovered it was the ruined foundation of a still grander house. He says, "It is much larger than the other one, stands on a pyramid, and has two wings inclosing a court-yard. The walls are thicker than those of the first habitation, and more strongly built. The apartments, too, are larger, though arranged in a similar fashion." Elsewhere he tells us that this building contained at least forty-three apartments, large and small. We presume very few will now question but what the buildings he here describes are ruined communal buildings, much like the structures in Arizona.

But perhaps the most interesting result of his labors was the proof that these ruins were certainly inhabited after the conquest—for how long a time we can not tell. This is shown by fragments of bones and other articles found in the refuse heaps. The bones were of such animals as the horse, swine, sheep, oxen, etc.—animals introduced into this country by the Spaniards. The fragments of pottery include specimens plainly not of Indian manufacture, such as fragments of porcelain, and that variety of glazed ware known as delf, and lastly, the neck of a glass bottle. It may be said that these fragments might have been left by a band of Spaniards who occupied the ruins in the early days of the conquest, perhaps long after the Indian owners had left. This is of course possible, but it is just as reasonable to suppose the fragments were left by descendants of the original builders.

Northward from Tulla is a small province, marked on the map Queratarо. From the accounts at our disposal, which are very brief, we gather that this whole section is a table-land, split up by ravines of great depths and precipitous sides; consequently one abounding in easily defended

positions. It was found that all the projecting points, naturally strong, were rendered still stronger by the presence of ditches, walls, and embankments. Three groups of ruins are mentioned especially, and their location is marked on the map. At Pueblito there was, at an early day, plainly to be seen, the foundation of a large, rectangular building. The walls were built of stone laid in clay.

At Canoas, in the northern part of the State, there is a steep and strongly fortified hill, but particulars in regard to it are very meager. "There are, in all, forty-five defensive works on the hill, including a wall about forty feet in height, and a rectangular platform with an area of five thousand square feet."[1] Ranas, the most northern one of the three sites mentioned, is regarded as the center of population in early times. "A small lake and a perennial spring are supposed to have been the attractions of this locality in the eyes of the people. On all the hills about are still seen vestiges of their monuments."

If we look at the map we will notice that we have gone but a little ways north of the valley of Anahuac. Yet, with the exception of the Gulf-coast, there are but few striking aboriginal ruins in Northern Mexico. At the time of the conquest the whole northern section was the home of tribes not generally considered to be as far advanced as those who lived in the section we have already described, and in regions further south. Yet it is certainly hard to draw the line betweeen the culture of the two people. We are told that, these Northern tribes though styled "dogs," and "barbarians," by the Southern tribes, were yet "tillers of the soil, and lived under systematic forms of government, although not apparently much given to the arts of agriculture and sculpture."

[1] Bancroft's "Native Races," Vol. IV, p. 550.

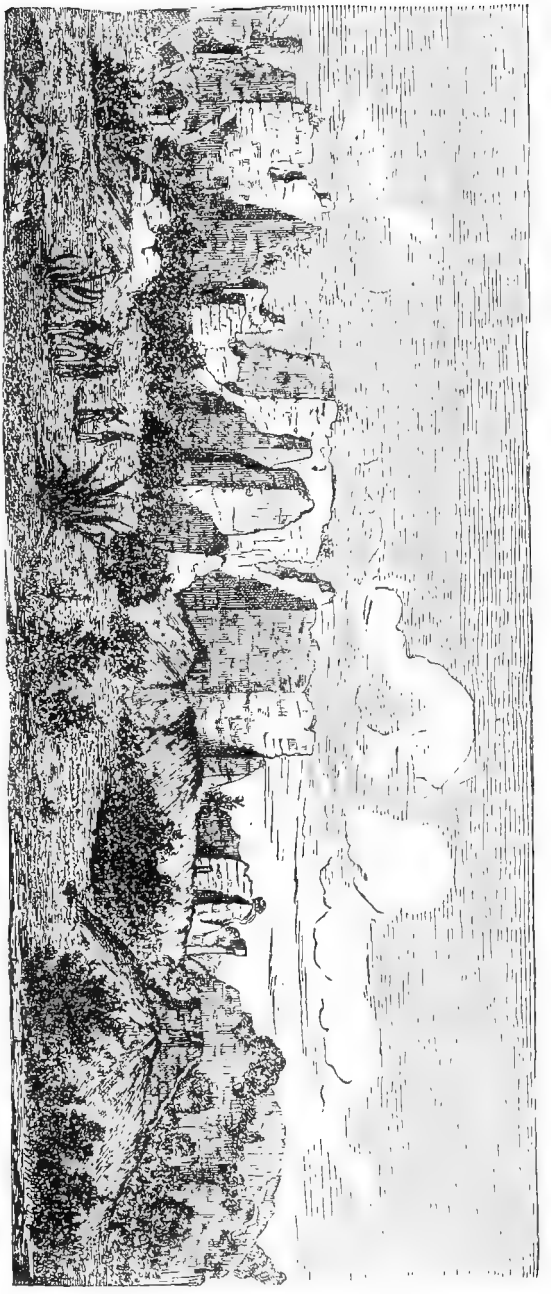
This point is of considerable interest to us, theoretically; for it is a question from whence came the various Nahua tribes. We would naturally think, if they came from the North, we ought to find evidence of their former presence in the various Northern States of Mexico. We must remember, however, that a migrating people are not apt to leave monuments until they reach the end of their migration. Neither has the territory been as carefully explored as it should be. What accounts we can obtain of the remains in this section are certainly very meager. But one place in Sonora do ruins occur, and they have never been examined by competent personages.[1] In Chihuahua occur ruins, evidently the works of the same people as built the separate houses to the west of the Rio Grande, in New Mexico.

These ruins have received the same name as those on the Rio Gila—that is, "Casas Grandes," meaning "Great House." This cut represents a view of these ruins. The river valley is here about two miles wide, and is said to be very fertile. Mr. Bartlett thinks there is no richer valley to be found from Texas to California. This valley was once the seat of a considerable population. Mounds are here found in considerable numbers. Over two thousand are estimated as occurring in a section of country sixty miles long by thirty in width.[2] We wish we knew more about the mounds. They are said to contain pottery, stone axes, and other implements. It is possible, then, that these mounds are ruins of separate houses. At any rate, such are the only kind of ruins noticed in the upper part of this same valley by Mr. Bandelier.

The ruins in question are undoubtedly those of a rich

[1] Bandelier: "Fifth Annual Report Arch. Inst.," p. 86.
[2] Bancroft's "Native Races," Vol. IV, p. 610.

and prosperous pueblo. They are so placed as to command a very extensive view. The river valley is cut through a plain, and has precipitous sides about twenty-five feet in height. The ruins in question are found partly in the bottoms and partly on the upper and more sterile plateau. The walls were made of adobe, and in consequence of their long exposure to the elements are very far gone in ruins; so much so that Mr. Bartlett was unable to make out the plan. But enough was seen



Casas Grandes.

to show that this was a pueblo much like the structure already described. They properly belong to the Arizona group of ruins.

We are told they face the cardinal points, and consist of fallen and erect walls. The portions still standing are from fifty to sixty feet high, or rather were that height in 1851. It is doubtful whether any thing more than a mound of adobe mud now marks the spot. The walls were highest in the center of the mass. At the distance of a few miles was a hill said to be fortified. But the descriptions of it are conflicting. Some represent it as crowned with a stone-built fortress two or three stories high. Others more reasonable, represent it as the site of a watch-tower, or sentry station, and that at regular intervals on the slope of the hill are lines of stone, with heaps of loose stones at their extremities.[1] Probably the same fate overtook the tribes of this valley as did the sedentary tribes of the North. They would not willingly abandon a place so well suited to their needs. The presence of an invading foe, cruel and vindictive, alone accounts for this group of ruins.

In Sinaloa we have no very definite account of ruins. However, Mr. Bandelier says, the existence of ancient villages in that section is certain, and that from "Sinaloa there are ample evidences of a continuous flow Southward."[2] There are no ruins worth mentioning in any of the other States, excepting Zacatecas, where we find a ruin of great interest. This is at Quemada, in the southern part of the State. The name is taken from that of a farm in the near neighborhood. The ruins are situated on the top of a hill, which is not only naturally strong, but the approaches to it are fortified. The hill ascends from the plain in a gentle

[1] Bancroft's "Native Races," Vol. IV, p. 613.
[2] "Fifth Annual Report," p. 86.

slope for several hundred yards, it then rises quite precipitously for about a hundred and fifty feet. The total height of the hill above the plain is probably not far from eight hundred feet.[1]

At all points where the approach to the top of the hill is not steep enough to form a protection of itself, the brow is guarded by walls of stone. This is especially true of the northern end of the hill. One peculiar feature of this place is the traces of ancient roads, which can still be clearly distinguished crossing each other at various angles on the slope we have mentioned. They can be followed for miles, and are described as being slightly raised and paved with rough stones. In places on the slope, their sides are protected by embankments.

Considerable speculations have been indulged in as to the purposes for which these roads were used. It has been suggested that they were the streets of an ancient city which must once have existed on the plains; and that the fortified hill, with the ruins on its summit, was the citadel, the residence of their rulers, and the location of their temples. But we think a more reasonable view is that all of the city that ever stood in that neighborhood was on the hill summit, and that these streets were for religious purposes, reminding us in this respect of the graded ways and traces of paved streets sometimes met with in the Mississippi Valley. In proof of this view, it is said that many of them, after being followed for a long distance, are found to terminate in a heap of stones, which are evidently the ruins of a regular pyramid. In opposition to both of these views, it has been suggested that the surrounding plain was low and marshy, and that the object of these causeways

[1] Bancroft's "Native Races," Vol. IV, p. 581. These dimensions are different in different accounts, as may be seen by consulting Mr. Bancroft's work.

was to secure a dry passage, which explanation is certainly very reasonable.

Of the top of the hill, it may be sufficient to state that it is of irregular shape, half a mile in length from north to south, and of varying width, but on an average one thousand feet wide. The approach to the top of the hill was strongly guarded. Although buildings were observed covering the whole top of the hill, yet they were in two principal groups. This cut, though but one of many, will give us very good ideas of all the ruins. It is seen to be an inclosure. It is on a small scale. It was one hundred and fifty feet square. We notice terraces on three sides. These terraces are three feet high by twelve wide, and in the center of each side are steps by

Quemada.

which to descend to the square.[1] Each terrace is backed by a wall, portions of which are seen in the engraving. These walls are twenty feet high by eight or nine in thickness. The openings seen in the wall are not properly doors, as they extend to the top of the wall.

This court, encompassed by terraces, is a peculiar feature. It is different from any thing we know of, either north or south.[2] Courts, surrounded by buildings located on terraces, are common enough, but all accounts of these ruins say nothing of buildings. We remember the inclosures that surrounded the houses clustered in groups on the Rio Gila. We think this comes near to being a development of the same idea. The low walls of the former inclosure are here quite pretentious pieces of masonry. In some cases two or more of these inclosed courts are joined by openings.

The opening in the wall on the right of the engraving leads into a perfect inclosed square of two hundred feet. In one case a range of pillars was noticed parallel with the walls, and distant twenty-three feet. These are supposed to have supported the roof of the portico, and houses of a rude description might have been ranged along under this roof, which has since completely vanished. Back of this square, but not very well shown in the drawing, rises a precipitous hill. A pyramid is placed in the center of the side towards the hill. It is only nineteen feet high,[3] but is divided into five stages or stories.[4]

This pyramid will serve as an example of numerous

---

[2] There is something of a similarity between these ruins and those of the coast tribes of Peru.

[3] Another authority states that it is thirty feet square and thirty feet high. Bancroft: "Native Races," Vol. IV, p. 587, note.

[4] As seen in the Drawing. Mr. Lyons states there are seven stories.

other pyramids scattered over the summit of the hill. They are made of stone. The largest one, whose dimensions are given, is fifty feet square, and the same in height. In front of the pyramid, and in the center of the square, are the remains of an altar. In view of the altar and pyramid, within the inclosed square, we may suppose this to have been dedicated to their religion. As if to confirm this belief, is the statement that on the hill to the back of the pyramid are numerous tiers of seats, either broken in the rock or built of rough stone. The people seated on them would be conveniently located as regards both sight and hearing of what transpired there.

From an Indian's point of view, this hill was very strongly fortified. It would be almost impossible for an enemy to capture the settlement on its summit. The surrounding country was probably fertile, and a large body of Indians could have lodged within the fortified inclosures. It has some peculiar features, which have been pointed out. There is now no water on the hill, but traces of what is psuppose to be an aqueduct are observed, as well as several tanks, and at one place a well. There is not an appearance of great antiquity about these ruins, and yet native traditions are silent in regard to them, and but one of the early writers refers to them, and he had not seen them.[1]

West of the central basin the remains are more numerous than to the north, but they are not very striking, and it is scarcely worth our while to stop and examine them. About sixty miles in a south-easterly direction from Mexico is the modern town of Cholula. This has grown at the expense of the ancient city of Cholula, grouped around the famous pyramid of that name. This was the Mexican "Tower of Babel." The traditions in regard to it smack

[1] This was Clavigaro. Mayer's "Mexico As It Was," p. 245.

so strongly of outside influence that but little reliance can be placed on them. They are evidently a mixture of native traditions and Biblical stories. Like Teotihuacan and Tulla, this is regarded as a relic of Toltec times. This is but another way of saying that it is older in time than the majority of ruins.

At the time of Cortez's march to Mexico Cholula was a very important place. In his dispatches he says: "The great city of Cholula is situated in a plain, and has twenty thousand householders in the body of the city, besides as many more in the suburbs." He further states that he himself counted the towers of more than four hundred "idol temples."[1]

We must remember that this is a Spanish account, and therefore exaggerated. Still, after making due allowance for the same, it would remain an important aboriginal settlement. We have no reliable data of the population at the time of the conquest. From documentary evidence Mr. Bandelier has shown that while Cholula was certainly a populous Indian pueblo, it is a misnomer to call it a city. It was a group of six distinct clusters, gathered around a common market. He estimates that its population may possibly have been thirty thousand.[2] All explorers have mentioned the fertility of the plain in the midst of which this monument is found.

But this plain is almost destitute of easily defended positions; which fact has an important bearing on the purpose for which the great mound was erected. At a distance it presents all the appearance of a natural hill. The casual observer would not believe it was entirely the work of men. "In close proximity," says Mr. Bandelier, "the mound pre-

[1] Thompson's "Recollections of Mexico," p. 29.
[2] "An Archæological Tour in Mexico," p. 163.

sents the appearance of an oblong conical hill, resting on projecting platforms of unequal length. Overgrown as it is with verdure and partly by trees, and with a fine paved road leading to the summit, it looks strikingly like a natural hill, along whose slopes the washing of the rains and slides have laid bare bold bluffs, and into whose bulk clefts and rents have occasionally penetrated."

This celebrated mound or pyramid has lately been the subject of a very careful study by Mr. Bandelier. The illustration we present gives us a very good idea of the present appearance of the mound. The mass is probably solid throughout, and if there is a natural hill in its center, it must be a very small one. The height of the central higher mass is very nearly two hundred feet.[1] The present appearance of the summit is entirely due to the Spaniards. At the time of the conquest the summit was convex; the friars had it leveled in order to plant a cross. The area of this upper platform is not far from two-thirds of an acre. It is now paved and surrounded by a wall.

In the illustration we detect the appearance of terraces. These are level areas, not all of the same height; neither do they extend entirely around the mound. In fact, the present appearance indicates three projections, or aprons, surrounding and supporting a conical hill, and separated from each other by wide depressions. This central mound, with its three projections, rests upon a very extensive platform, which was probably cross-shaped. This platform seems to have been about twelve feet high, and covered an area of at least sixty acres.

The object for which this great pile was erected is a topic that has exercised the thoughts of many scholars.

[1] The altitude varies according to the side where the measurement is taken. The average height is about one hundred and seventy feet.

PYRAMID OF CHOLULA

Some have supposed it was a burial mound. Some years ago, while in constructing a road from Pueblo to Mexico, the first terrace or story was slightly dug into, and disclosed a chamber, which contained two skeletons, two idols, and a collection of pottery." Yet, before deciding it to be a burial mound, it will be necessary to show the presence of tombs near the center.

We have referred to the results of Mr. Bandelier's explorations. He made a very thorough study of this great pyramid—more complete than any that had hitherto been made—and his results should have corresponding weight. He finds that the materials of which the adobe brick is composed are exactly the same as that of the surrounding plain. This does away with one old tradition, that the bricks were manufactured at a distance, and brought several leagues to their destination by a long line of men, who handed them along singly from one to another.

From the manner in which the bricks are laid, and from their variation in size, he concludes that the structure was not all erected at one time, but that the mound is the accumulation of successive periods of labor. From this it follows that it was built to serve some purpose of public utility, and not as a token of respect for some individual. Wherever found, these great works show the same evidence of not being all completed at once. This was true of the North; we shall also find it true of the South. Charney noticed the same thing in the house at Tulla. Nothing is more natural than that an Indian community would increase their buildings as the tribe increased.

Mr. Bandelier's final conclusion in regard to the purpose of its erection is one of great interest, but not at all surprising. "If we imagine the plateaus and aprons around it covered with houses, possibly of large size, like those of Uxmal

and Palenqué,[1] or on a scale intermediate between them and the communal dwellings of Pecos and many other places in New Mexico,[2] we have then, on the mound of Cholula, as it originally was, room for a large aboriginal population. The structure, accordingly, presents itself as the base of an artificially elevated, and therefore, according to Indian military art, a fortified, pueblo."

But this does not remove from it the air of mystery. Long-fallen indeed are the communal walls. It was not simply a few years ago that these pueblo-crowned terraces were reared. The date of its erection is hid in the dim traditions of the past. The traditions of the Nahua tribes, who came at a far later date, speak of it as even then standing on the plain. Scattered over the plain are other ruins of a somewhat different nature from the general ruins in the valley. These may be the ruins of works erected by the same class of people as built the mounds. Especially is this thought to be true of ruins found on the slopes of neighboring volcanoes.

To the south-west of Cholula are the ruins of Xochicalco, which, by some, are pronounced to be the finest in Mexico. There are many points of resemblance between this ruin and Tezcocingo. The meaning of the word is "Hill of Flowers." The hill is a very regular, conical one, with a base nearly three miles in circumference, and rises to a height above the plain of nearly four hundred feet.[3] The hill is considered to be entirely a natural formation; but it probably owes some of its regular appearance to the work of man. Around the base of the hill had been dug a wide and deep ditch. When Mr. Taylor visited the place, the side of this moat had fallen in, in many places, and

[1] To be described hereafter. [2] See chapter xi.

[3] Different explorers give different figures.

in some quite filled up—but it was still distinctly visible.[1] The whole surface of this hill was laid off into terraces.

Five of these terraces, paved with blocks of stone laid in mortar, and supported by perpendicular walls of the same material, extend, in oval form, entirely around the whole circumference of the hill, one above the other. From the accumulation of rubbish, these terraces are not easy to detect in all places. Probably, at one time, there was some easy means of access from one terrace to the other, but they have disappeared—so that now the explorer has to scramble up intervening slopes of the terraces as best he can. It is probable that defensive works once protected these slopes.

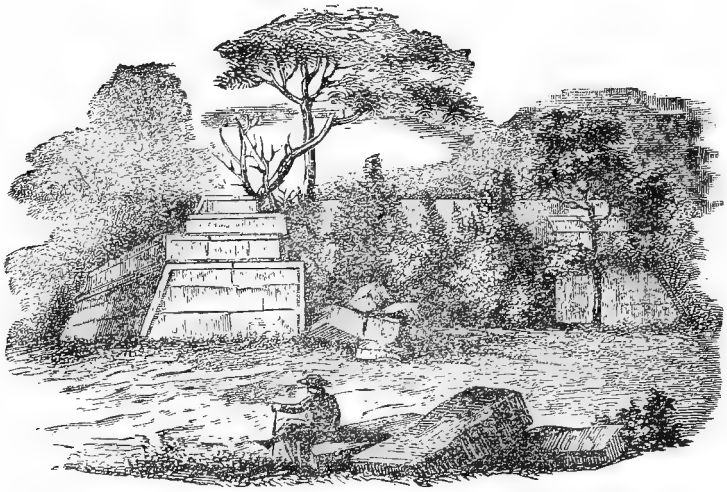
Mr. Mayer says: "At regular intervals, as if to buttress these terraces, there are remains of bulwarks shaped like the bastions of a fortification."[2] "Defense seems to have been the one object aimed at by the builders." The top of the hill is leveled off. Some writers represent that a wall of stone was run along the edge of the summit; but others think that the whole top of the hill had been excavated, so as to form a sunken area, leaving a parapet along the edge. This summit-platform measured two hundred and eighty-five feet by three hundred and twenty-eight feet. Within this area were found several mounds and heaps of stones. The probabilities are that it was once thickly covered with ruins. In the center of this sunken area are the remains of the lower story of a pyramid, which the inhabitants in the viciniity affirm to have been once five stories high.

To judge from the ruins still standing, this must have formed one of the most magnificent works of aboriginal

[1] Taylor's "Anahuac," p. 184.

[2] "Mexico as It Was," p. 180.

skill with which we are acquainted. This cut gives a general idea of the ruins from the west. We presume the broken appearance presented by this side is in consequence of the removal of stones by planters in the vicinity for their own use. It seems they have used this monument as a



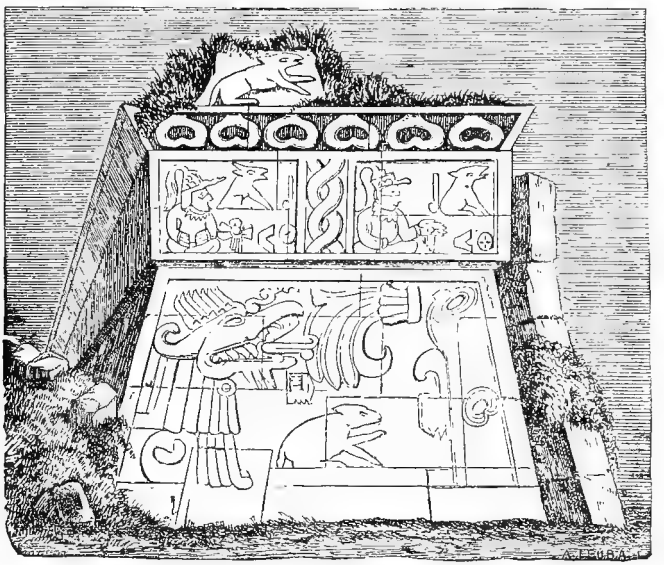
Xochicalco.

stone-quarry. This pyramid, or the first story of it, was nearly square—its dimensions being sixty-four feet by fifty-eight.

The next cut is an enlarged drawing of the north-west corner seen in the first drawing. Notice the grotesque ornamentations on it. The ornaments are not stucco-work, but are sculptured in bas-relief. As one figure sometimes covers parts of two stones, it is plain they must have been sculptured after being put in position. The height of this front is nearly fifteen feet. In the left-hand corner of this sculpture will be perceived the head of a monstrous beast with open jaws and protruding tongue. This figure is constantly repeated in various parts of the façade. Some have sup-

posed it to be a crocodile. The rabbit is another figure that constantly reappears in portions of the wall.

We can scarcely realize the labor involved in the construction of this pyramid and the terraced slope. Some idea may be formed of the immense labor with which this building was constructed from measurements made of several of the masses of porphyry that compose it. One stone was



Enlarged View of Ruins at Xochicalco.

nearly eight feet long by three broad. The one with the rabbit on is five feet by two and a half. When it is recollected that these materials were not found in the neighborhood, but were brought from a great distance, and borne up a hill more than three hundred feet high, we can not fail to be struck with the industry, toil, and ingenuity of the builders, especially as the use of beasts of burden was, at the time, unknown in Mexico. Nor was this edifice, on the summit, the only portion of the architect's labor. Huge rocks were brought to form the walls supporting the terraces that sur-

rounded the hill, a league in circumference, and the whole of that immense mass was cased in stone. Beyond these terraces, again, there was still another immense task in the ditch, of even greater extent, which had to be dug and regularly embanked.[1]

Now, what was the object of all this labor? This must have been the center of a large settlement. It seems that the surrounding hills—or, at least, some of them—were also terraced. Mr. Taylor says: "On the neighboring hills we could discern traces of more terraced roads of the same kind. There must be many miles of them still remaining." In a Mexican book we are told "adjoining this hill is another higher one, also covered with terraces of stone-work in the form of steps. A causeway of large marble flags led to the top, where there are still some excavations, and among them a mound of large size." Mr. Latrobe, from the top of the "Hill of Flowers," saw that it was the center towards which converged several roads, which could be traced over the plain. The road he examined was "about eight feet in breadth, composed of large stones tightly wedged together." It is extremely probable that in Xochicalco we have another instance of a strongly fortified hill, on the top of which was their pueblo, arranged around their teocalli, or temple.[2]

In our description of this ruin we must not forget to mention some curious underground chambers, excavated in the hill itself. On the northern slope, near the foot, is the entrance to two galleries, one of which terminated at the distance of eighty feet. The second gallery is cut in solid

[1] Mayer: "Mexico as It Was," p. 184.

[2] This is in strict keeping with what we have seen to be true of their pueblo sites. This is the conclusion of Mr. Bandelier, who discusses this subject in his essay on "Art of War Among the Mexicans." Peabody Museum Reports, Vol. II, p. 146, note 186.

limestone, about nine feet square, and has several branches. The floors are paved with brick-shaped blocks of stone. The walls are also, in many places, supported by masonry, and both pavement, walls, and ceilings are covered with lime-cement, which retains its polish, and shows traces, in some parts, of having had originally a coating of red ocher. The principal gallery, after a few turns, finally terminated, or appeared to, in a large room eighty feet long, in which two pillars were left to support the roof. In one corner of this room there was a dome-shaped excavation in the roof, from the apex of which a round hole about ten inches in diameter extended vertically upwards.

The natives say there are still other excavations. We have seen no good explanation of the uses of these excavations. The labor in constructing them must have been very great. In the province of Oaxaca we shall find several groups of ruins. In all probability those known and described are not more numerous than those unknown. The class of ruins represented by Quemada, Tezcocingo, and Xochicalco (that is, a hill strongly fortified, with traces of a settlement on the summit, mounds, foundations of communal houses, and pyramidal structures) are also to be found here. At Quiotepec we have very meager accounts of such a ruin. The hill is over two miles in circumference and a thousand feet high. A running stream has rendered one side of the hill very steep and precipitous, but the other sides are terraced.

One of the terrace-walls at the summit is about three hundred and twenty feet long, sixty feet high, and five and a half feet thick.[1] On the summit of the hill are found great numbers of mounds, foundations of small buildings, as well as ruins of statelier buildings, called by some palaces,

[1] Bancroft: "Native Races," Vol. IV, p. 419.

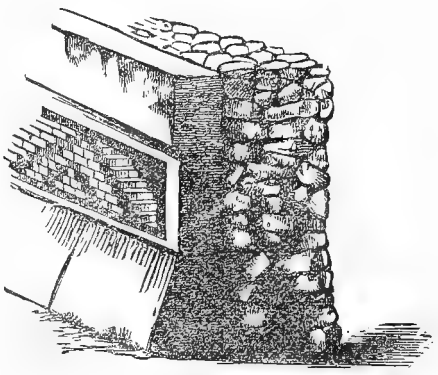
but which were probably regular communal structures; also the pyramid base of a temple. At different points near the summit of the hill are three tanks or reservoirs, one of which is sixty feet long, twenty-four feet wide, and six feet deep, with traces of steps leading down into it.

Still further south, near the center of the state at Monte Alban, is a more extensive group of ruins on the same general plan as the one just described. In this case, from the banks of a stream, there rises a range of high hills with precipitous sides. At their summit is an irregular plateau half a mile long by nearly a quarter of a mile wide. M. Charney states that a portion of this plateau is artificial. He represents the whole surface as literally covered with blocks of stone—some sculptured—the ruined foundations of buildings, terraces, and so forth. He regards it as one of the most precious remains of aboriginal work, and this is the view of Mr. Bandelier also. It is to be regretted that we have not more details of such interesting ruins. We, however, would learn but little new from them. One ruin is spoken of as an immense square court, inclosed by four long mounds, having a slight space between them at the ends. It is extremely probable that these mounds once supported buildings.

The most celebrated ruin in Oaxaca is Mitla. These are the first ruins we have met that, by their strange architecture and peculiar ornamentation, suggest some different race as their builders. The present surroundings are of the gloomiest character. The country is barren and desert. The valley in which the ruins are located is high and narrow, but surrounded by bleak hills. The soil is dry and sandy, and almost devoid of vegetation. The cold winds, blowing almost constantly, sweep before them great clouds of sand. A small stream flows through this dreary waste, which,

during the rainy season, is a raging torrent. "No birds sing, or flowers bloom," around these old ruins. Appropriately enough, tradition speaks of this as the "Place of Sadness," or "Dwelling of the Dead." As to the extent of territory covered by the ruins, we have not been able to learn further than the general statement that at the time of the conquest they covered an immense area.[1]

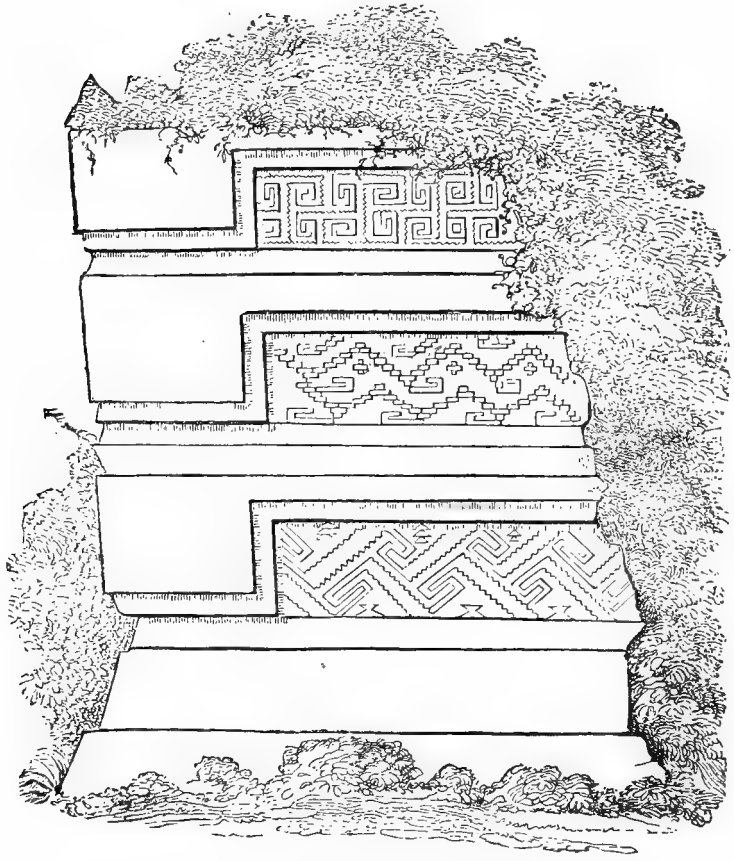
Mr. Bandelier found, besides two artificial hills, traces of thirty-nine distinct edifices, and, as he thinks these are all the buildings that ever stood there, it is manifest that this was not a city in our sense of the word. Two or three of the buildings were constructed of adobe, plastered, and painted red. The others were built of stone. Of these latter the greater part stands upon the ground, but a few are built upon elevated terraces, composed of stone and earth heaped together and faced with stone. In one group of four buildings the terraced foundation contained a basement—in one case, at least—in the form of a cross. The purpose of this cellar or basement left in the artificial foundation is unknown. Some think they were used for burial purposes, but it is more likely they were general store-rooms. The arrangement of these buildings was the same as elsewhere. That is, so placed as to inclose a court. This illustration shows us the method of constructing the walls of the building. We notice two distinct parts. The inner part is built of broken



Wall at Mitla.

[1] Bancroft's "Native Races," p. 393, note.

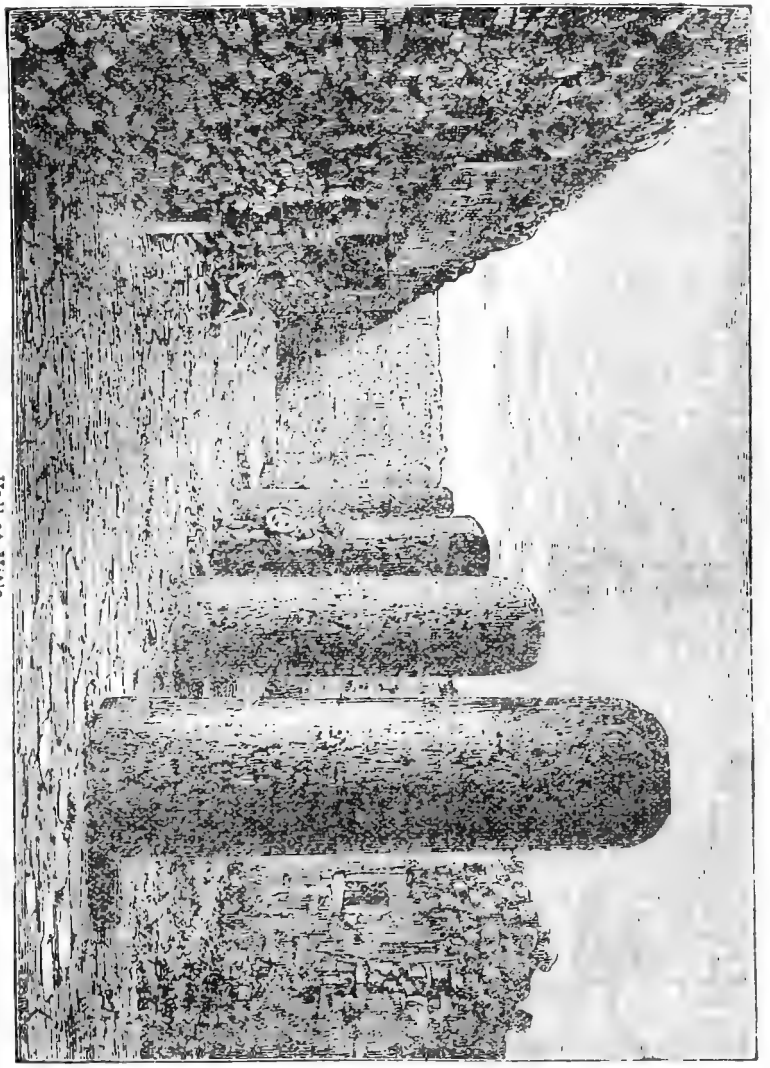
stones laid in tolerably regular courses in clay. There was no mortar used. This inner core is much the same sort of work as the masonry in the pueblos of Arizona. A facing was put on over this inner core, which served both for ornament



Ornamentation at Mitla.

and for strength. This illustration is a corner of one of these buildings, and gives us an excellent idea of the peculiar ornamentation employed at Mitla. Mr. Bancroft gives us a clear idea of how this facing was put on: "First, a double tier of very large blocks are placed as a base along the surface

of the supporting mound, projecting two or three feet from the line of the wall, the stones of the upper tier sloping



Hall at Mitla.

inward. On this base is erected a kind of frame-work of large, hewn blocks with perfectly plain, unsculptured fronts,

which divide the surface of the wall into oblong panels of different dimensions."[1]

It would, then, seem as if the panels were thickly coated with clay. Into this clay was then driven small, smoothed blocks of wedge-shaped stones, in such a way as to cover them with geometrical ornamentations, which, though not absolutely symmetrical, present a striking and agreeable appearance. Each section of the wall presents a different pattern, but this difference is so slight that the general effect is harmonious.[2] This mosaic ornamentation is found in some of the inner facings of the walls as well. In general, however, the walls on the inside were covered with mortar and painted.

Some of the blocks of stone forming the basement, the frame-work of the panels, and the lintels of the door are of great size, and the lintels were in some cases sculptured. One of the largest rooms at Mitla is represented in the preceding cut. The peculiar feature about it is the range of columns seen in the drawing. The inner plastering has fallen, exposing the rough wall. The columns are simple stone pillars, having neither chapter nor base. It is generally supposed that these pillars supported the roof. As in the pueblo buildings to the north, as well as the Toltec house at Tulla, the roof was probably formed of the trunks of small-sized trees laid close together and covered with clay and cement.

We have as yet not seen any thing in these ruins sufficiently striking to justify the somewhat extravagant assertion made about them. The ornamentation is indeed peculiar and tasteful, but aside from that, we see no reason to speak of them as magnificent structures. The buildings are low

[1] Bancroft's "Native Races," Vol. IV, p. 395.

[2] Bandelier: "An Archæological Tour in Mexico," p. 295.

and narrow; the rooms are small, dark, and illy ventillated. "Light could only have been admitted from one side, and the apertures for this purpose were neither lofty nor broad." Mr. Bandelier fittingly characterizes the ruins as the "barbaric effort of a barbarous people." Those scholars who think we have in Mexico the ruins of a highly civilized, powerful empire, regard these ruins as in some way set aside for mourning purposes of the royal family. "According to tradition," says Mayer, "They were . . . intended as the places of sepulture for their princes. At the death of members of the royal family, their bodies were entombed in the vaults beneath; and the sovereign and his relatives retired to mourn over the departed scion in the chambers above these solemn abodes, screened by dark and silent groves from the public eye." Another tradition devotes the edifices to a sect of priests, whose duty it was to live in perfect seclusion, and offer expiatory sacrifices for the royal dead who reposed in the vaults beneath.[1]

With all due respect to traditions, we think a much more reasonable explanation can be given. One reason why Mitla has been regarded as such an important place, is because it has been assumed that there were no other ruins like it, especially in Mexico. This, according to Mr. Bandelier, is a mistake. He examined one or two quite similar ruins in the near vicinity, and at another place he found a group of ruins in every way worthy of being compared to Mitla, but he was not able to examine them. So we must either decide there were a number of these "Sepulchral Palaces," or else adopt some simpler explanation. But still stronger is the fact, that at the time of the conquest, Mitla was an inhabited pueblo. We have the account of a monk who visited it in 1533. He mentions in particular

[1] Mayer: "Mexico As It Was," pp. 251–2.

the ornamentation of the walls, the huge doorways, and the hall with the pillars. It is extremely probable that if it was devoted to any such purpose, some mention would have been made of it. We think Mr. Bandelier is right when he concludes that these structures are communal buildings, but little different from others.

As for the other ruins in Oaxaca, we will not stop longer to examine them. At Guingola, in the southern part of the State, was found a ruined settlement. The principal ruins were located on the summit of a fortified hill, which, from a brief description, must have been much like those we have already described.

We will now turn our attention to the Gulf-coast. The whole coast region abounds in great numbers of ruins. It is in this section, however, that tribes of people belonging to a different family than the Nahua tribes, were living at no very distant time in the past. So it is not doubted but that many of these ruined structures, perhaps the majority of them, were the works of their hand. When Cortez landed on the coast, in the neighborhood of Vera Cruz, he was received by the Totonacas. These were a Nahua tribe, but both to the north and south of them were Maya tribes.[1] We will, however, describe the ruins in the present State of Vera Cruz under one head.

We notice, on the coast, the Gulf of Tampico, into which pours the river Panuco. From an antiquarian point of view, this is a most interesting locality. It was here that a feeble remnant of De Soto's disastrous expedition found a refuge in 1543. And it was here that, at a far earlier period, according to the dim, uncertain light of tradition, the ancestors of some of the civilized nations of Mexico made their first appearance; of this, more hereafter. Certain it

[1] Valentine, in "Proceedings Am. Antiq. Soc.," Oct., 1882.

is that, commencing at this river, we find ourselves in a land of ruins.

It is to be regretted, however, that our information is not definite in regard to them. We are told, in general terms, of a great field of ruins, but in the absence of cuts, can scarcely give a clear description of them. On the northern bank of the Panuco, Mr. Norman found at one place the ground "strewn with hewn blocks of stone and fragments of pottery and obsidian."[1] They were found over an area of several square miles. Many of the blocks of stone were ornamented with sculpture. They imply the presence, in former times, of some kind of buildings. We can not form an opinion as to the number, style, etc. Mr. Norman regards them as the ruins of a great city, the site of which is now covered with a heavy forest.

Amongst these ruins are about twenty mounds, both circular and square, from six to twenty-five feet in height. Some authorities think that the Mound Builders went by water from near the mouth of the Mississippi to this region. To such as place any real reliance on this theory, these mounds are full of interest. But some details of construction would seem to indicate a different people as their builders than those who reared mounds in the Gulf States of the Mississippi Valley. The main body of the mound is earth, but they are faced with hewn blocks of sandstone, eighteen inches square and six inches thick. Although one of the mounds is quite large, covering two acres, yet in but one instance was a terraced arrangement noticed. As a general thing, the facing of stone had fallen to the ground, and some of the smaller mounds had caved in; showing, perhaps, that they were used as burial mounds. In other cases the mounds had entirely disappeared, leaving the stone facing

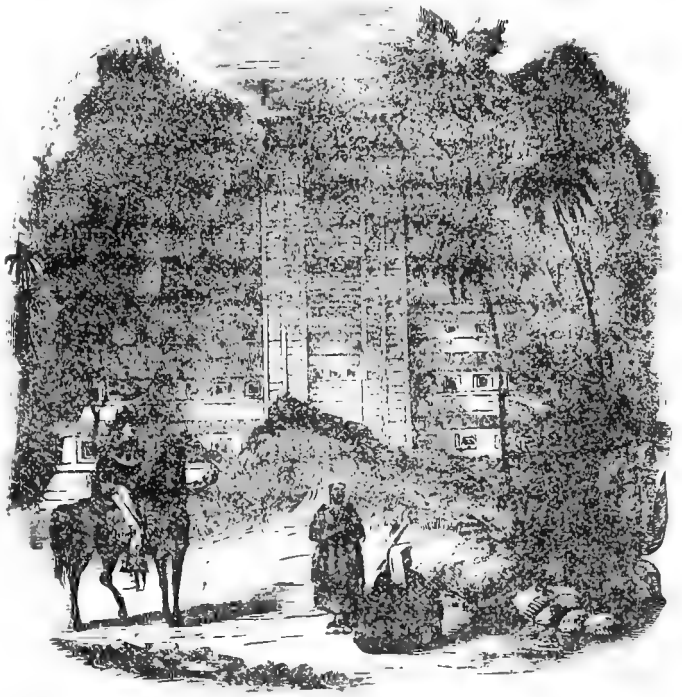
[1] Bancroft's "Native Races," Vol. IV, p. 595.

on the surface. This may account for some of the stones scattered over the surface. A few miles away there is another group of circular mounds.

Across the river in Vera Cruz, from very slight mention, we gather that, substantially, the same kind of ruins occur. At Chacuaco the ruins are said to cover three square leagues—but we have no further account of them than that. Small relics of aboriginal art are said to be common, and mention is made of mounds. The antiquities of Vera Cruz are a topic about which it is very difficult to form correct ideas. It will be noticed that it presents a long stretch of country to the Gulf. The land near the coast is low, and very unhealthy. About thirty miles from the coast we strike the slope of the mountains bounding the great interior plateau. This section is fertile and healthy, and was, evidently, thickly settled in early times. We must remember that it is always in a mountainous section of country that a people make their last stand against an invading foe. It was in these mountain chains where the Maya tribes made their last stand against the invading Nahua tribes, and even this line was pierced through by the Tonacas.

It is not strange, then, to find abundant evidence of former occupation in all this section of country. One thing in its favor was the number of easily defended positions. The country is cut up by deep ravines. The early inhabitants used all the land that was at all available for agricultural purposes. On steep slopes they ran terraces to prevent the soil from washing. In the smaller ravines they located great numbers of water-tanks, from which, in the dry season, they procured water to irrigate their land. Of this section, we are told, "there is hardly a foot of ground in the whole State of Vera Cruz in which, by excavation, either a broken obsidian knife, or a broken piece of pottery,

is not found. The whole country is intersected with parallel lines of stones, which were intended, during the heavy showers of the rainy season, to keep the earth from washing away. The number of these lines of stones shows clearly that even the poorest land, which nobody in our day would cultivate, was put under requisition by them."[1]



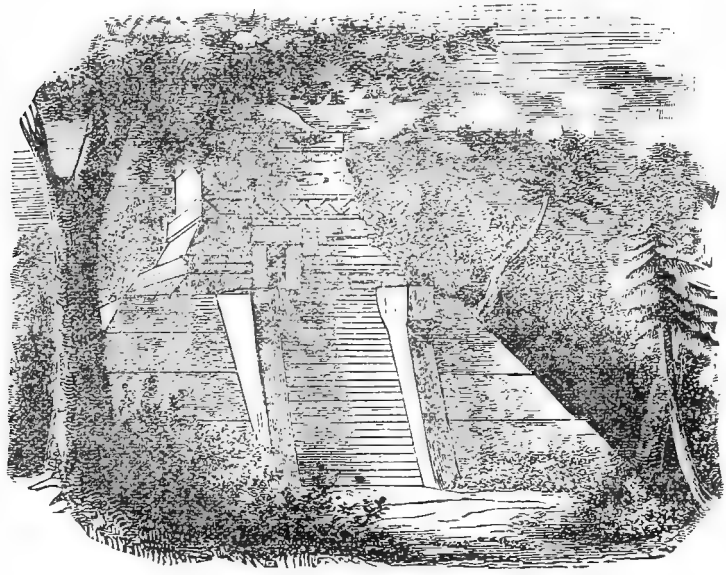
Papantla.

They no less conclusively show that a considerable body of people had here been pressed by foreign invasion into a small, contracted space. It is useless to attempt a more particular description of these ruins. In the absence of cuts, the description would only prove tiresome. Pyramids, both with and without buildings on their summits, are comparatively frequent. As they would be noticed where other

[1] "Smithsonian Report," 1873, p. 373.

ruins would be overlooked, we have some cuts of the more remarkable ones. The preceding cut is the pyramid at Papantla.

The base is ninety feet square, and the pyramid has seven stories, as seen in the engraving. Only the last one contains apartments; with this exception, the pyramid is solid. Stairways in front lead up to the top. Mr. Mayer says "there is no doubt, from the mass of ruins spread over the plain, that the city was more than a mile and a half in circuit." But we have no further description of them. Other



Tusapan.

localities with pyramids and ruins are known. At Tusapan occurs this ruin, which may be taken as a type of all the pyramids in this region. This was the only building remaining standing at Tusapan; but, from the ruins lying about, this is not supposed to have been the grandest structure there.

This will complete what we have to say of the ruins in

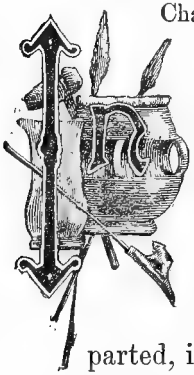
territory occupied by the Nahua tribes. Other remains of their handiwork we will examine when we treat of their customs and manners. We will now turn our attention to the ruins in the territory of the Mayas. As the culture of these two people is so similar, we will devote but one chapter to the two. Comparison is the great means we have of fixing in the mind points we wish to keep. We have to admit that the treatment of the Nahua ruins is not very satisfactory; but it is difficut to obtain accurate information in regard to them. We think what resemblance can be traced, is more in the direction of the Pueblo tribes than of the Mound Builders. The first ruin found in Mexico, Casa Grandes, in Chihuahua, is evidently but another station of Pueblo tribes.

The fortified hill at Quemada is apparently but a further development of the clustering houses with the little inclosures noticed on the Gila. Mounds are, indeed, mentioned in a number of localities, but they seem to be more nearly related to the terraced foundation of buildings observed in Arizona than to the mounds of the Mississippi Valley. Surely as striking a ruin as any is at Mitla, but Mr. Bandelier does not hesitate to compare it with some in the Pueblo country. Now, it is very unsafe and very unsatisfactory to trace resemblances of this kind, and we do not assign any especial value to them. But it only shows that, so far as this method is of use, it points to a closer connection with the Pueblo tribes than with the Mound Builders.

# CHAPTER XIV.

## THE MAYA TRIBES.

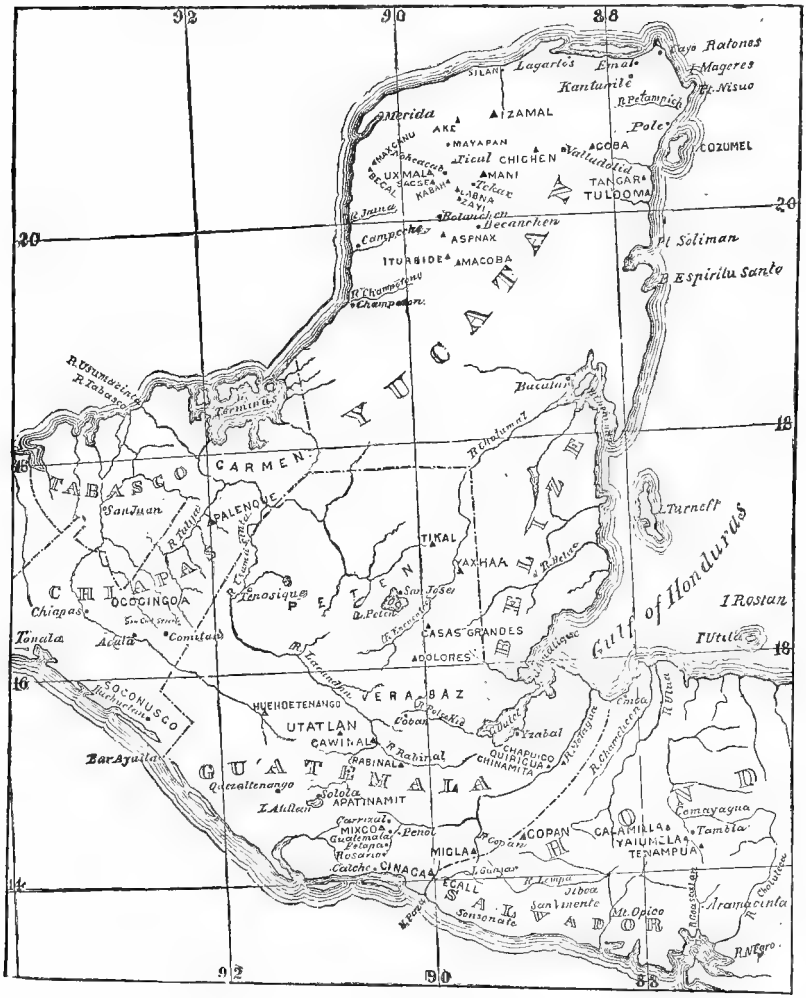
THE geographical location of the Maya tribes—Description of Copan—Statue at Copan—Altars at Copan—Ruins at Quiriga Patinamit—Utatlan—Description of Palenque—The Palace at Palenque—The Temple of the Three Inscriptions—Temple of the Beau-relief—Temple of the Cross—Temple of the Sun—Maler's Temple of the Cross—Significance of the Palenque crosses—Statue at Palenque—Other ruins in Tobasco and Chiapas—Ruins in Yucatan—Uxmal—The Governor's House—The Nunnery—Room in Nunnery—The sculptured façades—Temple at Uxmal—Kabah—Zayi—Labna—Labphak—Chichen Itza—The Nunnery—The Castillo—The Gymnasium—M. Le Plongon's researches—The tradition of the Three Brothers—Chaac-Mal—Antiquity of Chichen.



THE Central American region of the Western Continent are found the ruins of what are pronounced by all scholars to be the highest civilization, and the most ancient in time, of any in the New World. There it arose, flourished, and tottered to its fall. Its glory had departed, its cities were a desolation, before the coming of the Spaniards. The explorer who would visit them finds himself confronted with very great difficulties. Their location is in a section of the country away from the beaten track of travel. Their sites are overspread with the luxuriant vegetation of tropical lands, through which the Indian's machete must carve a passage. The states in which they are situated are notorious for anarchy and misrule, and the climate is such that it is dangerous for those not acclimated

to venture thither during a large part of the year. So it is not strange that but few have wandered among these ruins, and described them to the world at large.

But the accounts thus presented are interesting in the



Map of Central America.

extreme, though they have raised many questions that have thus far defied solution. There is no doubt but what there

exist large groups of ruins not yet described, structures and monuments which might, perhaps, throw some light on a past that now seems hopelessly lost. But the ruins thus far described are so numerous, their similarity is so evident, that we feel we have but little to hope from such undiscovered ruins. There are, doubtless, richly ornamented façades, grotesquely sculptured statues, and hieroglyphic-covered altars, but they would prove as much of an enigma as those already known. Our only hope is that some fortunate scholar will yet discover a key by whose aid the hieroglyphics now known may be read. Then, but not until then, will the darkness that now enshrouds ancient Maya civilization be dissipated.

As will be seen from a glance at the map, the most important ruins are in the modern states of Honduras, Guatemala, Chiapas, and especially Yucatan, the northern portion of this peninsula being literally studded with them. The river Usumacinta and its numerous tributaries flowing in a northern direction through Chiapas is regarded as the original home of the civilization whose ruins we are now to describe. From whence the tribes came that first settled in this valley is as yet an unsettled point. We notice that we have here another instance of the influence that fertile river valleys exert upon tribes settling therein. The stories told us of the civilization that flourished in primitive times in the valleys of the Euphrates and the Nile are not more wonderful—the ruins perhaps not more impressive—than are the traditions still extant, or the material remains fallen in picturesque ruins, of the civilization that once on a time held sway in the Usumacinta Valley.

One of the most famous groups of ruins in this section of the country is that of Copan, situated in Honduras, but very near the Guatemala line. This is commonly spoken

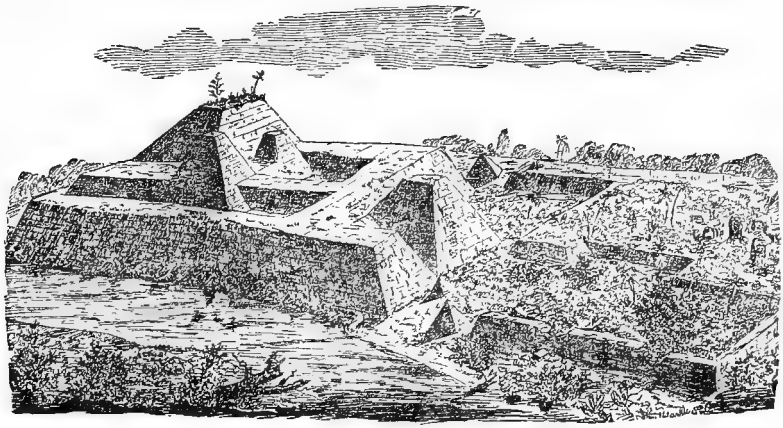
of as "the oldest city in America,"[1] and has some evidence to substantiate this claim. Whatever be its relative antiquity, it is doubtless very old, as it was probably in ruins at the time of the conquest. There are several facts going to prove this assertion. When Cortez, in 1524, made his march to Honduras, he passed within a few leagues of this place. He makes no mention of it, which he would have been very apt to do had it been inhabited. Fifty years later Garcia De Palacio made a report on these ruins to the king of Spain. According to this report, it was then in much the same state as described by modern travelers, and the same mystery surrounded it, showing that it must have been in ruin much longer than the short space of time from the conquest to the date of his report. But few travelers have visited Copan, and fewer still have left a good description of it. Mr. Stephens, accompanied by Mr. Catherwood, explored it in 1839, and this constitutes our main source of information.[2]

We feel that here is the place to speak a word of caution. In common with other writers, we have used the word cities, in speaking of the ruins of Maya civilization. In view of the criticisms that have been freely expressed by some of the best scholars of American ethnology, as to the generally accepted view of the civilization of the Mexican and Central American races, it is necessary to be on our guard as to the language employed. In the case of Copan, for instance, all the remains known, occur in an irregularly inclosed space of about nine hundred by sixteen hundred feet, while but a portion of such inclosed space is covered by the ruins themselves. Now it can, of course, be said that this space contains simply the remains of public

[1] Bancroft: "Native Races," Vol. V, p. 78.

[2] Stephens's "Incidents of Travel in Central America, Chiapas, and Yucatan," Vol. I, p. 113, *et seq.*

buildings, so to speak—such as temples, palaces, and others—while the habitations of the great body of the common people, poorly built, and located outside of this area, may have vanished away. But, on the other hand, it may also be that in this small area we have the ruins of all the buildings that ever stood at Copan. In which case the word city is a misnomer; pueblo would be more appropriate. But looking at them in the simplest light, we shall find there is still a great deal to excite astonishment. Fragments of the wall originally inclosing the



Ruins of Copan.

area in which are located the temple pyramids and statues, are still to be found. Very few particulars have been given of this wall. It was made of blocks of stone, and seems to have been twenty-five feet thick at the base, but the height is not given. The northern half of this area is occupied by a large terrace, somewhat irregular in outline, and impressed Mr. Stephens with the idea that it had not all been erected at the same time, but additions had been made from time to time. Instead of describing the ruins in full, we will let the illustration speak for itself. The dimensions of this terrace are, six hundred and twenty-four feet by eight hun-

dred and nine feet. The side fronting on the river was perpendicular. The other three sides consist of ranges of steps and pyramidal structures. All these steps and pyramidal sides were once painted. The general height of the terrace was about seventy feet above the surface of the ground.

Though Mr. Stephens warns us that this terrace was not as large as the base of the Pyramid of Ghizeh, still it must have required an immense amount of work, since careful computations show that over twenty-six million cubic feet of stone were used in its construction. This stone was brought from the quarries two miles away. We must not forget that this work was performed by a people destitute of metallic tools.

On the terrace were the ruins of four pyramids, one rising to the height of one hundred and twenty-two feet. The surface of the terrace was not continuous. In two places there were court-yards, or sunken areas. The larger is ninety by one hundred and forty-four feet, and has a narrow passage-way leading into it from the north. Whatever buildings that once stood on this terrace, have vanished away. At one place only, on the terrace, fronting the river, are the remains of small, circular towers, thought to have been watch towers. The whole terrace was thickly overgrown by trees of a tropical growth. Mr Stephens noticed two immense Ceiba trees growing from the very summit of one of the pyramids. This structure has been called the Temple, and a great many surmises have been made as to the scenes once enacted there. If analogous to other structures in Central America, this terrace was surmounted with buildings. They may have been temples or palaces, or they may have been communal houses, not unlike those of New Mexico, to the north.

But of more importance than the ruins of this temple,

are the statues and altars peculiar to this region. Mr. Stephens found fourteen of them. It seems very singular, indeed, to come upon these statues in the depth of a Central American forest, and they give us an idea of the state of advancement of these old tribes that nothing else does. They raise many queries. Why is it that so many are found here—so few elsewhere? Are they statues of noted personages, or idols? We are powerless to answer these questions. These secrets will only be yielded up when the hieroglyphics with which they are covered shall be read.

The places where these statues are found is seen to the right of the main body of ruins. It will be seen that only one is within the terrace area of the temple. Three others are situated near it, but the majority are near the southern end of the inclosure. We are not given the dimensions of all, but the smallest one given is eleven feet, eight inches high, by three feet, four inches width and depth; the largest, thirteen feet high, four feet wide, and three feet deep. No inconsiderable part of the labor on the statues must have been that of quarrying the large blocks of stone out of which they were carved, and transporting them to the place where found. They came from the same quarry as the other stones used in building; and so were transported a distance of about two miles. Mr. Stephens found, about midway to the quarry, a gigantic block, "which was probably on its way thither, to be carved and set up as an ornament, when the labors of the workmen were arrested."

There is such a similarity in all these statues that a representation of one will suffice. This is the representation of one of the largest statues. It is seen to be standing on a sort of pedestal. A face occupies a central position on the front. Some of the faces have what may be a rep-

COPAN STATUE. 571
(Bureau of Ethnology.)

resentation of a beard. In all but one, the expression is calm and peaceful. They were once painted red. Traces of color were still visible at the time of Mr. Stephens's visit. In all but one the hands are represented as placed back to back on the breast.

The complicated head-dress and the ornaments on the robes utterly defy description. The sides and back of the statues are covered with hieroglyphics, though now and then a face is introduced. A side view of another statue shows this feature. All are convinced that we have in these hieroglyphics an explanation of each statue, but what it is, is yet unknown. Mr. Stephens says: "Of the moral effect of the monuments themselves, standing as they do, in the depths of a tropical forest, silent and solemn, strange in design, excellent in sculpture, rich in ornament, different from the works of any other people; their uses and purposes—their whole history—so entirely unknown, with hieroglyphics explaining all, but perfectly unintelligible, I shall not pretend to convey any idea. Often the imagination was pained in gazing at them. The tone which pervades the ruins is that of deep solemnity."

In front of most of the statues is what is called an altar, which would seem to imply that these monuments are really idols. "The altars, like the idols, are all of a single block of stone. In general, they are not so richly ornamented, and are more faded and worn, or covered with moss. Some were completely buried, and of others it was difficult to make out more than the form. All differed in position, and doubtless had some distinct and peculiar reference to the idols before which they stood."

These altars are strongly suggestive of sacrificial scenes. The altar before the idol found in the court-yard on the terrace of the temple, is one of the most interesting objects

STATUE, COPAN.

found at Copan. It is six feet square and four feet high. The top is divided into thirty-six tablets of hieroglyphics,

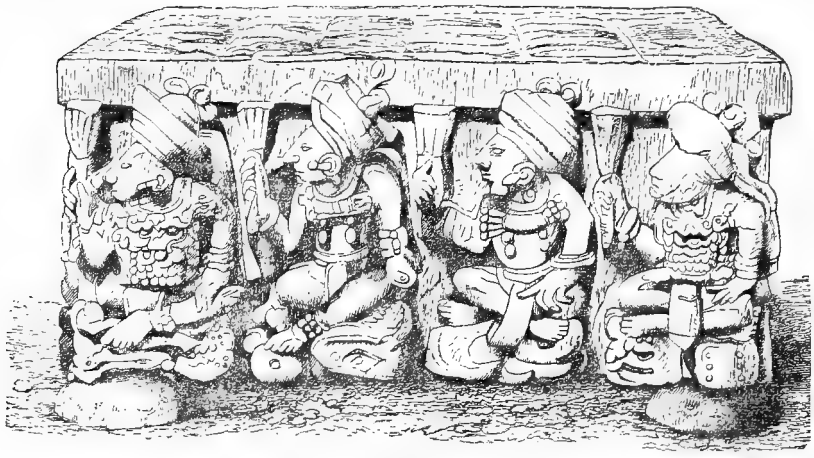
which we may well imagine records some events in the history of this mysterious people. Each side has carved on it four human figures. They are generally all represented as facing the same way. We give an illustration of the east side. Each individual is sitting cross-legged on a hierglyphic, and has a ponderous head-dress.

Hieroglyphics, top of Altar.

Mr. Stephens found the quadrangle at the south-east corner of the plan to be thickly strewn with fragments of fine sculpture. Amongst the rest was a "remarkable portrait." (Page 577) "It is probably the portrait of some king, chieftain, or sage. The mouth is injured, and part of the ornament over the wreath that crowns the head. The expression is noble and severe, and the whole character shows

a close imitation of nature." Colonel Gallindo, who visited Copan in 1835, discovered a vault very near where the circular towers are located, on the terrace fronting the river. This vault was five feet wide, ten feet long, and four feet high. It was used for burial purposes. Over fifty vessels of red pottery, containing human bones, were found in it.[1]

In this hasty sketch we do not feel that we have done justice to Copan. It is, however, all the space we can de-



Bas-relief, East Side of Altar.

vote to this interesting ruin. We call special attention to the hieroglyphics on the altar and the statues. We will find other hieroglyphics at Palenque, and in Yucatan, evidently derived from these.[2] They have been made the subject of very interesting study, and we will refer to them again at another page. We also notice especially the fact that we have no ruined buildings at Copan. In this respect it stands almost alone among the Central American ruins. The distinguishing features, however, are the carved obe-

[1] Bancroft's "Native Races," Vol. IV, p. 95.

[2] "Report of Bureau of Ethnology," Vol. I. Mr. Holden's article.

lisks. They are evidently not the work of rude people. Mr. Stephens, who was every way qualified to judge, declares that some of them "are in every way equal to the finest Egyptian workmanship, and that with the best instruments of modern times, it would be impossible to cut stone more perfectly."

Portrait, Copan.

A dark mystery hangs over these ruins. Their builders are unknown. Whether we have here some temple sacred to the gods of the Maya pantheon, or some palace made resplendent for royal owners, who can tell? Whether these are the ruins of the more substantial public buildings of a great city, of which all other buildings have vanished—or whether this is the remains of a prosperous pueblo, whose communal houses crowded the terraces, with sacrificial altars on the lofty pyramids—who knows? At long intervals a passing traveler visits them, ponders over their fast disappearing ruins, and goes his way. The veil drops, the tropical forest more securely environs them—and thus the years come and go over the ruins of Copan.

Nearly north from Copan (see map), about half-way to the coast, on the bank of the river Montagua, is found a small hamlet, by the name of Quiriga. Mr. Stephens, when traveling in the country in 1840, after many careful inquiries, heard of ruins near that place. Though not able to explore them himself, his companion, Mr. Catherwood, did.

The result of this gentleman's exertion makes us acquainted with another group of ruins, in many respects similar to those of Copan, though apparently much farther gone in decay. His visit was a very hurried one; and he was not able to clear the moss away from the statues so as to draw them as it should be done.[1]

We must notice that, though called a city, all the monuments and fragments thus far brought to light are scattered over a space of some three thousand square feet. No plan has been given. We gather, however, from Stephens's work, that a pyramidal wall inclosed the ruins, as at Copan.[2] No dimensions of this wall are given. Within the inclosure (if such it was) was a terrace. Here, again, dimensions are not given; but we are told it was about twenty-five feet to the top, and that the steps were, in some places, still perfect. It was constructed of neatly cut sandstone blocks. No monuments or altars were observed on the terrace, but in close proximity to it were fragments of sculpture. At another place near the wall, Mr. Catherwood mentions eight standing statues, one fallen one, and saw fragments of at least thirteen others. They are represented as being very similar to those of Copan, but two or three times as high. The hieroglyphics are pronounced identical with those already described.

There are no traditions extant of these ruins. No thorough exploration has been made. A city may have stood there; but, if so, its name is lost, its history unknown.

---

[1] Fourteen years later, these ruins were visited and described by an Austrian traveler, Dr. Scherzer. His account, though much more complete than Mr. Stephens's, has not yet appeared in English. Mr. Bancroft, in "Native Races," Vol. IV, p. 118, *et seq.*, gives a *résumé* of all information known as to these ruins.

[2] "Central America," Vol. II, p. 122. We are not sure about this inclosure. But Mr. Catherwood mentions a wall; and we are told the ruins are, in all respects, similar to those of Copan.

"For centuries it has lain as completely buried as if covered with the lava of Vesuvius. Every traveler from Yzabel to Gautemala has passed within three hours of it. We ourselves have done the same; and yet there it lay, like the rock-built city of Edom, unvisited, unsought, and utterly unknown."

A large extent of territory in Gautemala and Yucatan is as yet an unknown country, or at least has never been thoroughly explored. Strange stories have flitted here and there of wonders yet to be seen. The country swarms with savages, living in much the same state as they were when the Spaniards invaded the country. They have never been conquered, and, in the rugged fastnesses of their land, bid defiance to all attempts to civilize them. From all we can learn, there are numerous groups of ruins scattered here and there—but of their nature we are, as yet, mostly in the dark.

We have, indeed, historical notices of a few places; but, as the color of an object is the same as that of the medium through which it is viewed, we can not help thinking that the glamour of romance, which the early Spanish writers threw around all their transactions in the New World, has woefully distorted these sketches. This same effect is to be noticed in all the descriptions of the ruins. Where one party sees the ruins of imperial cities, another can detect but the ruins of imposing pueblos, with their temples and pyramids. It can be truthfully stated, that this is a land of ruins. Every few leagues, as far as it has been explored, are the remains of structures that excite astonishment.

The meager reports given us raise our curiosity, but fail to satisfy it. Almost all explorers relate stories of the existence of an aboriginal city. The location of this city shifts from place to place; always, however, in a section of country where no white men are allowed to intrude. The Curé of Santa Cruz, in whom Mr. Stephens expressed con-

fidence, declared that he had, years before, climbed to the summit of a lofty sierra, and then "he looked over an immense plain, extending to Yucatan and the Gulf of Mexico, and saw, at a great distance, a large city, spread over a great space, with turrets white and glittering in the sun." We are afraid a search for this mythical city would be attended with much the same results as rewards the child's pursuit of a golden treasure at the end of the rainbow.

As a sample of known ruins, we might cite two in the immediate neighborhood of Quirigua. At the distance of a few leagues, both above and below this latter place, are the remains of former settlements. The accounts are very brief. Of the ruins below, we are informed that they consist of the remains of a quadrilateral pyramid, with traced sides, up which steps lead to the summit platform, where *débris* of hewn stone are enveloped in dense vegetation." Of the ruins located above Quirigua, we are simply told "of a large area covered with aboriginal relics—in the form of ruined stone structures, vases and idols of burned clay, and monoliths, buried for the most part in the earth."

These descriptions will serve as samples of many others, and, though they are interesting in their way, we are afraid they would grow tiresome by repetition. We will, therefore, only make mention of one or two important points; premising, however, that, beyond a doubt, similar ruins are scattered up and down the river valleys of the entire country.[1]

Two cities of ancient Guatemala especially mentioned by Spanish writers are Utatlan and Patinamit. Here, if we may believe their recitals, were the capitals of two powerful monarchies. The pictures they draw for us are those of cities of Oriental magnificence. The system of govern-

[1] For full information consult Bancroft's "Native Races," Vol. IV, pp. 115 to 139.

ment they describe is that of absolute monarchy, founded on feudalism. We will briefly glance at the remains of these "imperial cities." Their location is seen on the map. The approach to Patinamit is very difficult, indeed. Situated on a high table-land, it commands an almost boundless view. On every side are immense ravines, and the only way of entering it was by a narrow passage cut in the side of the ravine, twenty or thirty feet deep, and not wide enough for two horsemen to ride abreast.

Mr. Stephens mentions coming to a wall of stone, but broken and confused. The ground beyond was covered with mounds of ruins, and in one place he saw the foundations of two buildings, one of them being one hundred and fifty by fifty feet. He does not give us the area covered by the ruins, but there is nothing in his description to make us think it very large in extent. He also quotes for us Fuentes's description of this same place, written, however, one hundred and forty years earlier. In this he speaks of the remains of a magnificent building, perfectly square, each side measuring one hundred paces, constructed of hewn stones, extremely well put together. In front of the building is a large square, on one side of which stand the ruins of a sumptuous palace; and near to it are the foundations of several houses.[1] He also asserts that traces of streets could still be seen, and that they were straight and spacious, crossing each other at right angles. Fuentes certainly had remarkable eyes. He wrote a description of Copan which not only differs from all accounts of modern travelers, but also from the still earlier description by Garcia De Palacio.[2]

[1] "Central America," Vol. II, pp. 152-3.

[2] Brasseur De Bourbourg styles Fuentes's description of Copan "La description menteuse de Fuentes." Bancroft: "Native Races," Vol. IV, p. 80, note.

Patinamit means "The City," and is represented as the capital city of the Cakchiquel "monarchy." The site of the city was certainly admirably chosen for defense, and we have no doubt but what here was the head-quarters of a powerful tribe of Indians; but, until scholars have settled some very disputed points about the civilization of the Central American nations, we must be cautious in the use of the words monarchy and palaces as applied to these old people or these ruins.

Thirty-five or forty miles north-eastward from Patinamit we come to the ruins of the most renowned city in Guatemala at the time of the conquest. This was Utatlan, the Quiche capital, a city which the Spaniards compared to Mexico in magnificence, and which, at the time of its destruction, was at its zenith of prosperity. The location was very similar to that of Patinamit. It also stood on an elevated plateau, with immense ravines on every side. It was approached only at one point, and guarding this one point of approach was a line of fortifications. They consisted of the remains of stone buildings, probably towers. The stones were well cut and laid together. These fortifications were united by a ditch.

Within this line of towers stood a structure, generally regarded as a fort, directly guarding the line of approach. Steps led up a pyramidal structure having three terraces, one over the other. The top was protected by a wall of stone, and from the center rose a tower. Beyond this fort was the ruins of the city. Mr. Stephens describes a large ruin which is called The Palace. It is said, in round numbers, to have been eleven hundred by twenty-two hundred feet. As this area is more than fifty-five acres in extent, we can see it was not a palace in our sense of the word. The stones of which it was composed have been

largely removed to build the modern town of Santa Cruz. But the floor could still be traced, and some remains of partition walls. The floor was still covered with hard cement.

Adjoining the palace was a large plaza or court-yard, also cemented, in the center of which was the ruins of a fountain. Another structure still remaining was a small pyramid, at the top of which was probably a temple, or, at least, a place of sacrifice. No hieroglyphics or statues have been found here. A few terra-cotta figures have been found, and one small gold image. It would seem from this description that the ruins simply consist of a few large structures. For aught we know, they may have been communal houses.

Mr. Stephens, however, condenses Fuentes's account, which is truly wonderful. According to him, the center of the city was occupied by the royal palaces, around which were grouped the houses of the nobles. The extremities were inhabited by the plebeians. He tells us there were many sumptuous buildings, the most superb of which was a seminary, where between five and six thousand children were educated at royal expense. The palace was formed of hewn stones of various colors. There were six principal divisions. In one was lodged the king's body-guard, in the second the princes and the relatives of the king, and so forth.

It is not necessary to remind the reader that it is very doubtful whether such a state of things ever existed. It is related, for instance, that the king marched from Utatlan with seventy-two thousand warriors to repel the attack of Alvarade. This would indicate a total population of between two and three hundred thousand souls. It seems to us that a city of that size would not so completely disappear

in a little over three centuries that a careful explorer could find only the ruins of a few large buildings.

We do not feel that we have done near justice to the ruins of Guatemala. As we have before remarked, there are, doubtless, many ruins not yet brought to light. They are rapidly disappearing, and we do not know that we will ever possess a description of them, or understand their real import. The light of history, indeed, fell on the two groups of ruins last described. But the Spanish writers were totally unacquainted with Indian society, and may, therefore, have widely erred in applying to their government terms suited only to European ideas of the sixteenth century. And it is not doubted but that their estimate of the population of the towns, and of the enemies with which they had to contend, were often greatly overdrawn. In short, the remains themselves are remarkable, but every ruined pyramid is not necessarily the remains of a great city, nor every large building in ruins necessarily a palace.

Going northward out of Guatemala, we pass into the modern state of Chiapas. This is described a country of great natural beauty and fertility. And here it is that we meet with a group of ruins which have been an object of great interest to the scientific world. They have been carefully studied and described, and many theories have been enunciated as to their builders, their history, and civilization. The place is supposed to have been deserted and in ruins when Cortez landed in the country. At any rate, he marched within a few leagues of it, but, as in the case of Copan, he is silent in regard to it.

They take their name from the modern town of Palenque, near which they are located. This town was founded in 1564. It was once a place of considerable importance, but its trade has died away, and now it would not be known

were it not for the ruins of a former people located near it. Though distant from the village only some eight miles, nearly two centuries went by before their existence was known. Had they been visited and described at the time of the founding of the village, no doubt much that is now mysterious in regard to them would have been cleared away. But for two centuries they were allowed to sleep undisturbed in the depths of the forest, and in that time the elements played sad havoc with the buildings, inscriptions, and ornaments. What are left are not sufficient to impart full information. Imagination is too apt to supply the details, and these ruins, grand in proportion, wonderful in location, enwrapt by dense forests, visited by the storms of tropical lands, are made to do service in setting forth a picture of society and times which we are afraid has but little real foundation to rest upon.

The ruins of Palenque are the first which awakened attention to the existence of ancient ruins in America, and, therefore, it may not come amiss to state more particularly the circumstances of their first discovery. The existence of an aboriginal city in this locality was entirely unknown; there were no traditions even that it had ever existed. Of course the natives of the modern town of Palenque must have known of their existence, but no account of them was published. They are said to have been discovered in 1750 by a party of traveling Spaniards. This statement Mr. Stephens doubts. The first account was published in 1784. The Spanish authorities finally ordered an exploration. This was made under the auspices of Captain Del Rio, who arrived on the ground in 1787. His report was locked up in the government archives, and was not made public until 1822.

The reception of this report illustrates how little interest is taken in American antiquities. It was scarcely noticed

by the *Scientific World*. As Mr. Stephens remarks, "If a like discovery had been made in Italy, Greece, Egypt, or Asia, within the reach of European travel, it would have created an interest not inferior to the discovery of Herculaneum, or Pompeii, or the ruins of Pæstum." But, from some cause, so little notice was taken of this report that in 1831 the explorations of Colonel Galindo, whose works we have referred to at Copan, was spoken of as a new discovery. In the meantime another government expedition under the direction of Captain Dupaix explored these ruins in 1807. Owing to the wars in Europe and the revolution in Mexico, his report was not published until 1835. Mr. Stephens visited the ruins in 1840. His account, profusely illustrated, was the means of making known to a large class of readers the wonderful nature of the ruins, not only at Palenque, but in Yucatan as well.

In this outline we have given an account of the early explorations at Palenque. Private individuals have visited them, and governments have organized exploring expeditions, and by both pencil and pen made us familiar with them. As to the remains actually in existence, these accounts agree fairly well, but we have some perplexing differences as to the area covered by the ruins. Where the early explorers could trace the ruins of a large city modern travelers can find but a few ruined structures, which, however, excite our liveliest interest. One of the earliest accounts speaks of the ruins of over two hundred buildings. Another speaks of them as covering an area of many square miles. Mr. Stephens thinks a few acres would suffice.

From the researches of M. Charney, it would seem that the ruins are really scattered over quite an area. His exploration made in 1881, seems to confirm the older writers. With abundant means at his command, he was enabled to

explore the forest, and he found many ruins which escaped the other observers. According to him, the ruins are scattered over an area extending about one mile and a quarter from north to south, and about one and three-fourths from east to west. Throughout this space, the ruined structures were in all respects similar to those previously described, consisting altogether of what he calls palaces and temples.[1]

There seems to be no especial order in the arrangement of the buildings. They are separated by quite an interval, excepting to the south of the palace, where there are groups of buildings near together. The fact that such careful explorers as Stephens and Waldeck failed to notice these additional ruins, gives us a faint idea of the density of the forest.

The plan represents the distribution and relative size of the ruins of which we have definite descriptions. Those having no numbers are some of the groups that were passed by as of no account. We must understand that so dense is the forest that not one of these structures is visible from its neighbors. Where the trees are cut down, as they have been several times, only a few years are necessary for it to regain its former density, and each explorer must begin anew.

The largest structure, marked one on the plan, is known as the palace. This is only a conjectural name. We have no reason, except its size, to suppose it the residence of a royal owner. Its base is a pyramid which, Mr. Stephens tells us, is of oblong form, forty feet high, three hundred and ten feet in front and rear, and two hundred and sixty feet on each side. The pyramid was formerly faced with stone, which has been thrown down by the growth of trees, so that its form is hardly distinguishable. The sides may

[1] Charney, in *North American Review*, 1881.

once have been covered with cement, and perhaps painted. Dupaix, who examined these ruins in 1808, so represents them. Mr. Stephens expressly states that the eastern front was the principal entrance. Mr. Waldeck, however, detected traces of stairways on the northern side. M. Charney has settled the point, that the principal entrance was on the northern side.

The principal bulk of this pyramid seems to have been earth; the facing only being composed of stone. Mr. Bancroft thinks he has discovered evidence that there were four or more thick foundation-walls built from the surface of the ground to support the buildings on top of the pyramid; that the space between these walls was subsequently filled with earth, and that sloping embankments, faced with stones, were built upon the outside.[1] The summit platform of this pyramid supports the building, or collection of buildings, known as the palace. Though generally spoken of as one building, we think we have here the ruins of a number of buildings.

Probably the original inhabitants built a continuous structure close to the edge of the platform, leaving the interior for an open court. Subsequently, as population increased, rather than resort to the labor necessary to raise a new pyramidal structure, they erected other buildings on this court. From the plan, as given by Mr. Stephens, there seems to have been no less than five such put up, besides the tower. Thus covering the platform with a somewhat confused mass of buildings, and, instead of the large open court, there were left only three narrow courts, and one somewhat larger—seventy by eighty feet.[2] The building erected near the edge of the platform, inclosing the court,

[1] "Native Races," Vol. IV, p. 300, *et seq.*

[2] Morgan's "Contribution to N. A. Ethnology," Vol. IV, p. 268.

was some two hundred and twenty-eight feet on its east and west sides, by one hundred and eighty feet on its north and south sides, and about thirty feet high.

Our general view, taken from Mr. Stephens's works, represents the ruined eastern front of this building, surmounting the pyramid. Trees are seen growing all over the ruins. The outer wall is pierced by numerous door-ways which, being somewhat wider than the space that separates them, gives to the whole the appearance of a portico with wide piers: no remains of the doors themselves have been discovered. Drilled holes in the projecting cornice, immediately above the doorway, gave Mr. Stephens the impression that an immense cotton curtain, perhaps painted in a style corresponding with the ornaments, had been extended the whole front, which was raised or lowered, according to the weather. The lintels of the doors were of wood. They had long since vanished, and the stones over the doorway fallen down. Of the piers separating the doorways, only fifteen were found standing, but the crumbling remains of the others were readily traced on the ruins.

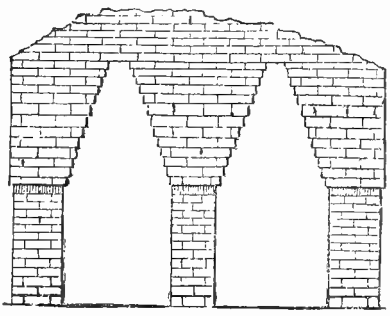
Bas-relief, Palenque.

Each of the standing piers, and presumably all the others, was ornamented with a bas-relief in stucco. This cut

GENERAL VIEW OF PALACE.

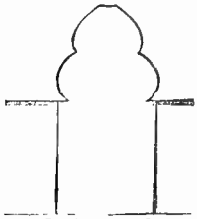
gives us a good example of this style of ornamentation. We notice portions of a richly ornamented border. This stucco work consists of human figures in various attitudes, having a variety of dress, ornaments, and insignia. The stucco is said to be nearly as hard as the stone itself. Traces of paint, with which the figures were once ornamented, were still to be seen. The conjectures in regard to these figures, have been innumerable. Vividly painted, and placed in a conspicuous place on the wall, we may be very sure they were full of significance to the builders. Three hieroglyphics are placed over the head of each group, but so far, they are as little understood as the figures themselves. We can imagine the effect, when the building was still perfect and entire, and all the piers were thus ornamented.

Passing to the top of the pyramid, we find the construction of the building whose outer wall we have been describing, to be substantially as follows: Three parallel walls, from two to three feet in thickness, composed of hewn stones, were erected about nine feet apart. At the height of ten feet, the walls commenced approaching each other; not, however, in an arch, for this was unknown, but in a triangular manner, the stones in each course projecting a little farther out. This cut represents a cross-section of the buildings, and shows also the slight cornice. All inequalities in the surface, as here represented, were then filled with cement, thus furnishing a smooth surface, which was then painted. The two outer walls were plentifully supplied with doorways;



Cross-section Palace, Palenque.

the central wall had but few. We are only given the description of one, which may not apply to all. This one, opposite the entrance on the east side, has a trefoil-shaped arch over the door, thus giving it this shape. Besides the few doorways, the central wall had numerous depressions, or niches, some of which served for ventilation, others for the support of beams, and perhaps others as receptacles for torches or idols. This principle of construction is substantially the same for all the buildings in the interior of the court, and indeed for all the buildings at Palenque.

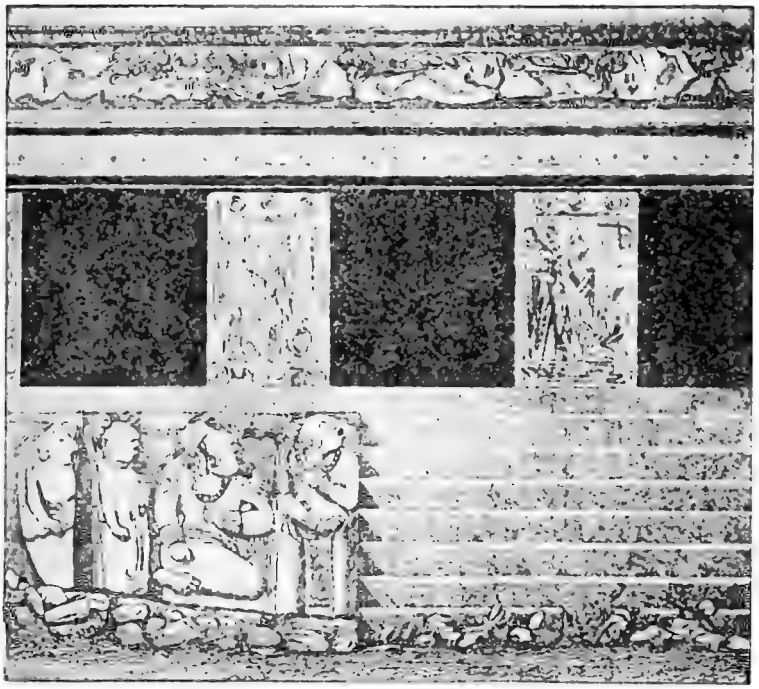


Trefoil Arch.

Passing through the doorway just described, we come into the second corridor, and continuing through that, we come to what was once a large court; but, as we stated, it was subsequently built over so as to leave only a few courts. The largest one, eighty by seventy feet, is immediately before us, with a range of steps leading down into it. On each side of the stairway is sculptured, on stucco, a row of grim and gigantic figures. The engraving opposite represents the same. "They are adorned with rich headdresses and necklaces, but their attitude is that of pain and trouble. The design and anatomical proportions of the figures are faulty, but there is a force of expression about them which shows the skill and conceptive force of the artist." From this small court stairways lead to the other buildings situated around it.

Stucco ornaments were plentiful. In one room, rather more richly ornamented than the others, was found a stone tablet, which is the only important piece of stone sculpture about the palace. We are told it is of hard stone, four feet long by three feet wide, and the sculpture is in bas-relief. It is set in the wall, and around it are the re-

mains of a rich stucco border. Its significance is unknown. (Page 596.) We must notice the small medallion, containing a face, suspended by a necklace of pearls from the neck of the principal figure. Mr. Stephens conjectures that it may represent the sun. Mr. Waldeck gives a drawing of this same subject; but instead of a face, he represents a cross.[1]



Entrance to Principal Court.

In the general view we see a tower rising up from the mass of ruins. Mr. Stephens speaks of this tower as follows: "This tower is conspicuous by its height and proportions, but an examination in detail is found unsatisfactory and uninteresting. The base is thirty feet square, and it has three stories. Entering over a heap of rubbish at the base, we found within another tower distinct from

[1] Bancroft's "Native Races," Vol. IV, p. 319.

the outer one, and a stone staircase, so narrow that a large man could not ascend it. The staircase terminated against a dead stone ceiling, closing all further passages, the last step being only six or eight inches from it. For what purpose a staircase was carried up to such a bootless termination we could not conjecture. The whole tower was a

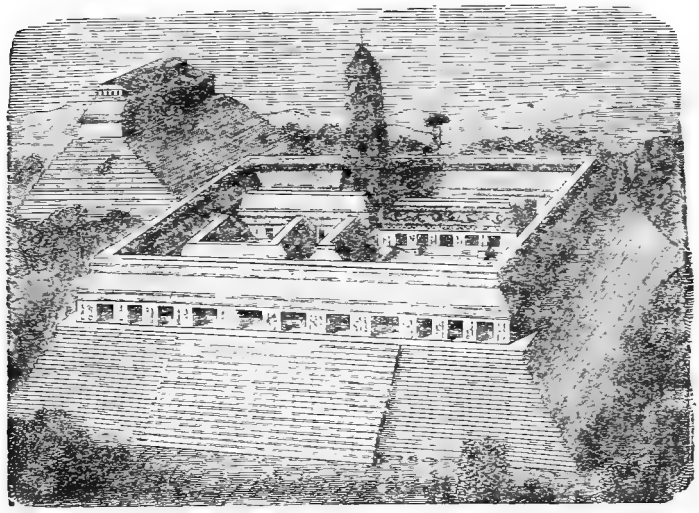
Stone Tablet.

substantial stone structure, and in its arrangements and purposes about as incomprehensible as the sculptured tablets."

At the best we can do, it is hard to give such a description of this ruin that it can be readily understood, so we will present a restoration of it by a German artist,[1] taken,

[1] Armin: "Das Heute Mexico."

however, from Mr. Bancroft's work.[1] This is very useful to us, since it conveys an idea of how the palace looked when it was complete. This view also includes a second structure, which we will examine soon. We notice the numerous doorways leading into the first corrider, the ornamental pier-like portions of the wall separating the doors,

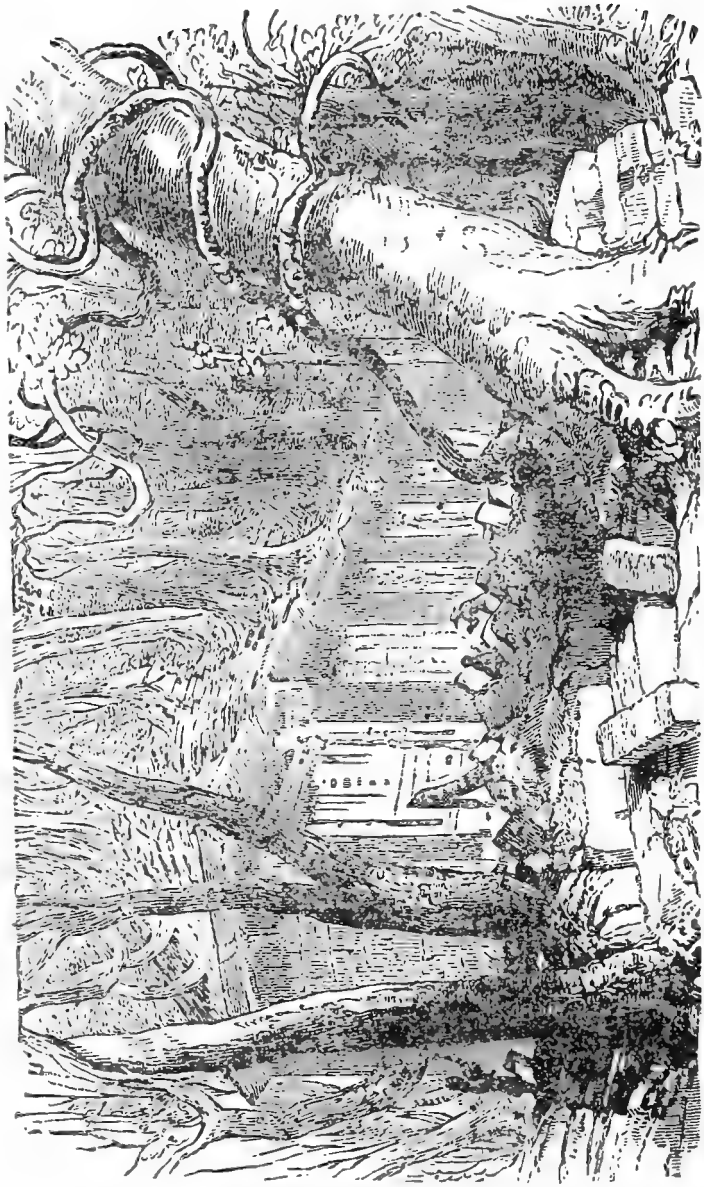


Palace, Palenque.

and the several buildings on the court; rising over all, the tower, which would have been better if the spire had been omitted.

This may have been a real palace. Its rooms may have been the habitations of royalty, and its corridors may have resounded with the tread of noble personages. M. Charney thinks the palace must have been the home of priests, and not kings—in fact, that it was a monastery, where the priests lived who ministered in the neighboring temples. He thinks Palenque was a holy place, a prehistoric Mecca. We must be cautious about accepting any theory until

[1] Native Races, Vol. IV.



Ruined Temple of the Three Tablets.

scholars are more agreed about the plan of government and society among the Central American tribes. But, whatever it was, many years have passed by since it was deserted.

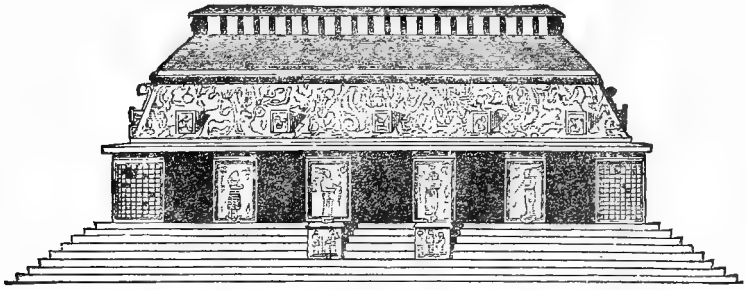
For centuries tropical storms have beat against the stuccoed figures. The court-yards and corriders are overrun with vegetation, and great trees are growing on the very top of the tower. So complete is the ruin that it is with difficulty the plan can be made out. The traveler, as he gazes upon it, can scarcely resist letting fancy restore the scene as it was before the hand of ruin had swept over it. In imagination he beholds it perfect in its amplitude and rich decoration, and occupied by the strange people whose portraits and figures may perhaps adorn its walls.

We must now describe the more important of the remaining structures of Palenque. Glancing at the plan for a moment, we see to the south-west of the palace a ruin marked 2. This is the site of a pyramidal structure known as the "Temple of the Three Tablets," or "Temple of Inscriptions." The pyramid is not as large in area as the palace, though of a greater height. It measures in height one hundred and ten feet on the slope, but we are not given the other dimensions. All the sides, which were very steep, seem to have had steps. Trees have grown up all over the pyramid and on the top of the building. This illustration, taken from Mr. Stephens's work, can not fail to impress on us the luxuriant growth of tropical vegetation, and we can also see how such a growth must accelerate the ruin. The stone steps leading up the sides of the pyramid have been thrown down, and such must be in time the fate of the building itself. The building on the summit platform does not cover all the area. It is seventy-six feet front by twenty-five feet deep and about thirty-five feet high.

This small cut is a representation of the same building on a small scale, but cleared of trees and vines. The roof is seen to consist of two parts, sloping at different angles.

The lower part was covered with stucco ornaments, which, though too much injured to be drawn, gave the impression that, when perfect and painted, they must have been rich and imposing. The upper slope is of solid masonry. "Along the top was a range of pillars, eighteen inches high and twelve apart, made of small pieces of stone laid in mortar and covered with stucco, having somewhat the appearance of a low, open balustrade."

In this wood-cut the front wall, as in the palace, presents more the appearance of a row of piers than any thing else. Each of the corner piers contains on its surface hiero-



Elevation Temple of the Three Tablets.

glyphics, each of which contains ninety-six squares. The other piers have ornaments of stucco similar to those we have already examined on the palace. In the building itself we have the usual three parallel walls. In this case, however, the second corrider is divided into three rooms, and there is no opening in the third wall, unless it be three small openings for air. The central wall is four or five feet thick.[1] The interior is very plain.

The principal point of interest about the building, from whence the name is derived, is three tablets of hieroglyphics. One on either side of the principal doorway of the middle wall, and the third in the rear wall of the middle room.

[1] Bancroft's "Native Races," p. 326.

Being so similar to other tablets, it is not necessary to give separate cuts of them. The similarity to those of Copan is very great, the differences being in minute points, which only critical examination would detect. Mr. Stephens tells us that the Indians call this building a school. The priests

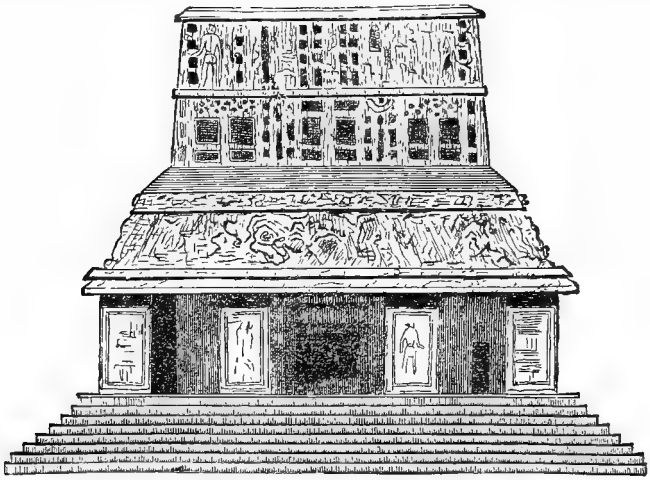
The Lau-he-uf.

who came to visit him at the ruins called it a temple of justice, and said the tablets contained the law. We do not think either are very safe guides to follow.

At number three on the plan are the ruins of an edifice which is fast disappearing. The outer wall had already

fallen at the time of Mr. Stephens's visit. It stands on the bank of the stream. The pyramid base is one hundred feet high on the slope. The building on the top is twenty-five feet front by eighteen feet deep. In the inner corridor could be dimly traced the outlines of a beautiful piece of stucco work. At the time of Waldeck's visit it was still complete, so we are enabled to give a cut of it.

We are sure the readers will not fail to notice the many points which make this such an exceptionally fine piece of



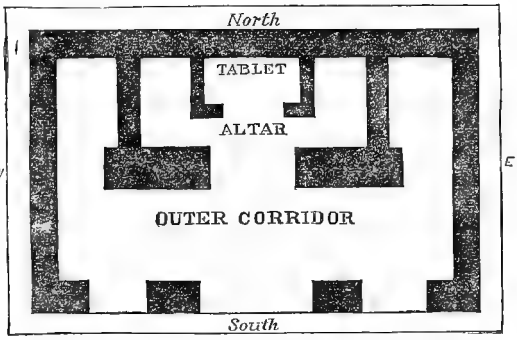
Temple of the Cross. (Smithsonian Institute.)

work. "In the original drawing the grace of the arms and wrists is truly matchless, and the chest muscles are displayed in the most perfect manner. The embroidered girdle and folded drapery of the figure, as well as the drapery around the leopard's neck, are arranged with taste. The head-dress is not unlike a Roman helmet in front, with the addition of numerous plumes. The sandals of the feet are secured by a cord and rosette, while the ornaments on the animal's ankles seem secured by leather straps."[1] Mr.

[1] Short's "North Americans of Antiquity," p. 389.

Waldeck, however, who drew this sketch, is supposed to have drawn at times better than his model.[1] This is generally called the "Temple of the Beau-relief." Mr. Holden, in his able article already referred to, comes to the conclusion that this figure represents the god Quetzalcohuatl, the nature god of the Mayas.

Eastward from the palace, and across the creek, are seen on the plan the location of two other structures. The one marked 4 is a somewhat famous structure, which, for reasons that will soon appear, is called the "Temple of the Cross." The pyramid in this case is one hundred and thirty-four feet on the slope. It, however, stands on a terrace about sixty feet on the slope. The forest is so dense that, though other structures are but a short distance from it, yet they can not be seen. The last two engravings represent the building and the ground plan. This is not a fanciful sketch, but is a restoration, "from such remains and indications that it is impossible to make any thing else out of it."

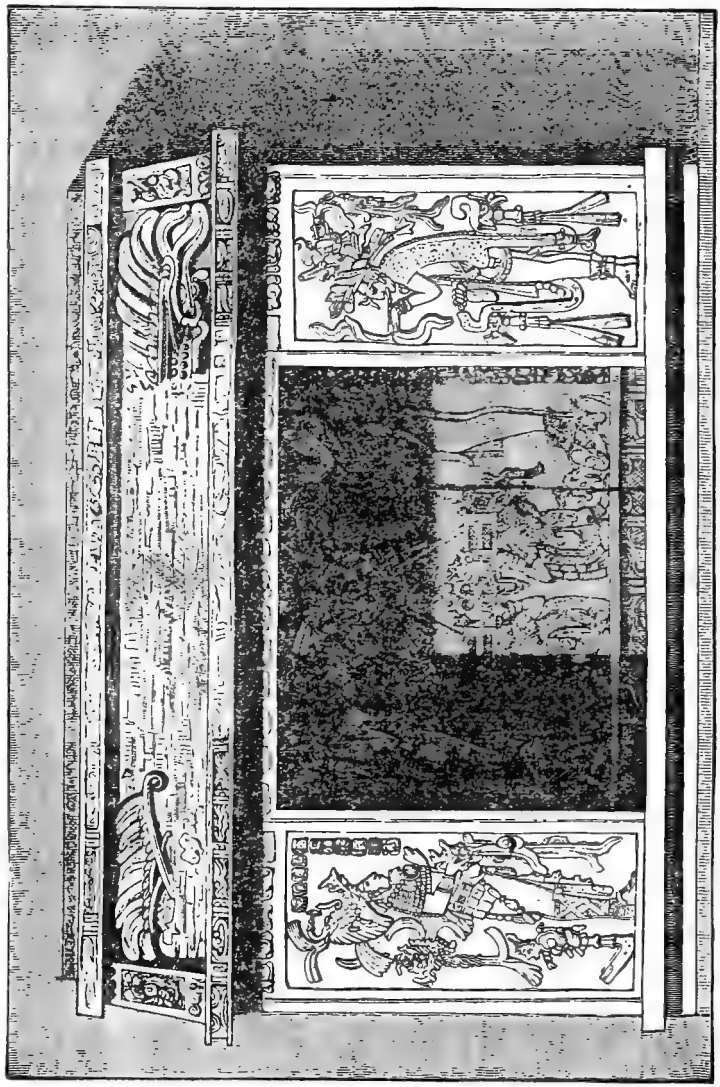


Plan of Temple. (Smithsonian Institute.)

"The building is fifty feet front, thirty-one feet deep, and has three door-ways. The whole front was covered with stucco ornaments. The two outer piers contain hieroglyphics." We notice a new feature about the roof. It is similar to the roof of the temple of the "Three Tablets," in having two different slopes—the lower one covered with

[1] Holden, in "First Annual Report of the Bureau of Ethnology."

stucco ornaments, but the range of pillars along the roof is here replaced by a peculiar two-storied arrangement nearly sixteen feet high. Mr. Stephens says: "The long sides of this



ALTAR IN TEMPLE OF THE SUN.—(Bureau of Ethnology.)

narrow structure are of open stucco-work, formed into curious and indescribable devices, human figures with legs and arms

spreading and apertures between, and the whole was once loaded with rich and elegant ornaments in stucco relief. Its appearance at a distance must have been that of a high, fanciful lattice. It was perfectly unique—different from the works of any other people with which we are familiar, and its uses and purposes entirely incomprehensible."

It was evidently added to the temple solely for the sake of appearance. One writer[1] believes the roof structures were erected by some people that succeeded the original builders of the temple. The plan of the temple gives us a clear idea of the arrangement of the inner rooms. Our principal interest centers in the altar, which we notice placed in the center of the back room. We give an illustration of a similar altar-form in the temple, at number 5 of the plan. In form it is that of an inclosed chamber, having a roof of its own. The altar in the Temple of the Cross was very similar to this. Mr. Stephens's description is as follows: "The top of the doorway was gorgeous with stuccoed ornaments, and on the piers at each side were stone tablets in bas-relief. Within, the chamber is thirteen feet wide and seven feet deep."

The room was plain within, and right against the back was the famous "Tablet of the Cross." This tablet was six feet four inches high, ten feet eight inches wide, and formed of three stones. The right-hand one is now in the National Museum in Washington. The central one, though torn from its original place, is still at the ruins. The next cut gives us only the sculptured part of the tablet. On both the right and left-hand were tablets of hieroglyphics. A long chain of ornaments hung suspended from the cap of the right-hand figure. The two figures are regarded as priests. The cross is very plainly outlined, and is the regular Latin one. Con-

[1] Brasseur De Bourbourg.

siderable discussion has arisen as to what supports the cross. Dr. Brinton thinks it a serpent.[1] Others think it a human skull.[2] We must also notice the bird on top of the cross. It is almost impossible to make out the species. The right-hand figure is offering it something.

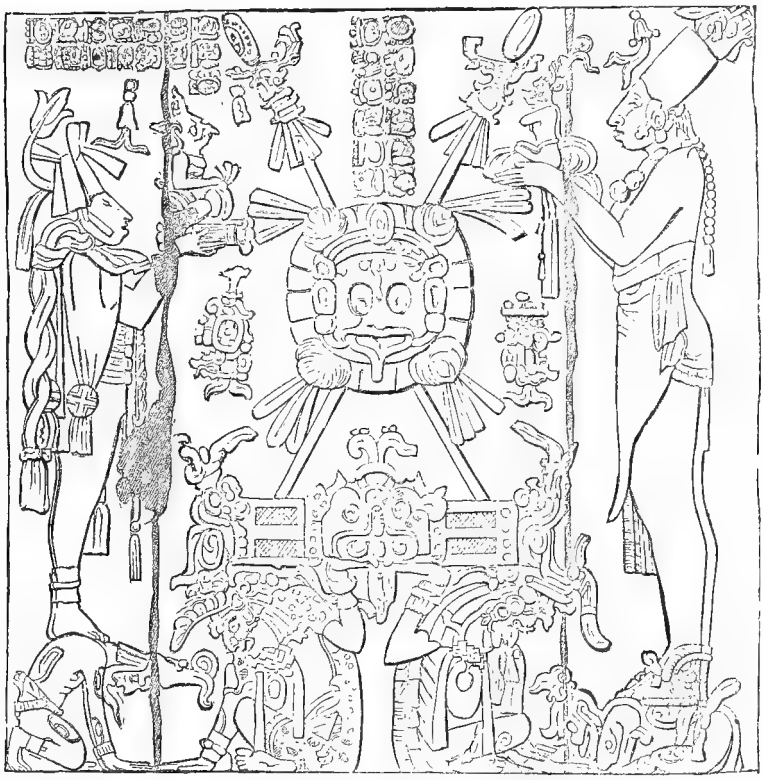
Tablet of the Cross.

We must refer to some more tablets found at Palenque before proceeding further. At number five of the plan was a temple but little smaller than the one just described.

[1] "Myths of the New World."

[2] Holden, in "First Annual Report Bureau of Ethnology."

There is, however, such a similarity between the buildings, that it is not necessary to give illustrations. The temple, also, had an inclosed altar; and against the back of that was placed the tablet which was very similar to the one just described. This illustration represents the sculptured portions. On each side were tablets of hieroglyphics. It



The Sun.

needs but a glance to show that the priests are, evidently, the same personages as in the other tablet.

The one on the left is standing on the back of a human being. The one on the right is, perhaps, standing on a beast; or, if a human being, he is crushed beneath the

weight of the priest. Two other human figures support a platform, from which rise two bâtons crossed like a St. Andrew's cross. These support a mask, from the center of which a hideous human face looks out. The Aztecs sometimes represented the sun by such a mask, and hence the name "Temple of the Sun."

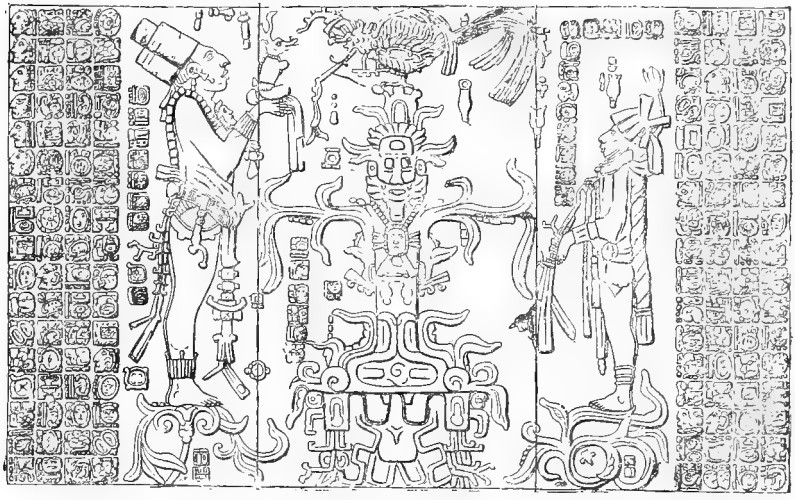
In still another temple, situated but a short distance from the others, was discovered a third tablet, which is shown in the cut opposite. We give all the tablet, showing the hieroglyphics as well. We must compare this with the first tablet given. The priests are, evidently, the same—but, notice, they stand on different sides of the cross. The same priest is making the offering as in the first, and the same bird is seen on the top of the cross. The priests stand on flowered ornaments. The support of the cross resembles the same thing as in the first; but whether it is a human skull, or a serpent, is hard to tell. The cross itself is not as well outlined. The two arms are floral ornaments. We must also notice the two faces seen on the upright part.[1]

These tablets are all of great interest That of the cross, the first one given, has attracted more attention than almost any other in the field of American antiquities. This is largely owing to the cross. As far as the sacred emblem itself is concerned, we do not think this tablet of more significance than that of the sun. It is well known that the cross, as a sacred emblem, had peculiar significance in the ancient religions of the world. Its use as such has come down to us from time immemorial. On the first expedition of the Spaniards, in 1518, to the coast and islands of Yucatan, they discovered that the cross was of some signifi-

[1] This tablet is named after its discoverer. The building in which it is situated was but a short distance from the others; yet, owing to the density of the forest, neither Waldeck nor Stephens discovered it. A cast of it is now in the National Museum at Washington.

cance to the natives. In the island of Cozumel they found a large cross, to which the natives prayed for rain[1]

Mr. Brinton thinks that the source of this veneration of the cross, like the sacredness of the number four, of which he gives numerous illustrations, is the four cardinal points.[2] From these points blow the four winds which bring the fertilizing rains, and thus render the earth fruitful; and hence the cross, in so many and widely separated portions of the earth, is used as the symbol of the life-giving, creative, and



Maler's Cross.

fertilizing principle in nature.[3] He thinks this is, perhaps, the significance of these Palenque crosses. It is true we have different forms of the cross; but in ancient sculpture they seem to have been of equal importance.[4]

The results of these inquiries into the hidden meaning of these tablets are not devoid of interest; but, thus far, but few conclusions of value have been obtained. They

[1] Rau, in "Smithsonian Contribution to Knowledge," Vol. XXII, p. 40.

[3] Bancroft's "Native Races," Vol. V, p. 506.
[4] See, also, "American Encyclopedia," Art. "Cross."

have been made to do service in support of some far-fetched theories. The early Spanish writers on these subjects concluded that the crosses found in Central America were positive proof that St. Thomas had traveled through the country preaching the doctrines of Christianity. The padres, who came to visit Mr. Stephens at the ruins, "at the sight of it, immediately decided that the old inhabitants of Palenque were Christians, and fixed the age of the buildings in the third century."

Wilson finds in the tablets of the cross a strong argument for the existence of a great Phœnician empire in Central America. This tablet represents, he thinks, the sacrifice of a child to Astarte,[1] also called Ashtoreth, the great female deity of the ancient Semitic nations on both sides of the Euphrates, but chiefly of Phœnicia. The original meaning of this word was "Queen of Heaven." Modern scholars do not think these early speculations of the slightest worth. Dr. Charles Rau[2] concludes that as reasonable a conjecture as any is the supposition that it represents a sacrifice to the god of rain, made, perhaps, at a time of drought, apparently influenced to that conclusion by the fact that the natives of Cozumel regarded a cross in such a light,[3] and further that a cross represents the moisture-bearing winds.

E. S. Holden[4] has made a critical study of the hieroglyphics of Copan and Palenque. Though far from complete, most interesting results have been obtained. We can not do more than set forth the results of his investigations.[5] He concludes, from a careful study of the tablets

[1] "Conquest of Mexico," p. 160.

[2] "Smithsonian Contribution to Knowledge," Vol. XXII.

[3] Bancroft's "Native Races," Vol. III, p. 470.

[4] "Annual Report of the Bureau of Ethnology," Vol. I.

[5] Mr. Holden uses, as an important link in his arguments, a figure engraved on a chalchiute (a sacred stone). He concludes it to be a representative of

of the cross and of the sun, that in both the left-hand priests are representatives of the god of war,[1] the right-hand priests being in both representatives of the god of rain and water.[2] In Mexico these deities frequently occupied the same temple.[3] He does not state his conclusions in regard to the central figures in the tablets. Mr. Brinton thinks the central figure in the tablet of the cross is a rebus for the nature god Quetzalcohuatl. The cross was one of the symbols of Quetzalcohuatl, as such signifying the four winds of which he was lord. Another of his symbols was a bird. We notice the two symbols present in the tablet. Mr. Holden also finds that the glyph standing for this god occurs several times in the tables of hieroglyphics belonging to this figure.

According to these last views, then, the old Palenquians seem to have been a very religious people, and Quetzalcohuatl, the god of peace, seems to have been their principal deity, differing in this regard from Mexico, where all honor was paid to the god of war. We are not given any explanation of the Temple of the Three Tablets, but the other temples have to do with the worship of this benign deity. The beautiful stucco-work in the Temple of the Beau-relief, Mr. Holden thinks, also represents him. At the Temples of the Cross, if we be right as to the meaning of the central figure, the priests of the god of war and the god of rain do honor to him.[4]

---

Huitzilopochtli, the god of war, or rather the Maya representative of the Mexican god of that name. It is unfortunate that Prof. Valentine gives to this same figure a different significance. In the "Proceedings of the American Antiquarian Society," for April, 1884, in a paper on that subject, he concludes it to be a representation of a victorious warrior giving sacrifice to his god. The only persons entitled to speak on such subjects are those thoroughly acquainted with Maya Archæology. [1] Huitzilopochtli. [2] Tlaloc.

[3] Bancroft's "Native Races," Vol. III, p. 324.

[4] While such seem to us to be the results of Mr. Holden's labors, it must not be understood that he vouches for them. They must be regarded as per-

Statue. Palenque. (Smith. Inst.)

Mr. Bandelier makes a statement in regard to the cross which, if it be accepted, clears away a number of theories. He remarks: "The cross, though frequently used previously to the conquest by the Aborigines of Mexico and Central America as an ornament, was not at all an object of worship among them. Besides, there is a vast difference between the cross and the crucifix. What has been taken for the latter on sculptures, like the 'Palenque tablet,' is merely the symbol of the 'New-fire,' or close of a period of fifty-two years. It is the fire drill more or less ornamented." According to this view, these interesting tablets have reference to the ceremonies observed by the Mayas at the expiration of a cycle.[1]

It now only remains to describe some miscellaneous relics obtained from Palenque. But few specimens of pottery have been found. One of the early explorers speaks of finding an earthen vessel about a foot in diameter. Waldeck made an exploration in a portion of

sonal views which we express with some mental forebodings. In this matter we must abide by further investigations.

[1] Bandelier: "An Archæological Tour in Mexico," p. 184.

BAS-RELIEF ON THE LEFT-HAND OF THE ALTAR OF THE CROSS.
(Bureau of Ethnology.)

the palace area, and found a gallery containing hewn blocks of stone and earthen cups and vases, with many little earthen balls of different colors. He also speaks of a fine specimen of terra-cotta.[1]

The only statues known were found near the Temple of the Cross. There were two of them, and they supported a platform before the central doorway. One was broken to pieces; the other is here represented. (Page 612.) Many writers point out resemblances between this figure and some Egyptian statues.

In the village of Palenque, built in the wall of a church,[2] are two stone tablets which once stood on each side of the doorway of the altar containing the tablet of the cross.[3] Mr. Stephens was under the impression that they were originally placed on the altar of the tablet of the sun, and they are so represented in the cut on page 604. This plate represents the left-hand figure. The only explanation which we have met is contained in that oft-quoted article by Mr. Holden. He regards it as the representation of the Maya god of war. We are warned that the weak part of Mr. Holden's method is his assumption that the mythology of the Mayas was the same as that of the Aztecs, when the evidence is not strong enough to assert such a fact.[4]

We feel that we have been somewhat lengthy in describing the ruins of Palenque. But it is one of the most important groups of ruins that this continent possesses. The most faithful work on the part of the scholars of all lands has not as yet succeeded in clearing up the mystery connected with it. We can tread the courts of their ancient

[1] Bancroft's "Native Races," Vol. IV, p. 345.

[2] See Charney, in *North American Review*, 1881. They were formerly in a house.

citadel, clamber up to the ruined temples and altars, and gaze on the unread hieroglyphics, but, with all our efforts, we know but little of its history. There was a time when the forest did not entwine these ruins. Once unknown priests ministered at these altars. But cacique, or king, and priest have alike passed away. The nation, if such it was, has vanished, and their descendants are probably to be found in the savage tribes of Yucatan to-day. "In the romance of the world's history," says Mr. Stephens, "nothing ever impressed me more forcibly than the spectacle of this once great and lovely city, overturned, desolate, and lost, discovered by accident, overgrown with trees for miles around, without even a name to distinguish it. Apart from every thing else, it was a mournful witness to the world's mutation.

> "'Nations melt
> From power's high pinnacle, when they have felt
> The sunshine for awhile, and downward go.'"

The ruins at Palenque have been so well known, that but little attention has been given to other ruins in the States of Tobasco and Chiapas; and yet, according to M. Charney, imposing ruins of great extent exist in the western part of Tobasco. At a place about thirty-five miles from San Juan, in a north-westerly direction, he found veritable mountains of ruins "overgrown with a luxuriant vegetation."[1] In the absence of cuts, we can not do more than give a general idea of these ruins.

He asserts that the whole State of Tobasco, and part of Chiapas, is covered with ruins. One landed proprietor informed him that, on his estate, he had counted over three hundred pyramids, all of them covered with ruins. In this connection he refers to the assertions of some of the early

[1] *North American Review*, February, 1881, p. 187.

Spanish voyagers, that, when skirting the shores of Tobasco, they "saw on the shore, and far in the interior, a multitude of structures, whose white and polished walls glittered in the sun." On one large pyramid, one hundred and fifteen feet high, he found the remains of a building two hundred and thirty-five feet long.

This building is named the palace. In this building we met with the type that we have learned is the prevailing one further south—that is, three parallel walls, forming two rows of rooms. In general, the rooms are not well arranged for comfort, according to our opinion; but they were, doubtless, well adapted to the communal mode of life prevalent among the Indians. M. Charney seems to have been strongly impressed with the number and importance of the ruins in this State; but, strangely enough, others have not mentioned them.[1] He says: "I am daily receiving information about the ruins scattered all over the State of Tobasco, hidden in the forests. . . . The imagination fails to realize the vast amount of labor it would involve to explore even a tithe of these ancient sites. These mountains of ruins extend over twelve miles. We still see the hollows in the ground whence the soil was taken for the construction of these pyramids. But they did not consist merely of clay; bricks, too, entered into their construction, and there were strengthening walls to make them firmer. These structures are more wonderful than the pyramids and the other works at Teotihuacan, and they far surpass the pyramids of Egypt."

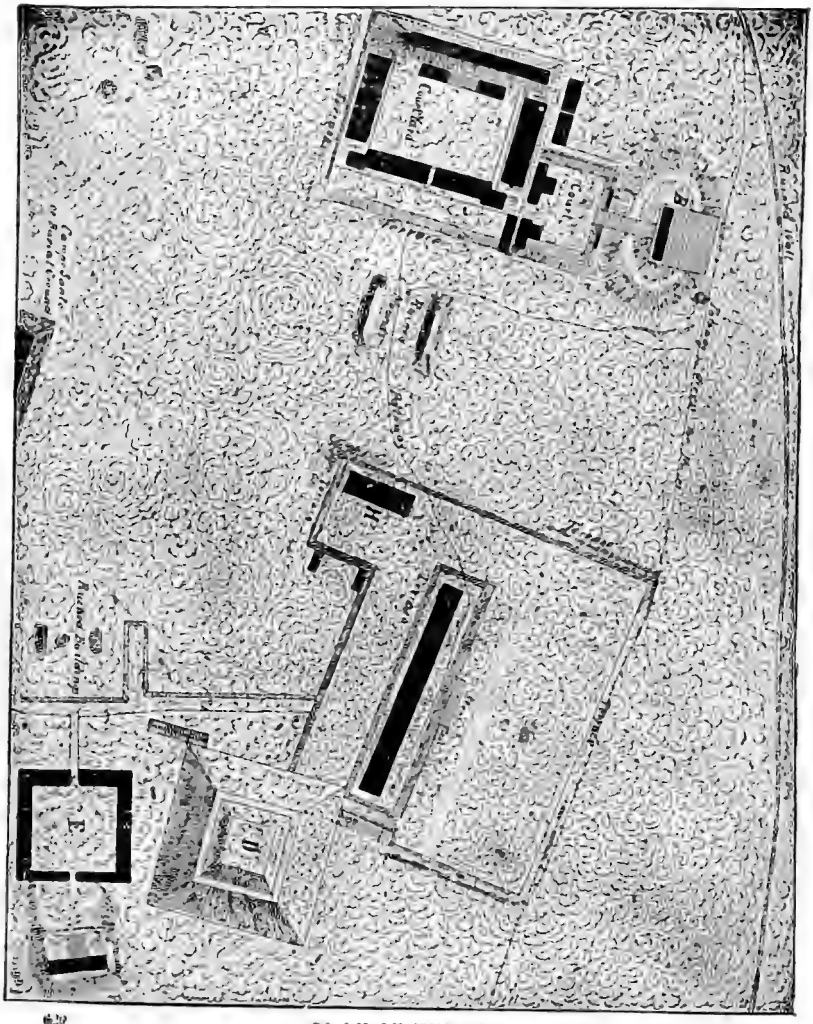
In the neighboring State of Chiapas, we find the location of several groups of ruins. At Ocosingo, we have the evident traces of a large settlement. Mr. Stephens mentions four or five pyramids crowned with buildings. Immediately

[1] Bancroft's "Native Races," p. 287.

beyond these pyramids he came upon an open plateau, which he considered to have been the site of the city proper. It was protected on all sides by the same high terraces, overlooking for a great distance the whole country around, and rendering it impossible for an enemy to approach from any quarter without being discovered. "Across this table was a high and narrow causeway, which seemed partly natural and partly artificial, and at some distance on which was a mound, with the foundation of a building that had probably been a tower. Beyond this the causeway extended till it joined a range of mountains. . . . There was no place we had seen which gave us such an idea of the vastness of the works erected by the aboriginal inhabitants."[1]

The ruins at Palenque are considered by some to belong to the ancient period of Maya architecture; those we are now to examine are regarded as of more modern date. This is at least true with respect to the time of their abandonment. Though the efforts of explorers in Yucatan have been attended with rich results, still few places have been fully described. The country is fairly dotted with sites of aboriginal settlements. In all probability there are many that are yet unknown. Hidden in tropical jungles, they are fast falling into meaningless mounds of *débris*. The early Spanish explorers, skirting the coasts of Yucatan, gazed in astonishment at the views they occasionally obtained of pyramids crowned with temples and imposing buildings. But this gleam of historic light was but momentary in duration. It served but to throw a sunset glow over the doomed tribes and civilization of the Mayas. By the aid of that dim, uncertain light, we are asked to recognize a form of government and society which, under the clearer light of modern

[1] "Central America," Vol. II, p. 261. At this time Mr. Stephens had not seen the ruins at Palenque, and those in Yucatan.



PLAN OF UXMAL.

researches, is seen to bear an equally strong resemblance to institutions more in keeping with the genius of the New World.

The few travelers who visit the country are generally content to revisit and describe places already known. This is not strange, considering the difficulties that have to be overcome. The country swarms with savage Indians, who are jealous of the intrusions of strangers. We have, however, this consolation: those ruins already brought to light show such a uniformity of detail, that it is not probable that any new developments are to be expected. The ruins that are already known are sufficient to illustrate all the points of their architecture; and we can draw from them, doubtless, all that can be drawn from ruins, throwing light on the civil organization of the Mayas of Yucatan.

We can not do better than to describe some of the more important ruins, and then notice wherein others differ. Examining the map, we see that Uxmal[1] is one of the first ruins that would meet us on arriving in the country. It is more fully described than any other, though perhaps not of greater importance than those of some other localities. As at Palenqué, while the principal ruins are said to be situated in a small area, the whole section abounds in mounds and heaps of *débris*, and it may well be said that buildings as imposing as those already described are concealed in the forest not far removed from the present ruins. A plat of ground seventeen hundred feet long by twelve hundred feet wide would include the principal structures now known.

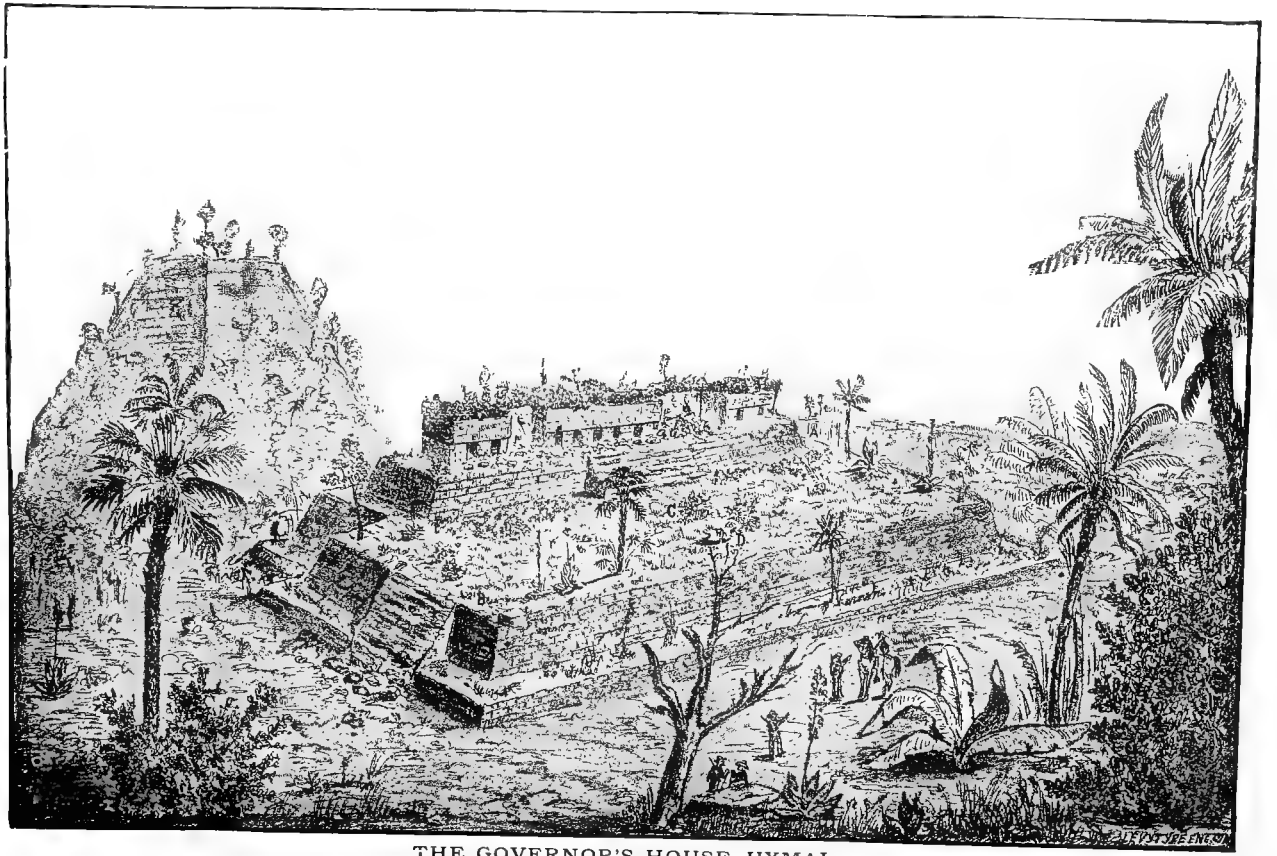
The most imposing single edifice here is that called the Governor's House. The only reason for giving it this name is its size. Being of large size, and located on a terraced pyramid, it has received a name which may be very inappro-

[1] Pronounced "oosh-mal."

priate. We will first notice the pyramid on which the building stands. At Palenque the pyramid rises regularly from the ground. Here the pyramid is terraced. In order to understand clearly the arrangement of these various terraces, we introduce this drawing. The base is a somewhat irregular figure, though nearly a square. Another pyramid cuts into one corner of the terrace. The first terrace is about three feet high, fifteen feet broad, and five hundred and seventy-five feet long. The second terrace is twenty feet high, two hundred and fifty feet wide, and five hundred and forty-five feet in length. The third terrace, on which the building stands, is nineteen feet high, and its summit platform is one hundred by three hundred and sixty feet. The height of this platform above the general surface is a little over forty feet.[1]

The material of which the pyramid is composed, is rough fragments of limestone, thrown together without order; but the terraces were all faced with substantial stone work. At the time of Mr. Stephens's visit the facing of the second terrace was still in a good state of preservation. Charney believes the platform was paved with square blocks. This pyramid was not entirely artificial—they took advantage of a natural hill, as far as it went. No stairway or other means of ascent to the first terrace is mentioned. From its low height, probably none was needed. The second terrace being twenty feet high, some means of ascent was required. This was afforded, as seen in the drawing, by an inclined plane, at the south side one hundred feet broad. From the second terrace a grand staircase, one hun-

[1] Our principal authority on the ruins of Yucatan is Mr. Stephens, whose work, "Incidents of Travel in Yucatan," in two volumes, is all that can be desired. Mr. Bancroft, in "Native Races," Vol. IV, has gathered together whatever of worth there is in the writings of various explorers.



THE GOVERNOR'S HOUSE, UXMAL.

dred and thirty feet wide, containing thirty-five steps, led up to the summit of the third terrace.

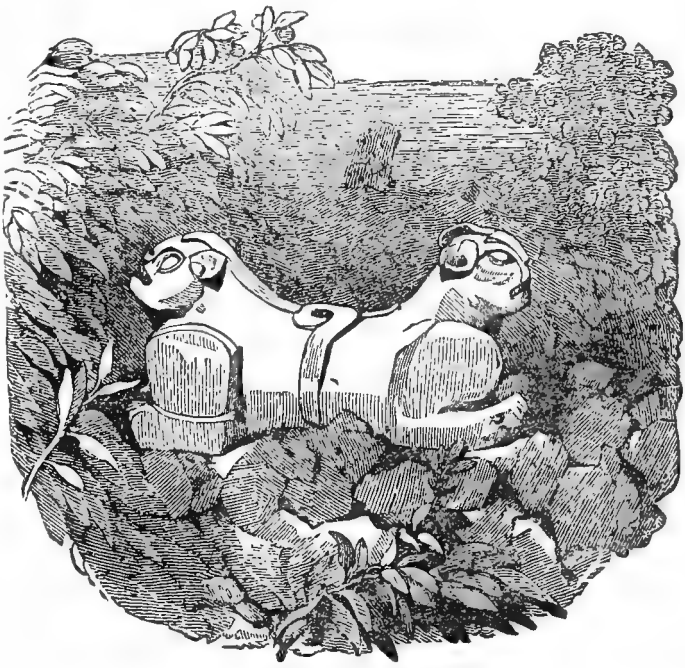
No buildings or other ornaments are mentioned as having been found on the lower terrace. The wide promenade of the second one supported some structures of its own, but they were in too dilapidated a condition to furnish a clear idea of their original nature, except in one instance—that is of the building at A of the drawing. This building was ninety-four feet long, thirty-four feet wide, and about twenty feet high.

The roof had fallen in, so that we do not know the arrangement of the rooms in the interior. The simplicity of ornaments on the outer wall is commented on. Instead of the complicated ornaments, so apparent on the buildings of Yucatan, the only ornament in this case was a simple and elegant line of round columns, standing close together, and encircling the whole edifice. At regular intervals on the upper cornice appeared a sculptured turtle. From this circumstance, the building was named "The House of Turtles." No steps lead to the terrace below or to the one above. "It stands isolated and alone, seeming to mourn over its own desolate and ruinous condition."

At B, along the south end of the terrace, there was a long, low mound of ruins, and arranged along its base was a row of broken columns about five feet high and nearly five feet in circumference. Some have supposed, from this, that columns extended along the entire promenade of the second terrace. This would indeed give it a very grand appearance; but there is no foundation for such a view. East of the central stairway at C, was a low, square inclosure. This contained a standing pillar, now in a slanting position, as if an effort had been made to throw it over. It was about eight feet above the surface of the ground, and five below.

The Indians called it a whipping-post. Mr. Stephens thinks it was connected with the ceremonial rites of an ancient worship. He found a similarly shaped stone in connection with other buildings at Uxmal, and at other places in Yucatan.

Still further east, at D, he found a rude, circular mound of rough stones. On excavating this, he was rewarded by the discovery of a double-headed monument. It was carved

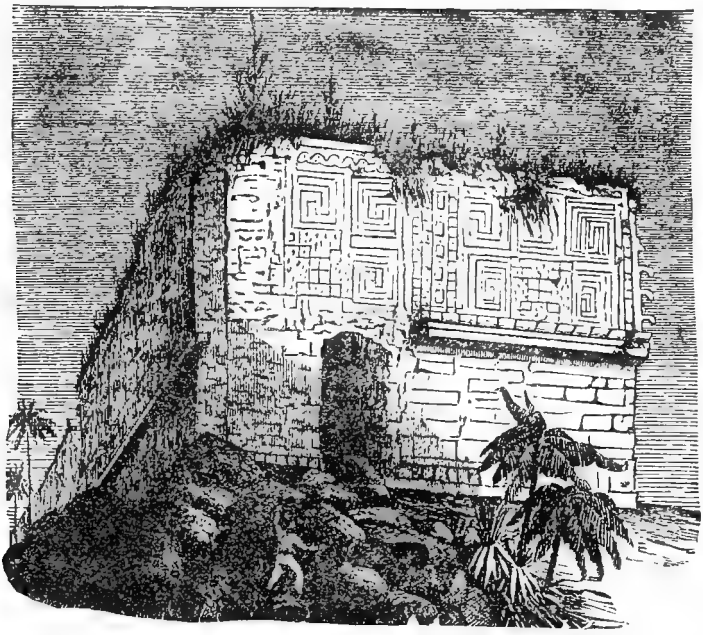


Two-headed Monument, Uxmal.

out of a single block of stone. The probabilities are that it was purposely buried when the natives abandoned Uxmal, to prevent the Spaniards from destroying it. Scattered about over this platform were found excavations much like well-made cisterns in shape. As it is something of a mystery where the inhabitants obtained water, it is a reason-

able supposition that these were really cisterns. Similar excavations were discovered all over the area of the ruins.

Leaving the second terrace, and passing up the ruined stairway, we find ourselves on the summit platform of the third terrace, and see before us one of the long, low, richly ornamented buildings of Yucatan. This cut presents us an



End View.

end view, but gives us a good idea of the building as a whole. It does not occupy the entire summit; there is a wide promenade all around it. Its length is three hundred and twenty-two feet; its width, thirty-nine feet, and its height twenty-six feet.

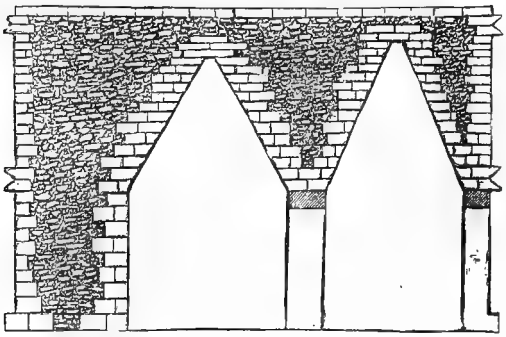
In order to understand clearly the arrangement of the rooms, we will here give the ground-plan. The two end portions may have been additions to the original structure.

There are, at any rate, reasons for supposing the small rooms in the two recesses of later construction. We must notice that we have here the usual three parallel walls and

Ground Plan.

two rows of rooms. All the walls are massive, the rear wall especially so. It is nine feet thick throughout, and so are the transverse walls of the two recesses. Supposing the rear wall might contain rooms, Mr. Stephens made an opening through it. He found it to be solid.

The stones facing the walls and rooms are smooth and square, and the mass of the masonry consists of rough, irregular fragments of stone and mortar. This cross-section makes this meaning plain. We can but notice what an immense amount of useless labor was bestowed on the walls and ceilings of this building. We gather more the idea of galleries excavated in a rocky mass, than of rooms inclosed by walls. The rooms are very plain; no attempt at decoration was observed. In one or two instances the remains of a fine coat of plastering was noticed. "The floors were of cement, in some places hard, but by long exposure broken, and now crumbling under foot." The arches supporting the roof are of the same style as those at Palenque—that is, triangular,—though, in this case, the ends of the projecting stones were



Cross-section of Uxmal.

beveled off so as to form a smooth surface. At Palenque, we remember, the inequalities were filled with cement. Across the arches were still to be observed beams of wood, the ends buried in the wall at both sides. The supposition is that they served to support the arches while building, and afterwards for the suspension of hammocks.[1]

There are no openings for light and ventilation, consequently some of the rear rooms are both damp and dark. The lintels over each doorway were of wood. This was the common and ordinary material employed for lintels in Yucatan, though in one or two instances stone was used. They used for this purpose beams of zapote, a wood noted for its strength and durability. Some inner lintels still remain in place. The one over the central doorway of the outer wall was elaborately carved, the others were plain.

The outside of the building is also of interest to us. By a careful examination, we notice a cornice just above the doorway. The wall below the cornice presents a smooth surface of limestone, no traces of plaster or paint appearing; above the cornice the façade is one solid mass of rich, complicated, and elaborately sculptured ornaments. This is not stucco work, as at Palenque, but the ornaments are carved on stone. Mr Stephens tells us, "Every ornament or combination is made up of separate stones, each of which had carved on it part of the subject, and was then set in its place in the wall. Each stone, by itself, is an unmeaning fractional portion, but placed by the side of others, makes part of a whole which, without it, would be incomplete."

It is not possible to give a verbal description of all of

[1] Mr. Stephens thinks they were for the support of the arches, while building. As, however, it is almost certain they constructed this arch over a solid core of masonry, which they afterwards removed (see "Contributions to N. A. Ethnology," Vol. IV, p. 262), they could not have been intended for such use.

the ornaments; we can notice but few. Over each doorway was represented a person apparently seated on a sort of throne, having a lofty head-dress, with enormous plumes of feathers falling symmetrically on each side. Though the figures varied in each case, in general characteristics they

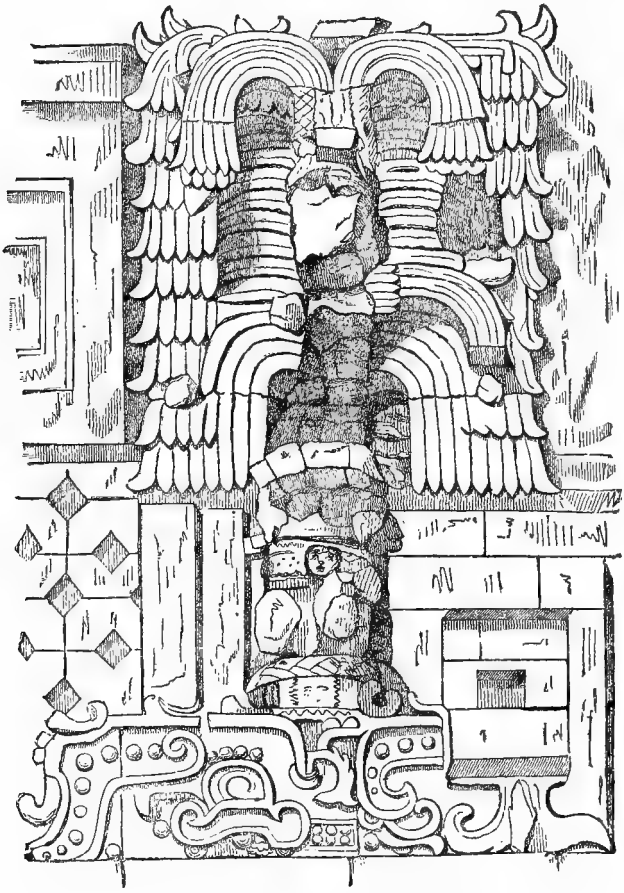


Figure over the Doorway.

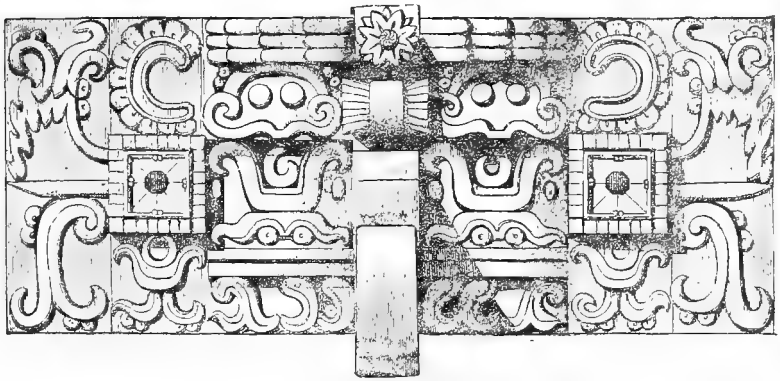
were the same as the one here represented, which was the figure over the central doorway of the building.

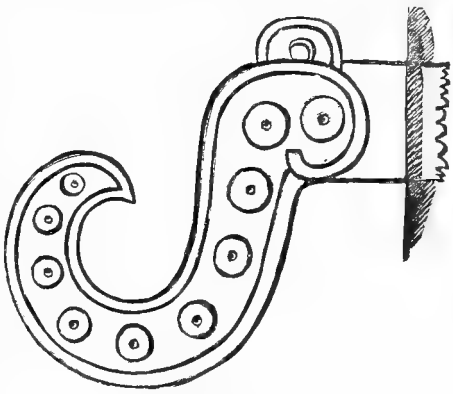
Among the most commonly reappearing ornaments at Uxmal, and at other places, is one that has received the

name of the "Elephant's Trunk," and has given rise to no little discussion. One occurs immediately above the figure. Part of this ornament is represented in this plate. The



Ornament over the Doorway.

central part of this figure, which appears as a plain band, is in reality a curved projecting stone, which, when looked at sideways, has the appearance given in this cut. Though requiring a little imagination, the majority of travelers see in this some monster's face. The eyes and teeth are seen in the first engraving. This projecting stone is the nose.



Elephant's Trunk.

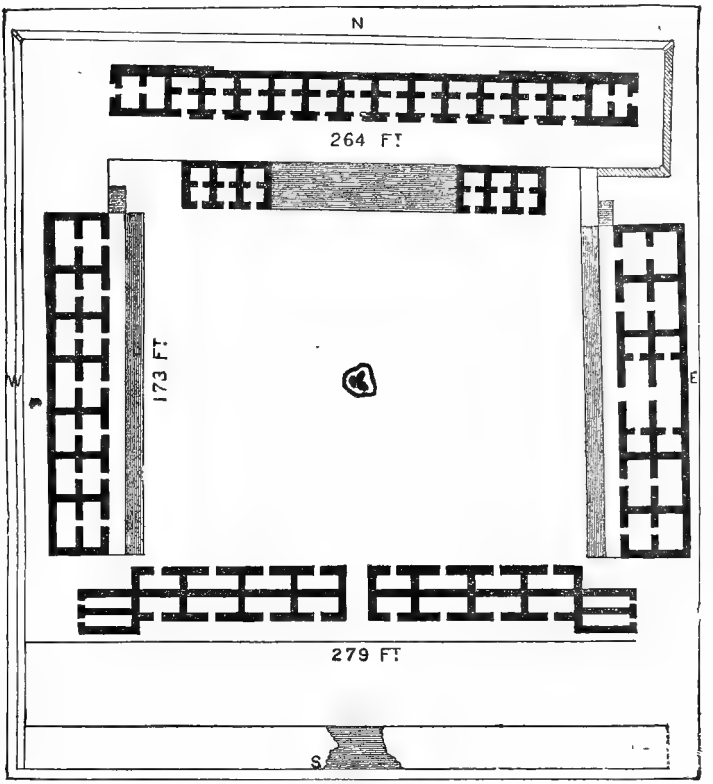
We stand in amazement before this sculptured façade. We must reflect that its builders were not possessed of metallic tools. It extends entirely around the building, though the end and rear walls are not as elaborately decorated as the front. A little calculation shows that it contains over ten thousand square feet of carved stone. The roof of

the building was flat. It had been covered with cement. But vegetation had somehow acquired a foothold, and the whole is now overgrown with grass and bushes. Such is a brief description of this "casa." Hastening to ruins, it appeals powerfully to the imagination. It is a memorial of vanished times. We wonder what of the strange people that pressed up these stairs and entered these rooms? For many years it has been abandoned to the elements. Year by year portions of the ornamented façade fall. Though the walls are massive and the roof is strong, it is but a question of time when a low mound of ruins will alone mark its site.

Like the palace at Palenque, this structure has given rise to conflicting theories as to its use. While many of the writers on this subject claim that it was the residence of royalty, there are, on the other hand, those who think it is simply a communal house of village Indians, or the official house of the tribe. In whatever light we shall ultimately view it, it is surely an interesting monument of native American culture. The labor necessary to rear the terraced pyramid, even though advantage was taken of a natural eminence, must have been great. The building itself, though not of great dimensions, except in length, must have required the labor of a large number of Indians for a long time. For purposes of defense, the location, from an Indian point of view, was an excellent one, since with them elevation constitutes the principal means of defense. The terraces could be easily ascended from but one point, where an enemy could be easily resisted. In a general way, it may be regarded as a representative of Yucatan buildings, and so we will be able to more rapidly describe the remaining structures.

On the general plan we see, to the north of the structure

we have just described, a group of ruins marked "C." This is regarded as the most wonderful collection of edifices in Yucatan, and as exhibiting the highest state of ancient architecture and sculpture in North America. They are known as the "Nunnery," which we think is a very absurd



Plan of Nunnery.

name. The pyramid on which they stood is also terraced, though on one side only. We give a drawing showing the position on the summit platform of the four buildings forming this group. Since we have so many ruined structures to describe, we must avoid such details as will prove tiresome. We will give in a note the dimensions of these buildings,

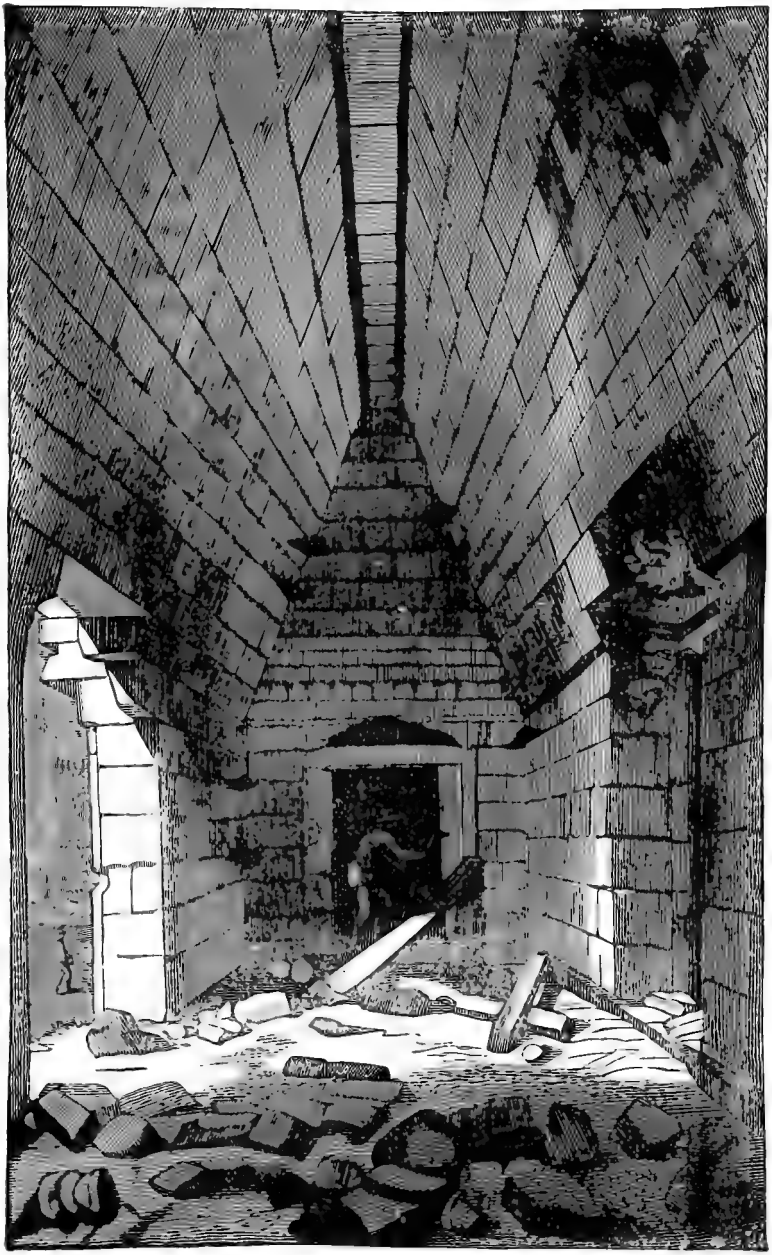
and of the pyramid, and pass at once to some points of special interest.[1]

Traces of stairways are mentioned as leading up to the terrace, but none of the steps remained in place. The southern building is seen to have doors in both the court and terrace walls, but in this case the middle wall is unbroken. All the rooms of this building are single. In the plan it appears divided into two buildings; the opening is, however, but a triangular arched doorway, through which access was had to the court.

There is no one to dispute our right of way, and so, climbing up the ruined stairs, and passing through the deserted gateway, we emerge into a court-yard, now silent and deserted and overgrown with bushes and grass. It was once paved and covered with cement, and in the center are the remains of a stone pillar, similar to that in front of the governor's house. When the houses were all occupied this court must have presented an animated scene. But, now that the buildings are tenantless and going to ruin, it must impress all beholders with a sense of the changes wrought by time.

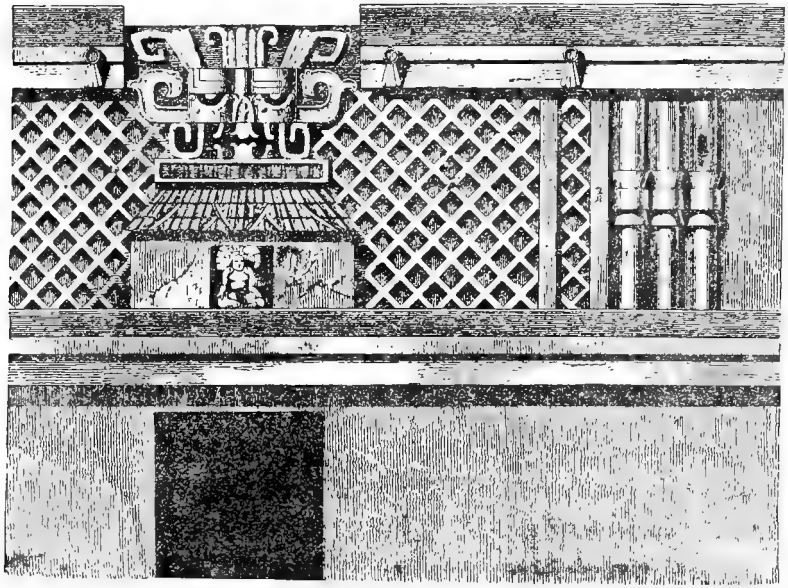
It will be noticed that the northern building does not

[1] The pyramid is three hundred and fifty feet square at the base and nineteen feet high. The terraces are along the south side. The lowest terrace is three feet high and twenty feet wide. The second is twelve feet high and forty-five feet wide. The third is four feet high and five feet wide. The building on the south side is two hundred and seventy-nine feet long, twenty-eight feet wide, and eighteen feet high. The north one is two hundred and sixty-four feet long, twenty-eight feet wide, and twenty-five feet high. The eastern one, one hundred and fifty-eight feet long, thirty-five feet wide, and twenty-two feet high. The western one, one hundred and seventy-three feet long, thirty-five feet wide, and twenty feet high. (Bancroft's "Native Races," Vol. IV, p. 174.) The area of the court is two hundred and fourteen feet by two hundred and fifty-eight feet. It is about two and a half feet lower than the buildings on the eastern, western, and southern sides. There are seventy-six rooms in the four ranges of buildings, and twelve more in the facings of the terrace of the north building, to be described. In size the rooms vary from twenty to thirty feet long by from ten to twelve feet wide.



ROOM IN NUNNERY

stand in quite the same direction as the southern one, which detracts from the symmetry of the whole. It stands on a fourth terrace, twenty feet higher than the others. A grand, but ruined, staircase leads up the cetner of the terrace. At each end of this staircase, built against the terrace, could be distinguished the ruins of a small building. There is one unusual feature about the ruins in the eastern building. In general, only two rooms open into each other. In this

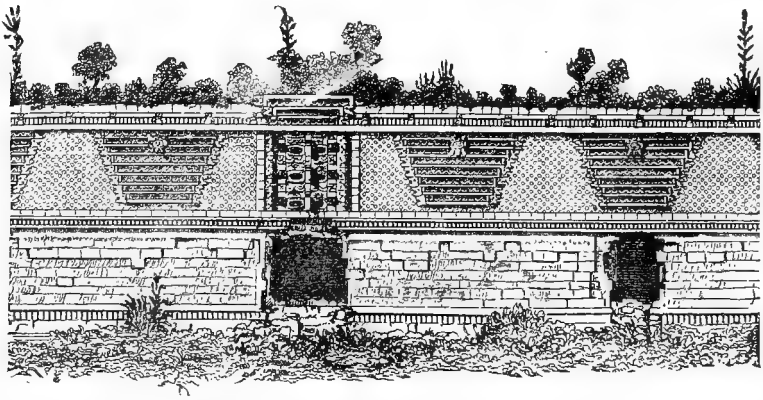


Façade, Southern Building.

building, however, six rooms form one suite, and, furthermore, all the doorways of this suite are decorated with sculpture. As this suite of rooms was evidently a place of interest, we will introduce this illustration, which gives us a good idea of the appearance of the rooms on the inside. We would do well to compare this cut with that of the room in Pueblo Bonito (page 471). The arched roof is not a true arch, but simply the triangular arch we have already spoken of.

The principal attraction about these buildings is the beautiful façades which overlook the court-yard. They are pronounced by all to be the finest examples of native American art. With one exception, they are neither complicated nor grotesque, but chaste and artistic. As in the Governor's House, the part below the cornice is plain, but the remaining part, both front and rear, is covered with sculpture. On entering the court-yard from the arched gateway of the southern building, we notice that its façade is composed of diamond lattice-work and vertical columns, while over each doorway is something that resembles a house, with a human figure seated in a doorway. This cut represents but a small portion of this façade, but it gives us an idea of the whole.

The façade of the eastern building was in the best state of preservation of any. We give a section of this also. It

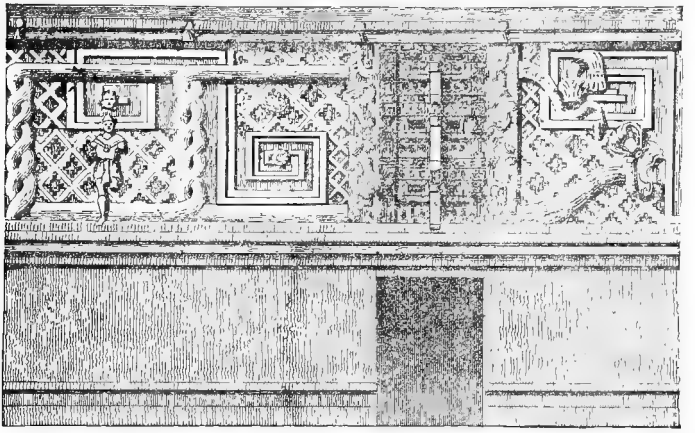


Façade, Eastern Building.

is the most simple in design also. The ornaments over the doorway, shown in the cut, consist of three of those mysterious masks, with the projecting curved stone, already described. "The ornaments over the other doorways are less striking, more simple, and more pleasing. In all of

them there is, in the center, a masked face, with the tongue hanging out, surmounted by an elaborate head-dress. Between the horizontal bars is a range of diamond-shaped ornaments, in which the remains of red paint are still distinctly visible, and at each end of these bars is a serpent's head, with the mouth wide open." It is necessary to examine the drawing attentively, to distinguish these features. Some think the masked face represents the sun.

The western façade is known as the Serpent Façade.



Serpent Façade, Western Building.

It was very much in ruins at the time of Mr. Stephens's visit. When entire, it must have been of great beauty. Two serpents are trailed along the whole front, and by the interlacing of their bodies divide the surface into square panels. In the open mouth of these serpents is sculptured a human head. The panels are filled with ornaments similar in design to those of the "Governor's House," and among the ornaments of each panel are found one or more human faces, while full-sized figures are not entirely absent. This cut represents but a small portion of the façade. It

gives us, however, an idea of the whole. We notice, over the doorway again, the elephant's trunk ornament.

The northern building, standing high above the rest, on its own terrace, was doubtless intended to have the grandest front of all. It was, however, in such a ruined state, and the few remaining fragments so complicated, that no drawings have been given us. Human figures are represented in several places; two are apparently playing on musical instruments. We recall that at Palenque, the roof of some of the temples bears a curious two-storied work, erected apparently for ornamental purposes. The same instinct reappears in this building. At regular intervals along the front they carried the wall above the cornice, forming thirteen turret-like elevations ten feet wide, and seventeen feet high. These turrets were also loaded with ornaments. Another curious feature about this building is, that it was erected over, and completely inclosed, a smaller building of an older date. Wherever the outer walls have fallen, the ornamented cornice of the inner building is visible.

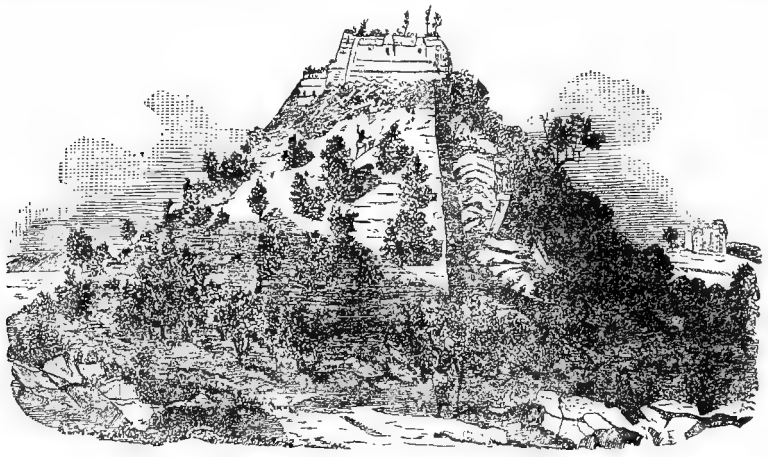
When we reflect on the patient labor that must have been expended on this pyramid and these buildings, we are filled with admiration for their perseverance and ingenuity. They had neither domestic animals or metallic tools. The buildings were massively built and richly ornamented. The sculptured portion covers over twenty-four thousand square feet.[1] The terraced mound supporting the house contained over sixty thousand cubic yards of materials, though this may not be wholly artificial. To our eyes, as these rooms had neither windows nor fire-places, they are not very desirable. But we may be sure that the builders considered them as models of their kind.

Leaving this interesting ruin, we will now visit one of

[1] Bancroft: "Native Races," Vol. IV, p. 179.

the temples. This is east of the Nunnery, and is marked "D" on the plan. The mound on which this building stands is high enough to overlook the entire field of ruins. This cut represents the eastern side of the mound, up which a flight of stone steps lead to the building on the summit. There are some grounds for supposing a grander staircase, supported on triangular arches, led up the western side.

The building on the top is not large—only seventy-two feet long, and twelve feet wide—and consists of but three rooms, none opening into each other. The front of the



Temple, Uxmal.

building, though much ruined, presented an elegant and tasteful appearance. There seems to be no doubt that this temple was the scene of idolatrous worship; perhaps of human sacrifices. In a legal paper which Mr. Stephens saw at Meridia, containing a grant of the lands on which these ruins stand, bearing date 1673, it is expressly stated that the Indians at that time had idols in these ancient buildings, to which, every day, openly and publicly, they burned copal. Nor is there any doubt that this was the continuation of an old custom. In the end room of this temple are

engraved two circular figures which, by some, are considered as proofs of the presence of Phallic worship.[1]

The buildings we have described will give us a very good idea of the structures of this ancient city. We have described but a few of them, but we have now only space to make some general observations. We wish to point out some resemblances to the ruins at Palenque. In both, buildings that served as temples were not large, but of small dimensions, and contained but few rooms. They occupy the summits of high pyramids. Such was probably the building on the summit of the pyramid at "F" (see plan). The buildings on the top of this pyramid, like that just described, had but three rooms. A very large pyramid is seen at "E." Our information in regard to it is very meager. A square platform was found on the summit. It is not unreasonable to suppose that this platform was intended to support a temple. But, before it was erected, the presence of the Spaniards put an end to all native building. There are, however, no proofs to be advanced in support of this statement; it is a mere suggestion.

We think the House of the Nuns illustrates the general plan of building employed at both places. That is as follows: They first erected a rectangular pyramid or mound, often terraced. Buildings were then put up parallel to the four sides, thus inclosing a court. At Palenque this court, as we have seen, was built over. Besides the House of Nuns, there are several other instances at Uxmal of courts with buildings on their sides. Looking at the plan, we see one at "G," and a still more ruined one between that and

[1] The dimensions of this mound are as follows: Length of base, two hundred and thirty-five feet; width of base, one hundred and five feet; height, eighty-eight feet. Though diminishing as it rises, it is not exactly pyramidal, but its corners are rounded. It is incased with stone, and is apparently solid from the plain.—Stephens's "Yucatan," Vol. I, p. 316.

"F." Such a court, with traces of ruined buildings, also exists between the nunnery and the temple, at "D." It is not improbable that groups of low ruins existing to the the westward of the structures described would be found, on examination, to reveal the same arrangements.

As for the grand terraced pyramid supporting the Governor's House, it may well be that other buildings would have been added in process of time, as population increased. It is not necessary to suppose they erected all the buildings around a court at once. It seems very reasonable to suppose the northern building of the House of Nuns the oldest. The direction is not quite the same as the others; it stands on a higher terrace; and, furthermore, the present exterior walls are simply built around the older building. It may be, however, that the great terraced mound of the Governor's House was intended to support but one building. As there is the best of reason for supposing that Uxmal was inhabited at the time of the conquest, there is nothing to forbid the conclusion that the erection of pyramids, temples, and buildings was still going on.

Hieroglyphics, which formed such an interesting feature at Palenque, are here almost entirely wanting. A few rows occur around the head of the figure over the principal doorway of the Governor's House. They are of the same general character as those already described, but are "more rich, elaborate, and complicated." As to the probable antiquity of these ruins, we must defer consideration until we become more acquainted with the ruins of Yucatan.

The places we have now described will make us acquainted with the general character of the ruins scattered all over Yucatan. We do not feel as if we would be justified in dwelling at any great length over the remainder, though one or two important places must be mentioned. A

word as to the frequency with which the ruins occur. We want to repeat that Yucatan, even to this day, is far from being thoroughly explored. Almost our only source of information is the writings of Mr. Stephens. But he only described a few places. In a trip of thirty-nine miles he took in a westerly direction from Uxmal he saw no less than seven different groups of ruins. Some of these, though in a very dilapidated state, presented points of great interest. When he started he knew of but few of those ruins. Some he heard of quite by accident while on his way, and some he first saw as he journeyed along the road. We must suppose the whole country equally well supplied.

After he had left Uxmal for good, at the village of Nochahab (see map), a little inquiry brought him information of so many ruins that he did not have time to visit them all. As to the question of use to which these buildings were applied, we must either suppose they had an immense number of temples and palaces—one or the other every few miles—or else they were the residences of the people themselves. And, though it may seem very strange that an imperfectly developed people should ornament so profusely and delicately their ordinary places of abode,[1] yet it is difficult to understand why they should rear such an abundance of temples and palaces.

At Kabah (see map) Mr. Stephens found a most interesting field of ruins, rivaling Uxmal in extent, if not surpassing it. One group of buildings, arranged much like the House of Nuns, has some interesting features about it. The highest terrace in this case is nearly square, and the building on its summit is nearly the same shape. We have here two rows of double rooms, separated by a middle wall, very massive, as if two of the typical Maya buildings had been

[1] See "Proceedings Am. Antiq. Society," April, 1880, p. 57.

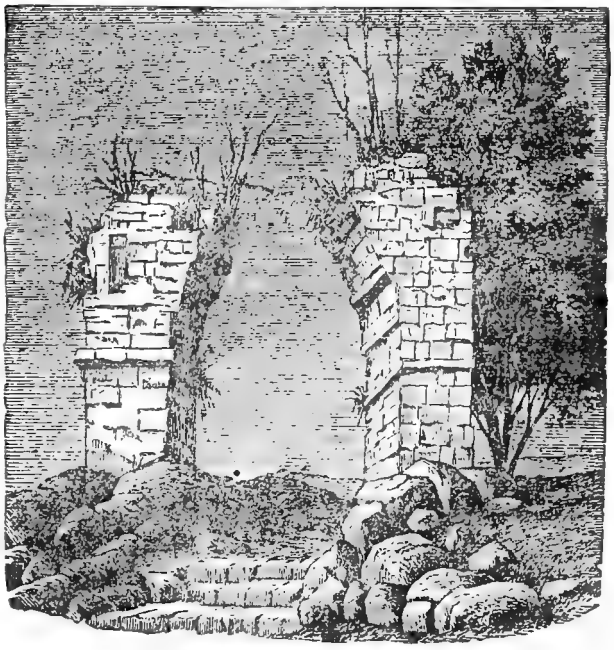
placed back to back. The front of this building was elaborately ornamented. In all the buildings at Uxmal the part above the cornice only was ornamented. Here the entire front was covered with carved stone. To make room for further ornaments the roof bore an additional appendage, like the second story of the Palenque temples. This building must have presented a wonderful appearance when entire.

Another feature at this place has reference to the pyramid. We are familiar with the idea of a terraced mound supporting buildings. In one of these Kabah structures the buildings are arranged in a different and suggestive way. That is, the pyramid was terraced off. There were three ranges of buildings, the roof of one range forming a promenade in front of the other. In another of the Kabah structures was found a wooden lintel, elegantly carved. Mr. Stephens tells us the lines were clear and distinct, and the cutting, under any test, and without any reference to the people by whom it was executed, would be considered as indicating great skill and proficiency in the art of carving on wood. At the expense of a great deal of hard work, he succeeded in getting this lintel out and removed to New York, where it was unfortunately destroyed by fire.

They worked stone to better advantage at Kabah than at Uxmal. For the first time we meet with lintels of stone and a doorway with carved jambs. The lintels were supported in the center by a pillar. The pillars were rude and unpolished, but they were not out of proportion, and, in fact, were adapted to the lowness of the building. We will only mention one more structure. This is a lonely arch, of the same form as all the rest, having a span of fourteen feet. It stands on a ruined mound, disconnected from every other structure, in solitary grandeur. "Darkness rests upon its

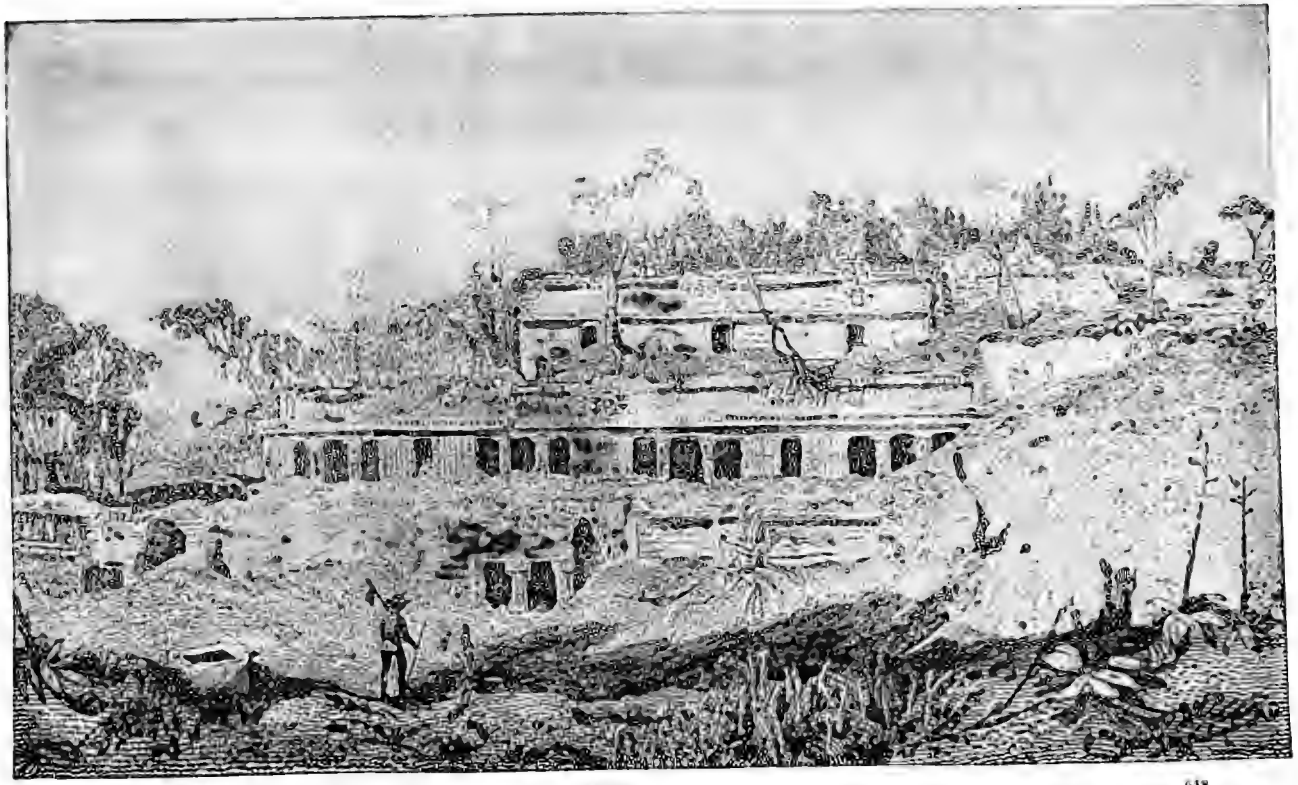
history, but in that desolation and solitude, among the ruins around, it stood like the proud memorial of a Roman triumph." There was the usual pyramid with a temple. In a plan given of the field of ruins seventeen groups are seen, and, without a doubt, many more exist in the immediate forest.

M. Charney has of late years made a discovery which conclusively shows that this was an inhabited place at the



Arch, Kabah.

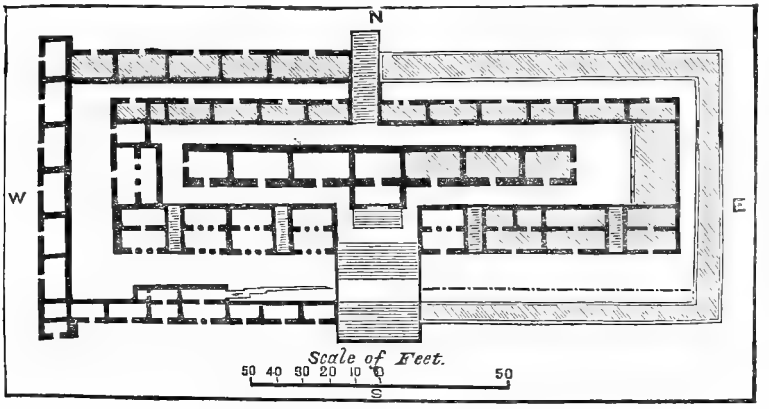
time of the conquest. In a room as ruined as the rest he discovered the stucco figure of a horse and its rider. They are formed after the Indian manner by an inexperienced hand guided by an over-excited imagination. Both figures are easily recognized. The horse has on its trappings. We can see the stirrups. The man wears his cuirass. We all know what astonishment the appearance of men on horse-



ZAYI. 648

back produced among the Indians, and so we are not at a loss to divine the cause which led to the construction of this figure. We must remember Mr. Stephens was hurried for time. Portions of this figure were mutilated, and other portions had been covered over by a layer of stucco, which Charney had to remove before the figure could be distinctly made out.[1]

Within a radius of ten miles from Kabah are located no less than six so-called cities. The general appearance of all is the same—low ranges of buildings on terraced mounds, and ornamented façades. One of these places, by the name of Zayi, is of interest to us, because it gives us a hint as



Plan of Zayi. (Bureau of Ethnology.)

to how these people constructed their buildings. Amongst other buildings they found one large terraced mound, with buildings arranged on it in a very significant manner. There were three ranges of buildings, one over the other—the roof of one range on a level with the foundation of the range above. A grand stair-way led up the mound. This feature is illustrated in the plate opposite. We can imagine what a grand appearance must have been presented by

[1] *North American Review*, 1882.

this great terraced mound, when its buildings were all perfect.

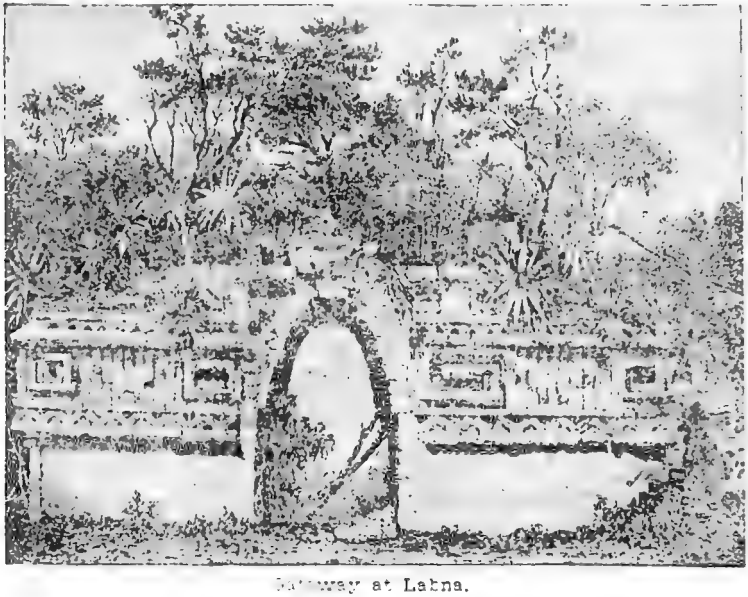
The plan of this mound and buildings is shown in the last cut. Ten rooms on the north side of the second range presented a curious feature. They were all filled up with a solid mass of stone and mortar, and this filling up must have gone on as fast as the walls rose, and the arched ceiling must have closed over a solid mass. A very reasonable explanation is given of this state of things by Mr. Morgan.[1] He considers that such was the rudeness of mechanical knowledge among these people that the only way they could construct their peculiar arched roof was to build it over an internal core of masonry. Once put together over such a core, and carried up several feet, the down weight of the arch would articulate and hold the mass together. Then the core of masonry would be cleaned out, and the room was ready for use. If this be true, it follows that these rooms were the last erected. They were not yet cleared out when the operations of the Spaniards put an end to all native building. We must notice the structures at Zayi are in as ruined a condition as the others—thus strengthening the conviction that their abandonment was at about the time of the conquest of the peninsula.

We have not space to follow Mr. Stephens in all his journey. Every few miles he came across one of these peculiar structures. A common design is apparent in all; but all are alike enveloped in mystery. At Labna he found an extensive field of ruins, equal in importance to any in Yucatan. The next illustration represents an arched gate-way, which reminds us of that in the "House of Nuns." Passing through this he found himself in a ruined court-yard, fronting which were the remains of buildings; but this was

[1] "Contributions to North American Ethnology," Vol. IV, p. 267.

only one of many groups of ruins, and Labna was but one of many places visited. At Labphak Mr. Stephens found "the tottering remains of the grandest structure that now rears its ruined head in the forests of Yucatan." This was a terraced mound, faced by buildings on three sides, leaving an immense stair-way occupying the fourth side.

Small interior stair-ways are mentioned in this building, but no particular description is given of them. At two



Gateway at Labna.

places sculptured tablets were found. These tablets are worthy of notice. They were the only ones Mr. Stephens found, except at Palenque. It will be seen, on the map, that this ruin is nearer Palenque than any of the places in Yucatan yet described. Stucco ornaments, so apparent at the latter place, were now becoming numerous again. At Uxmal stone for building could be had in the greatest abundance—it was not as plenty here. The builders, apparently, adapted their ornamentation to the material at hand; and, while at

Palenque they employed stucco in ornament, at Uxmal they carved stone.[1]

We must now leave this interesting section of Yucatan, though only a few places have been mentioned. The reader is well aware of the difference of opinion with which these ruins are viewed. Some of them are unquestionably temples. If we regard the others as palaces and the public buildings of great cities, we are at once puzzled to account for their great numbers. If we look on the majority of them as communal residences of the inhabitants, we are amazed at the mass of decorations with which they are adorned. But our admiration stops there—we are accustomed to speak of them as stately edifices. This is owing to their exterior ornaments, and their position on terraced mounds. The houses are often of great length, but not striking in other regards. The rooms, in the majority of cases, are small, low, dark, and ill ventilated. A great amount of useless labor was bestowed upon the walls, which were unnecessarily massive.

Near the center of the northern part of the peninsula is seen a place marked Chichen, to which is generally added the word Itza, making the entire name of the place Chichen-itza. In this case the ancient Maya name has come down to us with the ruins—Chichen meaning the "mouth of wells," having reference to two springs which supplied the place with water. Itza is the name of a branch of the Maya people. This place is of interest to us in several ways. It was, unquestionably, a renowned city in aboriginal times. Here the Spaniards met with a very severe repulse. As a ruin it attracted the attention of early writers, and it has been the subject of antiquarian research in recent times. The description of the buildings will not de-

[1] Stephens's "Yucatan," Vol. II, p. 164.

tain us long. They are, evidently, the work of the same people as those whose structures we have already described.

One of the most important buildings is known as the Nunnery, reminding us at once of the collection of buildings of that name at Uxmal. In this case, however, the pyramid is represented by a solid mass of masonry one hundred and twelve by one hundred and sixty feet, rising with perpendicular sides to the height of thirty-two feet. This is seen to be a departure from the method of constructing pyramids hitherto described. The proprietor of the estate on whose grounds these ruins are located used this mound as a stone-quarry. An excavation of thirty feet revealed no secret chambers.

The probabilities are that it is solid throughout. A grand staircase, fifty-six feet wide, leads up to the top of this mound. Mr. Stephens tells us that three ranges of buildings occupied the summit, and his drawings represent the same. The roof of the one forms a promenade in front of the one above. So each range of buildings rests on a foundation solid from the ground. Mr. Bancroft describes this mound as having but two ranges of buildings on the summit. Of these buildings the second range was, seemingly, the most important. Several of its rooms contained niches in the back wall, extending from floor to ceiling. From traces still visible, they were once covered with painted ornaments. One of the rooms was fifty-seven feet long and nine wide.

In the rear wall of this room were nine of these niches. "All of the walls of this room, from the floor to the peak of the arch, had been covered with painted designs, now wantonly defaced, but the remains of which present colors, in some places, still bright and vivid; and among these re-

mains detached portions of human figures continually reappear, well drawn, the heads adorned with plumes of feathers, and the hands bearing shields and spears." To this pile of masonry, at one end, a wing had been attached. This building was similar in design to other buildings in Yucatan. Theoretically we would expect this wing to be much later in time than the buildings on the mound. That it is so, is proven by the fact that in two rooms the internal core of masonry, as described at Zayi, had not been wholly removed.

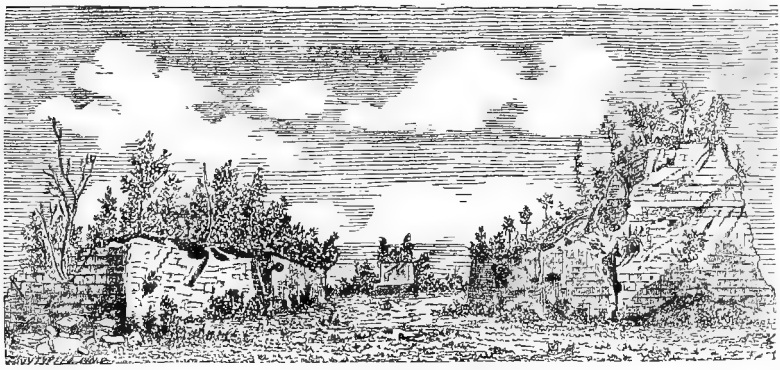
We have noticed in all these structures, the builders first threw up a mound or pyramid to support the building. In one of the Chichen edifices the earth had been excavated from all around it, so as to still present the appearance of a mound. Perhaps the most prominent object at this place is a stately pyramid, with an imposing building, represented in the plate opposite. The mound itself is nearly two hundred feet square, and rises to the height of seventy-five feet. On the west and north sides are ruined staircases.

On the ground, at the foot of the stairway on the north side, "forming a bold, striking, and well conceived commencement to this lofty range, are two colossal serpents' heads, ten feet in length, with mouths wide open, and tongues protruding. No doubt they were emblematic of some religious belief, and, in the mind of an imaginative people passing between them, to ascend the steps, must have excited feelings of solemn awe." The temple on the summit of this pyramid has some peculiar features about it. It is nearly square—forty-three by forty-nine feet—only one door in each side. In the room within, instead of partition walls supporting arches, were two immense beams, resting on square pillars, and supporting two arches—the only instance in the ruins of Yucatan of such use of beams.

We now wish to speak of one class of ruins which are

CASTILLO, CHICHEN-ITZA

present at Uxmal, but which we did not describe. They are two parallel walls. On the plan of Uxmal they are noticed between the Governor's House and the House of Nuns. This illustration represents this feature. These walls are each two hundred and seventy-four feet long, thirty feet thick, and twenty-six feet high. The distance separating them is one hundred and twenty feet. About one hundred feet from the north end, is seen a building fronting the open space between the walls. A building



Gymnasium, at Chichen-Itza.

stood in a like position at the south end. In the cut a stone ring is seen projecting from each side. On the rim and border of these rings were sculptured two serpents, represented on page 658. The general supposition is that this structure was used in the celebration of public games. Mr. Stephens refers us to the writings of Herrera, an early historian, for a description of a game of ball played at Mexico, where the surroundings must have been much the same as is here represented.

Most of the structures in Yucatan have been left in undisturbed quiet since the visit of Mr. Stephens. Five years after his visit, the Indians rose in revolt, and a large portion of country through which he traveled in perfect

safety has, since then, been shunned by cautious travelers. As he says, "For a brief space the stillness that reigned around them was broken, and they were again left to solitude and silence." At Uxmal, and some places near the coast, more recent travelers have investigated the ruins, wondered over them, and passed on, without materially adding to our knowledge respecting them. In 1873 a French scientist, Dr. A. Le Plongon, accompanied by his wife, visited Yucatan for the purpose of exploring the ruins. They spent a year in Meridia, thoroughly studying the customs of the country, and preparing for work

Ring.

Their first field of work was this ancient city, Chichen-Itza. As a result, he lays before us a picture of life and times not only vastly remote from us, but surpassing in wonder any thing hitherto presented. In the field of American antiquities we need scarcely be surprised at whatever conclusions are presented to us. We believe, however, we are not too harsh in saying that scholars, as a rule, consider Le Plongon as too much carried away by enthusiasm to judge coolly of his discoveries.[1] The most im-

[1] Short's "North Americans of Antiquity," p. 396; Charney: *North American Review*, October, 1880.

portant part of his discoveries seem to have been in the buildings in connection with the Gymnasium last described.

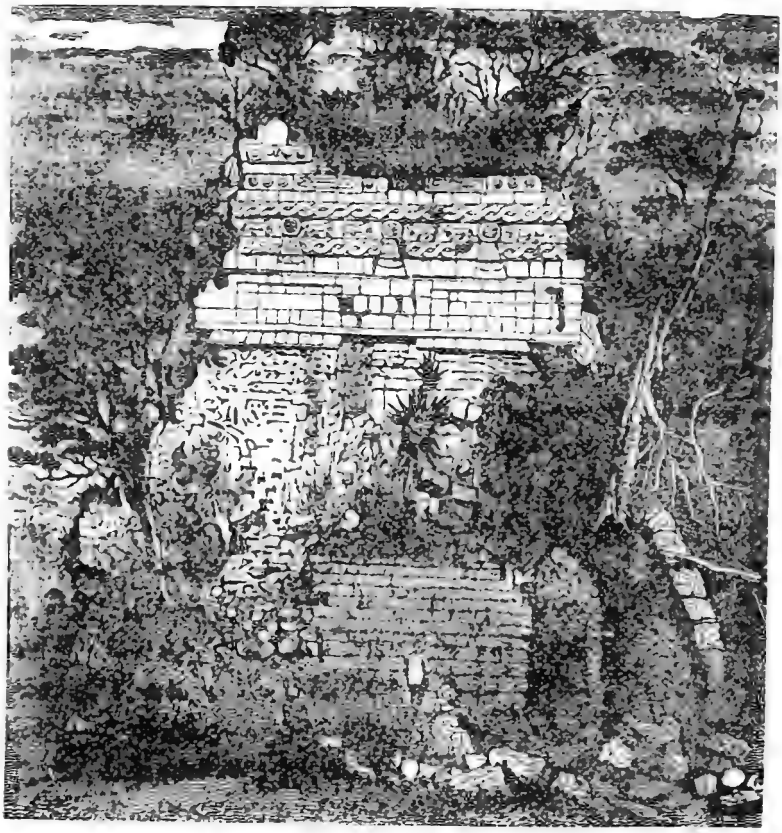
At the time of the Spanish conquest, a very common tradition among the natives was that, in ancient times, three brothers governed the country. This legend of three rulers in olden times, was not peculiar to the Mayas, but was found among all the Indian nations of Central America.[1] In our opinion this last statement at once shows we have here to deal with a question belonging to mythology and not to history. But M. Le Plongon considers the buildings at Chichen, especially those of the Gymnasium, illustrative of the lives of the three brothers, and of the queen of one of them. In brief, he tells us the names of these three brothers were, Chaac-Mol, Huuncay, and Aac. The first of these, Chaac-Mol, means Tiger King. It was he who raised Chichen-Itza to the height of its glory. M. Le Plongon would have us believe that the merchants of Asia and Africa traded in its marts, and that the wise men of the world came hither to consult with the H-men,[2] whose convent, together with their astronomical laboratory, is still to be seen. Aac was the younger brother of the three. He conspired against the life of Chaac-Mol, and finally killed him. The queen of Chaac-Mol then erected the buildings around the Gymnasium as his memorial.

At the south end of the eastern wall Mr. Stephens noticed two ruined buildings, an upper and a lower one, of which our next cut is a representation. He was struck with the remains of painting, which entirely covered the walls. He tells us the walls were everywhere covered with designs in painting, representing, in bright and vivid colors, human figures, battles, houses, trees, and scenes of domestic life. We

[1] "Proceedings Am. Antiq. Society," Oct., 1878, p. 73.

[2] Learned men of the Mayas.

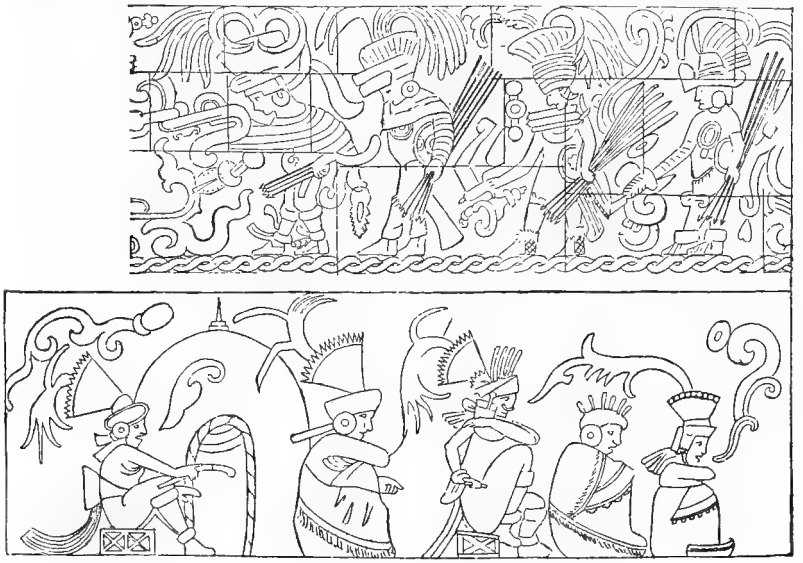
give, in a plate, detached portions of these figures. We must understand that, in the original, these were beautifully colored. The colors used were "green, yellow, red, blue, and reddish brown, the last being invariably the color given to human flesh." (Page 661.)



Building at end of Gymnasium.

M. Le Plongon contends that these paintings represent scenes in the lives of the three brothers and the Queen of Chaac-Mol, "in the funeral chamber." Says he: "The terrible altercation between Aac and Chaac-Mol, which had its termination in the murder of the latter by his brother, is

represented by large figures three-fourths life size."[1] And in another place he tells us: "The scenes of his death is impressively portrayed on the walls, which the queen caused to be raised to the memory of her husband, in the two exquisite rooms, the ruins of which are yet to be seen upon the south end of the east wall of the Gymnasium. The rooms were a shrine where the conjugal love of the queen worshiped the memory of her departed lover. She adorned



Painted Stucco-work.

the outer walls with his effigies, his totem-tiger, and his shield and coat-of-arms between tiger and tiger;[2] whilst on the admirably polished stucco, that covers the stones in the interior of the rooms, she had his deeds—his and her own life, in fact—painted in beautiful, life-like designs, superbly drawn, and sweetly colored."[3]

He tells us, further, that Aac, after the commission of

[1] American Antiquarian Society, October 1878.

[2] The tigers can be seen on the engraving of the gymnasium. (Page 660.)

[3] Proceedings American Antiquarian Society, April, 1877, p. 97.

his crime, fled to Uxmal for protection, where he built the edifice described as the "Governor's House." The seated figures over the central door-way (see page 630), he says, represents Aac. In the hieroglyphics around the head he finds the name. Although neither Mr. Stephens nor the other travelers mention any thing of the kind, he says that, under the feet of this figure, "are to be seen the bodies of three figures, two men and one woman, flayed."[1] Though

Queen Consulting the H-men.

the figures are headless, he has no doubt but that they represent Huuncay, Chaac-mol, and the queen, his wife. We are further told that the ruined structure on the second terrace, called the "House of Turtles," was Aac's private residence.

This wonderful story of the lives and adventures of the three brothers was revealed to the doctor by a careful study

[1] Proceedings American Antiquarian Society, April, 1877, p. 101.

of the detached painting mentioned by Mr. Stephens. One of the paintings which served him so good a turn is shown in the cut opposite, which he considers represents the queen, when a child, consulting one of the wise men as to her future destiny.[1]

Perhaps as interesting a portion of his discoveries as any, is finding sculptured figures of bearded white men on the pillars of the temple, and painted on the walls of Chaac-mol's chambers. He thinks they have Assyrian features. He also claims to have discovered figures having true Negro features.

As to the antiquity of this city he readily figures up nineteen thousand years; but this did not take him to the beginning. He arrives at this estimate in this way: To the north-east of the pyramid, we have described, are to be seen rows of small columns, which have excited the curiosity of all who have seen them. Mr. Stephens represents them in four rows, inclosing a rectangular area. M. Le Plongon says they surrounded three sides of a terraced pyramid, which once supported the main temple of the city. Mr. Stephens has no suggestions to offer as to their use.

Le Plongon claims they were used to measure time, and quotes from old authors to the effect, that each stone in them stands for twenty years; and, as there is always just eight stones in a column, each column means one hundred and sixty years. He counted one hundred and twenty of these columns—and then, as he says: "Got tired of pushing my way through the nearly impenetrable thicket, where I could see many more among the shrubs." From this number he computes nineteen thousand two hundred years.

[1] M. Le Plongon interprets the curved figures issuing from the throat of the wise-man. In the original, different parts of this figure were of different colors. The doctor frankly tells us, that "imagination does the greater part of the work" in his interpretation.

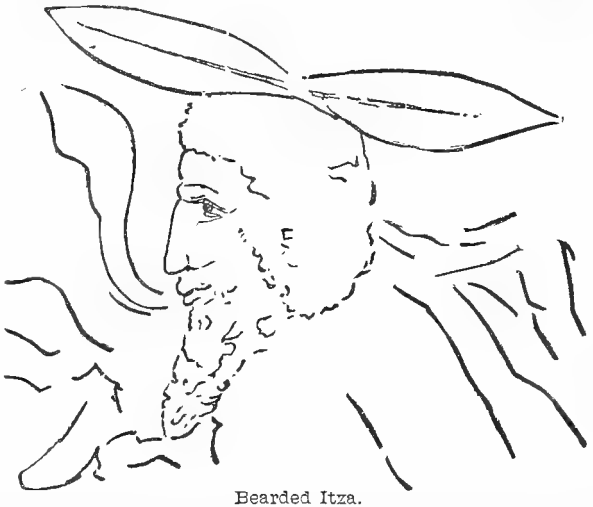
What shall we say to this story that M. Le Plongon brings us of ancient Maya civilization? It is unquestioned that he has expended a great amount of patient labor in his work, has braved many dangers, and is thoroughly in earnest. He has also spent years in the field, and ought to be well qualified to judge of the ruins. We believe, however, he is altogether wrong in his conclusions. The keystone of his discoveries—the one on which he relies to prove the accuracy of his methods—fails him. This was the discovery of the statue of Chaac-mol himself, which is here represented. He claims to have found it as the result of successfully rendering certain mural tablets in the funeral chamber, but a careful reading of his own account of the affair leaves us under the impression that the "instincts of the archæologist" had as much to do with it as any thing else.[1]

Chaac-mol.

Be that as it may, he certainly did find this statue buried in the ground. He is very positive it is Chaac-mol, claiming to have read the name readily in hieroglyphics on the ear-tablets. He says: "It is not an idol, but a true portrait of a man who has lived an earthly life. I have seen him represented in battle, in council, and in court receptions. I am well acquainted with his life, and the man-

[1] "Guided, as I have said, by my interpretations of the mural paintings, bas-reliefs, and other signs, . . . I directed my steps, perhaps inspired by the instincts of the archæologist, to a dense part of the thicket." Proceedings Am. Antiq. Society, April, 1877, p. 85.

ner of his death." This statue was seized by the Mexican Government, and taken to Mexico. Here a curious discovery was made. Another statue similar to this was already in the museum. This latter had been found not far from Mexico. Since then, still a third, smaller than the others, but evidently representing the same personage, has been discovered. In short, it has been shown that this is an idol, worshiped as well by the Astecs as by the Mayas, and,



Bearded Itza.

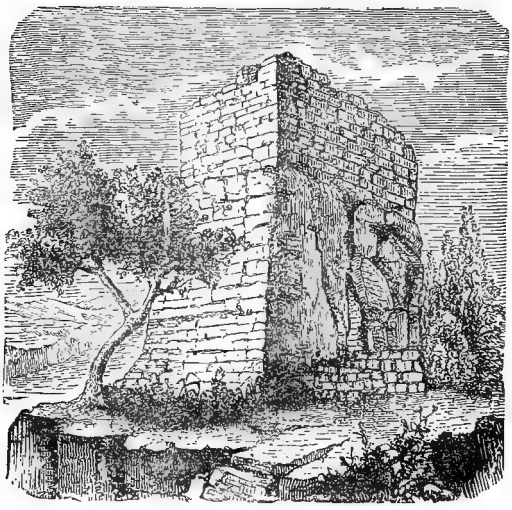
instead of being buried, as Le Plongon asserts, five thousand years ago, we have not much doubt it was buried to prevent its falling into the hands of the Spaniards.[1]

As to the antiquity with which Le Plongon would clothe Chichen, if his method be right, he has not more than made a beginning. Mr. Stephens counted three hundred and eighty of these same columns, and tells us there were many more.[2] We know no good reason for supposing Chichen was not inhabited at the time of the conquest.

[1] *North American Review*, October, 1880. And yet there are indications that this is a statue. See Bandelier's "Archæological Tour in Mexico," p. 74.

[2] Stephens's "Yucatan," Vol. II, p. 318.

The wooden beams and lintels in the temples have not yet decayed, and the masonry had not been cleaned out of some of the rooms. On this point we wish to make a suggestion, a mere hint. The pillars that supported the arches in the temple mentioned some pages back were covered with sculpture. Amongst some others, but very faintly represented, was the preceding figure of a bearded man. May it not be that it represents a Spaniard? We must recall the stucco figure of the horse and its rider at Kabah. It seems to us a reasonable suggestion that they should carve on the pillars of their temples representations of the Spaniards, for the Spaniards were twenty-five years in gaining a permanent foothold in Yucatan, and during that time the Indians would continue to build and ornament as before.



ARIZONA RUIN

# CHAPTER XV.

## THE CULTURE OF THE CIVILIZED TRIBES.[1]

DIFFERENT views on this question—Reason for the same—Their architecture—Different styles of houses—The communal house—The tecpan—The teocalli—State of society indicated by this architecture—The gens among the Mexicans—The phratry among the Mexicans—The tribe—The powers and duties of the council—The head chiefs of the tribe—The duties of the "Chief-of-men"—The mistake of the Spaniards—The Confederacy—The idea of property among the Mexicans—The ownership of land—Their laws—Enforcement of the laws—Outline of the growth of the Mexicans in power—Their tribute system—How collected—Their system of trade—Slight knowledge of metallurgy—Religion—Quietzalcohuatl—Huitzilopochtli—Mexican priesthood—Human sacrifices—The system of Numeration—The calendar system—The calendar stone—Picture writing—Landa alphabet—Historical outline.

A LANDSCAPE presents varied aspects according to the standpoint from which it is viewed. Here we have a glimpse of hill and dale; there a stretch of running water. But two persons, standing in the same position, owing to their different mental temperaments, will view things in a different light. Where one, an artist born, is carried away with the beautiful scenery, another, with a more practical turn of mind, perceives only its adaptability for investments. Education

[1] The manuscript of this chapter was submitted to A. F. Bandelier for criticism. The part bearing on religion was subsequently rewritten. Absence from the country prevented his examining it.

and habits of life are also very potent factors in determining our views on various questions. Scholars of wide and extended learning differ very greatly in their views of questions deeply affecting human interests. We know how true that is of abstruse topics, such as religion and questions of state polity. It is also true of the entire field of scientific research. The unknown is a vastly greater domain than the known, and men, after deep and patient research, adopt widely different theories to explain the same facts.

It need, therefore, occasion no surprise to learn that there is a great difference of opinion as to the real state of culture among the so-called civilized tribes of Mexico and Central America. We have incidentally mentioned this difference in describing the ruins and their probable purpose. As one of the objects we have in view, and perhaps the most important one, is to learn what we can of the real state of society amongst the prehistoric people we treat of, it becomes necessary to examine these different views, and, if we can not decide in our own minds what to accept as true, we will be prepared to receive additional evidence that scholars are now bringing forward, and know to how weigh them and compare them with others.

It has only been within the last few years that we have gained an insight into the peculiar organization of Indian society. After some centuries of contact between the various tribes of Indians and whites, their social organization was still unknown. But we are now beginning to understand this, and the important discovery has also been made that this same system of government was very widely spread, indeed. This subject has, however, been as extensively treated as is necessary in chapter xii, so we need not stop longer. But if, with all the light of modern learn-

ing, we have only lately gained a clear understanding of the social organization of Indian tribes, it need occasion no surprise, nor call for any indignant denial, to affirm that the Spaniards totally misunderstood the social organization of the tribes with which they came in contact in Mexico.

We must also take into consideration the political condition of Europe at this time. Feudalism still exercised an influence on men's minds. The Spanish writers, in order to convey to Europeans a knowledge of the country and its inhabitants, applied European names and phrases to American Indian (advanced though they were) personages and institutions. But the means employed totally defeated the object sought. Instead of imparting a clear idea, a very erroneous one was conveyed.

As an illustration of this abuse of language, we might refer to the case of Montezuma, which name itself is a corruption of the Mexican word "Motecu-zoma," meaning literally "my wrathy chief." Mr. Bandelier[1] and Mr. Morgan have quite clearly shown what his real position was. His title was "chief of men."[2] He was simply one of the two chief executive officers of the tribe and general of the forces of the confederacy. His office was strictly elective, and he could be deposed for misdemeanor. Instead of giving him his proper title, and explaining its meaning, the Spaniards bestowed on him the title of king, which was soon enlarged to that of emperor, European words, it will

[1] Mr. Bandelier is the author of three essays on the culture of the ancient Mexicans. These are published in Volume II of "Peabody Museum Reports." We wish to make a general reference to these essays. They are invaluable to the student. Every position is sustained by numerous quotations from the early writers. In order to save constant references to them, we will here state that, unless other authorities are given for striking statements as to the culture of the Mexicans, their social organizations, etc., it is understood that our authority is found in these essays.

[2] In Mexican, "Tlaca-tecuhtli."

be observed, which convey an altogether wrong idea of Mexican society. Many such illustrations could be given.

The literature that has grown up about this subject is very voluminous, but the authors not being acquainted with the organization of Indian society, have not been able to write understandingly about them. We do not flatter ourselves that we have now solved all the difficulties of the case. But since Mr. Morgan has succeeded in throwing such a flood of light on the constitution of ancient society, and especially of Indian society, and Mr. Bandelier has given us the results of his careful investigation of the culture of the Mexicans, we feel that a foundation has been laid for a correct understanding of this vexed problem.

We will now examine their architecture, or style of building. In dealing with prehistoric people, we have several times referred to the tribal state of government, involving village life and communism in living. We have seen how this principle enabled us to understand the condition of Europe during the Neolithic Age. In still another place we have used this principle to show the connection of the Pueblo Indians and other tribes of the United States. Now we think this is the key which is to explain many of the ruins we have described in the preceding chapter. But another principle to be borne in mind, is that of defense. War, we have seen, is really the normal state of things amongst tribal communities. Therefore, either some position naturally strong must be selected as a village site, or the houses themselves must be fortified, after the fashion of Indians. This will be found to explain many peculiarities in their method of construction.

Amongst the pueblo structures of to-day, and among the ruins of the cliff-dwellers, we have seen how compact every thing was. The estufa, or place of council and worship,

was built in close proximity to the other building, and sometimes it formed part of it, and we do not learn that there was any thing distinguishing about the apartments of the chief. Further South a change is noticed. A specialization of structures, if we may use such an expression, has taken place, and, among the Mexicans, three kinds of houses were distinguished. It is extremely probable the same classification could be made elsewhere. There was, first of all, the ordinary dwelling houses. Every vestige of aboriginal buildings in the pueblos of Mexico has long since disappeared, and our knowledge of these structures can only be gathered from the somewhat confused accounts of the early writers.

Many, perhaps most, of the houses had a terraced, pyramidal foundation. Some were constructed on three sides of a court, like those on the Rio Chaco, in New Mexico. Others probably surrounded an open court, or quadrangle. The houses were of one and two stories in height. When two stories, the upper one receded from the first, probably in the terraced form. As serving to connect them with the more ornamental structures in Yucatan, we are told they were sometimes "adorned with elegant cornices and stucco designs of flowers and animals, which were often painted with brilliant colors. Prominent among these figures was the coiling serpent."[1] After pointing out, by many citations, that the evidence always was that these houses were occupied by many families, Mr. Morgan concludes, "They were evidently joint tenement-houses of the aboriginal American model, each occupied by a number of families ranging from five and ten to one hundred, and perhaps, in some cases, two hundred families in a house."[2]

[1] Bancroft's "Native Races," Vol. II, p. 572.

[2] "Contribution to North American Ethnology," Vol. IV, p. 229.

We can discern this kind of dwelling-house in many of the descriptions we have given of the ruins in the preceding chapter. M. Charney evidently found them at Tulla and Teotihuacan. Mr. Bandelier concludes that similar ruins once crowded the terraces at Cholula, and that to this class belongs the ruins at Mitla. The Palace, at Palenque, is evidently but another instance, as well as the House of Nuns, at Uxmal. In fact, with our present knowledge of the pueblos of Arizona, and the purposes which they subserved, as well as the uses made of such houses by the Mexicans, we are no longer justified in bestowing upon the structures in Yucatan the name of palaces.

The mistake was excusable among the Spaniards. They were totally ignorant of the mode of life indicated by these joint tenement-houses. When they found one of these large structures, capable of accommodating several hundred occupants, with its inner court, terraced foundation, and ornamented by stucco work, or sculpture, it was extremely natural that they should call it a palace, and cast about for some titled owner.

A second class of houses includes public buildings. The Mexicans, when at the height of their power, required buildings for public use, and this was doubtless true of the people who inhabited Uxmal and Palenque. The most important house was the tecpan, the official house of the tribe, the council house proper. This was the official residence of the "chief of men" and his assistants, such as runners. This was the place of meeting of the council of chiefs. It was here that the hospitality of the Pueblo was exercised. Official visitors from other tribes and traders from a distance were provided with accommodations here. When Cortez and his followers entered Mexico they were provided for at the tecpan. We would not expect to find

these public buildings, except in rich and prosperous pueblos. It has been suggested that the Governor's House at Uxmal was the official house of that settlement. The large halls, suitable for council purposes, favor this idea.[1]

A third class of buildings was the teocalli, or "House of God"—in other words, the temple. These were quite common. Each of the gens that composed the Mexican tribe had its own particular medicine lodge or temple. This was doubtless true of each and every tribe of sedentary Indians in the territory we are describing. "The larger temples were usually built upon pyramidal parallelograms, square or oblong, and consisted of a series of superimposed terraces with perpendicular or sloping sides."[2] It is not necessary to dwell longer on this style of buildings. We have only to recall the temples of the Sun, of the Cross, and of the Beau-relief at Palenque; the House of the Dwarf at Uxmal, and the Citadel at Chichen-Itza, to gather a clear idea of their construction.

The architecture of a people is a very good exponent of their culture. Yet all have seen what different views are held as to the culture of the tribes we are considering. We have, perhaps, said all that is required on this part of the subject, yet even repetition is pardonable if it enables us to more clearly understand our subject. The ornamentation on the ruins of Yucatan is so peculiar that in our opinion it has unduly influenced the judgment of explorers in this matter. They lose sight of the fact that the apartments of the houses are small, dark, and illy ventilated.

That they should have gone to the trouble of so profusely decorating their usual places of abode is, indeed,

[1] Morgan's "Contributions to N. A. Ethnology," p. 256.
[2] Bancroft's "Native Races," Vol. II, p. 576.

somewhat singular.[1] But Mitla was certainly an inhabited pueblo at the time of the Spanish conquest, and there is no good reason for concluding it was ever any thing more than a group of communal buildings. Yet, from the description given of it, we can not see that the buildings are greatly inferior in decoration to the structures in Yucatan. And yet again, from the imperfect accounts we have of the aboriginal structures in the pueblo of Mexico, we infer they were constructed on the general plan of communal buildings. As for the decorations, we have seen they had sometimes elaborate cornices, and were covered with stucco designs of animals and flowers. In this case some of them were, to be sure, public buildings for tribal purposes, but the majority of them were certainly communal residences. With these facts before us, we can not do otherwise than conclude that these so-called ruins of great cities we have described are simply the ruins of pueblos, consisting of communal houses, temples, and, in the case of large and powerful tribes, official houses. To this conclusion we believe American scholars are tending more and more.

This requires us to dismiss the idea that the majority of the people lived in houses of a poorer construction, which have since disappeared, leaving the ruins of the houses of the nobles. There was no such class division of the people as this would signify. These ruins were houses occupied by the people in common. With this understanding, a questioning of the ruins can not fail to give us some useful hints. We are struck with their ingenuity as builders. They made use of the best material at hand. In Arizona the dry climate permits of the use of adobe bricks, which

[1] "Who ever heard of an imperfectly developed race decorating so profusely and so delicately their ordinary abodes, in a manner usually reserved for temples and palaces?" S. F. Haven, in Proceedings of Am. Antiq. Society, April, 1880, p. 57.

were employed, though stone was also used. Further south the pouring tropical ruins would soon bring down in ruins adobe structures, and so stone alone is used.

In the Arizona pueblo we have a great fortress-built house, three and four stories high, and no mode of access to the lower story. This is in strict accord with Indian principles of defense, which consists in elevated positions. Sometimes this elevated position was a natural hill, as at Quemada, Tezcocingo, and Xochicalco. Where no hill was at hand they formed a terraced pyramidal foundation, as at Copan, Palenque, and Uxmal. In the highest forms of this architecture this elevation is faced with stone, or even composed throughout of stone, as in the case of the House of Nuns at Chichen-Itza. In the construction of houses progress seems to have taken place in two directions. The rooms increased in size. In some of the oldest pueblo structures in Arizona the rooms were more like a cluster of cells than any thing else.[1]

They grow larger towards the South. In the house at Teotihuacan M. Charney found a room twenty-seven feet wide by forty-one feet long. Two of the rooms in the Governor's House at Uxmal are sixty feet long. But the buildings themselves diminish in size. In Mexico the majority of the houses were but one story high, and but very few more than two stories. In Yucatan but few instances are recorded of houses two stories high. We must remember that throughout the entire territory we are considering the tribes had no domestic animals, their agriculture was in a rude state, and they were practically destitute of metals.[2] They could have been no farther advanced on the road to

[1] Morgan's "Contribution to N. A. Ethnology," Vol. IV, p. 186.

[2] Cortez saw "trinkets made of gold and silver, of lead, bronze, copper, and tin." They were on the confines of a true Bronze Age. Proceedings of Am. Antiq. Society, April, 1879, p. 81.

civilization than were the various tribes of Europe during the Bronze Age. Remembering this, we can not fail to be impressed with the ingenuity, patient toil, and artistic taste they displayed in the construction and decoration of their edifices.

It may seem somewhat singular that we should treat of their architecture before we do of their system of government, but we were already acquainted with the ruins of the former. When we turn to the latter we find ourselves involved in very great difficulties. The description given of Mexican society by the majority of writers on these topics represent it as that of a powerful monarchy. The historian Prescott, in his charming work [1] draws a picture that would not suffer by comparison with the despotic magnificence of Oriental lands. At a later date Mr. Bancroft, supporting himself by an appeal to a formidable list of authorities, regilds the scene.[2] But protests against such views are not wanting. Robertson, in his history, though bowing to the weight of authority, can not forbear expressing his conviction that there had been some exaggeration in the splendid description of their government and manners.[3] Wilson, more skeptical, and bolder, utterly repudiates the old accounts, and refuses to believe the Aztecs were any thing more than savages.[4]

With such divergent and conflicting views, we at once perceive the necessity of carefully scanning all the accounts given, and make them conform, if possible, to what is known of Indian institutions and manners. The Mexicans are but one of several tribes that are the subjects of our research; but their institutions are better known than the others, and, in a general way, whatever is true of them will

[1] "History of the Conquest of Mexico."

[4] Wilson's "Conquest of Mexico."

be true of the rest. We have seen the efforts of the Spanish explorers to explain whatever they found new or strange in America by Spanish words, and the results of such procedure. We are at full liberty to reject their conclusions and start anew.

What the Spaniards found around the lakes of Mexico was a union or confederacy of three tribes. Very late investigations by Mr. Bandelier have established the presence of the usual subdivisions of the tribes. So we have here a complete organization according to the terms of ancient society: that is, the gens, phratry, tribe, and confederacy of tribes. It is necessary that we spend some time with each of these subdivisions before we can understand the condition of society among the Mexicans, and, in all probability, the society among all of the civilized nations of Central America.

We will begin with the gens, or the lowest division of the tribe. We must understand its organization before we can understand that of a tribe, and we must master the tribal organization before attempting to learn the workings of the confederacy. To neglect this order, and commence at the top of the series, is to make the same mistake that the older writers did in their studies into this culture. A gens has certain rights, duties, and privileges which belong to the whole gens, and we will consider some of the more important in their proper place. We must understand by a gens a collection of persons who are considered to be all related to each other. An Indian could not, of his own will, transfer himself from one gens to another. He remained a member of the gens into which he was born. He might, by a formal act of adoption, become a member of another gens; or he might, in certain contingencies, lose his connection with a gens and become an outcast. There is no such thing

as privileged classes in a gens. All its members stand on an equal footing. The council of the gens is the supreme ruling power in the gens. Among some of the northern tribes, all the members in the gens, both male and female, had a voice in this council. In the Mexican gens, the council itself was more restricted. The old men, medicine men, and distinguished men met in council—but even here, on important occasions, the whole gens met in council.

Each gens would, of course, elect its own officers. They could remove them from office as well, whenever occasion required. The Mexican gentes elected two officers. One of these corresponded to the sachem among northern tribes. His residence was the official house of the gens. He had in charge the stores of the gens; and, in unimportant cases, he exercised the powers of a judge. The other officer was the war-chief. In times of war he commanded the forces of the gens. In times of peace he was, so to speak, the sheriff of the gens.

The next division of the tribe was the phratry—the word properly meaning a brotherhood. Referring to the outline on page 486, we notice that the eight gentes were reunited into two phratries. Mr. Morgan tells us that the probable origin of phratries was from the subdivision of an original gens. Thus a tradition of the Seneca Indians affirms that the Bear and the Deer gentes were the original gentes of that tribe.[1] In process of time they split up into eight gentes, which would each have all the rights and duties of an original gens—but, for certain purposes, they were still organized into two divisions.

Each of these larger groups is called a phratry. All of the Iroquois tribes were organized into phratries, and the same was, doubtless, true of the majority of the tribes of

[1] Morgan's "Ancient Society" p. 91.

North America. The researches of Mr. Bandelier have quite conclusively established the fact, that the ancient Mexican tribe consisted of twenty gentes reunited as four phratries, which constituted the four quarters of the Pueblo of Mexico.

It is somewhat difficult to understand just what the rights and duties of a phratry were. This division does not exist in all tribes. But, as it was present among the Mexicans, we must learn what we can of its powers. Among the Iroquois the phratry was apparent chiefly in religious matters, and in social games. They did not elect any war-chief. The Mexican phratry was largely concerned with military matters. The forces of each phratry went out to war as separate divisions. They had their own costumes and banners. The four phratries chose each their war-chief, who commanded their forces in the field, and who, as commander, was the superior of the war-chiefs of the gentes.

In time of peace, they acted as the executors of tribal justice. They belonged to the highest grade of war-chiefs in Mexico—but there was nothing hereditary about their offices. They were strictly elective, and could be deposed for cause. They were in no case appointed by a higher authority. One of these chiefs was always elected to fill the office of "Chief of Men;"[1] and, in cases of emergency, they could take his place—but this would be only a temporary arrangement.

Ascending the scale, the next term of the series is the tribe. The Spanish writers took notice of a tribe, but failed to notice the gens and phratry. This is not to be considered a singular thing. The Iroquois were under the observation of our own people two hundred years before the discovery was made in reference to them. "The existence

[1] But, on this point, see "Peabody Reports," Vol. II, p. 685 -note, p. 282.

among them of clans, named after animals, was pointed out at an early day, but without suspecting that it was the unit of a social system upon which both the tribe and the confederacy rested."[1] But, being ignorant of this fact, it is not singular that they made serious mistakes in their description of the government.

We now know that the Mexican tribe was composed of an association of twenty gentes, that each of these gens was an independent unit, and that all of its members stood on an equal footing. This, at the outset, does away with the idea of a monarchy. Each gens would, of course, have an equal share in the government. This was effected by means of a council composed of delegates from each gens. There is no doubt whatever of the existence of this council among the Mexicans. "Every tribe in Mexico and Central America, beyond a reasonable doubt, had its council of chiefs. It was the governing body of the tribe, and a constant phenomenon in all parts of aboriginal America."[2] The Spanish writers knew of the existence of this council, but mistook its function. They generally treat of it as an advisory board of ministers appointed by the "king."

Each of the Mexican gens was represented in this council by a "Speaking Chief," who, of course was elected by the gens he represented. All tribal matters were under the control of this council. Questions of peace and war, and the distribution of tribute, were decided by the council. They also had judicial duties to perform. Disputes between different gentes were adjusted by them. They also would have jurisdiction of all crimes committed by those unfortunate individuals who were not members of any gens, and of crimes committed on territory not belonging to any gens, such as the Teocalli, Market-place, and Tecpan.

[1] Morgan's "Ancient Society," p. 197. [2] Ibid., p. 205.

The council must have regular stated times of meeting; they could be called together at any time. At the time of Cortez's visits they met daily. This council was, of course, supreme in all questions coming before it; but every eighty days there was a council extraordinary. This included the members of the council proper, the war-chiefs of the four phratries, the war-chiefs of the gentes, and the leading medicine men. Any important cause could be reserved for this meeting, or, if agreed upon, a reconsideration of a cause could be had. We must understand that the tribal council could not interfere in any matter referring solely to a gens; that would be settled by the gens itself.

The important points to be noticed are, that it was an elective body, representing independent groups, and that it had supreme authority. But the tribes needed officers to execute the decrees of the council. Speaking of the Northern tribes, Mr. Morgan says, "In some Indian tribes, one of the sachems was recognized as its head chief; and so superior in rank to his associates. A need existed, to some extent for an official head of the tribe, to represent it when the council was not in session. But the duties and powers of the office were slight. Although the council was superior in authority, it was rarely in session, and questions might arise demanding the provisional action of some one authorized to represent the tribe, subject to the ratification of his acts by the council."[1]

This need was still more urgent among the Mexicans; accordingly we find they elected two officials for this purpose. It seems this habit of electing two chief executives was quite a common one among the tribes of Mexico and Central America. We have already noticed that the Mexican gentes elected two such officers for their purpose. We

[1] "Ancient Society," p. 118.

are further told that the Iroquois appointed two head war-chiefs to command the forces of the confederacy.[1]

One of the chiefs so elected by the Mexicans bore the somewhat singular title of "Snake-woman." He was properly the head-chief of the Mexicans. He was chairman of the council and announced its decrees. He was responsible to the council for the tribute received, as far as it was applied to tribal requirements, and for a faithful distribution of the remainder among the gentes. When the forces of the confederacy went out to war, he commanded the tribal forces of Mexico; but on other occasions this duty was fulfilled by his colleague, who was the real war-chief of the Mexicans. His title was "Chief-of-men." This is the official who appears in history as the "King of Mexico," sometimes, even, as "Emperor of Anahuac." The fact is, he was one of two equal chiefs; he held an elective office, and was subordinate to the council.

When the confederacy was formed, the command of its forces was given to the war-chief of the Mexicans; thus he was something more than a tribal officer. His residence was the official house of the tribe. "He was to be present day and night at this abode, which was the center wherein converged the threads of information brought by traders, gatherers of tribute, scouts and spies, as well as all messages sent to, or received from, neighboring friendly or hostile tribes. Every such message came directly to the "Chief-of-men," whose duty it was, before acting, to present its import to the "Snake-woman," and, through him, call together the council." He might be present at the council, but his presence was not required, nor did his vote weigh any more than any other member of the council, only, of course, from the position he occupied, his opinion

[1] Morgan's "Ancient Society," p. 147.

would be much respected. He provided for the execution of the council's conclusions. In case of war, he would call out the forces of the confederacy for assistance. As the procurement of substance by means of tribute was one of the great objects of the confederacy, the gathering of it was placed under the control of the war-chief, who was therefore the official head of the tribute-gatherers.

We have thus very imperfectly and hastily sketched the governmental organization of the Mexican tribe. It is something very different from an empire. It was a democratic organization. There was not an officer in it but what held his office by election. This, to some, may seem improbable, because the Spaniards have described a different state of things. We have already mentioned one reason why they should do so—that was their ignorance of Indian institutions. We must also consider the natural bias of their minds. The rule of Charles the V was any thing but liberal. It was a part of their education to believe that a monarchical form of government was just the thing; they were accordingly prepared to see monarchical institutions, whether they existed or not.

Then there was the perfectly natural disposition to exaggerate their achievements. To spread in Europe the report that they had subverted a powerfully organized monarchy, having an emperor, a full line of nobles, orders of chivalry, and a standing army, certainly sounded much better than the plain statement that they had succeeded in disjointing a loosely connected confederacy, captured and put to death the head war chief of the principal tribe, and destroyed the communal buildings of their pueblo.

We must not forget that, from an Indian point of view, the confederacy was composed of rich and powerful tribes. This is especially true of the Mexicans. The position they

held, from a defensive standpoint, was one of the strongest ever held by Indians. They received a large amount of tribute from subject tribes, along with the hearty hatred of the same. From the time Cortez landed on the shore he had heard accounts of the wealth, power, and cruelty of the Mexicans. When he arrived before Mexico the "Chief-of-men," Montezuma, as representative of tribal hospitality, went forth to meet him, extending "unusual courtesies to unusual, mysterious, and therefore dreaded, guests." We may well imagine that he was decked out in all the finery his office could raise, and that he put on as much style and "court etiquette" as their knowledge and manner of life would stand.

The Spaniards immediately concluded that he was king, and so he was given undue prominence. They subsequently learned of the council, and recognized the fact that it was really the supreme power. They learned of the office of "Snake-woman," and acknowledged that his power was equal to that of the "Chief-of-men." They even had some ideas of phratries and gentes. But, having once made up their minds that this was a monarchy, and Montezuma the monarch, they were loath to change their views, or, rather, they tried to explain all on this supposition, and the result is the confused and contradictory accounts given of these officials and divisions of the people. But every thing tending to add glory to the "Empire of Montezuma" was caught up and dilated upon. And so have come down to us the commonly accepted ideas of the government of the ancient Mexicans.

That these views are altogether erroneous is no longer doubted by some of the very best American scholars. The organization set forth in this chapter is one not only in accord with the results obtained by the latest research in the field of ancient society, but a careful reading of the accounts

of the Spanish writers leads to the same conclusions.[1] In view of these now admitted facts, it seems to us useless to longer speak of the government of the Mexicans as that of an empire.

We have as yet said nothing of the league or confederacy of the three tribes of Mexico, Tezcuco, and Tlacopan; nor is it necessary to dwell at any great length on this confederacy now. They were perfectly independent of each other as regards tribal affairs; and for the purpose of government, were organized in exactly the same way as were the Mexicans. The stories told of the glories, the riches, and power of the kings of Tezcuco, if any thing, outrank those of Mexico. We may dismiss them as utterly unreliable. Tribal organization resting on phratries and gentes, and the consequent government by the council of the tribe was all the Spaniards found. These three tribes, speaking dialects of the same stock language, inhabiting contiguous territory, formed a league for offensive and defensive purposes. The commander-in-chief of the forces raised for this purpose was the "Chief-of-men" of the Mexicans.

We have confined our researches to the Mexicans. Mr. Bandelier, speaking of the tribes of Mexico, remarks: "There is no need of proving the fact that the several tribes of the valley had identical customs, and that their institutions had reached about the same degree of development." Or if such proofs were needed, Mr. Bancroft has furnished them. So that this state of society being proven among the Mexicans, it may be considered as established among the Nahua tribes. Neither is there any necessity of showing that substantially the same state of government existed among the Mayas of

[1] We refer again to Mr. Bandelier's articles. A careful reading of them will convince any one that the picture of Mexican Government as set forth in Mr. Bancroft's "Native Races," Vol. II, is very erroneous. Mr. Bancroft's views are, however, those of many writers.

Yucatan. This is shown by their architecture, by their early traditions, and by many statements in the writings of the early historians. These can only be understood and explained by supposing the same social organization existed among them as among the Mexicans.

But this does not relegate these civilized nations to savagism. On the other hand, it is exactly the form of government we would expect to find among them. They were not further along than the Middle Status of barbarism. They were slowly advancing on the road that leads to civilization, and their form of government was one exactly suited to their needs, and one in keeping with their state of architecture. When we gaze at the ruins of their material structures, we must consider that before us are not the only ruins wrought by the Spaniards; the native institutions were doomed as well. Traces of this early state of society are, however, still recoverable, and we must study them well to learn their secret.

We have yet before us a large field to investigate; that is, the advance made in the arts of living among these people. This is one of the principal objects of our present research. We are here slightly departing from the prehistoric field, and entering the domain of history. But the departure is justifiable, as it serves to light up an extensive field, that is, the manner of life among the civilized nations just before the coming of the Spaniards. And first we will examine their customs in regard to property. We have in a former chapter reverted to the influence of commerce and trade in advancing culture. The desire for wealth and property which is such a controlling power to-day was one of the most efficient agents in advancing man from savagism to civilization. The idea of property, which scarcely had an existence during that period of savagism, had grown stronger

with every advance in culture. "Beginning in feebleness, it has ended in becoming the master passion of the human mind."

The property of savages is limited to a few articles of personal use; consequently, their ideas as to its value, and the principles of inheritance, are feeble. They can scarcely be said to have any idea as to property in lands, though the tribe may lay claim to certain hunting-grounds as their own. As soon as the organization of gens arose, we can see that it would affect their ideas of property. The gens, we must remember, was the unit of their social organization.

They had common rights, duties, and privileges, as well as common supplies; and hence the idea arose that the property of the members of a gens belonged to the gens. At the death of an individual, his personal property would be divided among the remaining members of the gens. "Practically," says Mr. Morgan, "they were appropriated by the nearest of kin; but the principle was general that the property should remain in the gens."[1] That this is a true statement there is not the shadow of a doubt. This was the general rule of inheritance among the Indian tribes of North America. As time passed on, and the tribes learned to cultivate the land, some idea of real property would arise—but not of personal ownership.

This is quite an important topic; because, when we read of lords with great estates, we are puzzled to know how to reconcile such statements with what we now know of the nature of Mexican tribal organization. Mr. Bandelier has lately gone over the entire subject. He finds that the territory on which the Mexicans originally settled was a marshy expanse of land which the surrounding tribes did not value enough to claim.

This territory was divided among the four gentes of the

[1] "Ancient Society," p. 528.

tribe. As we have already seen, each of these four gentes subsequently split up into other independent gentes until there were twenty in all. Each of these gens held and possessed a portion of the original soil. This division of the soil must have been made by tacit consent. The tribe claimed no ownership of these tracts, still less did the head-chief. Furthermore, the only right the gentes claimed in them was a possessory one. "They had no idea of sale or barter, or conveyance, or alienation."

As the members of a gens stood on equal footing, this tract would be still further divided for individual use. This division would be made by the council of the gens. But we must notice the individual acquired no other right to this tract of land than a right to cultivate it—which right, if he failed to improve, he lost. He could, however, have some one else to till it for him. The son could inherit a father's right to a tract.

We have seen that the Mexicans had a great volume of tribal business to transact, which required the presence of an official household at the tecpan. Then the proper exercise of tribal hospitality required a large store of provisions. To meet this demand, certain tracts of the territory of each gens were set aside to be worked by communal labor. Then, besides the various officers of the gens, and the tribe, who, by reason of their public duties, had no time to till the tracts to which, as members of a gens, they would be entitled, had the same tilled for them by communal labor. This was not an act of vassalage, but a payment for public duties.

This is a very brief statement of their customs as regards holding of lands. It gives us an insight into the workings of ancient society. It shows us what a strong feature of this society was the gens, and we see how necessary it is

to understand the nature of a gens before attempting to understand ancient society. We see that, among the civilized nations of Mexico and Central America, they had not yet risen to the conception of ownership in the soil. No chief, or other officer, held large estates. The possessory right in the soil was vested in the gens composing the tribe, and they in turn granted to individuals certain definite lots for the purpose of culture. A chief had no more right in this direction than a common warrior. We can easily see how the Spaniards made their mistake. They found a community of persons holding land in common, which the individuals could not alienate. They noticed one person among them whom the others acknowledged as chief. They immediately jumped to the conclusion that this chief was a great "lord," that the land was a "feudal estate," and that the persons who held it were "vassals" to the aforesaid "lord."[1]

We must now consider the subject of laws, and the methods of enforcing justice amongst the civilized nations. The laws of the Mexicans, like those of most barbarous people, are apt to strike us as being very severe; but good reasons, according to their way of thinking, exist for such severity. The gens is the unit of social organization; which fact must be constantly borne in mind in considering their laws. In civilized society, the State assumes protection of person and property; but, in a tribal state of society, this protection is afforded by the gens. Hence, "to wrong a person was to wrong his gens; and to support a person was to stand behind him with the entire array of his gentile kindred."

The punishment for theft varied according to the value of the article stolen. If it were small and could be returned, that

[1] Morgan's "Ancient Society," p. 537.

settled the matter. In cases of greater value it was different. In some cases the thief became bondsman for the original owner. In still others, he suffered death. This was the case where he stole articles set aside for religion—such as gold and silver, or captives taken in war; or, if the theft were committed in the market-place. Murder and homicide were always punished with death. According to their teaching, there was a great gulf between the two sexes. Hence, for a person of one sex to assume the dress of the other sex was an insult to the whole gens—the penalty was death. Drunkenness was an offense severely punished—though aged persons could indulge their appetite, and, during times of festivities, others could. Chiefs and other officials were publicly degraded for this crime. Common warriors had their heads shaved in punishment.

These various penalties necessarily suppose judicial officers to determine the offense and decree the punishment. Having established, on a satisfactory basis, the Mexican empire, the historians did not scruple to fit it out with the necessary working machinery of such an organization. Accordingly we are presented with a judiciary as nicely proportioned as in the most favored nations of to-day. But when, under the more searching light of modern scholarship, this empire is seen to be something quite different, we find the whole judicial machinery to be a much more simple affair.

Not much need be added on this point to what we have already mentioned. Each gens, through its council, would regulate its own affairs, and would punish all offenses against the law committed by one of its members against another. Of necessity the decision of this council had to be final. There was no appeal from its decision. The council of the tribe had jurisdiction in all

other cases—such as might arise between members of different gentes, or among outcasts not connected with any gens, or such as were committed on territory not belonging to any gens.

For this work, the twenty chiefs composing the council were subdivided into two bodies, sitting simultaneously in the different halls of the tecpan. This division was for the purpose of greater dispatch in business. They did not form a higher and lower court, with power of the one to review the decisions of the other. They were equal in power and the decisions of both were final. The decision of the council, when acting in a judicial capacity, would be announced by their foreman, who was, as we have seen, the head-chief of the Mexicans—the Snake-woman. It is for this act that the historian speaks of him as the supreme judge, and makes him the head of judicial authority.[1] His decisions were, of course, final, not because he made them, but because they were the conclusions of the council.

The "Chief-of-men," the so-called "king," did not properly have any judicial authority. He was their war-chief, and not a judge; but from the very nature of his office he had some powers in this direction. As commander-in-chief, he possessed authority to summarily punish (with death, if necessary) acts of insubordination and treachery during war. It was necessary to clothe him with a certain amount of discretionary power for the public good. Thus, the first-runner that arrived from the coast with news of the approach of the European ships was, by the order of Montezuma, placed in confinement. "This was done to keep the news secret until the matter could be investigated, and was therefore a preliminary measure of policy." Placed at the tecpan as the official head of the tribe, he had power to appoint his

[1] Bancroft's "Native Races," Vol. II, p. 435.

assistants. But this power to appoint implied equal power to remove, and to punish.[1]

This investigation into their laws and methods of enforcing them, carries us to the conclusion already arrived at. It is in full keeping with what we would expect of a people in the Middle Status of barbarism. We also see how little real foundation there is for the view that this was a monarchy. There is no doubt but that the pueblo of Mexico was the seat of one of the largest and most powerful tribes, and the leading member of one of the most powerful confederacies that had ever existed in America.

It may be of interest for us to inquire as to what was the real extent of this power, and the means employed by the Mexicans to maintain this power; also how they had succeeded in attaining the same. They were not by nature more gifted than the surrounding tribes. The valley of Mexico is an upland basin. It is oval in form, surrounded by ranges of mountains, rising one above the other, with depressions between. The area of the valley itself is about sixteen hundred square miles. The Mexicans were the last one of the seven kindred tribes who styled themselves, collectively, the Nabuatlacs. We treat of them as the Nahuas.

The Nahuas on the north and the Mayas on the south included the civilized nations. When the Mexicans arrived in this valley, they found the best situations already occupied by other tribes of their own family. To escape persecution from these, they fled into the marsh or swamp which then covered the territory which they subsequently

[1] It is needless to remark that these results are greatly at variance with those generally held, as will be seen by consulting Mr. Bancroft's "Native Races," Vol. II, Chap. xiv. Mr. Bancroft, however, simply gathers together what other writers have stated on this subject. We follow, in this matter, the conclusions of an acknowledged leader in this field, Mr. Bandelier, who has fully worked out Mr. Morgan's views, advanced in "Ancient Society."

converted into their stronghold. Here on a scanty expanse of dry soil, surrounded by extensive marshes, they erected their pueblo. Being few in numbers they were overlooked as insignificant, and thus they had a chance to improve their surroundings. They increased the area of dry land by digging ditches, and throwing the earth from the same on the surrounding surface, and thus elevated it. In reality, in the marshes that surrounded their pueblo was their greatest source of strength. "They realized that while they might sally with impunity, having a safe retreat behind them, an attack upon their position was both difficult and dangerous for the assailant." They were, therefore, strong enough for purposes of defense. But they wished to open up communication with the tribes living on the shore of the great marsh in the midst of which they had their settlement. For this purpose they applied to their near and powerful neighbors, the Tecpanics, for the use of one of the springs on their territory, and for the privilege of trade and barter in their market. This permission was given in consideration that the Mexicans become the weaker allies of the Tecpanics, that is, pay a moderate tribute and render military assistance when called upon.

The Pueblo of Mexico now rapidly increased in power. Communication being opened with the mainland, it was visited by delegates from other tribes, and especially by traders. They fully perceived the advantages of their location and improved the same. By the erection of causeways, they entirely surrounded their pueblo with an artificial pond of large extent. To allow for the free circulation of the water, sluices were cut, interrupting these causeways at several places. Across these openings wooden bridges were placed which could be easily removed in times of danger.

Thus it was that they secured one of the strongest defensive positions ever held by Indians. The Tecpanics had been the leading power in the valley, but the Mexicans now felt themselves strong enough to throw off the yoke of tribute to which they were subject. In the war that ensued the power of the Tecpanics was broken, and the Mexicans became at once one of the leading powers of the valley. We must notice, however, that the Mexicans did not gain any new territory except the locality of their spring. Neither did they interfere at all in the government of the Tecpanics. They simply received tribute from them.

Once started on their career of conquest, the Mexicans, supported by allies, sought to extend their power. The result was that soon they had subdued all of the Nahua tribes of the valley except one, that was a tribe located at Tezcuco. This does not imply that they had become masters of the territory of the valley. When a modern nation or state conquers another, they often add that province to their original domain, and extend over it their code of laws. This is the nature of the conquests of ancient Rome. The territory of the conquered province became part of the Roman Empire. They became subject to the laws of Rome. Public works were built under the direction of the conquerors, and they were governed from Rome or by governors appointed from there.

Nothing of this kind is to be understood by a conquest by the Mexicans, and it is necessary to understand this point clearly. When they conquered a tribe, they neither acquired nor claimed any right to or power over the territory of the tribe. They did not concern themselves at all with the government of the tribe. In that respect the tribe remained free and independent. No garrisons of troops were stationed in their territory to keep them in subjection;

no governors were appinted to rule over them. What the Mexicans wanted was tribute, and in case of war they could call on them for troops. Secure in their pueblo surrounded by water, they could sally out on the less fortunate tribes who chose to pay tribute rather than to be subject to such forays.

Instead of entering into a conflict with the tribe at Tezcuco, the result of which might have been doubtful, a military confederacy was formed, into which was admitted the larger part of the old Tecpanic tribe that had their chief pueblo at Tlacopan. The definite plan of this confederacy is unknown. Each of the three tribes was perfectly independent in the management of its own affairs. Each tribe could make war on its own account if it wished, but in case it did not feel strong enough alone, it could call on the others for assistance. When the force of the confederacy went out to war, the command was given to the war chief of the Mexicans, the "Chief-of-men."

If a member of the confederacy succeeded in reducing by its own efforts a tribe to tribute, it had the full benefit of such conquest. But when the entire confederacy had been engaged in such conquest, the tribute was divided into five parts, of which two went to Mexico, two to Tezcuco, and one to Tlacopan. This co-partnership for the purpose of securing tribute by the three most powerful tribes of the valley, under the leadership of Mexico, was formed about the year 1426, just about one hundred years from the date of the first appearance of the Mexicans in the valley.

From this time to the date of the Spanish conquest in 1520, the confederate tribes were almost constantly at war with the surrounding Indians, "and particularly with the feeble village Indians southward from the valley of Mexico to the Pacific, and thence eastward well towards Guatemala.

They began with those nearest in position, whom they overcame, through superior numbers, and concentrated action, and subjected to tribute. These forays were continued from time to time for the avowed object of gathering spoil, imposing tribute and capturing prisoners for sacrifice, until the principal tribes within the area named, with some exceptions, were subdued and made tributary.[1]

The territory of these tribes, thus subject to tribute, constitutes what is generally known as the Mexican Empire.[2] But, manifestly, it is an abuse of language to so designate this territory. No attempt was made for the formation of a State which would include the various groups of aborigines settled in the area tributary to the confederacy. "No common or mutual tie connected these numerous and diverse tribes," excepting hatred of the Mexican confederacy. The tribes were left independent under their own chiefs. They well knew the tribute must be forthcoming, or else they would feel the weight of their conquerors' displeasure. But such a domination of the strong over the weak, for no other reason than to enforce an unwilling tribute, can never form a nation, or an empire.[3] These subject tribes, held down by heavy burdens—inspired by enmity, ever ready to revolt—gave no new strength to the confederacy: they were rather an element of weakness. The Spaniards were not slow to take advantage of this state of affairs. The tribes of Vera Cruz, who could have imposed an almost impassable barrier to their advance through that section, were ready to welcome them as deliverers.[4] The Tlascaltecans, though never made tributary to the Mexicans, had to wage almost unceasing war for fifty years preceding the coming of the Spaniards.

Without their assistance, Cortez would never have passed into history as the conqueror of Mexico.

A word as to the real power of the Mexicans. Their strength lay more in their defensive position than any thing else. As we have just stated, the entire forces of the confederacy were unable to subject the Tlascaltecans, the Tarasca of Michhuacan were fully their equal in wealth and power. The most disastrous defeat that ever befell the forces of the confederacy was on the occasion of their attack upon this last-named people in 1479. They fled from the battle-field in consternation, and never cared to renew the attempt. As to the actual population of the Pueblo of Mexico, the accounts are very much at variance. Mr. Morgan, after taking account of their barbarous condition of life—without flocks and herds, and without field agriculture, but also considering the amount of tribute received from other tribes—considers that an estimate of two hundred and fifty thousand inhabitants in the entire valley would be an excessive number. Of these he would assign thirty thousand to the Pueblo of Mexico.[1]

This is but an estimate. In this connection we are informed, that, when the forces of the confederacy marched against Michhuacan, as just stated, they counted their forces, and found them to be twenty-four thousand men. This includes the forces of the three confederate tribes, and their allies in the valley, and would indicate a population below Mr. Morgan's estimate. The Spanish writers have left statements as to the population of Mexico which are, evidently, gross exaggerations. The most moderate estimate is sixty thousand inhabitants; but the majority of the writers increase this number to three hundred thousand.

The main occupation of the Aztecs, then, was to enforce

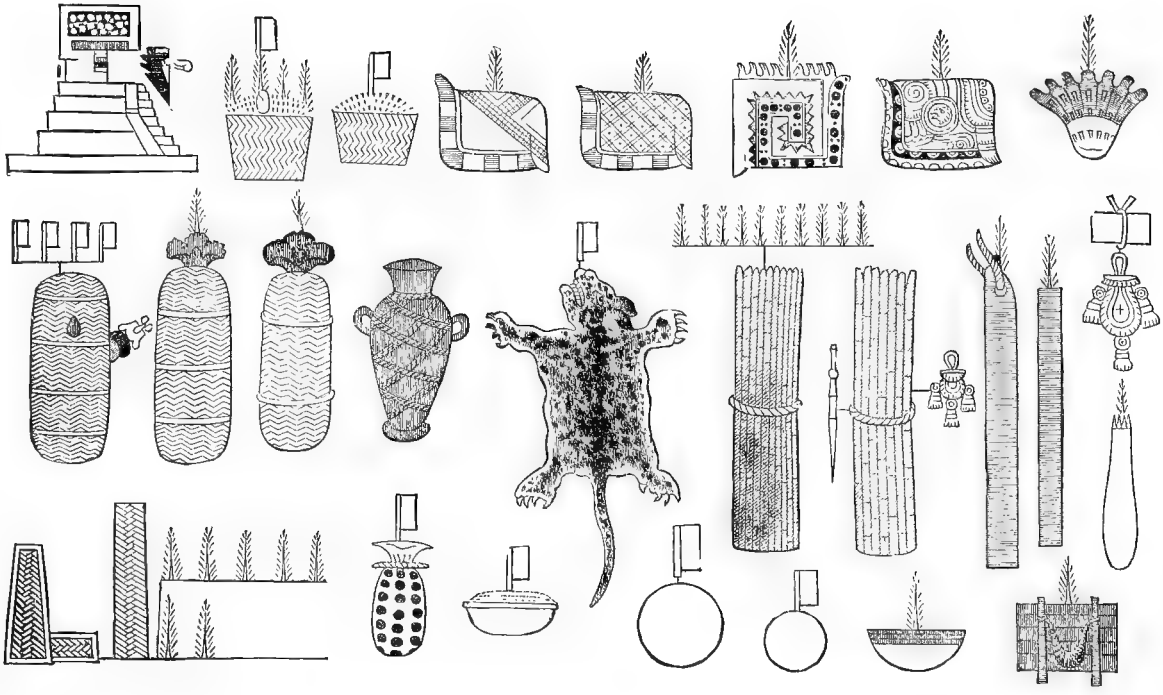
[1] Morgan's "Ancient Society," p. 195.

the payment of tribute. From the limited expanse of territory at the disposal of the Mexicans, and the unusually large number of inhabitants for an aboriginal settlement, as well as the natural inclination of the Mexicans, they were obliged to draw their main supplies from tributary tribes. It is human for the strong to compel the weak to serve them. The inhabitants of North America were not behind in this respect.[1] This is especially true of the civilized tribes of Mexico and Central America. The confederacy of the three most powerful tribes of Mexico was but a copartnership for the avowed purpose of compelling tribute from the surrounding tribes, and they were cruel and merciless in exacting the same.

Our information in regard to this tribute is derived almost entirely from a collection of picture writings, known as the Mendoza collection, which will be described more particularly when we describe their picture writings. The confederacy was never at a loss for an excuse to pounce upon a tribe and reduce them to tribute. Sometimes the tribe marked out for a prey, knowing their case to be hopeless, submitted at once when the demand was made; but, whether they yielded with or without a struggle, the result was the same—that is, a certain amount of tribute was imposed on them. This tribute consisted of articles which the tribe either manufactured, or was in situation to acquire by means of trade or war; but, in addition to this, it also included the products of their limited agriculture.

The same distribution of land obtained among all the civilized tribes that we have already sketched among the Mexicans. So, a portion of the territory of each conquered tribe would be set aside to be cultivated for the use of the confederacy. But, as the tribe did not have any land of its own,

[1] Bancroft's "Native Races," Vol. I, p. 344.



700

TRIBUTE SHEET.

except for some official purpose, this implies that each gens would have to set aside a small part of its territory for such purpose. Such lots Mr. Bandelier calls tribute lots. These were worked by the gentes for the benefit of the Mexicans. It is to be noticed right here, that the Mexicans did not claim to own or control the land; this right remained in the gentes of the conquered tribe.

The miscellaneous articles demanded were generally such that they bore some relation to the natural resources of the pueblo. For instance: pueblos along the coast, in the warm region of country, had to furnish cotton cloth, many thousand bundles of fine feathers, sacks of cocoa, tiger-skins, etc. In other, and favorable locations for such products, the pueblos had to furnish such articles as sacks of lime, reeds for building purposes, smaller reeds for the manufacture of darts.

These facts are ascertained in the Mendoza collection. We are given there the pictorial symbol, or coat-of-arms, of various pueblos; also, a pictorial representation of the tribute they were expected to pay. The plate opposite is a specimen of their tribute rolls. The pueblos paying it are not, however, shown. Considerable can be learned from a study of this collection—such, for instance, as that the Pueblo of Chala had to pay a tribute of forty little bells, and eighty copper ax blades.[1] And, in another place, we learn that the Pueblo of Yzamatitan was tributary to eight thousand reams of paper. The articles are here pictured forth; the number is indicated by the flags, feathers, etc. The tribute of provisions consisted of such articles as corn, beans, cocoa, red-pepper, honey, and salt—amounting in all, according to this collection,[2] to about six hundred thousand

[1] Valentini, in Proceedings of American Antiquarian Society, April, 1879.

[2] Gallatin: "American Ethnological Society's Transactions," Vol. I, p. 119.

bushels. Still it will not do to place too great a reliance on picture records. The number of tributary pueblos must have been constantly changing. The quantity of articles intended for clothing was certainly very great. A moderate quantity of gold was also collected from a few pueblos, where this was obtainable.

The collection of this tribute was one of the most important branches of government among the Mexicans. The vanquished stood in peril of their lives if they failed to keep their part of the contract. In the first place, the Mexicans took from each subject tribe hostages for the punctual payment of tribute. These hostages were taken to the Pueblo of Mexico, and held there as slaves; their lives were forfeited if the tribute was refused.[1] But special officers were also assigned to the subject tribes, whose duty it was to see that the tribute was properly gathered and transmitted to Mexico. These stewards or tribute gatherers, are the officers that the early writers mistook for governors. Their sole business, however, had to do with the collection of the tribute, and they did not interfere at all in the internal affairs of the tribe.

Where the forces of the confederacy had conquered a tribe, but one steward was required to tend to the tribute, but each of the confederate tribes sent their representative to such pueblos as had become their own prey, and as sometimes occurred, one pueblo paid tribute to each of the confederate tribes, it had to submit to the presence among them of three separate stewards.

We can easily enough see that it required men of ability to fill this position. They were to hold their residence in the midst of a tribe who were conquered, but held in subjection only by fear. To these people they were the con-

[1] Valentine: Proceedings American Antiq. Soc., October, 1880, p. 75.

stant reminder of defeat and disgrace. They were expected to watch them closely and report to the home tribe suspicious movements or utterances that might come to their notice. We need not wonder that these stewards wore the tokens of chiefs. It was a part of their duty to superintend the removal of the tribute from the place where gathered to the Pueblo of Mexico. The tribe paying tribute were expected to deliver it at Mexico, but under the supervision of the steward. Arrived at Mexico the tribute was received, not by the so-called king, the Chief-of-men, but by the Snake-woman, or an officer to whom this personage delegated his authority. This officer was the chief steward, and made the final division of the tribute. We are not informed as to details of this division. A large part of it was reserved for the use of the tribal government. It was upon this store that the Chief-of-men could draw when supplies were needed for tribal hospitality or for any special purpose. The stores required for the temple, its priests and keepers were gathered from this source. The larger division must have gone direct to the stewards of the gentes, who would set some aside for their official uses, some for religion or medicine, but the larger part would be divided among the members of the gentes.

In our review of the social system of the Mexicans we have repeatedly seen how the organization of gentes influenced and even controled all the departments of their social and political system. One of the cardinal principles, we must remember, is that all the members of a gens stand on an equal footing. In keeping with this we have seen that all were trained as warriors; yet the great principle of the division of labor was at work. Some filled in their leisure during times of peace by acting as traders; others became proficient in some branch of work, such as feather

work, or making gold and silver ornaments. Yet under a gentile system of society, persons practicing such callings could never become very rich or proficient, simply because, being members of different gentes, there could not be that co-operation and united efforts among workmen in these various trades and callings that is necessary to advance them to the highest proficiency. It required the breaking up of the gentes and substituting for that group a smaller one, our modern family, as the unit of social organization, before great progress could be made.

From what we have just said it follows that it is not at all likely that there was any great extremes in the condition of the people. No very wealthy or extremely poor classes. This brings us to consider the condition of trade and commerce among them. They had properly no such a thing as money, so their commerce must have consisted of barter or trade and exchange. Some authorities assert quite positively that they had money, and mention as articles used for such purposes grains of cacao, "T" shaped pieces of tin or copper, and quills of gold dust.[1] But Mr. Bandelier has shown that the word barter properly designates the transactions where such articles passed. But this absence of money shows us at once that the merchants of Mexico were simply traders who made their living by gathering articles from a distance to exchange for home commodities.

We are given some very entertaining accounts of the wealth and magnificence of the "merchant princes of Mexico."[2] It needs but a moment's consideration of the state of society to show how little foundation there is for such accounts. Mr. Bancroft also tells us that "throughout the Na-

[1] Bancroft's "Native Races," Vol. II, p. 381. Proceedings American Antiquarian Society, April, 1879, p. 110.

[2] Bancroft's "Native Races," Vol. II, p. 193.

hua dominions commerce was in the hands of a distinct class, educated for their calling, and everywhere honored by the people and by kings. In many regions the highest nobles thought it not disgraceful to engage in commercial pursuits."

Though we do not believe there is any foundation for this statement, yet trading is an important proceeding among sedentary tribes. "The native is carried over vast distances, from which he returns with a store of knowledge, which is made a part of his mythology and rites, while his personal adventures become a part of the folk lore."[1] It was their principal way of learning of the outside world. It was held in equally high esteem among the Mexicans. Such an expedition was not in reality a private, but a tribal undertaking. Its members not only carried into distant countries articles of barter, but they also had to observe the customs, manners, and resources of the people whom they visited. Clothed with diplomatic attributes, they were often less traders than spies. Thus they cautiously felt their way from tribe to tribe, from Indian fair to Indian fair, exchanging their stuff for articles not produced at home, all the while carefully noting what might be important to their own tribe. It was a highly dangerous mission; frequently they never returned, being waylaid or treacherously butchered even while enjoying the hospitality of a pueblo in which they had been bartering."

We may be sure the setting out of such an expedition would be celebrated in a formal manner.[2] The safe return was also an important and joyful event. The reception was almost equal to that afforded to a victorious war-party. After going to the temple to adore the idol, they were taken before the council to acquaint them with whatever they had

[1] "Fifth Annual Report Archæological Institute of America," p. 83.

[2] Bancroft's "Native Races," Vol. II, p. 389.

learned of importance on their trip. In addition to this, their own gens would give them appropriate receptions. From the nature of things, but little profit remained to the trader. They had no beasts of burden, and they must bring back their goods by means of carriers; and the number of such men were limited. Then their customs demanded that the most highly prized articles should be offered up for religious purposes; besides, the tribe and the gens each came in for a share. But the honors given were almost as great as those won in war.

The Mexicans had regular markets. This, as we have already stated, was on territory that belonged to the tribe; not to any one gens alone. Hence the tribal officers were the ones to maintain order. The chiefs of the four phratries were charged with this duty. The market was open every day, but every fifth was a larger market.[1] They do not seem to have had weights, but counted or measured their articles. In these markets, or fairs, which would be attended by traders from other tribes, who, on such occasions, were the guests of the Mexicans, and lodged in the official house, would be found the various articles of native manufacture: cloth, ornaments, elaborate featherwork, pottery, copper implements and ornaments, and a great variety of articles not necessary to enumerate.

We must now briefly consider their arts and manufactures. Stone was the material principally used for their weapons and implements. They were essentially in their Stone Age. Their knives, razors, lancets, spear and arrow-heads were simply flakes of obsidian. These implements could be produced very cheaply, but the edge was quickly spoiled. Axes of different varieties of flint were made. They also used flint to carve the sculptured stones which we have described in the preceding chapter. They also had

[1] Bancroft's "Native Races," Vol. II, p. 325.

some way of working these big blocks of stone used in building. But they were not unacquainted with metals—the ornamental working of gold and silver had been carried to quite a high pitch. Were we to believe all the accounts given us of their skill in that direction, we would have to acknowledge they were the most expert jewelers known. How they cast or moulded their gold ornaments is unknown. They were also acquainted with other metals, such as copper, tin, and lead. But we can not learn for what purpose they used lead or tin, or where they obtained it.[1]

Cortez, in one of his letters, speaks of the use of small pieces of tin as money. But we have already seen that the natives had not risen to the conception of money. They certainly had copper tools, and bronze ones. It seems, however, that their bronze was a natural production and not an artificial one—that is to say, the ores of copper found in Mexico contain more or less gold, silver, and tin. So, if melted, just as nature left them, the result would be the production of bronze.[2] They were then ignorant of the knowledge of how to make bronze artificially. This shows us that they had not attained to a true Bronze Age; and yet the discovery could not have been long delayed. Sooner or later they would have found out that tin and copper melted together would produce the light copper that experience had taught them was the most valuable.

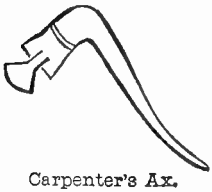
Yucatan Axes.

The most important tool they made of copper was the ax. The ax, in both Mexico and Yucatan, was made as represented in this

[1] Valentine: Proceedings Am. Antiq. Society, April, 1879, p. 90.

[2] Ibid., p. 111.

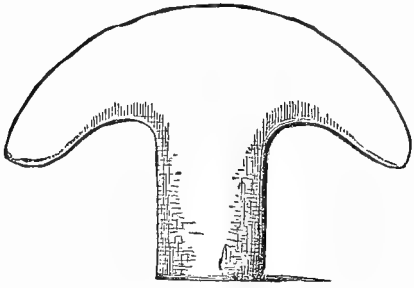
illustration. From their shape and mode of hafting them, we see at once they are simply models of the stone ax; and this recalls what we learned of the Bronze Age in Europe. At first they contented themselves with copying the forms in stone. Nature, everywhere, conducts her children by the same means to the same ends. This form of ax is a representation of a carpenter's hatchet. The next cut is from the Mendoza collection, and represents a carpenter at work. He holds one of these hatchets in his hand, and is shaping a stick of timber. The cut below represents a form of copper tool found in Oaxaca, where they were once used in abundance. The supposition is that this implement was used for agricultural purposes—probably as a hoe. The pieces of T-shaped copper said to have been used as money, are diminutive forms of this same tool.



Carpenter's Ax.

Mexican Carpenter.

The statement is sometimes made that they had a way of hardening copper. "This," says Mr. Valentine, "is a hypothesis, often noted and spoken of, but which ranges under the efforts made for explaining what we have no positive means to verify or to ascertain." The presence of metals necessarily implies some skill in mining; but their ability to mine was certainly very limited. Gold and silver were collected by washing the sands. We do not know how copper was mined; the probabili-



Copper Tool.

ties are that this was done in a very superficial way. Whenever, by chance, they discovered a vein of copper, they probably worked it to an easy depth, and then abandoned it. M. Charney speaks of one such locality, discovered in 1873. In this case they had made an opening eleven feet long, five feet wide, and three feet deep. To judge from appearances, they first heated the rock, and then perhaps sprinkled it with water, and thus caused it to split up.[1] This is about all we can discover of their Metallic Age. It falls very far short of the knowledge of metallurgy enjoyed by the Europeans of the Bronze Age; and, with the exception of working gold and silver, it was not greatly in advance of the powers of the North American aborigines.[2] Certainly no trace of mining has been discovered at all on the scale of the ancient mines in Michigan.

A few words as to some of their other arts, and we will pass on to other topics. In manufacturing native pottery, they are spoken of as having great skill. The sedentary Indians everywhere were well up in that sort of work.[3] They knew how to manufacture cotton cloth, as well as cloth from other articles. We have stated that paper furnished an important article of tribute. They made several kinds of paper. One author states that they made paper from the membrane of trees—from the substance that grows beneath the upper bark.[4] But they also used for this purpose a plant, called the maguey plant. This was a very valuable plant to the aborigines, since we are told that the natives managed to extract nearly as great a variety of useful articles from it as does an inhabitant of the East Indies from his cocoa palm. Amongst other articles, they made paper. For this paper,

[4] Proceedings Am. Antiq. Society, Oct., 1881, p. 66. (Valentine.)

we are told, "the leaves were soaked, putrefied, and the fibers washed, smoothed, and extended for the manufacture of thin as well as thick paper."[1]

They used feathers for plumes, fans, and trimmings for clothing. The articles the Spaniards are most enthusiastic in praising is that variety of work known as feather mosaic. They took very great pains with this sort of work. The workman first took a piece of cloth, stretched it, and painted on it, in brilliant colors, the object he wished to reproduce. Then, with his bunch of feathers before him, he carefully took feather after feather, arranging them according to size, color, and other details, and glued each feather to the cloth. The Spanish writers assert that sometimes a whole day was consumed in properly choosing and adjusting one delicate feather, the artist patiently experimenting until the hue and position of the feather, viewed from different points, and under different lights, became satisfactory to his eye.[2]

This disregard of time is a thoroughly Indian trait of character. Years would be spent in the manufacture of a choice weapon. The impression is given that these feather-workers formed a craft, or order, and that they lived by themselves. But this would be such an innovation on the workings of the gens that there is probably no foundation for it.

We will now consider the subject of religion. We can never judge of the real state of culture of a people by their advance in the arts of government and of living alone. Constituted as men are, they can not help evolving, in the course of time, religious conceptions, and the result is that almost all the races and tribes of men have some system

[1] Proceedings Am. Antiq. Society, Oct., 1881, p. 66. (Valentine.)
[2] Bancroft's "Native Races," Vol. II, p. 489.

of belief, or, at any rate, some manner of accounting for the present condition of affairs, and some theory as to a future state. It is true that these theories and beliefs are often very foolish and childish, still they are not on that account devoid of interest. From our present standpoint, we can clearly see that the religious belief of a people is a very good index of their culture. At first such conceptions are necessarily rude, but as the people advanced in culture, they become clearer.

Fearing that we will be misunderstood in the last statement, we will state to whom it applies. The Christian world hold that God revealed himself to his chosen people, and that we draw from his Word what is permitted mortals to know of his government and the future world. We make no question but that this is true. But long before there was a Hebrew people there was a Paleolithic race, who doubtless had some vague, shadowy, ill defined idea of supernatural power, and sought, in some infantile way, to appease the same. Afterwards, but long before the glories of Solomon, a Neolithic people were living in Palestine, and the same culture was wide-spread over the world. To this day a large part of the world's inhabitants have never so much as heard of the Christian religion. It is to such people that we especially refer.

The religious beliefs of the Indians have not been fully studied as yet; but, until that is done, it is scarcely possible to understand and fully weigh what is said as to the religious beliefs of the Mexicans. What we can discern of the religion of the Nahua and Maya tribes shows us that it is not at all probable they had reached a stage of development in which they had any idea of One Supreme, Overruling Power. But our scholars differ on that point, many contending that the Mexicans distinctly affirmed the exist-

ence of such a God.[1] To form such conceptions implies a power of reasoning on abstract topics that is vain to expect of a people in their state of development. We think, therefore, that the idea that they had such a belief, arises from a misconception. Let us see if we can discover how that was.

Nearly all of the North American tribes had some word to express supernatural power. The Iroquois used for this purpose the words "oki" and "otkon."[2] The first meaning of these words is "above." As used by these Indians, however, they expressed the working of any unseen, mysterious, and, therefore, to them, supernatural power. There was, however, no idea of personality or of unity about it. Other Indian tribes had words to express the same meaning. The English and French explorers translated these words into their languages in various ways. The most common is the rather absurd one of "medicine," which has passed into common use. Thus, to mention one in very frequent use, we have the expression "Medicine-men"—meaning their priests and conjurers. The same custom prevailed among the higher class of sedentary Indians of Mexico and Central America. The Aztecs used the word "teotl" to express the name meaning; the Mayas, the word "ku;" the Peruvians, "huaca." But the word used, in each case, meant not so much a personal supreme-being as it did an ill-defined sense of supernatural, mysterious power. This point not being clearly understood, it was quite natural that the early writers understood by these various expressions their name of the First Cause.

In the present state of our knowledge, it is certainly

[1] Bancroft's "Native Races," Vol. III, pp. 182–199. In this connection, see also Bandelier: "An Archæological Tour in Mexico," p. 185, note 2. It seems that none of the early writers speak of such a belief. The idea of one single God is first found in the writings of Ixtilxochitl.

[2] Brinton's "Myths of the New World," p. 45.

very hard to give an intelligent statement of the religious conceptions of the Maya and Nahua tribes. Among the Nahuas, their conception of creative power was that of a pair—a man and wife. These were not the active agents, however—they engendered four sons, who were the creators. This seems to be a widely extended form of tradition. Two authors, writing about fifty years after the conquest, speak of the four principal deities and statues. They had a great many idols besides—but four were the principal ones.

It would be very satisfactory could we frame some theory to account for this state of things. If we could only be sure that each god was symbolic of some of the elements—or, if we could only say that this was but another instance of the use of the number "four"—and thus connect them with the cardinal points, it would be very satisfactory to many. The amount of study that has been bestowed on this question is very great, and it is very far from being settled. Each of these four was the principal, or guardian, deity of a particular tribe.[1] All of these appear in native traditions as historical personages, as well as deities. It is for this reason that Mr. Bandelier concludes that the "four principal gods were deified men, whose lives and actions became mixed up with the vague ideas of natural forces and phenomena."[2]

As prominent a figure as any in Central American Mythology is Quetzalcohuatl; and we can form a good idea of the force of the preceding remarks by considering this case. The name is a compound of two words, "quetzal-cohuatl"—and is, says Mr. Bandelier, a fair specimen of an Indian personal name. He tells us that the meaning is "bright," or

[1] Tezcatlipoca, the tutelar deity of Tezcuco; Huitzilopochtli, the tutelar deity of Mexico; Camaxtli, the tutelar deity of Tlaxcala; Quetzalcohuatl, the tutelar deity of Cholula.

[2] Bandelier: "An Archæological Tour in Mexico," p. 188.

"shining snake." Others have translated it, "feathered serpent." We have referred to the attempt to show that the tablet of the cross, at Palenque, had reference to him. Those who think he was the nature-god of the Nahuas find a great deal of significance in the name.[1] Mr. Bandelier, after carefully considering all reference to him by the early writers, shows that it is quite as likely that Quetzalcohuatl "was a man of note, whose memory was afterward connected with dim cosmological notions." It is plain that our idea of the culture of the Mexicans will vary according as we consider the base of this myth to be a man, or the forces in nature producing the fertilizing summer rain.[2]

The worship of Quetzalcohuatl was very widely extended; but it was mostly confined to the Nahua tribes. But there are somewhat similar traditions among the Maya tribes; and this is one of those few points which, like the similarity of their calendar systems, seems to point to a close connection in early times. The Quiches have a very similar myth. Briefly, it is to the effect that four principal gods created the world. One of these was named Gucumatz—meaning, also, shining, or brilliant snake. Some think that this is the same personage as Quetzalcohuatl, and from this fact show how true it is that the operations of the forces of nature everywhere affect the minds of men in a similar manner.[3] Others will not, however, go as far as this, and will only say there is a similarity between the two characters. The tribes in Yucatan also have a tradition of Cuculcan, whose name means the same as the two already mentioned. The authority who refers to him speaks of him only as a man. The Quiche legend, already referred to,

[1] This subject is fully treated of in Brinton's "Myths of the New World."

[2] "Among the Indians it is very easy to become deified. The development of the Montezuma myth among the Pueblo Indians of New Mexico is an instance." (Bandelier.)

[3] Brinton's "Myths of the New World."

speaks of Gucumatz only as a god. The Nahua traditions of Quetzalcohuatl, as we have seen, are confused accounts of a man and a god.

The traditions having reference to the earthly career of Quetzalcohualt represent him as having considerable to do with Tulla and Cholula. At Tulla he appears in the light of a great medicine-man, or priest; at Cholula, as a sachem. Still other traditions represent him as a great and successful warrior. None of these characters are incompatible with the others, from an Indian point of view. These traditions are so hopelessly confused, that it is doubtful if any thing of historical value can be gained from them. As a deity, he was worshiped as god of the air or wind. Why he should be so considered is answered in various ways. If, reasoning from his name, we choose to believe he is a nature-god—as such standing for the thunder-storm, clouds of summer—then, as the winds "sweep the path for the rain-clouds," he would be considered their god. Also, following out this line of thought, we can see how, as the god which brings the fertilizing summer rain, he would be considered the god of wealth, and the patron deity of traders.

We must not lose sight of the fact that all these traditions are most wofully mixed; that, since the conquest, many ideas from other than native sources have been engrafted on them; and, furthermore, that other explanations that are worth considering can be presented. The horticultural tribe located at Cholula had Quetzalcohuatl for their tutelar deity. Their crops depend upon the timely descent of the rain. What more natural than that they should regard such rains as sent by him? This pueblo was also famous for its fairs. "By its geographical position, its natural products, and the industry of its people," it became a great trading market. Near it was raised cochineal dye, in large quanti-

ties. This was eagerly sought after by traders from a distance. Cholula was also famous for its pottery. The Tlaxcaltecos told Cortez that the inhabitants of Cholula were a tribe of traders; what more natural, then, than that their tutelar deity should become, in the eyes of foreign tribes, the god of traders.[1]

Quetzalcohuatl was but one of the four principal gods. The tutelar deity of the Mexicans was Huitzilopochtli. His altars were almost daily wet with the blood of sacrificed victims. No important war was undertaken, except with many ceremonies he was duly honored. If time were so short that proper care could not be bestowed on the ceremonies, then there was a kind of deputy god that could be served in a hurried manner that would suffice.[2] After a successful battle, the captives were conducted at once to his temple, and made to prostrate themselves before his image. In times of great public danger, the great drum in his temple was beaten. The Spaniards, by dire experience, knew well the meaning of that awful sound.

The plate opposite represents what was probably the idol of Huitzilopochtli. "It was brought to light in grading the Plaza Mayor in the City of Mexico in August, 1790. It was near the place where the great Teocalli stood, and where the principal monuments of Mexico were. They were thrown down at the time of the conquest and buried from sight. It is an immense block of bluish-gray porphyry, about ten feet high and six feet wide and thick, sculptured on front, rear, top, and bottom, into a most complicated and horrible combination of animal, human, and ideal forms."[3] This idol is generally stated to be that of the goddess of death.

---

HUITZILOPOCHTLI

But Mr. Bandelier, after carefully reviewing all the authorities, concludes that it represents the well-known war-god of the Mexican tribe.[1]

To properly conduct the services in honor of these various gods, required established rites and a priesthood. What we call "Medicine men" wizards, and names of similar import among the northern tribes, were more correctly priests. There was no tribe of Indians so poor but what they had these priests. But we would expect this office to increase more in power and importance among the southern Indians. Among the Iroquois, we are told each gens elected certain "keepers of the faith." These included persons both male and female. Their principal duty was to see that the feast days were properly celebrated. From what we know of the gens we feel confident that they would be perfectly independent in religious matters as well as in other respects. Consequently it is not probable that there was even in Mexico any hereditary caste of priests.[2]

However set aside, or chosen, or elected, we have every reason to believe that the organization of the priesthood was systematic. The aspirant for the office had to acquaint himself with the songs and prayers used in public worship, the national traditions, their principles of astrology, so as to tell the lucky and unlucky days. When admitted to the priesthood, their rank was doubtless determined by meritorious actions. Successes in war would contribute to this result as well as sanctity, a priest who had captured several prisoners ranking higher than one who had captured but one, and this last higher than the unfortunate who had

[1] "An Archæological Tour in Mexico," p. 67.

[2] "Peabody Museum Reports," Vol. II, p. 600. Dr. Brinton in "Myths of the New World," p. 281, gives some instances that might be thought to show the contrary. But even in those extracts we notice the parties had to deserve the office, and that in no case was it confined to certain persons.

taken none.[1] We must not forget that war was the duty of all among the Mexicans. The priests were not in all cases exempt; part of their duties may have been to care for the wounded. It is not likely that the priests of any one god ranked any higher than the priests of others, or had any authority over them.

This body of priests of whom we have just treated concerned themselves a great deal with the social life of the Mexicans, and their power was doubtless great. Their duties commenced with the birth of the child, and continued through life. No important event of any kind was undertaken without duly consulting the priests to see if the day selected was a lucky one. The Nahuas were, like all Indians, very superstitious, so there was plenty of work cut out for the priests. Into their hands was committed the art of explaining dreams, fortune-telling, astrology, and the explanation of omens and signs. Such as the flight and songs of birds, the sudden appearance of wild animals; in short, any unexpected or unusual event, was deemed of sufficient importance to require in its explanation priestly learning. In addition there was the regular routine of feasts.[2] We have seen what a multitude of gods the Nahuas worshiped. Like all Indian people, they were very fond of feasts and gatherings of that character; therefore feast days in honor of some one of the numerous deities were almost constantly in order, and every month or two were feasts of unusual importance. The most acceptable sacrifice to these gods, and without which no feast of any importance was complete, was human life.

This introduces us to the most cruel trait of their character. It was not alone true of the Mexicans, but of all the

[1] Bancroft: "Native Races," Vol. III, p. 335.
[2] Bancroft: "Native Races," Vol. II, p. 500.

Nahua tribes and of the Mayas, though in a less degree. On every occasion of the least importance victims were sacrificed. Any unusual event was celebrated in a similar manner. Before the departure of a warlike expedition, the favor of Huitzilopochtli was sought by the sacrifice of human life; on the return of the same, similar scenes were enacted. On all such occasions the more victims the better. These victims were mostly captives taken in war, and wars were often entered into for the express purpose of procuring such victims. They were even made a subject of tribute. Devout people sometimes offered themselves or their children for the sacrifice. The number of victims, of course, varied from year to year, but it is possible that it counted up into the thousands every year.

What we are able to gather from the religious beliefs of the civilized nations sustains the conclusions we have already arrived at in reference to their culture. We can but believe this had been greatly overrated. It is the religion of barbarians, not of a cultivated and enlightened people the historians would have us believe in. It is a religion in keeping with the character of the people who had confederated together for the purpose of compelling unwilling tribute from weaker tribes. It is in keeping with what we would expect of a people still in the Stone Age, who still practiced communism in living, and whose political and social organization was founded on the gens as a unit.

It will not be out of place to devote some space to a consideration of their advance in learning; and first of all let us see about their system of counting or numeration. This knowledge, as Mr. Gallatin remarks, must necessarily have preceded any knowledge of astronomy, or any effort to compute time. They must have known how to count the days of a year before they knew how many days it con-

tained. We all know how natural it is for a child to count by means of his fingers. This was undoubtedly the first method employed by primitive man. Proof of this is found in the wide extended use of the decimal system. Among the civilized nations, traces of this early custom are still preserved in the meaning of the words used to express the numbers.

To express the numbers up to twenty, small dots or circles were used—one for each unit. For the number twenty they painted a little flag; for the number four hundred, a feather; and for eight thousand, a purse or pouch. The following table represents the method of enumeration employed by the Mexicans. But it is necessary to remark they used different terminations for different objects.[1]

Substantially the same system of numeration prevailed among all the Nahua tribes and the Mayas. It will be seen from this table that the only numbers having simple names are one, two, three, four, five, ten, fifteen, twenty, four hundred, and eight thousand. The other names are compounds of these simple names. It is also easy to understand their method of pictorial representation. In reference to the flag, the feather, and the purse, we must remark that, when these were divided into four parts, only the colored parts were counted. The collective number, used among them much as we use the word dozen, was always twenty; but queerly enough their word for twenty varied according to the object to be counted. The regular word given in the table was "pohualli." In counting thin objects that could be arranged one above the other, the word twenty was "pilli." Objects that were round and plump and thus re-

[1] Mr. Bandelier remarks that the numbers from five to ten should be macuil-pa-oc-ce, etc. We give the same table as both Mr. Gallatin and Mr Bancroft.

# MEXICAN SYSTEM OF NUMERATION.

| NO. | MEXICAN NAME. | PICTORIAL SIGN. | EQUIVALENT. | REMARKS. |
|---|---|---|---|---|
| 1 | Ce or cem. |  | 1 | |
| 2 | Ome. |  | 2 | |
| 3 | Yey or ey. | | 3 | |
| 4 | Nahui. |  | 4 | |
| 5 | Macuilli. | | 5 | The word for five means "clinched hand," or all the fingers on a hand. |
| 6 | Chico a ce. | | 5+1 | They set their dots for units in sets of five. |
| 7 | Chic ome. |  | 5+2 | |
| 8 | Chico ey. | | 5+3 | Notice from six to nine we have the ordinary numbers from one to four with a prefix, the meaning of which, though not very plain, is "with one side." |
| 9 | Chico nahui. | | 5+4 | |
| 10 | Matlactli. |  | 10 | A new word, meaning "upper part of the body." |
| 11 | Matlactli oc ce. | | 10+1 | |
| 12 | Matlactli om ome. |  | 10+2 | Notice we have for the numbers from eleven to fourteen, inclusive, the word for ten; and the words for the numbers from one to four, inclusive, joined by the words oc, om, or o, evidently used as conjunctions. |
| 13 | Matlactli om ey. | | 10+3 | |
| 14 | Matlactli o nahui. |  | 10+4 | |
| 15 | Caxtolli. | | 15 | A new word, meaning unknown. |
| 16 | Caxtolli oc ce. | | 15+1 | For seventeen, eighteen, and nineteen, we would have the word caxtolli connected with the words from one to four, inclusive. So they need not be given. |
| 20 | Cem pohualli. |  | 1×20 | This word pohualli means a "count." Twenty was their base. In some languages the word for man means twenty also. Cem is the word for one. |
| 30 | Cem pohualli ihuan matlactli. | | 1×20+10 | |
| 35 | Cem pohualli ihuan caxtolli. |  | 1×20+15 | We have the words for twenty and ten connected by the word ihuan, evidently used as the word om (above). The flag meant twenty. When divided into four parts, each colored part meant five; in this case we use half the flag. The words to express thirty-five, forty, and one hundred can easily be made out. |
| 40 | Ome pohualli. | | 2×20 | |
| 100 | Macuil pohualli. | | 5×20 | |
| 200 | Matlactli pohualli. | | 10×20 | A feather is the proper sign for four hundred. Half a feather sometimes meant two hundred, or use ten flags. |
| 400 | Cen tzontli. | | 1×400 | The word tzontli means the "hair of the head." |
| 800 | Ome tzontli. |  | 2×400 | |
| 1000 | Ome tzontli ihuan matlactli pohualli. | | 2×400+10×20 | The words for eight hundred and two hundred connected by "ihuan." |
| 8000 | Xiquipilli. | | 8000 | The pictorial sign is a purse supposed to contain 8,000 grains of cocao. |

sembling a stone, were counted with "tetl" for twenty, and other words for different objects.[1]

The division of time or their calendar system, is one that was thought to show great advance in astronomical learning, but of late years it has been shown that this also was overrated. This question of how to keep a record of time was a difficult one for primitive man to solve; that is, when he began to think about it at all. A long while must have elapsed, and considerable advance in other respects been made before the necessity of such a thing occurred to them. The increase and decrease of the moon would form a natural starting point. It is well known that this is about as far as the knowledge of the Indians extended. The Maya word for month means also moon, showing this was their earliest system of reckoning time.[2]

The various Nahua and Maya tribes of Mexico and Central America had reached about the same stage of development. But their calendar system is so similar that it affords a strong argument of the original unity of these people.[3] All of the civilized tribes had months of twenty days each, and each of these days had a separate name, which was the same for every month of the year. This period of twenty days was properly their unit of time reckoning. It is true they had smaller divisions,[4] but for all practical purposes, they were ignored. As none of these tribes possessed the art of writing, they had to represent these days by means of hieroglyphics. The preceding table

[1] For authorities on this subject see Gallatin in "American Ethnological Society's Transactions," Vol. I, p, 49; Bancroft's "Native Races," Vol. II, p. 497; Valentine, in Am. Antiq. Soc. Proceedings, Oct., 1880, p. 61.

| Akbal, . . | | Household. | Xochitl, . . . | | Flower. |

shows the Mexican and Maya days, the meaning of each, and the pictorial sign by which they were represented. We must notice that the Maya hieroglypics look more arbitrary, more conventional than the Mexican. This is interesting, because some of our scholars now believe the Mayas were the inventors of the calendar. Their hieroglyphics, therefore, as being the older of the two, should appear more conventional. In the Mexican hieroglyphics for the days, we can still trace a resemblance to the natural objects they represent; in the Maya hieroglyphics, this resemblance has disappeared.

It is not out of place to theorize as to the facts already mentioned. The first thing that strikes us is that they should have chosen twenty days for a unit of time. There must have been some reason lying back of this selection. It would have been more natural for them to have chosen a number of days (say thirty) more nearly corresponding to the time from one new moon to another. Whether we shall ever learn the reason for choosing this number of days is doubtful; but Mr. Bandelier has given us some thoughts on this subject, which, though he is careful to state are not results, but mere suggestions, seem to us to have some germs of truth, the more so as it is fully in keeping with Indian customs.

He points out that many of the names for these days mean the same as the names of the gens in the more northern Indian tribes. Thus seven of the days have the same meaning as the names of seven of the nine gens of the Moqui tribe in Arizona. He, therefore, suggests that the names of these twenty days are the names of the twenty gens of the aboriginal people from whom have descended the various civilized tribes under consideration. Indeed, this is expressly stated to be the method of naming the

days adopted by the Chiapanecs, one of the tribes in question.[1]

As soon as the people commenced to take any observation at all, they would perceive that it took just about eighteen of these periods of twenty days to make a year. So the next step appears to have been the division of the year into eighteen months. These months received each a name,

MAYA MONTHS.

and were of course designated by a hieroglyphic. The names of the Mexican months seem to have been determined by some of the feasts happening therein. There is great diversity among the early writers both as to the names of these months, and the order in which they occur, as well as by the hieroglyphics by which they are represented.[2] It

[1] Bandelier: Peabody Museum Reports." Vol. II, p. 579. Note 29.

[2] Mr. Bancroft, " Native Races," p. 508, gives a table showing the variation of authors in this respect. Gallatin " American Ethnological Society's Transactions," Vol. I, p. 66, says, " the published hieroglyphics are dissimilar in many respects."

does not seem worth while to give their names and meaning. We give a plate showing the name, order in which they occur, and hieroglyphic symbol of the Maya months. In point of fact, the months were very little used, as we shall soon see it was not necessary to name the month to designate the day; but of that hereafter.

But it would not take these people very long to discover that they had not hit on the length of a year. Eighteen months, of twenty days each, make only three hundred and sixty days; so the next step would be to add on five days to their former year. As these days do not make a month, they were called the nameless days. They were considered as being unlucky—no important undertaking could be commenced on one of them. The child born therein was to be pitied. But we will see that the expression, "nameless days" was hardly the case among the Mayas, though it was among the Mexicans.

Perhaps this will be as good a place as any to inquire whether they had exact knowledge of the length of the year. As every one knows, the length of the year is three hundred and sixty-five and one quarter days, or very nearly; and for this reason we add an extra day to every fourth year. We would not expect to find this knowledge among tribes no farther advanced than we have found these to be. If, as our scholars suspect, the Maya be the one from which the others were derived, they would be apt to possess this knowledge, if known. Perez, however, could find no trace of it among them.[1] Many authors have asserted that the Mexicans knew all about it. Some say they added a day every four years; others, that they waited fifty-two years, and then added thirteen days; and some, even, give them credit for still closer knowledge, and say they added twelve

[1] Stephens's "Yucatan," Vol. I, p. 438.

and one-half days every fifty-two years.[1] Prof. Valentine, who has made their calendar system a special study, concludes that they knew nothing at all about the matter.[2]

The beginning of the year is variously stated. Among the Mexicans it seems that, while the authors differ very much, all but one places it on some day between the second day of February and the tenth of April. As their word for year means "new green," it is probable they placed its commencement about the time new grass appeared. The Mayas are said to have placed the commencement of the year about the sixteenth of July. As this happens to be just about the time that the sun is directly overhead in Yucatan, it has been surmised that the natives took astronomical observations, and tried to have their year commence at that time. But it must be manifest that, if they did not possess a knowledge of the true length of the year, and so make allowance for the leap-year, in the course of a very few years they would have to revise this date.

Refer once more to the Maya table of days. Suppose the first day of the year to commence with the day Kan. As there are twenty days in a month, we see that the second month would also commence with Kan. In like manner, Kan would be the first day of every month of that year. When the eighteen months were past, there would still remain the five days to complete the year. Now, although they were said to be nameless days, the Mayas gave them names. The first day was Kan, the second day Chichan, the third day Quimij, the fourth day Manik, the fifth day Lamat. The regular order of days we see. They were now ready to commence a new year.

The next day in the list is Muluc. This becomes the

[1] Bancroft's "Native Races," Vol. II, p. 513, note 15.
[2] Proceedings Am. Antiq. Society, April, 1878, p. 99.

first day of the first month of the new year. But, being the first day of the first month, it was the first day of every month of that year. At the end of the eighteen months of that year, the five days would have to be named in their order again, which would carry us down to Gix, the first day of the first month of the third year. It would also be the first day of every month of that year. Similarly we see that Cavac would be the first day of every month of the fourth year. The fifth year would commence again with Kan. So we see that four of these twenty days became of more importance than the others. The years were named after them. The year in which the month commenced with Kan was also called Kan. The same way with the other days. So the name of the year was either Kan, Muluc, Gix, or Cavac. These four days were called "carriers of the year;" because they not only gave the name to the year, but because the name of the year was also the name of the first day of every month of that year.

The foregoing will help us to understand the Mexican method. Let us refer now to the list of Mexican days. The first day of the first month was Cipac. For the same reason as above set forth, this would be the first day of every month of the year. The five extra days either were not named at all, or at any rate they were not counted off in the table of days. The consequence was that Cipac was the first day of every month; for we have just seen that it was the first day of every month of the first year. At the end of the eighteen months the five nameless days would come in; but, as they did not form part of a month, were not named. The first day of the first month of the next year would be named as if they had not occurred.[1] But, when they came to name the years, we find they pro-

[1] Gallatin: "American Ethnological Soc. Trans.," Vol. I, p. 71.

ceeded on exactly the same principle as the Mayas. Thus four of the twenty days, occurring just five days apart, were taken to name the years. These days were Tecpatl, Calli, Tochtli, and Acatl.[1]

Mr. Bandelier, who made the valuable suggestion in regard to the origin of the names of the days, has also suggested that, inasmuch as there are four of the days more prominent than the others, they may signify four original gentes, from which the others have come. It seem to us, however, when we notice they are just five days apart, that the system pursued by the Mayas in naming their years explains the whole matter.

Before we mention the longer periods of time in use among them we must refer to another mode of reckoning time, and trace the influence of this second method on the one already named. The method already explained seems to have been a perfectly natural one—the second method is founded on superstition. A large part of the duties of the priests, we remember, was to determine lucky and unlucky days, and in soothsaying. For this purpose they made a peculiar division of time, which we will now try and explain.

For some cause or other, thirteen was a number continually recurring in their calendar. We can perceive no reason why it should have been chosen. It has been suggested that it was just about the time from the appearance of a new moon to its full. Be that as it may, the number of days thirteen comes very near to what we would call a week. Among the Mexicans, and probably among the Mayas, these thirteen days were divided into lucky, unlucky, and indifferent days, and were supposed to be

[1] See Valentine, in Proceedings American Antiq. Society, April, 1878, p. 106. Gallatin, who is also good authority, gives the order different, viz., Tochtli, Acatl, Tecpatl, Calli.

under the guidance of different gods. The priests had regularly painted lists of them, with the deities which governed them. These lists were used in fortune telling.

We must now inquire as to how they kept track of the years. The Mayas named their next longer period of time an ahau. There is some dispute as to what number of years it meant. Most of the early writers decide that it was twenty years;[1] but Perez, whose work we have already referred to, contends that it was twenty-four years. And this conclusion seems to be confirmed by a careful study of some of their old manuscripts.[2] Thirteen of these ahaus embraced their longest period of time, known as an ahau-katun. It had a length of either two hundred and sixty or three hundred and twelve years, according as we reckon either twenty or twenty-four years to an ahau. It may be that the length of an ahau varied among the different tribes of the Mayas.

The Mexicans also had this week of thirteen days. Twenty of these weeks, or two hundred and sixty days, formed that part of the year they called the moon-reckoning; the remainder of the year was the sun-reckoning. Their longer period of time was also based on this number. A period of thirteen years they called a tlapilli; four of these constituted a cycle equal to fifty-two years. The end of this cycle was anxiously awaited by the Mexicans. They supposed the world was to come to an end on one of these occasions. As the time drew near, the furniture was broken, the household gods were thrown into the water, the houses were cleaned, and finally, all the fires were extinguished. As the last day of the cycle drew to a close, the

[1] Valentine: Proceedings Am. Antiq. Soc., Oc ., 1879, p. 84, *et seq.*

[2] Thomas: "A study of the Manuscript Troano," in "Contributions to North American Ethnology," Vol. V, p. 29.

priests formed a procession, and set out for a mountain about six miles from Mexico. There an altar was built. At midnight a captive, the bravest and finest of their prisoners, was laid on it. A piece of wood was laid on his breast, and on this fire was built by twirling a stick. As soon as fire was produced, the prisoner was killed as a sacrifice. The production of new fire was proof that the gods had granted them a new period of fifty-two years.

To understand how the years in this cycle were arranged and numbered, we must refer once more to the Mayas, for though they did not use the cycle themselves, yet they give us a hint as to how it was obtained, and afford one more reason why we should think the Mayas were the originators of this calendar system. We give a table showing the arrangement of the days of the year among the Mayas. We will take the year Kan—that is, we remember, when Kan was the first day of every month. We would naturally think they would describe a day by giving the name of the day and the month—as, the day Kan, of the month Xul, or the first day of the month Xul—but instead of so doing, they made use of the period of thirteen days.

For instance, we see, by looking at the table, that the day ten Kan can not be any other day during the year than the day above mentioned; so that, for all purposes, it is sufficient to give the day and its number in the week. We notice, however, that the last five columns of figures for week days of thirteen are just the same as the first five. But this did not confuse any, for the last five columns of days belong to the "sun-reckoning," the others to the moon-reckoning. And though the number of the day in the week was the same, yet a different deity ruled over them than in the corresponding days of the first five columns. We can not affirm that we know this to be true of the Mayas.

# ALMANAC FOR MAYA YEAR "KAN."

| | | MOON RECKONING. | | | | | | | | | | | | | SUN RECKONING. | | | | | |

We see by looking at this that all that is necessary is to give the name of the day and its number in the week to determine at once what day of what month it was, or what day of the year it was. For instance, the day "four Kan" can not be any other day in the year than the first day of the seventh month; or, as there are twenty days in the month, the one hundred twenty-first of the year. But it would be necessary to know whether the day belonged to the moon reckoning or to the sun reckoning. In the Aztec system this was determined by the hieroglyphic of the deity governing the day. Some such system must have been in use among the Mayas.

Such, however, we know to be the case among the Mexicans.[1]

Now we notice in this almanac that the last day of the year Kan, is number one of the week. As the count goes right along, the first day of the next year, Muluc, must be number two. If we would make an almanac for that year, we would find the first day of the third year would be number three of the week. If we were to continue this, we would find that the first days of the years would range from one to thirteen. This table shows the number in the week of the first day of the first fourteen years. The first day of the fourteenth year would be number one of the week again, but this time one Muluc, and not Kan. If we would continue our researches, we would quickly discover that fifty-two years would go by before we would have a year Kan in which the first day of the year would be number one again.

| No. in the week of the first day of the years. | YEARS. |

| 10 | Muluc. |
| 11 | Gix. |
| 12 | Cavac. |
| 13 | Kan. |
| 1 | Muluc. |

We think the above explains the origin of the Mexican cycle of fifty-two years. The Mayas either never had this cycle, or had abandoned its use.[2] The Mexicans, however, used this period of time, and they numbered their years in it in such a way that we can not explain it, unless we suppose they derived it in some such a way as just set forth. We give a table showing the order of the years in a cycle, and also notice that all that was needed was the number and name of the year to show at once what year of the cycle it was. The year seven Calli, for instance, could

[1] According to the teachings of the Mexican priests nine deities governed the days. They had painted lists of these weeks, and the deities governing each.

[2] Valentine: Proceedings Am. Antiq. Soc., Oct., 1879, p. 85.

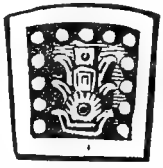
never be any other year than the twentieth year of the cycle.[1]

ARRANGEMENT OF YEARS IN A MEXICAN CYCLE.

| NO. | NAME OF THE YEARS. | | | |
|---|---|---|---|---|
| 1 | Tochli | Acatl | Tecpatl | Calli |
| 2 | Acatl | Tecpatl | Calli | Tochli |
| 3 | Tecpatl | Calli | Tochli | Acatl |
| 4 | Calli | Tochli | Acatl | Tecpatl |
| 5 | Tochli | Acatl | Tecpatl | Calli |
| 6 | Acatl | Tecpatl | Calli | Tochli |
| 7 | Tecpatl | Calli | Tochli | Acatl |
| 8 | Calli | Tochli | Acatl | Tecpatl |
| 9 | Tochli | Acatl | Tecpatl | Calli |
| 10 | Acatl | Tecpatl | Calli | Tochli |
| 11 | Tecpatl | Calli | Tochli | Acatl |
| 12 | Calli | Tochli | Acatl | Tecpatl |
| 13 | Tochli | Acatl | Tecpatl | Calli |

To express the dates, they of course painted the hieroglyphic of the day, and dots for the number of days. This cut, for instance, expresses the day-date "seven Acatl." They generally wrote the dots in sets of five. Seven was sometimes expressed in the above manner. When they wished to express a year-date, they made a little frame and painted in the hieroglyphics of the year, and dots for the number. This date here expressed is their thirteen Acatl, which, by the above table, is seen to be the twenty-sixth year of the cycle.

Day Date.



Year Date.

We have already dwelt too long on this part of the subject. Glancing back over the ground, we see there is nothing implying astronomical knowledge, more than we would expect to find among a rude people. We find there are several particulars

[1] In this table we have followed Mr. Gallatin. According to Prof. Valentine, the order of the years is different. This, however, is immaterial to an understanding of the system.

CALENDAR STONE.

of the Mexican system which we could not understand, except by reference to the Maya system. It would bother us to explain why they should choose the days Tochli, Acatl, Tecpatl, and Calli, to be the names of their years, if we did not know how the Mayas proceeded. We would be at a loss to explain why they choose the number of fifty-two years for the cycle, and arranged their years in it as they did, if we had not learned the secret from the construction of the Mayas' almanac. From this comparison, we should say the Mexican calendar was the simpler of the two. As the Mayas had twenty days in the month, and, for priestly use, weeks of thirteen days, so they took twenty years, which, as they imagined, were supported by four other years, as a pedestal for their next longer period, the ahau; and for apparently no other reason than that they had weeks of thirteen days, they took thirteen of these ahuas for their longest period of time. They did not use the cycle of fifty-two years, but they numbered their years in such a way that, in effect, they were possessed of it. The Mexican did away with all but the cycle of fifty-two years.

No account of the calendar system of the Mexicans would be complete without reference to the so-called calendar stone. The stone, the face of which is sculptured as represented in this cut, was dug up from the square in front of the cathedral of the City of Mexico, where it had been buried in 1557. When the temple was destroyed, this stone still remained entire. Finally the authorities, fearing it attracted too much attention from the natives, ordered it buried. It was brought to light again in 1790, but its early history was completely forgotten. The astronomer Gama pronounced it a calendar stone, and his interpretation of the characters engraved on it have been the foundation for the

idea that the Mexicans had considerable knowledge of astronomy.[1] Prof. Valentine and others have, however, shown that it was simply a sacrificial stone, which the artist had decorated in a peculiar manner. This stone is considered by some to be so important that we will condense Prof. Valentine's description of it as being the best at hand. Not all of our scholars accept it, however. The central figure is the face of the sun-god. It is decorated in a truly savage style. It has ear-rings, neck-chain, lip-pendant, feathers, etc. The artist's design has been to surround this central figure with all the symbols of time. We notice on each side of the sun a small circle or oval with hieroglyhics resembling claws. In Mexican traditions these represent two ancient astrologers who were supposed to have invented the calendar. According to Nahua traditions of the world, there had been four ages of the world; at the end of each age, the world was destroyed. Right above and below the ovals with the claws, we see four squares containing hieroglyphics.

Each of these squares refers to one of the destructions of the world. The upper right hand square contains the head of a tiger. This represents the first destruction of the world, which was by tigers. The four dots seen in this square do not refer to a date as they generally do; it is a sacred number, and constantly reappears in all hieroglyphics referring to feasts of the sun. To the left of this square, crowded between it and the pointer, can be seen the hieroglyphic of the day Tecpatl. The little dot is one, so this day one tecpatl probably refers to the day in which the feast in reference to this destruction was celebrated. The second age was terminated by a hurricane. The upper left hand square containing the hieroglyphic for wind refers to this destruction. Between this square and the pointer is

[1] Gallatin: "Am. Eth. Soc. Transactions," Vol. I, p. 94, *et seq.*

crowded in the hieroglyphic of one Calli, referring to the feast in memory of this destruction. The third destruction of the world was by rain, the lower left hand square containing the hieroglyphic of rain. Below, not very distinctly, is the date of this feast, one quiahuitl. The last destruction was by water, represented by the lower right hand square. The date of this feast as represented below is seven Ozomatl.[1]

Passing out of this central zone we notice the hieroglyphics for the days of the month arranged in a circle. The A shaped ray from the head of the sun indicates where we are to commence to read; and we notice they must be read from right to left. Resting on this circle of day, we notice four great pointers not unlike a large capital A. They are supposed to refer to sunrise, noon, sunset, and midnight. Next in order after the days we notice a circle of little squares, each containing five dots. Making allowance for the space covered by the legs of the pointers just mentioned, there are found to be two hundred and sixty of these days; they, therefore, refer to the days of the moon reckoning. We notice four smaller pointers not quite so elaborate as those already referred to, resting in this circle. They probably refer to smaller divisions of the days. The next circle contains a row of glyphs not unlike kernels of corn. One hundred and five are represented on this circle; they refer to the days of the sun reckoning.

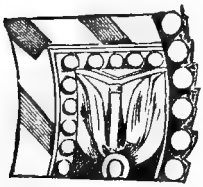
Resting on this circle of days are small towers; they, like the smaller pointers, refer to divisions of the day. Adjoining each of these little towers is a figure; this cut represents one of them. We notice they form a circle extending clear around the stone. The meaning of this

Sign of Rain.

[1] Thus says Prof. Valentine. The cast of this stone in the Smithsonian Institution gives the date eight, instead of seven Ozomatl.

circle is gathered from other painted records. It represents a rain storm; four drops are seen falling to the ground. The ground is cultivated, as shown by the three ridges; a grain of corn is represented lying on the ground. This band on the stone is in honor of the rain-god.

There remains only to explain the outer row or band. At the bottom is a rude representation of two heads with helmets. The meaning of these figures is unknown. From each of these figures extend in a semicircle a row of figures of this shape, ending with pointers at the top, between which is a year-date. Near the points on each side is what might be described as four bundles tied together. Each of the small figures just described is the representation of a cycle of fifty-two years.



Sign of a Cycle.

The date on the top is the year date, Thirteen Acatl. This is an easily determinable date. From Mexican paintings, we know the conquest of Mexico occurred in the year Three Calli. From this tracing their years back by the table given on page (736), we would find that the first Thirteen Acatl we meet was in the year 1479. This is exactly the date when, according to tradition, the great temple was finished, and this stone dedicated by bloody sacrifices. If we count the number of signs for cycles, we find that there are just twelve on each side, twenty-four in all. As the artist could easily have made this number more or less, the probabilities are that it means something. The most plausible explanation is, that in the year 1479, they had traditions of twenty-four cycles. But this number of cycles is equivalent to twelve hundred and forty-eight years, which would carry us back to about the year 231, A. D., which date we must bear in mind; not that we think there is any

scientific value to it, but for its bearing on other matter at the close of the chapter.[1]

We come now to consider the subject of their picture writings. The germ of writing is found in the rude attempts to assist the memory to recall past events. Some of the northern Indian tribes resorted for this purpose to belts of wampum. When a new sachem was to be invested with office among the Iroquois, the historical wampum belts were produced; an old man taking them in hand, and walking back and forth, proceeded to "read" from them the principles of the confederacy. In this case, particular events were con-

Indian Picture Writing.

nected with particular strings of wampum.[2] Pictorial representation would be the next stage. At first the aim of the artist would be to make his drawings as perfect as possible. A desire to save labor would soon lead them to use only the lines necessary to show what was meant. This seems to be about the stage of picture writing, reached by some Indian tribes, who have left here and there specimens carved on

[1] For information on the Calendar Stone, consult, "American Ethnological Society's Transactions," Vol. I, p. 94, *et seq.*; Bancroft's "Native Races," Vol. II, chap. xvi, and p. 755, *et seq.*; Valentine: American Antiquarian Society's Proceedings, April, 1878, p. 92, *et seq.*; Short's "North Americans of Antiquity," p. 419, *et seq.*

[2] Morgan's "Ancient Society," p. 143.

rocks. This cut is a specimen of such writing from the cañon of the San Juan in Arizona. Although quite impossible to read it, there is no doubt but what it expressed a meaning at the time it was engraved.

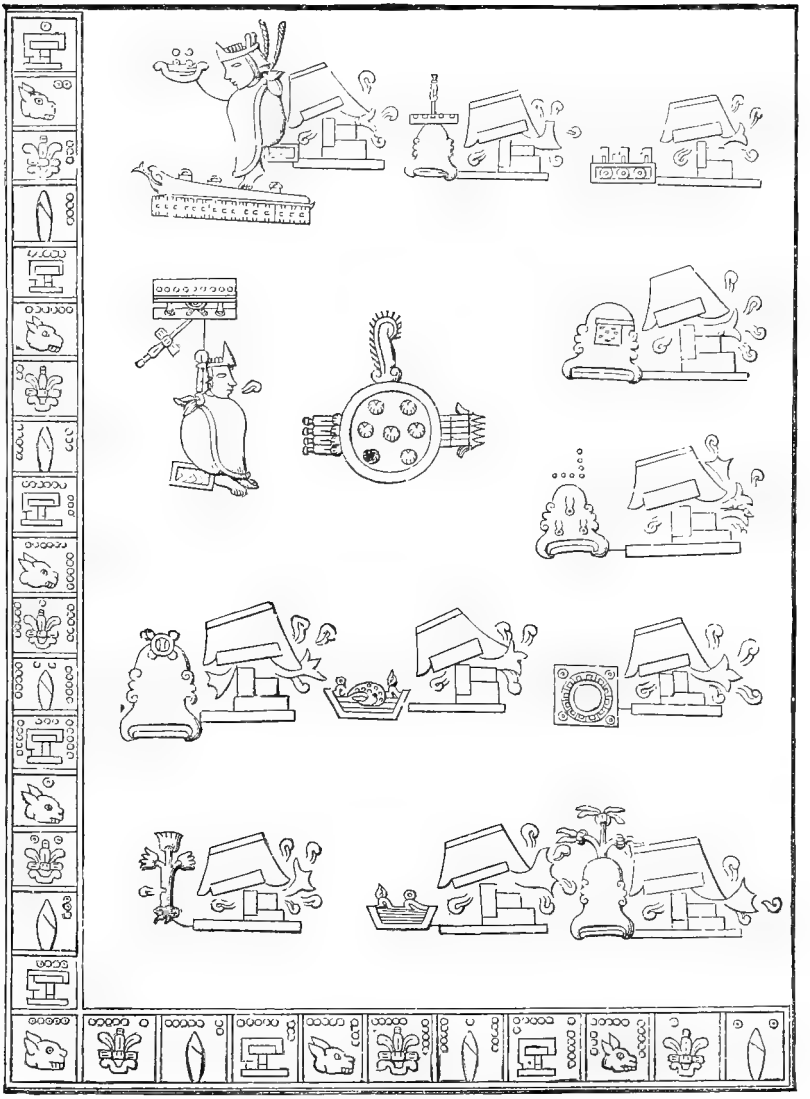
From this stage of development would naturally arise symbolical paintings. Thus "footsteps" might signify the idea of going. A comma-shaped figure, issuing from a person's mouth, would stand for speech. The next step is what we might call rebus-writing, where not the thing itself was meant but the sound. Thus this cut represents Chapultepec—meaning grass-hopper-hill, or locust mount. It is evident, here, the pictures of the objects represent the name. They, probably, did not use this principle farther than to represent the proper names of persons and things before the coming of the Spaniards.

Chapultepec.

Some think that, in addition to the above, the Mexicans used, to a very limited extent, a true phonetic writing—one in which the figures refer not to the thought, but to the sound of the thought.[1] Others are not ready to concede that point. They could not have been further along than the threshold of the discovery, at all events. The Spanish missionaries were very desirous of teaching the Indians the Pater-noster, the Ave-Maria, and the Credo. Either the Indians themselves, or the priests (probably the latter), hit on the device of using painted symbols for the words and syllables of the church prayers and formulas. Thus in this manner was painted the word Amen. The first sign is the conventional figure for water, in Mexican "atl," which stood for A. For the second syllable they put the picture of a maguey plant, in

Amen.

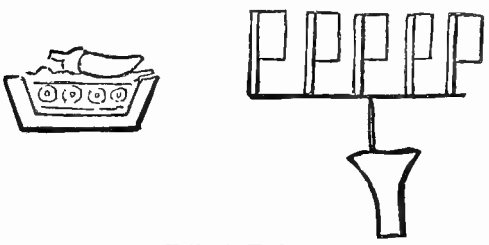
[1] Brinton: "Introduction to the Study of the Manuscript Troano."



Mexican "metl." The whole, then, was "atl-metl," which was as near as they could express the word amen. We must observe, that this was after the conquest.[1]

The plate opposite is one of the paintings of the Mendoza collection. This collection, we must remember, was made after the conquest, simply to gratify the curiosity of the King of Spain. The matter treated of is the events connected with time when Motecuma the fifth "chief-of-men" held office. Around the edge we see the hieroglyphics of the years. We notice he was chief-of-men from the year one calli to two tecpatl. About the only thing recorded of him is the different pueblos he conquered. In all he subdued thirty-three; but only eleven are shown in this plate. The pueblos are indicated by a house toppling over—flames issuing from under the roof. The other little hieroglyphics are the names of the pueblos. The last one in the second transverse line from the bottom is the hieroglphic of Chalco, which we thus learn was reduced to tribute under this chief. All the events indicated in this cut took place before the discovery of America.[2]

A second part of this codex has reference to the tribute received from various tribes. In this cut the left-hand figure



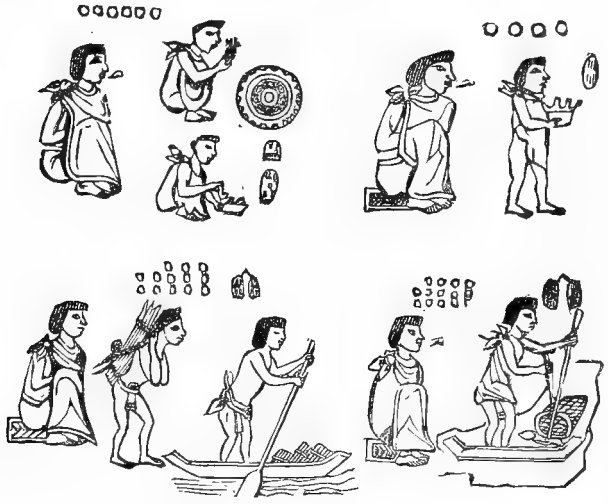
Chilapi—Tribute.

is the hieroglyphic of the town of Chilapi, and is an excellent representation of their rebus-writing we have just referred to. It is a tub of water, on which floats a red-pepper pod. The Mexican word for this last is chilli, for water it is "atl." The word "pa"

[1] Valentine: Proceedings of American Antiquarian Society, April, 1880.
[2] Gallatin: "American Ethnological Society's Transactions," Vol. I, p. 131.

means above. For the full word we have "chilli-atl-pa." Contracted, it becomes chilapi. The figure to the right is the tribute. The five flags denotes one hundred. Below is represented a copper ax-blade—from which we infer that the Pueblo of Chilapi had to furnish a tribute of one hundred copper axes.

A third part of this same collection refers to the Mexican customs. In this cut we have represented the training of a boy at the different ages of four, six, thirteen and four-

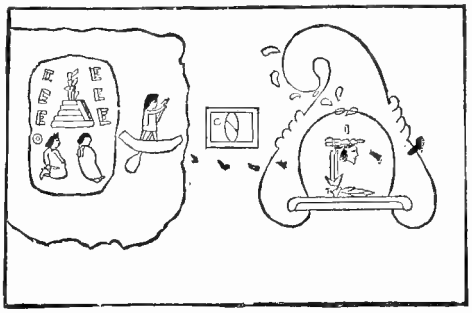


Child Training.

teen years of age. The little round marks number the years of his age. The little elliptical-shaped figures show the number of tortullas the child is allowed at a meal. The boy is trained to carry and make various things, to row a boat, and to fish.

The most interesting of Mexican picture-writings is the record of their wanderings. This was formerly supposed to represent their migrations from Asia—but is now known to refer only to their wanderings in the Valley of Mexico. De La-

field, in his "Antiquities of America," gives a full representation of this picture-writing. Bancroft's "Native Races," Vol. II, pp. 548–49, give a very good reduced copy. We will not attempt to reproduce it all. This cut represents the beginning of it. A man is seen crossing a stream in a boat. The figure behind him may mean an island, on which are represented some pueblos and human figures.



Migration Chart.

On the opposite bank of the stream, to which the footsteps lead, is the hieroglyphic of Culhuacan, "the curved mountain." The year date of this movement is "one tecpatl." The character within that of Culhuacan is Huitzilopochtli, their national god. The flakes issuing from his mouth signify that he is guiding them. The principal figures about this map are the hieroglyphic names of various places where they stopped, and the time spent at each place.

The Mayas seem to have been further advanced in the art of writing than their Nahua neighbors. Specimens of their hieroglyphic writings have been given in the preceding chapter. The hopes of our scholars were greatly raised when, in 1863, the announcement was made that there had been discovered, in Madrid, a Maya alphabet, which, it was expected, would unlock the mysterious tablets just mentioned.

The alphabet thus discovered is represented in the next cut. It will be seen that some of the letters have a number of different forms. This discovery was hailed as of the greatest importance, and a number of scholars at once set about to

decipher the tablets. They were speedily undeceived. The alphabet is, practically, of no help whatever. Prof. Valentine even goes so far as to declare that this alphabet was not of native origin.

Landa Alphabet.

He thinks that Bishop Landa, who is the authority for this alphabet, and who was Bishop of Yucatan from 1549 to 1579, being anxious to assist the natives in learning the new faith, set about the manufacture of an alphabet for them. This he did by having the natives paint some native object which came the nearest to the sound of our alphabet. Thus, for instance, this symbol there are excellent reasons for supposing represents the sun, or the word "day." The Maya word for this is *te*. We

Maya T.

MAYA MANUSCRIPT.

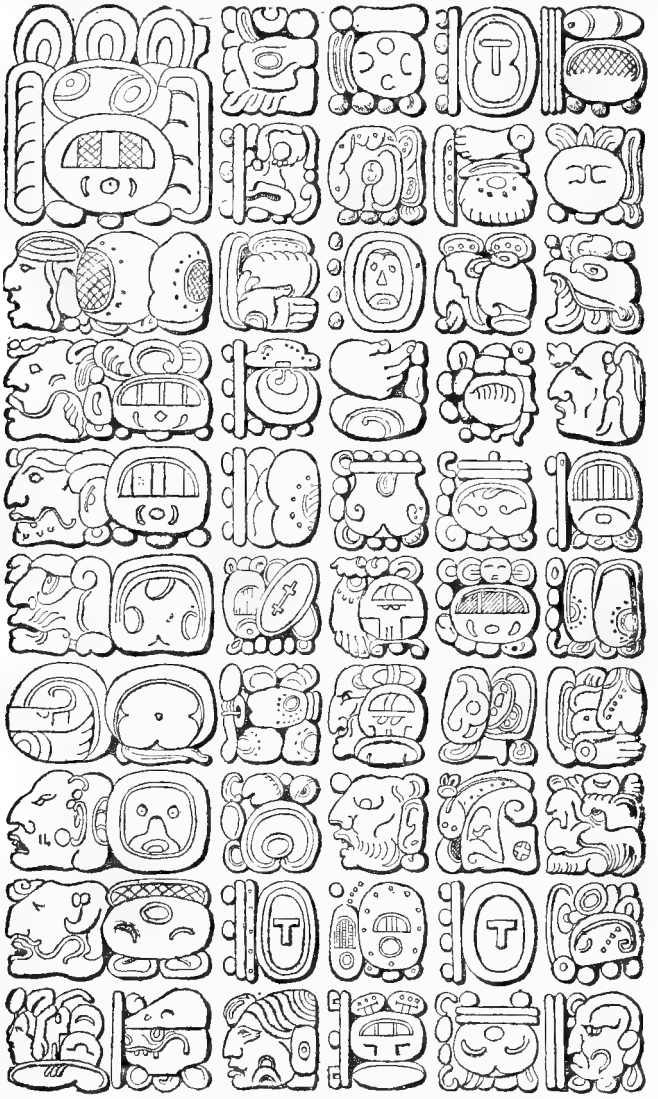
find that this is the symbol that Landa employs for the letter T, only, in his drawing, the central dot has fallen into the lower dashes. Nearly all the other letters can be traced to a similar source.[1] But the professor's reasoning does not satisfy all. He is believed to be right in a number of his identifications; but still the characters might have been used in a phonetic way.[2]

There is no doubt but that the Mayas had a different system than that in use among the Nahua people. The knowledge how to use it was, probably, confined to the priests; and, furthermore, the system was, doubtless, a mixed one. A few phonetic characters might have been used; but they also used picture-writing. Plate on page 751 is a sample of the manuscripts they left behind. It is in the nature of a religious almanac, and refers to the feasts celebrated at the end of a year. The line of characters on the left hand are the days characters Eb and Been. In the lower division, a priest offers a headless fowl to the idol on the left. In the middle division, the priest is burning incense to drive away the evil-spirit. In the upper division, the assistant, with the idol on his back, is on his march through the village. As yet, we know but very little about the tables. We know the hieroglyphics of days and of months.

Examining the tablets in the Temple of the Cross, at Palenque, represented in opposite plate, we notice a large glyph, at the commencement of the tablet, something like a capital letter. This, Mr. Valentine thinks, represents the censers which stood in the temples before the idols, in which fire was constantly kept.[3] Running through the tablets we notice glyphs, in front of which are either little dots, or one

[1] Valentine: Amer. Antiq. Society's Transactions, April, 1880, pp. 59–91.
[2] Brinton's "Introduction to Study of manuscript Troans," p. xxvi.
[3] American Antiquarian Society, April, 1881, p. 294.

or more bars with little dots in front of them. These are day-dates. The dots count one—the little upright bars, five.



Hieroglyphics—Tablet of the Cross.

The probabilities are that this tablet is a sort of list of feast-days in honor of the gods represented by the central tablet.

As we have made a considerable effort to acquaint ourselves with the social organization and customs of the various tribes, and have spent some time in learning the details of their calendar system, and their advance in the art of writing, it will not be out of place to inquire as to their history—to determine, if possible, some of the dates to be given for the arrival of the tribes, and some of the important points of their prehistoric life. Whatever difficulties we have experienced in acquiring a knowledge of their customs will be greatly increased now. Their architecture, social organization, and general enlightenment could be perceived by the conquering Spaniards, and our information in regard to the same should have been full and complete. We have seen, however, how meager it is. The only light thrown on these disputed points is the result of the labors of modern scholars. When we were made acquainted with some of the first principles of Indian society, we could read with profit the accounts of the early writers.

But, when we come to ask for dates in their history, we are almost entirely at sea. The traditions, in this respect, are almost worthless. So, all that we shall attempt to do, is to present some of the thoughts of our scholars as to the probable connection of the civilized tribes with each other, and what value is to be given to the few dates at our command. We will begin, first, with the Maya tribes. This includes those tribes that speak the Maya language, and its dialects. It was in their territory that the most striking ruins were found. They include the tribes of Yucatan, Guatemala, Chiapas, and Tobasco. Then there comes a break; but they were also settled on both banks of the River Panuco. Many theories have been advanced as to the origin of the Mayas. As yet, the question is not solved.

Not a few have supposed them to be the same as the

Mound Builders of the United States. Dr. Brinton has pointed out that the language of the Natchez Indians contains some words of the Maya.[1] A Mexican scholar, Señor Orozco-y-Berra, thinks it probable that the Mayas once occupied the Atlantic sea-board of the United States; that they passed from the peninsula of Florida to Cuba, and thence to the other Caribbean Islands, and so to Yucatan. He states that the traditions of the Mayas uphold this view.[2] But others are not ready to admit it. We have found a number of points of resemblance between the Mayas and the Nahuas. Differences we would, of course, expect to find; but still the points of resemblance are sufficiently strong to indicate either that the tribes were once subject to the same influence, from whence they derived their culture, or else that they are descended from the same stock. We have reverted to the worship of Quetzalcohuatl, and shown how the Quichés, under the name of Gucumatz, worshiped a similar deity. We have also referred to the great similarity of the calendar system.

From the limited space at our command, it is not possible to refer to the traditions of the Maya tribes. We will refer to but one manuscript bearing on this question; but this is, probably, the most important one. This manuscript was written by a native with the Spanish letter, but in the Maya language. It was written not far from the time of the conquest of Yucatan by the Spaniards, and the account is, doubtless, as full a one, from the native stand-point, as can be given. The period of time used by the author is Ahau, which we have seen is either twenty, or twenty-four years.

Carefully going over this manuscript, Prof. Valentine ar-

[1] "Myths of the New World." The doctor now thinks his statement just referred to too strong. There is, indeed, a resemblance, as he pointed out; but it is not strong enough to found any theories on.

[2] Short's "North Americans of Antiquity," p. 474.

rives at the following conclusions: About the year 137, A. D., the Mayas started from some place they called Tulla, or Tullapan, on their migration. Where this place was we do not know. The traditions of all the civilized nations refer to this place as a starting-point. It was a "land of abundance." It may be that this was but some fabled place, such as almost all primitive people have traditions of.[1] About the year 231, A. D., they arrived on the coast of Central America, and spread themselves over a large part of it. This same manuscript speaks of the "discovery" of Chichen-Itza, 522, A. D. The date of the founding of Uxmal is given as about the year 1000, A. D. From 1000 to 1200, A. D., was the golden era of the Mayas in Yucatan.

The tribes at Uxmal, Mayapan, and Chichen-Itza formed a confederacy of which Mayapan seems to have been the head. About the year 1200, inter-tribal war broke out. It seems to have been caused by the arrival of Nahua tribes, who established themselves in Mayapan. They were finally expelled, but they left the Mayas in such a state of exhaustion that they could not present a united front against the Spaniards. Such are the conclusions of Prof. Valentine. He estimates the length of an Ahau at twenty years, and it does seem that the author of the manuscript used that number of years.[2]

Of the other branch of the civilized tribes we know but very little. The historical picture writings of the Mendoza

---

[1] Brinton's "Myths of the New World."

[2] This historical manuscript represents the traditions of the Maya people shortly after the conquest. It is very likely its author had before him picture records of what he wrote. Such records have since disappeared. The manuscript itself, the interpretation of it, and Perez's remarks are found in Stephen's "Yucatan," Vol. II, Appendix. The same in Bancroft's "Native Races," Vol. V, p. 628. The fullest and most complete discussion is by Prof. Valentine in Proceedings Am. Antiq. Soc., October, 1879, p. 80, *et seq.* Whether there is any thing worthy of the name of history is doubtful.

collection, a collection compiled, remember, after the conquest, and, therefore, representing the traditions then current among the Mexicans, takes us back to 1325, A. D., to the first settlement in the Pueblo of Mexico. Sahagun, a Franciscan monk, who went to Mexico as early as the year 1529, and remained there until his death in 1590, wrote a very voluminous account of the Mexicans, their customs and history, and as he was in Mexico at the time when their traditions were still fresh in the minds of the natives, his account is probably as good as any. He obtained his information in a very credible manner. He gathered together some old Indians, well acquainted with the traditional history of their country. They are supposed to have "refreshed" their memory by inspecting a number of picture writings, which have since disappeared.

It is manifest that this history is valuable, just in proportion as the traditions are valuable. He makes one statement that Prof. Valentine has dwelt upon with great ability. He states that numberless years ago the first settlers came in ships and landed at a northern port, which, from that cause, was called Pauntla. This is supposed to be the Panuco River. After they had settled here, a large part of them, including their leaders and the priests, went off south; Sahagun says as far as Guatemala. The party left behind organized themselves into an independent body. They reconstructed from memory the calendar; they increased and became powerful, until pushing over the mountain, they built the pyramid of Cholula, and finally reached the city of Teotihuacan, where they built a central sanctuary. For some reason they abandoned their homes, all except the Otomies, and wandered off across the plains, and high, cold, desert places, that they might discover new lands.[1]

[1] Proceedings Am. Antiq. Society, Oct., 1882.

No dates are mentioned for these occurrences, and we are not aware that this tradition is mentioned by other writers. We recall that from the mouth of the Panuco River southward, we found evidence of considerable population in olden times. We also recall that in this section are the ruined pyramids of Tuzpan and Papantla. Prof. Valentine is inclined to think that this date is referred to on the calendar stone; that is, 231 A. D. Just twenty-four cycles elapsed from this time to the date of the dedication of the calendar stone in 1479 (page 742).

He also thinks that the Maya traditions refer to this same occurrence. One more reference to this same mysterious date is contained in the traditions of the Tezcucan tribe. According to the traditions, the beginning of things were in the year 245 A. D. According to this view, then, the ancestors of both Nahua and Maya people appeared on the gulf coast about 231 A. D.; in the same place where a Maya-speaking tribe are found to-day. From here those who developed the Maya culture went to the south and south-west; those who developed the Nahua went to the west and northwest.

We do not profess to be a judge as to the value of this tradition. Our scholars will, probably, at no distant day, come to more definite conclusions in the matter. Prof. Short thinks the strangers who at this early time made their appearance on the gulf shore were colonies of Mound Builders from the Mississippi Valley.[1] We think it best to be very cautious about coming to any such conclusions. We must not forget that back of the twelfth century is nothing but vague traditions. Mr. Bandelier tells us that "nothing positive can be gathered, except that even during the earliest times Mexico was settled or overrun by seden-

[1] "North Americans of Antiquity," p. 578.

tary, as well as by nomadic tribes that both acknowledged a common origin." [1]

The savage tribes have the general name of Chichimecas, but by right this term ought to be applied to the sedentary tribes as well; however, the word Toltec stands for these sedentary tribes. We have all read about the great Toltec Empire in Mexico. This is a ridiculous use of words. There was no tribe or nation of people of the name of Toltecs.[2] All these prehistoric aborigines were probably Chichimecas; but by Toltecs we refer to the sedentary tribes, the skillful workers among them. If we are to judge any thing of traditions, the original home of these people were somewhere to the north of Mexico.

There was doubtless the usual state of inter-tribal warfare, but after a prolonged period the sedentary tribes—the Toltecs—were exterminated or expelled. Their successors were utter savages, coming from the north also. We doubt very much whether any date can be given for this event, but traditions assign it to about the year 1064. Prof. Valentine thinks he finds a reference to it in the calendar of stone. If we will notice, in the outer band near the top are four little bundles, or knots, in all, eight. We are told that each of these bundles refers to a cycle of fifty-two years, or in all four hundred and sixteen years. The date of the inauguration of the stone is 1479. If we subtract the number of years just mentioned, we have the date 1063. Whether this is simply a coincidence, or was really intended to refer to that event, we can not say.

Considerable speculations have been indulged in as to where the Toltecs went when driven out of Mexico. Some have supposed they went to Yucatan, and that to them we

[1] "Peabody Museum Reports," Vol. II, p. 387.

[2] Valentine: Proceedings Am. Antiq. Society, October, 1882, p. 209.

are to look for the builders of the ruined cities. This is the view of a very late explorer, M. Charney.[1] Some have supposed we yet see certain traces of their presence in Guatemala, where they helped to build up a great Queche "monarchy."[2] But we know very little about it. It is not probable that more than a feeble remnant of them escaped with their lives.

From the same mysterious regions from where had issued the aboriginal Chichimecas and Toltec people, there subsequently came still other bands of sedentary Indians, who finally came to settle around the lakes of Anahuac. These settlers all spoke closely related dialects of the same language as their predecessors, the Toltecs. Finally the Aztecs appeared on the scene, coming from the same mysterious land of the "Seven Caves." According to their historical picture-writings, they founded the Pueblo of Mexico in 1325. It is somewhat singular that no record of this event appears on the calendar stone. If the artist was ingenious enough, as Prof. Valentine thinks he was, to represent the dispersion of the Toltecs in the eleventh century, he surely would have found some way to refer to such an important event as the founding of their Pueblo. From this date the Mexicans steadily rose in power, until they finally became the leading power of the valley.[3]

[1] *North American Review*, from Sept., 1880, to 1883.

[2] Short's "North Americans of Antiquity," p. 218.

[3] This historical notice is a mere outline. Such, however, is all we wished to give. Those who wish for more details can not do better than to refer to Mr. Bancroft's fifth volume on the "Native Races." We do not believe, however, that any thing definite is known of the early periods of which some writers give such glowing descriptions. When they talk about the doings of monarchs, the rise and fall of dynasties, and royal governors, we must remember the majority of the descriptive matter is mere nonsense, consequently our faith in the dates given can not be very great.

# CHAPTER XVI.

## ANCIENT PERU.

FIRST knowledge of Peru—Expeditions of Pizarro—Geography of Peru—But a small part of it inhabitable—The tribes of ancient Peru—How classified—Sources of our knowledge of Peru—Garcillaso De La Vega—Origin of Peruvian civilization—The Bolson of Cuzco—Historical outline—Their culture—Divided into phratries and gentes—Government—Efforts to unite the various tribes—Their system of colonies—The roads of the Incas—The ruins of Chimu—The arts of the Chimu people—The manufacture of pottery—Excavation at Ancon—Ruins in the Huatica Valley—The construction of a Huaca—The ruins at Pachacamac—The valley of the Canete—The Chincha Islands—Tiahuanuco—Carved gateway—The Island of Titicaca—Chulpas—Ruins at Cannar—Aboriginal Cuzco—Temple of the Sun—The Fortress—General remarks.

EARLY part of the sixteenth century was surely a stirring time in the world's history. The night of the Dark Ages was passing off of the Old World; the darker gloom of prehistoric times was lifting from off the New. Spanish discoveries followed each other in rapid succession in the South. As yet, they supposed these discoveries to be along the eastern shores of Asia, but, in 1513, Balboa, from a mountain peak, in Darien, saw the gleam of the great Pacific, which intervenes between America and Asia. At the same time he was informed there was a country to the southward where gold was in common use, and of as little value among the people as iron among the Spaniards. As

gold was what the Spaniards most desired, we can imagine how they rejoiced over such information.

The rich country of which Balboa was thus informed was later known as Peru. Balboa himself did not attempt its discovery. There was no lack, however, of those who wished to achieve fame and fortune by so doing. Among other restless spirits who had been attracted to the New World, was Francisco Pizarro. He had been associated with Balboa in founding the settlement of Darien, and, of course, he was among the first to hear of the marvelous country further south. In 1518, Panama, on the Pacific coast, was made the seat of government for the Spaniards in that section of the country. Pizarro was one of the first there—his services had been rewarded by the grant of an estate. The historian of his expedition speaks of him as "one of the principal men of the land, possessing his house, his farm, and his Indians."[1] We need not doubt but what he often pondered over his knowledge of the rich country south. He was well acquainted with Indian character, and knew that a small band of resolute Europeans, possessed of fire-arms, could sweep every thing before them.

He could not endure the quiet life on his estate, and so he obtained from the governor permission to explore the coast of the South Sea to the eastward. He spent a large part of his fortune on a good ship and the necessary supplies for the voyage, and finally set sail from Panama in November of 1524. It needed a man of no common spirits to withstand the disappointments of the next few years. In less than a year this ship returned to Panama for reinforcements. Pizarro himself and a few of his men remained at a place not very far from Panama. Here he was joined

by reinforcements under Almagro. Undismayed by his first experience, he again sailed southward along the coast. Xeres's brief account is as follows: "When they thought they saw signs of habitations, they went on shore in their canoes they had with them, rowed by sixty men, and so they sought for provisions. They continued to sail in this way for three years, suffering great hardships from hunger and cold. The greater part of the crew died of hunger, insomuch that there were not fifty surviving. During all these years they discovered no good land; all was swamp and inundated land without inhabitants."

This expedition accomplished nothing further than to obtain definite information as to Peru. Pizarro's grant from the governor having expired, and the further fact that he had spent all his fortune in these unsuccessful expeditions, made it necessary for him to go to Spain. Received by the emperor with favor, clothed with ample authority, he was able to raise men and money, and finally sailed from Panama in 1531 on his third and successful expedition for the conquest of Peru. Thus was made known to the world what is regarded as the most wonderful example of native civilization in the two Americas.

The dawn of history for Peru was the sunset of her native culture. In a few short years what has come down to us as the Empire of the Incas was completely overthrown; the enslaved Indians were groaning under the weight of Spanish oppression; the demolition of her ancient monuments had already begun, and romance, tradition, and wonder had already thrown their subtle charms around the ruins. The old customs and usages were on the sudden dropped, a new culture was forced upon the unwilling natives, and prehistoric Peru, though distant but a few years in time, was as completely separated from historic Peru as

is the culture of the Neolithic Age in Europe from that of the early historic period.

The magician's wand in the fairy stories of olden days did not present results more bewildering in their changes than did the operations of the Spaniards in Peru. All accounts unite in praising the government of ancient Peru. There is probably no question but what the government the Spaniards overthrew was one far better adapted to the wants of the native inhabitants than the one they forced them to accept. But when we read the accounts of that government as set forth by the early writers, we are at a loss to know what to believe. There is such an evident mixture of fables, traditions, and facts, that the cautious student hesitates, and asks what support the researches of later scholars give to these early writers. We doubt whether we have to this day clear ideas of the culture of ancient Peru. This is to be regretted. There is no question but that here was the highest development of the Indian race in America. If we accept the accounts given us, here rose an empire which will not suffer by comparison with the flourishing empires of early times in Oriental lands. Let us try and learn what we can of this culture, and see wherein it differed from that of the civilized tribes already discussed.

We must, first of all, acquaint ourselves with the physical features of the country. We can never fairly judge of the civilization or culture of a people until we know their surroundings. One of the discoveries of late years is, that the culture of a people is greatly influenced by their surroundings. The very appearance of a country whether it is mountainous or plain, sea-girt or inland, influences the character of a people. Civilization is found to depend upon such common factors as climate, food, and physical surroundings.[1]

[1] Buckle's "History of Civilization," chap. ii.

Now if we will examine the map of South America, we will see that the entire section of country occupied by the tribes under consideration is very mountainous. What is known as the Andes is in reality the most eastern of the two ranges. The western one nearer the coast is called the Cordillera, or the Coast Range. The summit of this mountain range often spreads out into great undulating plains, the general elevation of which is from fourteen to eighteen thousand feet above the sea. This series of elevated plains forms a dreary, uninhabited stretch of country, "frigid, barren, and desolate, where life is only represented by the hardy vicuna and the condor."[1]

This is the uninhabited portion of Peru. The general width of this plateau region is about one hundred and fifty miles. Passing this dreary stretch of country we come to another still elevated plateau section, which extends to the snow-clad Andes proper. The distance between these two great mountain ranges is from one to two hundred miles, but as we see on the map they come together in places. One such place, the Pass of La Raya, fifteen degrees south latitude, is of importance as marking the northern extremity of the great basin of Lake Titicaca. This basin is remarkable in many respects. It is of no inconsiderable size, being six hundred miles in length by one hundred and fifty in width. It has a lake and river system of its own. At the northern extremity of the basin is the noted Lake Titicaca, which is given by some as the traditional place of origin of the Incas. This lake finds an outlet in the River Desaguadero, which flows in a broad and swift stream in a southerly direction, where it empties into Lake Aullagas.

Of this lake we know next to nothing, but it seems to be established that it has no outlet to the sea. Thus this Titicaca basin is but another example of interior basins like

[1] Squier's "Peru," p. 9. The Vicuna is a species of the llama.

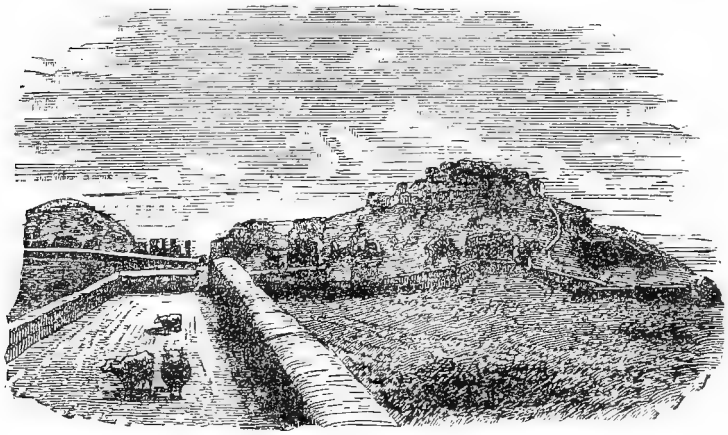
that of our own great Salt Lake. It is not, however, favorably situated for agricultural purposes. It is a "region where barley will not ripen except under very favorable circumstances, and where maize in its most diminutive size has its most precarious development; where the potato, shrunk to its smallest proportions, is bitter; where the only grain is the quinoa, and where the only indigenous animals fit for food are the biscacha, the llama, and the vicuna." [1]

Thus we see that a large part of the interior of Peru was not desirable for habitations. But this great plateau region north of the basin of Lake Titicaca is here and there broken up by what we would call valleys, but which the Spaniards more appropriately named *bolsons*, literally meaning "pockets." These bolsons are of various altitudes, and, therefore, have different climates and productions. Some are well drained and fertile, others are marshy and contain considerable lakes. As a general thing, the bolsons are separated from each other by stretches of the dreary, desolate plateau; or by ranges of precipitous hills and mountains; or by profound gorges, along which courses some river on its way to swell the flood of the mighty Amazon.

The coast range of mountains of which we have spoken runs nearly parallel to the coast, distant from it about forty miles. This stretch of country along the entire coast of ancient Peru is mainly a desert. Owing to causes which we need not explain, rain is almost unknown; the consequence is, the coast presents a dreary, verdureless, forbidding appearance. The melting snows on the great Cordil-

[1] Squier's "Peru," p. 12. The quinoa is a species of plant of the same genus as our pig-weeds. But it is a larger plant, and its seeds give a very nutritious meal. The biscacha is about the size and shape of the rabbit. It belongs to the chinchilla family. The llama is the only representative of the camel family on the western hemisphere. There were three species of this genus in Peru, the llama, alpaca, and vicuna. These domesticated and constituted what the Spaniards in their first reports called sheep.

lera, however, send down, here and there, on their western flanks, feeble rivers. Some of these rivers reach the sea, others prolong their flow but a few miles from the mountains before the thirsty desert swallows them from view. As is true of all desert countries, all that is needed to render it fertile is water; so, wherever these rivers occur there are found wonderfully fertile valleys. Every one of these valleys was once thickly settled, but, like the bolsons of the interior, they were not connected with each other. Each valley is separated from its neighbor by many miles of almost trackless desert, across which the Incas are said to have indicated the road by means of stakes driven into the sand and joined by Ozier ropes. No remains of such roads have been found by modern travelers.



Fortress, Huatica Valley.

From this description it is "clear that but a small portion of the country was inhabitable, or capable of supporting a considerable number of people. The rich and productive valleys and bolsons are hardly more than specks on the map."[1] It is necessary that we bear this description

[1] Squier's "Peru," p. 12.

of the country in mind. It will help us to understand as nothing else will how the tribes located in one rich and productive bolson could, by successive forays, reduce to a condition of tribute tribes living in other detached valleys and bolsons. It will also enable us to put a correct estimate on the extravagant accounts that have reached us of the population of this country under the rule of its ancient inhabitants. We can also readily see why the tribes living in the hot and fertile valleys along the coast, which were called Yuncas by the Peruvians, should differ in religion and mental and moral characteristics from the tribes living in the bolsons of the interior, where the snow-clad peaks were nearly always in sight, and where the sun, shedding his warm and vivifying beams, would appear to the shivering natives as the beneficent deity from whence comes all good.

We must now turn our attention to the tribes inhabiting the section of country just described. We have seen that the Mayas, of Central America, the Nahuas, of Mexico, and the sedentary tribes, of the United States, were considerably in advance of the great body of the Indian tribes of North America. We find the same fact true of the natives of South America. Those tribes inhabiting the territory of ancient Peru, and those of the territory now known as the United States of Columbia, were considerably further advanced than the wild tribes living in the remaining portions of South America. Quite a number of our scholars have grouped in one class these partially civilized tribes of both North and South America, and called them the Toltecan Family.[1] But others do not think that there are sufficient grounds for such a class division. They can not detect any

[1] Morton's "Crania Americanæ," pp. 6, 83. Winchell's "Pre-Adamites," p. 388.

radical changes in the domestic institutions of the various tribes.[1] On this point we must wait until our authorities are agreed among themselves.

Attempts have been made to classify the various partially civilized tribes of Peru. There are several difficulties in the way. It was, for instance, the custom of the Incas, whenever they had reduced a tribe to tribute, to force them to learn their language, which was the Quichua, and is what the early Spanish writers call the general language of Peru.[2] How far this language was forced on the tribes, and how far it was their own idiom, we can not tell. Mr. Markham, who has made a very careful study of all the authorities bearing on Peru, divides the territory of ancient Peru into five divisions, and in each locates a number of tribes, which he thinks forms a family.

The first, and most northern one, extends north from near Tumbez, in the present State of Ecuador. The second extends from Loja, on the north, to Cerro De Pasco, in about eleven degrees south latitude. The third, and most important, extends from this last named place to the pass of La Raya, fifteen degrees south latitude. This was the home of the Incas and five other closely related tribes. To the south of La Raya is the basin of Lake Titicaca, the home of a family of Indians generally known as the Aymara Indians. This name is, however, wrong; these tribes should be called the Collao Indians. These four divisions do not include any territory west of the Cordillera range, except one part of the third division. These four families

[1] H. L. Morgan: "Systems of Consanguinity and Affinity of the Human Family," p. 255; other works by the same author, "House and House-life of American Aborigines," and "Ancient Society."

[2] The Quichuas were a closely related tribe to the Incas, and their name has been given to the language of Peru. But as the Incas were the ruling tribe, their name should have been given to this family of languages.

are all closely related. Mr. Markham thinks they all had a common origin. Mr. Squier thinks the Collao, or, as they are generally called, the Aymara Indians, are distinct from the others. "They differ from each other as widely as the Germans differ from the French," is his own conclusion. The entire coast district of Peru was the home of many tribes of Indians, about which we as yet know but little. The name by which they are known is Yuncas.[1]

We are now ready to proceed to a consideration of the culture of ancient Peru, and a description of the monuments. But before doing so we must have a word to say as to the authorities. At the time of the Spanish conquest of Peru, the Empire of the Incas was supposed to have been in existence about four hundred years. But the Incas had no hieroglyphic or pictorial system of recording events. The most they had was a system of knot records or quippos, which will be explained in due time. These records were simply aids to the memory. Mr. Squier places them "about on a par with Robinson Crusoe's Notched Calendar, or the chalked tally of an illiterate tapster."[2] They are manifestly of no value as historical records.

It must be evident, then, that all our knowledge of Peru, previous to the arrival of the Spaniards, rests solely upon traditions. We have no reason to suppose that these traditions are of more value in their case than in the case of other rude and illiterate people. The memory of such people is very short lived. The tribes in the southern part of the United States must have been greatly impressed with De Soto's expedition. They heard fire-arms for the first time, and for the first time saw horses ridden by men. Yet

---

[1] "The Geographical Distribution of the Tribes of the Inca Empire," in "Journal of the Geographical Society," Vol. XLI, p. 281, *et seq.*

[1] "Peru," p. 571.

in the course of a few generations they had completely forgotten all this.[1]

One very eminent authority is Garcillasso De La Vega.[2] Let us examine his writings a minute. He was born in Cuzco about 1540, but a few years after the conquest. His mother claimed descent from the royal family. He left Peru in 1560, when he was just twenty years old, and went to Spain. He first sought advancement in the army. Despairing of success in that line, he turned his attention to literature. One of his first works was an account of De Soto's expedition to Florida. The historian Bancroft thus characterizes this work: "An extravagant romance, yet founded upon facts—a history not without its value, but which must be consulted with extreme caution." Yet in this work there were no subtile ties of blood, no natural bias as there would be in favor of the land of his birth.

About 1600 he commenced his "Royal Commentaries of Peru." This is the main source of information as to ancient Peru. We must reflect that he had been away from his native land forty years when he commenced the work. His sources of information were the stories told him in his boyhood days, the writings of the Spanish travelers, monks, and conquerors, and what he learned by corresponding with his old friends in Peru, which he did when he formed the design of writing his history. In other words, his history rests on the traditions extant at the time of the conquest, viewed, however, from a distance of sixty years. Who can doubt but what the old man, writing his accounts of this mother's race, that race that had been so deeply wronged,

[1] Foster's "Prehistoric Races," p. 375. The Zuñi Indians have indeed preserved a tradition of the visit of Coronado three hundred and fifty years ago, but in such a form that no one not acquainted with the facts would guess the meaning. "Fifth Annual Report Archæological Institute," p. 40.

[2] More than one-third of Mr. Prescott's quotations are from this authority.

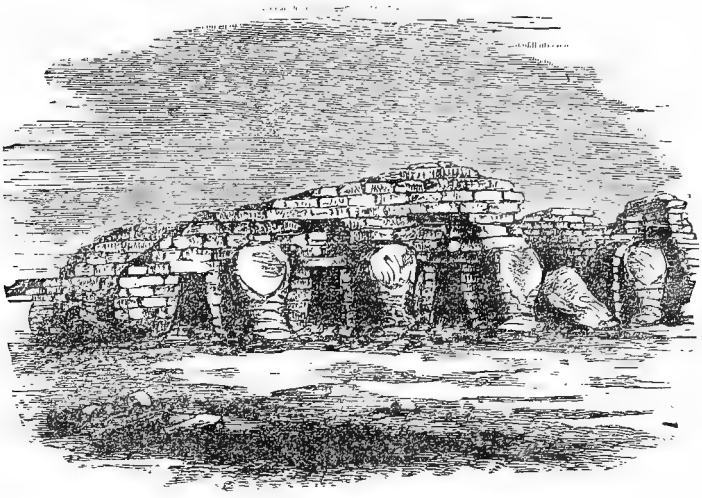
wrote it under the influence of that potent spell, which the memory of old age throws around childhood's days?

It is evident we have in these accounts but little deserving the name of history. When he undertakes to tell us of the doings of the Incas, who are supposed to have reigned three or four hundred years before the Spanish conquest, descending to such details as what nations they subdued, the size of their armies, their speeches to their soldiers, the words of counsel they addressed to their heirs, their wise laws and maxims—and we know that this account rests on traditions—he who believes that they are of historical value, is surely possessed of a good store of credulity. We do not mean to say that his writings are of no account. On the other hand, they are of value. The historical part we are to consider simply as traditions, and we are to weigh them just as we would any other collection of traditions and compare them with monuments still extant. He is good authority on the customs and manners of the Peruvians just previous to the arrival of the Europeans.

We have seen what strange mistakes the Spanish writers made in describing the government and customs of the Mexicans. We have no doubt but what substantially the same mistake has been made in regard to Peru. We believe that a careful, critical study of all that has been written on the subject of Peru by the early writers will establish this fact. As yet this has not been done. We must therefore be careful in our description of the state of society amongst them, as we do not wish to make statements not supported by good authority.

We must try and decide as to what is the most probable origin of the ancient Peruvian civilization. Some of the earlier writers on this subject would trace it to an influx of Toltecs, the same mythical race that is credited with being

the originators of the culture found in Mexico and Central America. But our modern scholars have clearly shown that the Toltec Empire, which was supposed to have preceded the Mexican, never existed. What we are to understand by the Toltecs is the sedentary tribes of Indians, either of the Nahua or Maya stock. The only value we would assign to the story of their dispersion is that it is a traditional state-



Ruins at Pachacamac.

ment that the migration of the sedentary Indians has been in a direction from north to south.

We have no means of knowing when the first tribes arrived in the country, or of their state of culture. It was doubtless at a very early date, and the tribes were probably not far advanced. We have no reason to suppose the culture of Peru was influenced from outside sources at all. We can not detect any evidence of a succession of races in Peru. The distinguished author to whom we have already referred[1] speaks of what he calls the ancient Peruvians as distinguished from the modern tribes that acknowledged the

[1] Morton.

government of the Incas.[1] We think that all the evidence points to a long continued residence of the same race of people.

We may suppose that in the fertile valleys of the coast, and in the bolsons of the interior, tribes of rude people were slowly moving along the line of progress that conducts at last to civilization. There is no reason to suppose that this progress was a rapid one. Under all circumstances this development is slow. We must not forget the natural features of the country. The inhabited tracts were isolated, hence would arise numerous petty tribes, having no common aims or mutual interests. Each would pursue their own way, and would keep about equal pace through the stages of Barbarism.[2]

In process of time geographical and climatic causes would produce those effects, from which there is no escape, and some tribes would distinguish themselves as being possessed of superior energy, and the same results would follow there as elsewhere; that is the dominion of the strong over the weak. All other circumstances being equal, we would look for this result in a section where a mild climate and fertile soil enabled man to put forth his energies, and rewarded his labors. All accounts agree in speaking of the bolson of Cuzco as well provided by nature in this respect. One eminent traveler speaks of it as "a region blessed with almost

---

[1] This idea was largely based on the differences of the skulls. On this point see "Fourth Annual Report Peabody Museum." Some authors speak rather vaguely of the ancient race of the Titicaca basin. We know of no good foundation for such expressions.

[2] Garcillasso impresses on his readers the idea that the Incas was the only tribe at all civilized. The Aymara Indians were certainly as far advanced as the Incas, and even surpassed them in the art of cutting stone, if we conclude the ruins at Tiahuanuco to be of Aymara origin. The tribes of the coast region were certainly not far behind. The Muyscas, of Bogota, who were never under the dominion of the Incas, were yet possessed of a high degree of culture.

every variety of climate. On its bracing uplands were flocks of llamas and abundance of edible roots, while its sunny valleys yielded large crops of corn, pepper, and fruits.[1] Mr. Squier thinks that, on the whole, the climate is very nearly the same as that of the south of France.[2]

This bolson was the home of the Incas. A number of writers speak of the Incas very much as if they were a royal family. It is not necessary to discuss this point very extensively at present. All our accounts of their early history are traditional. Mr. Markham and Mr. Squier, both competent judges, assert that the weight of traditions is to the effect that the Incas originated near Cuzco. "Universal traditions," says Mr. Markham, "points to a place called Peccari Tampu as the cradle or point of origin of the Incas." As near as we can make out from the description, this was where, as seen from Cuzco, the sun appeared to rise.[3]

We must remark that the sun was the ancestral deity of the Incas. All the Andean people worshiped some object as an ancestral deity. "An Indian," says La Vega, "is not looked upon as honorable unless he is descended from a fountain, river, or lake, or even the sea, or from a wild animal, such as a bear, lion, tiger, eagle, or the bird they called a condor, or from a mountain, cave, or forest." The Incas claimed descent from the sun. So we can see why their legends would center on the place where the sun appeared to rise. In after years, when they had extended their conquests to the Collao,[4] and stood on the shore of Lake Titicaca, the sun appeared to them to rise out of its waves; and so this lake became to them a second point of traditional origin.

---

[1] Markham in Forbes's "Aymara Indians," p. 111. [2] "Peru," p. 427.
[3] "It was from Cuzco the nearest point to the sun-rising." (Markham.)
[4] Their name for the Titicaca basin.

We see we can not solve the question of the origin of the Incas until we solve the deeper problems of the origin of the Andean tribes. Every thing seems to indicate a long-continued residence, perhaps for centuries, and a slow advance in culture. We are not to suppose the Incas were endowed with unusual capacity for improvement; all the tribes were probably about equal in this respect.[1] But their situation was in their favor, and they did not have to contend with those obstacles that confronted other tribes. They must have increased in numbers and in culture; they would in time feel themselves strong enough for conquest. We must bear in mind the peculiar geographical features of the country. In the isolated valleys and bolsons were living other tribes, but little inferior to the Incas. There were no common interests between these tribes. One by one they fell before the assaults of the Incas, and were reduced to tribute. Rendered still more powerful by success, the Incas pushed on their conquests until finally all the tribes living in that vast stretch of country from the Andes to the Pacific, from Chili to the United States of Colombia, acknowledged themselves tributary to the Incas. This was the state of things when the Spaniards, under Pizarro, appeared on the scene.

When we undertake to learn the history or the state of culture among the Incas, we are entering on a difficult subject. Of their history, we know but very little more than is given in this outline; and owing to the complete absence of all records, we can not expect to know very much. Garcillasso draws such an inviting picture of the happy government of the Incas, that we would suppose that no rebellion or insurrection would ever occur. It seems, however, that their government was as much subject to such

[1] Markham, in Forbes's "Aymara Indians."

trials as any. Mr. Forbes tells us that "the Aymaras never submitted tamely to their Peruvian masters, but from time to time gave them much trouble by attempting to recover their independence." And M. Reville tells us of the Incas that, "more than once they had to suppress terrible insurrections." And we shall see, further on, that the probabilities are that the various tribes composing this so-called empire were not more compact and united than were the tribes composing the Mexican Empire.

Shortly before the conquest, the Incas had reached their zenith of power. Huayna Capac, who died about 1525, was in reality the last of the Inca chiefs. Under his management the tribes as far north as Quito were reduced to tribute. The story goes that shortly before his death he divided the empire between two of his sons. One, Huascar, the rightful heir to the throne; the other, Atahualpa, half-brother to Huascar. His mother was daughter of the last king (?) of Quito. Her father had been forced to submit to the victorious Huayna Capac. This division of the Incarial Empire, was not at all to the liking of either Huascar or Atahualpa. They both wished to be sole Inca. Civil war was the result. Atahualpa, by treachery, had taken his brother prisoner, and would doubtless have achieved his ambition, but just then Pizarro invaded the country, and the reign of the Incas was over.

Thus far, the story. We very much doubt whether this expresses the facts of the case. There is no question, of course, that civil war was in progress when the Spaniards arrived, which war, by the way, was a very fortunate thing for the Spaniards; but we do not know enough about the government of the Incas to know whether Huayana Capac could bequeath any powers to his sons. About all we are justified in saying is, that on his death, two persons

(they were very likely brothers, and sons of Huayna Capac) aspired to the chieftaincy of the Incas, and, failing to agree, resorted to war to settle the matter.

The question is, how far back in the unrecorded past can we follow tradition? Huayna Capac is thought to have been chief for about fifty years. His predecessor is said to have been one Tupac Yupanqui. Velasco, an early writer on the Peruvians, thinks he was chief for about thirty-six years. As this would carry us back nearly one hundred years, it must be evident we have gone about as far as we can place any reliance on tradition. However, the third chief, going backwards, was also called Yupanqui, sometimes denominated "Yupanqui the Great," and his reign (?) takes us back to about the year 1400. "Beyond this point," says M. Castaing, "we fall into a mythological era." We fully agree with him. We can not think there is any special value in accounts of events said to happen before that time—that is, for historical purposes.

That there were victorious chiefs, conducting victorious forays before that date, is, of course, admitted. That the names of many of the chiefs have come down to us, as well as some of their notable achievements, is quite possible. It is also evident that some mythological personages would appear in tradition as "reigning Incas." It is equally plain that neither Garcillasso, nor any of the Spanish writers, had any clear ideas of these ancient times or events. All traditions finally settle on Manco Capac as the first chief of the Incas. M. Castaing says he "is but an allegory of the period of formation.[1] The date of the accession of this mythological chief is given by most authorities as about the year 1000. M. Castaing thinks it was in the middle of the twelfth century. It does not make much difference which

[1] *American Antiquarian*, Sept., 1884, p. 295, *et seq.*

date the reader concludes to accept—one will do as well as the other.[1]

Let us turn our attention to the culture of the Incas, and their state of government. Here we would expect to be on firm ground. We would expect the Spanish writers to give us reliable accounts of the state of society of the people they conquered. But, as Mr. Squier remarks, the overthrow of the Peruvian government "was so sudden and complete that the chroniclers had hardly time to set down the events which took place before their own eyes, and had little leisure, or perhaps inclination, to make a careful investigation into the principles of their civil and religious polity. As a consequence, this work has devolved upon the laborious student and archæologist of a later time." In other words, we are to compare the accounts given us by the early writers with our present knowledge of Indian society.

We have already made the statement that the Incas were a tribe of Indians. But, if they were a tribe, did they have the usual subdivisions of a tribe—which, we remember, are the phratry and gens? The Spanish writers say nothing about such divisions. This is not strange. They said nothing about the phratries and gentes of the Mexicans; and yet they were in existence. Neither did the English mention the institution of the phratries and gentes among the Iroquois; and yet they were fully developed. We

[1] It is manifest that, during the centuries of slow development which the Incas underwent, they had a great many chiefs. How many we shall never know. Garcillasso gives us a list of fourteen, including Huascar and Atahualpa. Montesino generously increases this number to one hundred and one. Neither of them knew any thing positive about it; but this latter number is the more reasonable of the two. Mr. Markham, who goes at the problem in another way, thinks there were five historical Incas, counting Huayna-Capac the last. He surmises that the first may have flourished two hundred years before the conquest.

answer, that the Inca tribe were divided into both phratries and gentes. It is necessary to show what grounds we have for such belief. It is well to have a little better understanding of the surroundings of this tribe.

The isolated section of country which they occupied is about seventy miles long by sixty in width. "The proper name for the aboriginal people of this tract," says Mr. Markham, "is Incas." This word must have been at first the title for chief—for all the chiefs in this section were called Incas; but, in process of time, the name was assumed as the special title of the tribe at Cuzco. Mr. Markham gives us further the names of seventeen lineages who occupied this valley. Whether a lineage was a tribe or not we can not decide. We will now confine our attention to the ruling tribe at Cuzco.

The Spaniards noticed that Cuzco was divided into two parts, called respectively Upper and Lower Cuzco. Garcillasso tells us that this division was made as follows: Manco-Capac with his wife and queen were children of the Sun, sent to civilize the Indians, who, before their arrival, were a very degraded sort of savages. From Cuzco this sun-descended couple went their different ways—the king to the north, the queen to the south—"speaking to all the people they met in the wilderness, and telling them how their father, the Sun, had sent them from heaven to be the rulers and benefactors of the inhabitants of all that land; . . . and, in pursuance of these commands, they had come to bring them out of the forests and deserts to live in villages." This sounded so good to the wild tribes, that they "assembled in great numbers, both men and women," and set out to follow their exhorters.[1]

The tribe that followed the king settled Upper Cuzco;

[1] Markham's Garcillasso's "Royal Commentaries," Vol. I, p. 66.

while the queen's converts settled Lower Cuzco. This division was not made so that those living in one half should have any special privileges over the other—for they were all to be equal, like brothers. The division was solely in order "that they might be a perpetual memory of the fact that the inhabitants of one were assembled by the king, and the other by the queen." The only difference between them was, "that the people of Upper Cuzco should be looked upon and represented as elder brothers, and those of Lower Cuzco as younger brothers."

Such is the account of the settlement of Upper and Lower Cuzco. Any one acquainted with the general principles on which the division of Indian tribes into phratries took place, can not help concluding that these divisions were simply two phratries. The inhabitants of each traced their descent back to a supernatural personage. They were equal in power to each other as elder and younger brothers. Polo Ondegardo simply remarks that "the lineage of the Incas was divided into two branches, the one called Upper Cuzco, the other Lower Cuzco."[1] There ought to be no objection to substituting for the word branches used above the scientific term our scholars now employ; that is, phratry. Each tribe of the Iroquois confederacy was divided into two phratries, and their name for this division was a word which meant brotherhood.[2]

Whatever doubt we may have on this point vanished when we come to examine into the customs of the Incas. We must not forget that the most prominent way a phratry shows itself is in matters of religion, and in the play of social games. "The phratry, among the Iroquois," says Mr. Morgan, "was partly for social and partly for religious ob-

[1] Markham's translation, p. 151.

[2] Morgan's "Ancient Society," p. 100.

jects. . . . In the ball game, for example, they play by phratries, one against the other. Each phratry puts forward its best players, usually from six to ten on a side, and the members of each phratry assemble together, but on opposite sides of the field in which the game is played. The members of each phratry watch the game with eagerness, and cheer their respective players at every successful turn of the game."

Relics from Guano Deposits.

Let us see how it was among the Incas.[1] Like all Indian tribes, the Incas were very fond of ceremonious feasts. Nearly every month they celebrated one or more. We gather from Molina that on occasions when the whole tribe participated in such religious observances, the people of Upper Cuzco sat apart from Lower Cuzco. In the month corresponding to August they had a celebrated feast, the object of which was to drive out all evil from the land. We read: "All the people of Cuzco came out, . . . richly dressed, sat down on benches, each man according to the rank he

[1] Our authority is Christoval Molina, a priest of Cuzco. He made a report to the bishop, which must have been written some time between 1570 and 1584, on the "Fables and Rites of the Incas." This was translated by Markham, and published by Hakluyt Society in 1873. He obtained his information by gathering together a number of aged Indians, including some priests, who had participated in these ceremonies in the days of the Incas.

held, those of the Upper Cuzco being on one side, and those of Lower Cuzco on the other." And of another feast we read: "They brought out the embalmed (?) bodies of the dead Incas, placing those who had belonged to Upper Cuzco on the side where that lineage was stationed, and the same with those of Lower Cuzco." Other examples could be given, but this point is well established. In games this same division was observed, since we read that in the month of December, "on the first day of the month, those who had been armed as knights—as well those of the lineage of Upper Cuzco as those of Lower Cuzco—came out into the square with slings in their hands, . . . and the youths of Upper Cuzco hurled against those of Lower Cuzco." We may therefore consider it well established that the Incas were a tribe of Indians having two phratries.

Let us now see how the matter stands in regard to gens. This division follows almost as a matter of course, but it is well to see what separate grounds exist for the assertion. Garcillasso, in his description of Cuzco, after a reference to the division into Upper and Lower Cuzco, tells us further that it was divided into twelve wards. Mr. Squier gives us a map of the ancient city. From this we see that the twelve wards were arranged in an irregular oval around the principal square. Seven of them belonged to the division of Upper Cuzco, the other five to Lower Cuzco.

This division is utterly unintelligible to us, unless we suppose them to be subdivisions of the phratries. It makes no difference what name we bestow upon them, in effect they can be nothing else than gentes. As to the number of them, it is well to notice a coincidence in the statement of an Indian writer, Salcamayhua.[1] On a certain very important occasion there were assembled "*all* the councilors. The

[1] This writer, a native Indian, wrote about the same time as Garcillasso.

governor entered the chamber, where *twelve* grave councilors were assembled."[1] The most reasonable explanation that can be given for the number twelve is that each gens had one representative in the council. The Incas are thus seen to be very probably, at least, no exception to the general rule of Indian tribes.

From our present standpoint what can we learn as to their government? It is, of course, well known what the position of the early writers on this subject is. They all agree that the government of the Incas was a monarchy of the strictest type. We have seen what a wonderful empire they bestowed on the Mexicans. The Peruvian Empire is painted in still brighter colors. Modern writers have not allowed the early accounts to suffer by repetition. Rivero uses the following language: "The monarchs of Peru, . . . uniting the legislative and executive power, the supreme command in war, absolute sovereignty in peace, and a venerated high-priesthood in religious feasts, . . . exercised the highest power ever known to man."[2] Even so cautious a writer as Mr. Squier speaks of the Incas as ruling "the most thoroughly organized, most wisely administered, and most extensive empire of aboriginal America."[3]

It is freely admitted that there is much that is indeed wonderful in the culture of the Incas; but it has, undoubtedly been greatly exaggerated. To deal with this question as it should be would require an entire volume of itself, and would require far more extensive research than the writer has been able to make, or is, indeed, prepared to make. It will do no harm to see what we can learn by comparing the statements of some of the early writers with what we have now learned of Indian society.

[1] "Fables and Rites of the Incas," p. 105.
[2] "Peruvian Antiquities," p. 105. [3] "Peru," p. 5.

Let us first inquire as to the council. There is no question as to the existence of a council. Garcillasso and all the early writers refer to it in an accidental sort of way. To show the force of this statement, we will give a few quotations. Garcillasso, speaking of the movements of the Inca Viracocha, says: "Having passed some years in making these journeys, he returned to Cuzco, where, with the advice of his councilors, he resolved on war." And, in another place: "Having consulted with his council" he assembled his army. Talking about the son of the foregoing, he says: "In fine, this king, with the advice of his council, made many laws, rules, ordinances," etc.[1] In the foregoing we are made aware of the existence of a council, but are not told as to its size or powers. Each gens would of course be represented in the council. We have spoken in one place of the number twelve. Mr. Bandelier tells us that the council consisted of sixteen members.[2] As to its power we are also left in the dark; but, judging from what we have learned of the council among the Mexicans and Indian tribes of the North, who can doubt but that it was the supreme governing body?[3]

The more we study this question, the more points of resemblance we would find with the social organization of the Mexicans. The tenure of land was of course the same, as we learn from the report of Ondegardo—some differences may have occurred in regard to tribute.

---

[1] Many such quotations could be given, not only from Garcillasso, but from Molina, Salcamayhua, and others.

[2] Address before the Historical Society of New Mexico.

[3] We can not help wondering if the Incas did not have two chief executives. This would make them similar to the Iroquois, and most of the more southern tribes, such as we have already seen to be true of the Mexicans. Mr. Bandelier says there is abundant proof that the Incas had two chiefs—one the "dispensing Inca," the other the "speaking head." ("Archæological Tour in Mexico," p. 167, note 6.)

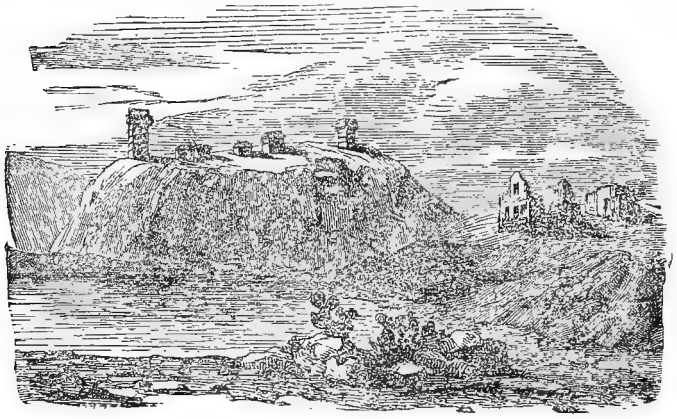
The Mexicans, we must remember, were at the head of a confederacy, and the tribute was brought to Mexico to be divided among the three tribes. The Incas were the only tribe, in the case of Peru, having supreme power. Having no one to suit but themselves, they introduced some new features. The tribute, instead of being all brought to Cuzco, seems to have been, at least a portion of it, stowed away in storehouses located at places most convenient for the Incas. Cieza De Leon says: "The Incas . . . formed many depots full of all things necessary for their troops. In some of these depots there were lances; in others, darts; and in others, sandals: and so, one with another, arms and articles of clothing which these people used, besides stores of food. Thus, when a chief was lodged in one of these depots with his troops, there was nothing, from the most trifling to the most important article, with which they were not supplied."[1] This tribute was gathered by regular tribute-gatherers. As in the case of Mexico, these appear in history as governors. Ondegardo says they left "Cuzco every year, and returned in February, . . . bringing with them the tribute of the whole empire."

As a rule, the Incas did not interfere with the customs of the tribes they had conquered. Garcillasso says: "Excepting a few alterations that were necessary for the welfare of the whole empire, all the other laws and customs of the conquered province were retained without any change." In the main, all they wished for was tribute. Yet they seem to have had some idea of a higher policy than that. They are credited with carrying out measures which would certainly tend to bring the tribes into a close union. Mr. Squier remarks: "The efforts of the Incas to assimilate the families that were brought within their empire, by force or

[1] "Travels," Markham's Translation, p. 164.

alliance—in respect to language, religion, and modes of life—were powerful and well-directed."[1] This was a step ahead of any thing that can be said of the Mexicans.

In the matter of language, it is said they made persistent efforts to have the conquered tribes learn their own language. De Leon tells us that it was a law throughout the kingdom that this language should be used—"fathers were punished if they neglected to teach it to their children in their childhood." How much we are to believe of this account is doubtful. Mr. Markham has shown us that the languages of all the interior tribes were related. We know



Burial Towers.

how difficult it is to compel a conquered people by law to learn a foreign language. William the Conqueror made an unsuccessful attempt to compel the Anglo-saxons to learn French—it ended by his followers learning English. Are we to believe that a tribe of Peruvian Indians were successful in spreading their language over a wide extent of territory in the course of a few generations?

What is considered as the great stroke of policy on the part of the Incas, was their system of colonies. On this

[1] In Forbes's "Aymara Indians," p. 109.

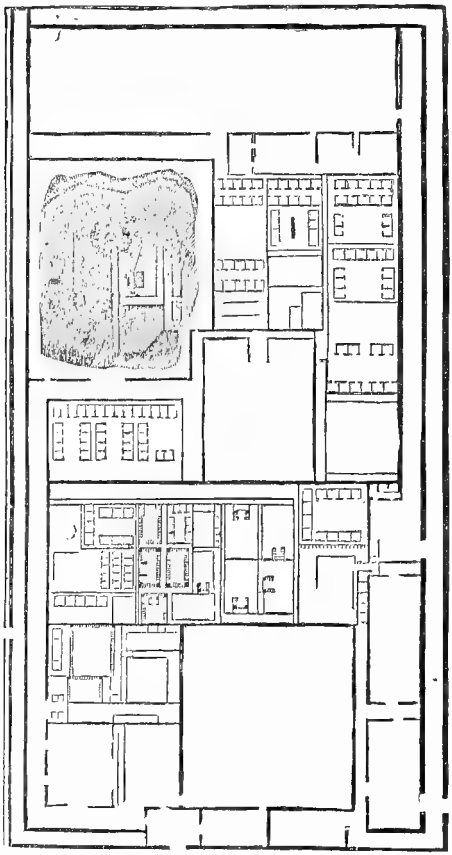
point De Leon tells us: "As soon as a province was conquered, ten or twelve thousand men were ordered to go there with their wives; but they were always sent to a country where the climate resembled that from whence they came. If they were natives of a cold province, they were sent to a cold one; and if they came from a warm province, they went to a warm one. These people were called mitimaes — which means Indians who have come from one country and gone to another." On this we might remark, that the Incas did not always show such discriminating care where they sent the exiles, since Mr. Markham tells us that the "descendants of colonists on the coasts of Peru (a warm climate, notice) still retain traditions concerning the villages in the Andes (a cold province), whence their ancestors were transported."

We will only refer to the so-called royal roads of Peru. Humboldt observed them in Northern Peru, and speaks in high praise of them. Many of the early writers mention them. De Leon gives us a really wonderful account. Modern travelers have not been so fortunate in finding their remains. Mr. Squier does not mention them. Mr. Hutchinson searched at every place along the coast, and could find no trace of such works. The northern part of Peru, where Humboldt saw them, was almost the last section to be conquered by the Incas. It is singular that they should have been in such a hurry to build roads in that section, when the other parts of their territory were destitute of them.

We are now prepared to inquire as to what remains of this ancient people have come down to us; and in studying these ruins we must keep constantly in mind the social organization of Indian tribes.[1] We notice on the map, at

[1] "Indian architecture, from the Sioux lodge to the houses of Uxmal, Mitla, and Tiahuanuco, is only understood through Indian social organization." (Bandelier.)

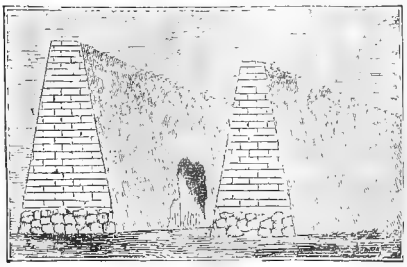
about 8° south latitude, a place marked Truxillo. It is situated nearly two miles from the sea, in the valley of the Chimu. Its port is the town of Huanchaco, a dilapidated village of a few hundred houses, about ten miles further north. Truxillo was founded in 1535 by Francisco Pizarro, and was once a place of considerable importance, but at present it is probably most noted for the famous ruins located near it. Several of the fertile coast valleys that we have previously described, here unite; consequently this was a place of great importance to the coast tribes. The ruins here are among the most remarkable in Peru. The road from Huanchaco to Truxillo passes directly through the field of ruins.



Palace.

Mr. Squier tells us that the ruins "consist of a wilderness of walls, forming great inclosures, each containing a labyrinth of ruined dwellings and other edifices." As our space is limited, we will describe but one of these inclosed spaces. This is a view of what is usually called a palace, but this certainly is an absurd name. The inclosure contains some thirty-two acres; the walls surrounding it are double, and sufficiently heavy

to resist field artillery. At the base the walls, in some cases, are fifteen feet thick, gradually diminishing toward the top, where they are not more than three feet thick. They vary in height, the highest ranging from thirty to forty feet high. In order to give a clear idea of these walls, we introduce this cut, which gives us a section of the walls. The materials of which they are built is adobe.



Section of Palace Wall.

Within this inclosure we notice three open places, or courts, a number of smaller cross-walls dividing the remaining space into a number of small courts. Around each of these courts, generally on three sides, are the ruins of houses. All in the interior of the large inclosures is so far gone in ruins that we can with difficulty make out the plan. Inclosures, such as we have described here, are the principal features of the Chimu ruins. Mr. Squier speaks of one three or four times the size of this one. With our present knowledge we are justified in concluding that Chimu was the head-quarters of a powerful tribe. We are surely justified in assuming further that each of these great inclosed squares, containing upwards of thirty, forty, and even fifty acres, was the home of a gens—their fortified place.

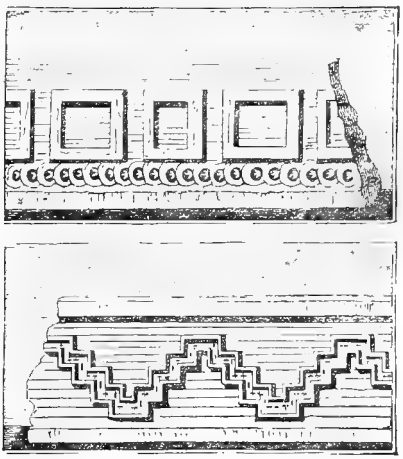
Of the houses, Mr. Squier says: "Around each court the dwellings of the ancient inhabitants are grouped with the utmost regularity. . . . Some are small, as if for watchmen, or people on guard; others are relatively spacious, reaching the dimensions of twenty-five by fifteen feet inside the walls. These walls are usually about three feet thick, and about twelve feet high. The roofs were not

flat, but, as shown by the gables of the various buildings, sharply pitched, so that, although rain may not have been frequent, it was, nevertheless, necessary to provide for its occurrence. Each apartment was completely separated from the next by partitions reaching to the very peak of the general roof. There are no traces of windows, and light and air were admitted into the apartment only by the door."

On one side, at least, the whole area of the city was protected by a heavy wall, several miles of which were still standing at the time of Mr. Squier's visit. At various places along this wall, cross-walls extended inward, thus inclosing great areas which have never been built over, and which show all evidence of ancient cultivation. We notice, near the upper end of this inclosure, a court, occupied by a mound. This is known as a *huaca*, which calls for some explanation. It seems that the general name among all the Peruvian people, for a sacred object, is huaca. Being a very superstitious people, this name is applied to a great variety of purposes, amongst others, to these great artificial mounds, the majority of which are probably burial mounds. The construction of many of these mounds is very singular. It seems as if they were a large collection of rooms, each one of which was filled with clay or adobe. In some of these chambers, probably, treasures are concealed. One very celebrated huaca, at Chimu, was found to contain an enormous amount of gold vessels.

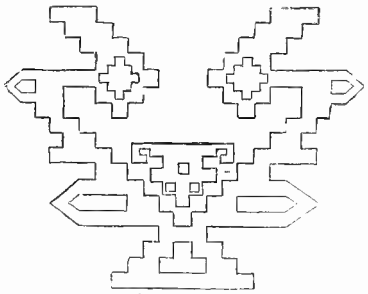
We must not forget to notice the arts of the Chimu people. The walls of the inner edifices were often ornamented as is seen in the following cut, of which the upper one is stucco-work and the lower one is in relief. Adobe bricks are allowed to project out, forming the ornamental design. Other ornaments of stucco-work were observed.

The second figure on this page gives us an idea of this style of ornaments. As an evidence of how the climate of Peru preserves ruins, we would mention that, though this last stucco-work has been exposed to the elements for probably several centuries, yet it is still apparently perfect.



Ornamentation on Walls.

The Chimu people were certainly very expert workmen in gold and silver. De Leon asserts that, when the Incas conquered them, they took to Cuzco many of the artisans of the country, "because they were very expert in the working of metals, and the fashioning of jewels and vases in gold and silver." In the cut on next page we have two vases — the smaller one of gold, the larger of silver." The material is very thin, and the ornaments are produced by hammering from the inside.

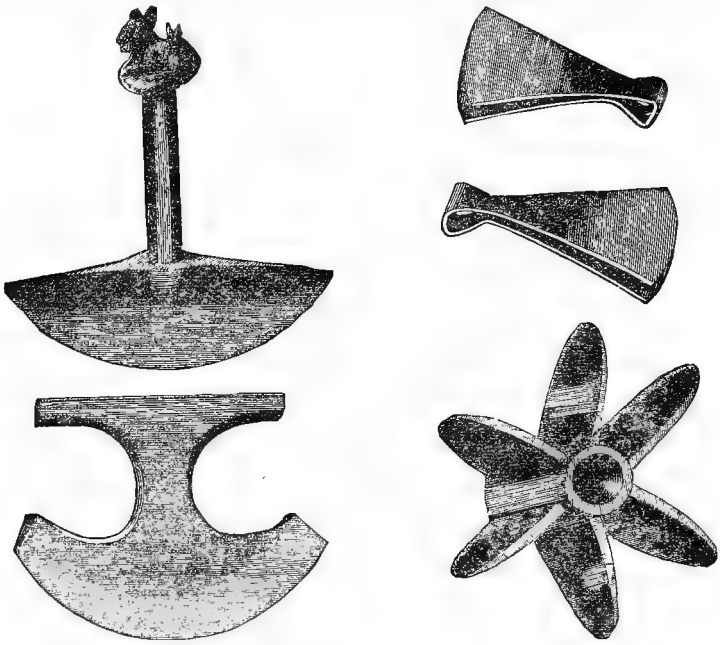


Adobe Ornament.

Besides such works as just described, they had the art of casting representations of men, animals, and reptiles in silver—sometimes hollow, sometimes solid. They even cast more complex objects. Mr. Squier says he has one "representing three figures—one of a man, and two women, in a forest. It rises from a circular base about six inches in diameter, and weighs forty-eight and a half ounces. It is solid throughout—or, rather, is cast in a single piece, and rings,

Gold and Silver Vases.

when struck, like a bell." The trees, he says, are well represented, their branches spreading in every direction. The human figures are also well proportioned, and full of action.

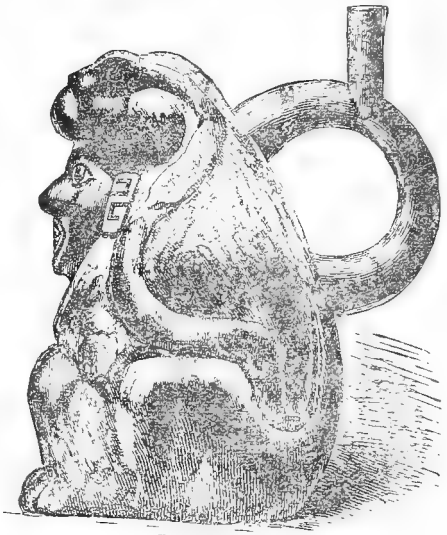


Bronze Knives and Tweezers.

They also knew how to manufacture bronze. Many agricultural implements are found, not only at Chimu, but all

along the coast. In the preceding cut we have bronze knives and tweezers—also, a war-club of the same material.

All the coast tribes of Peru excelled in the manufacture of pottery. Mr. Squier tells us that, in this sort of work, we find "almost every combination of regular or geometrical figures"—men, birds, animals, fishes, etc., are reproduced in earthenware. In this cut we have one of the many forms. Notice the serpent emblem.



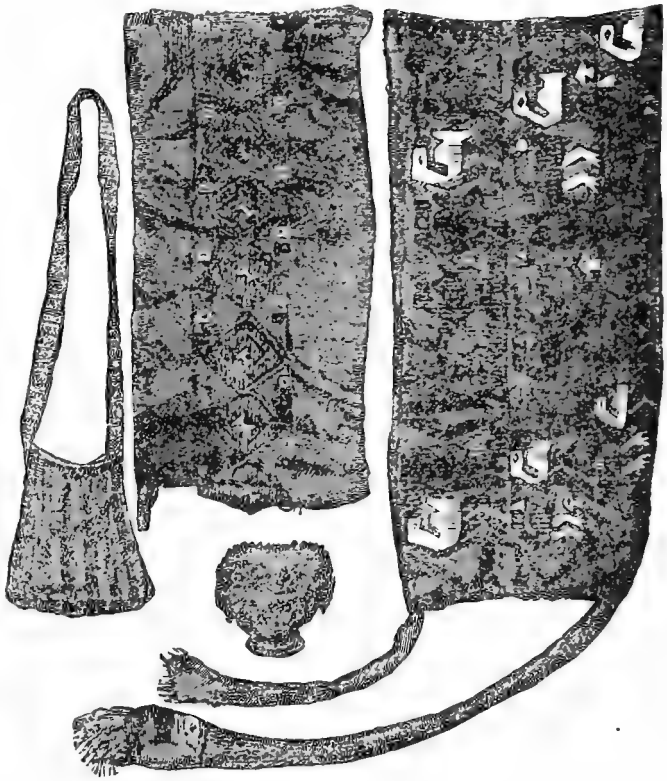
Water-jar.

The people of Chimu, whose ruins we have been describing, belong to the coast division—differing in many respects from the Peruvian tribes in the interior. Our information in regard to the coast people is very lim-

Water-jars from Ancon.

ited. We have to judge of them almost entirely from the ruins of their towns, and the remains of their handiwork.

There is no reason to suppose they were the inferiors of the Peruvians in culture. It is quite the custom to speak of them as if they were low savages before the Incas conquered the country; and that they owe to the latter all

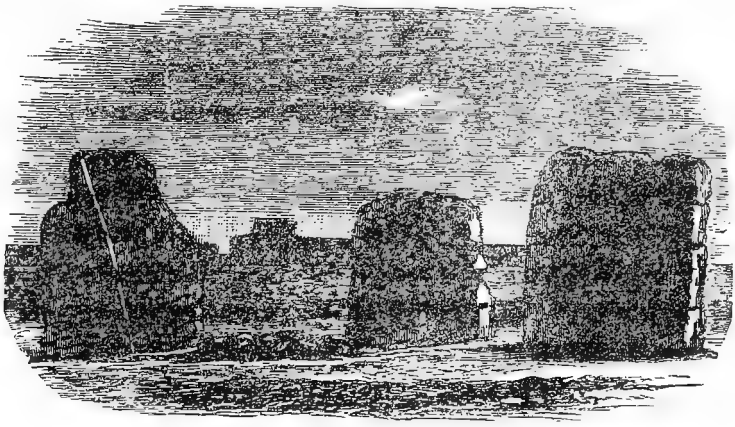


Cloth found in Grave.

their advance in culture. On the contrary, we may well doubt whether their condition was at all improved by the Inca conquest. The coast people are supposed to have been conquered about one hundred years before the Spanish conquest. It was only after a most stubborn resistance that the principal valleys were subdued.

It is not necessary, neither have we space, to give a review of all the ruins along the coast. They are very

plentiful. There is not an inhabitable valley but that they abound there. The soil where not irrigated is very dry, and tends to preserve any thing buried therein. All the coast people buried their dead; hence it is that we find, in nearly all the coast valleys, such extensive cemeteries. At Ancon, for instance, twenty miles north of Lima, it is simply wonderful how extensive the cemeteries are. Mr. Hutchinson



Wall in Huatica Valley.

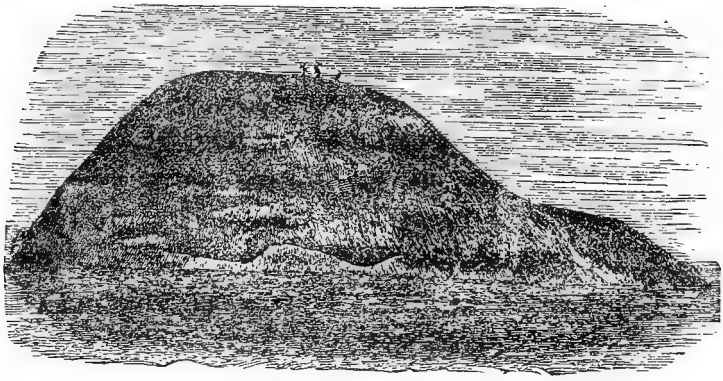
says they extend for miles. Very extensive explorations have been made here for scientific purposes. We have given, on page 795, some water-jars excavated at Ancon; in last illustration we have some specimens of cloth found in graves farther north; and in the same locality was found a very wonderful piece of feather-work. The small feathers were so fastened to a ground of cotton cloth that they could not be pulled off.

Another noted place, about the same distance south of Lima, is Pachacamac. Mr. Squier concludes, from the cemeteries at this place, that it was a holy place, to which pilgrims resorted from all parts of the empire so as to be laid to rest in holy ground. When we learn of so many other similar localities, we see that this conclusion does not follow.

The most we can say is, that these valleys have surely been settled for a long while.

The city of Lima is situated on the south bank of the Rimac River, about six miles from the coast. Its port is the town of Callao. The valley is called the Huatica Valley. Very extensive and wonderful ruins occur in this valley, between Lima and the sea. We are told these ruins are thick and close over a space of a few square miles, and are inclosed within a triple wall. The last cut is given as a representation of a portion of this wall, though only a small portion here and there is still discernible. Amongst these ruins are a large number of immense mounds.

Some are huacas, or burial mounds; and some are in the nature of fortresses. It is best to explain a little more particularly about the burial mounds of the coast region of Peru.



Burial Mound, or Huaca.

This cut gives us an idea of their appearance. As to their construction Mr. Squier says: "Many if not most of the pyramids, or huacas, were originally solid—built up of successive vertical layers of bricks, or compacted clay, around a central mass or core."

But this is not always the case; since in many huacas we find walls, in some rooms, and, finally, as before re-

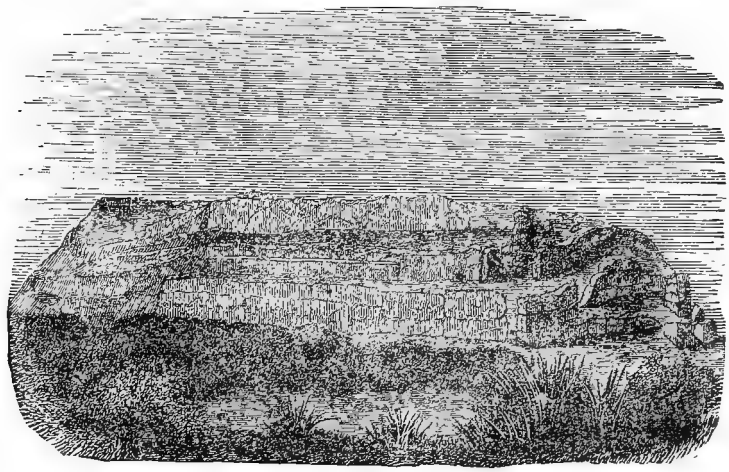
marked, some apparently consist of a large, many-storied building, the rooms of which are all filled with clay. In the mound just mentioned, Mr. Hutchinson found a number of inclosures—though the work was done in a rough, shapeless manner. Mr. Squier gives us a description of a many-roomed huaca as follows: "Thanks to the energy of treasure-hunters who have penetrated its sides, we find that it had numerous large painted chambers, was built in successive diminishing stages, ascended by zigzag stair-ways, and was stuccoed over and painted in bright colors. The conquerors filled up these chambers, and recast the edifice with a thick layer of adobe."[1]

This is surely a singular piece of work. The building just described by Mr. Squier must have been much like a pueblo. We wish we had fuller descriptions of it. Mr. Squier is eminent authority, and scholars delight to honor him for his researches. We take the liberty, however, to question some of his conclusions. How does he know that this structure was ever used for any other purpose than as a mound? It is indeed a singular way to construct a mound, but when we learn of the existence of mounds showing the different methods of work—some solid, some with walls, others with rude rooms, still others with rooms towards the top—why not say that this many-storied building was simply one style of mound-building? He claims that the Incas filled up these rooms, and transformed the house into a mound. Mr. Hutchinson claims there is no proof that the Incas did this sort of work.

As an example of fortress-mounds, also prevalent in the valley of the Huatica, we present the next cut. Mr. Hutchinson describes this mound as being eighty feet high, and about four hundred and fifty feet square. "Some of the

[1] "Peru," p. 214.

adobe walls, a yard and a half in thickness, are still quite perfect. That this was not likely to have been a burial-mound may be presumed from its formation. Great large square rooms show their outlines on the top, but all filled up with earth. Who brought this earth here, and with what object was the filling up accomplished? for the work of obliterating all space in these rooms with loose earth



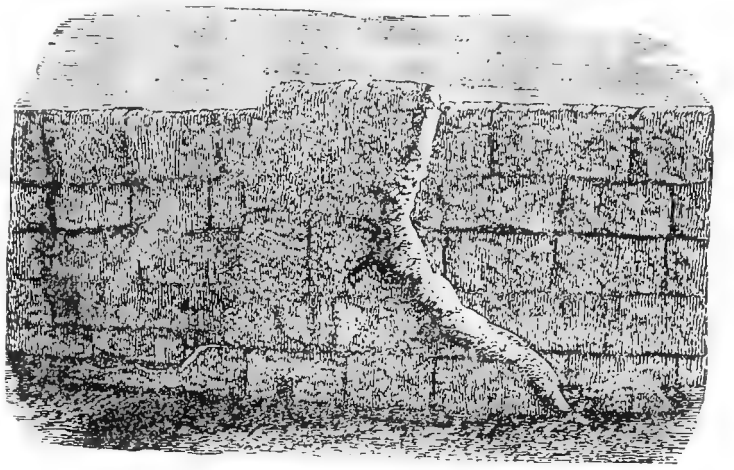
Fortress Mound.

must have been almost as great as the construction of the building in itself."[1] So it seems that in the fortress-mounds also we meet with this same mysterious feature—rooms filled with earth.

The Huatica Valley was also the location of a famous temple—at least such are the traditions—and ruins are pointed out as being those of the temple in question. It is simply an immense, large inclosed square, of some forty-nine acres. On each side of this square there is a huge mass of ruins, and another in the center. In our next illustration we have a portion of the wall surrounding the ruins on the south side of the supposed temple. This is the largest

[1] "Two Years in Peru," Vol. I, p. 283.

of the group of ruins. The walls are seventy feet high; the area of the top is over five acres. Here, again, we no-



Temple Wall.

tice the same mysterious feature already referred to, for "on the top of this were also discernible the outlines of

Fortress, Huatica Valley.

large square rooms, filled up, as all the others, even to the topmost height of seventy feet, with earth or clay."

This cut is given as that of a fort, meaning thereby a

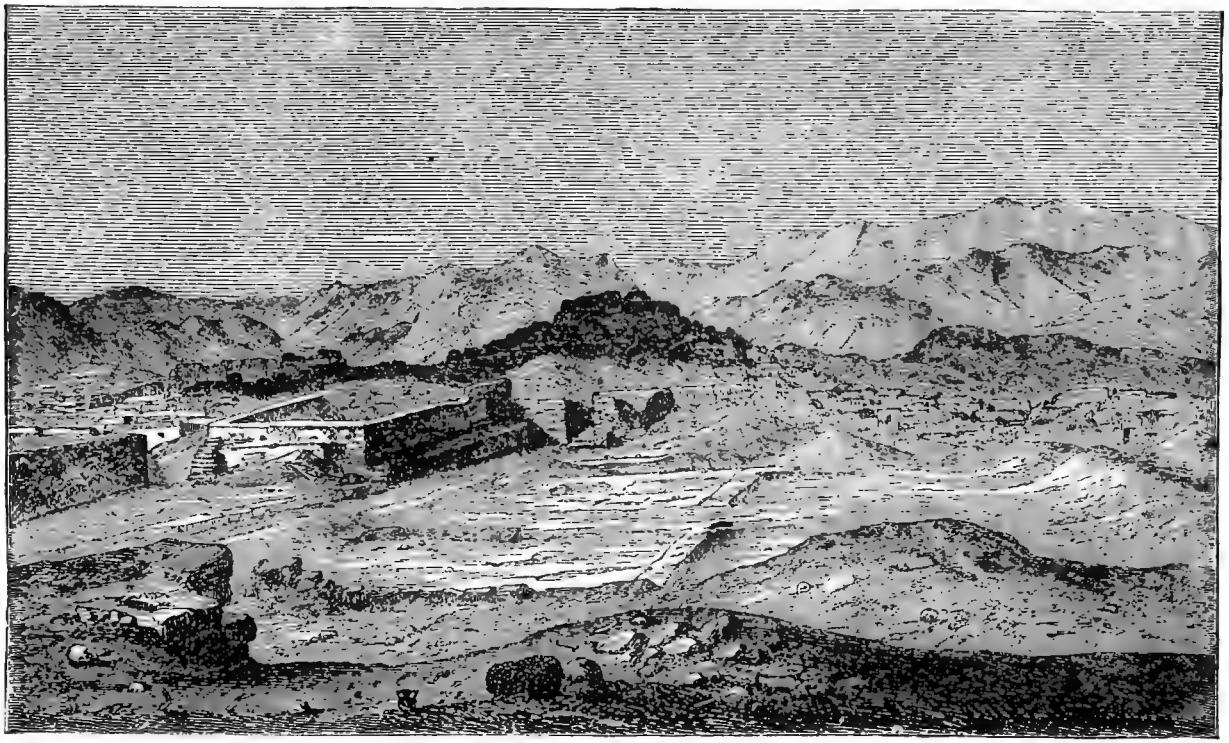
fortress-mound, such as we have already described. It is said to be situated to one side of the temple. From this we understand that the wall seen in the cut is that already mentioned as inclosing the temple. Another ruined fortress found in this valley is given on page 768.

Twenty miles south of Lima, in the valley of the river Lurin, is an important field of ruins, known as Pachacamac, which is still the name of a small village in the neighborhood. We give a general view of the ruins. The principal point of interest about it is the ruins of an old temple. Traditionally, this is one of the most interesting points in Peru. All the coast tribes were very superstitious. We have already referred to the celebrated temple near Lima. The temple at Pachacamac was of still greater renown. Arriaga, a famous ecclesiastic, took an active part in extirpating their idolatrous belief. From his accounts, it seems they were much addicted to fortune-telling. Their gods were made to give out oracles, and their temples became renowned just in proportion as their priests were shrewd in this matter.

Those at Pachacamac were especially skillful, and it is said, pilgrims resorted to it from all parts of the coast. As a consequence, it became very rich. The god that was worshiped here was a fish-god. The name of this god, and the name of this old town are alike lost to us. When the Incas conquered the coast people, they imposed the name of one of their own divinities on this temple, and by that name the place is now known to us.[1]

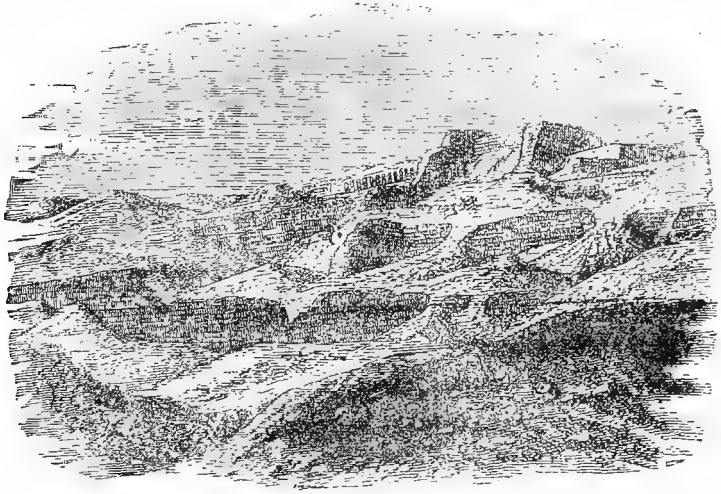
The ruins of the supposed temple are seen on the hill in the background of the picture. A number of writers speak of this hill in such terms as to imply that it was altogether artificial, like the famous pyramid at Cholula.

[1] Markham's "Introduction," to "Report on the Discovery of Peru."



PACHACAMAC.

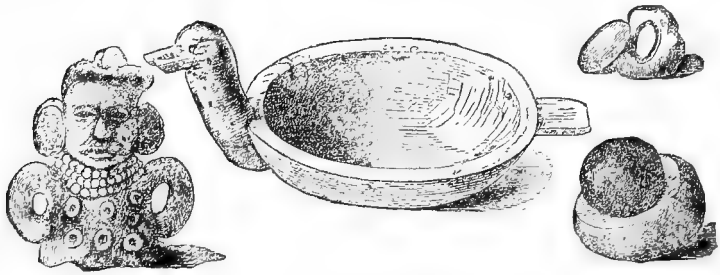
Mr. Squier says that it is largely artificial, but that the central core is a natural hill. He speaks of rocks cropping out on the highest part, which seem to be conclusive of the matter. They built up great terraces around this central core. These terrace walls are now in such a ruined condition that they can with difficulty be made out. We introduce this cut as a nearer view of the ruins of the temple.



View of the Temple.

Some writers assert that the Incas erected on the summit of this hill a temple of the sun. There are, however, no good proofs of this assertion. According to Mr. Squier the only ruin of the Inca type of architecture is a mile and a half distant. Mr. Hutchinson noticed, on the very top of the hill, evidence of the same mysterious proceedings to which we have already referred—that is, great rooms all filled up with clay. He propounds this query: "Whose hands carried up the enormous quantities of earth that fill every space and allow no definition of rooms, halls, or, indeed, of any thing but the clay itself, and the walls cropping up from amongst them?' We are afraid this query

can never be answered. Mr. Hutchinson found graves to be very plentiful all over the field of ruins. Quite a number of curiosities have been found in these graves. We present in this cut some of the same. We call especial attention to the duck-headed bowl. Compare this with the cut given on page 404, and we will be struck with the similarity. Another view of the ruins at Pachacamac is given on page 774. As in the case of the ruins of Grand Chimu, the whole field of ruins was encompassed by a wall, portions of which Mr. Hutchinson observed on the north, stretching away from the sea inland. Explorers have found here true arches. They are said to exist in Northern Peru.



Relics from Graves at Pachacamac.

We are at a loss to account for their appearance, for certainly the people generally were ignorant of their use.

The valley of the Canete, the next one we meet going south, is a very large and very fertile valley. It is also full of ruins, but not differing enough from the others to justify a separate description. About one hundred miles below Lima we notice three small islands. These are the Chincha Islands, noticeable on account of the immense quantities of guano they contain. It seems that at various depths in this guano deposits are found relics of man. In our next cut we present some of these objects. The two small vessels, which were probably water jars, were found buried in the

guano at a depth of sixty-two feet. The other figure, a wooden idol, was found at the depth of thirty-five feet.

We have no very good data on which to rely when we attempt to estimate the number of years required to bury the water jars to the depth where found. Thousands of years must have passed.[1] The water jars are not rude forms. No little skill is indicated by their formation. The wooden idol is not necessarily near as old as the jars, but no one can doubt but that it dates from long before the Inca conquest of the valley. Another collection of small idols, and supposed royal emblems, also found in guano deposits, but at an unknown depth, is shown on page 783.

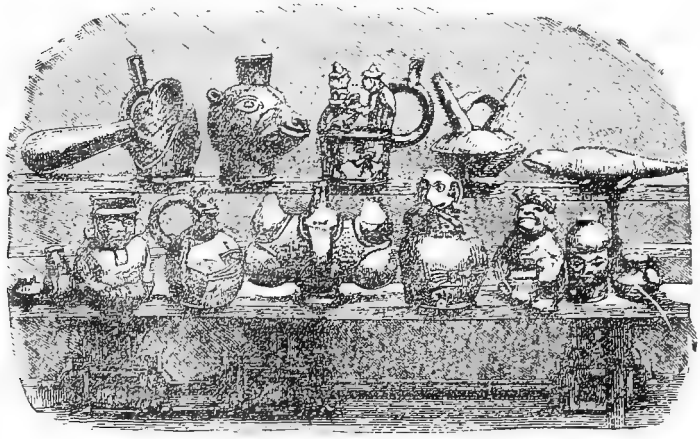
Relics found buried in Guano deposits.

We have thus far been describing the ruins that occur in the territory occupied by the coast tribes, a people in many ways different from the great body of Peruvian people in the interior. According to traditions, the conquest of the coast tribes took place about one hundred and fifty years before the Spanish conquest. The details of this conquest are given with great precision. We doubt whether any great reliance can be placed upon them. We might remark that

[1] "In this case it is nonsense to talk of hundreds." (Hutchinson.)

while Garcillasso traces the progress of the conquest from the south north, Salcamayhua reverses this order, and makes the victorious Incas march from the north to the south. One or the other made a mistake in traditions.

The Inca conquest of the coast tribes was a very thorough one. The names and traditions of the tribes were blotted out. The word Yunca, by which they are known,



Prehistoric Pottery Ware.

is from the Inca language. The same is true of the names of the coast valleys, and yet, from what we have already learned of them, we feel sure that they were very far from the degraded savages Garcillasso would have us believe they were. The inhabitants of each valley formed a distinct community under its own chief. De Leon says: "The chief of each valley had a great house, with adobe pillars and door-ways, hung with matting, built on extensive terraces." This might have been the official house of the tribe.

They were an industrious people, and the evidence is abundant that they had made considerable advance in cultivation of the ground. They "set apart every square foot of ground that could be reached by water for cultivation,

and built their dwellings on the hillsides overlooking their fields and gardens. Their system of irrigation was as perfect as any that modern science has since adopted.[1] It is an altogether mistaken idea to suppose the Incas were the authors.

We are not without evidence that they were possessed of considerable artistic skill. This preceding collection of pottery ware is not the work of savages. Mr. Markham further tells us that they made "silver and gold ornaments, mantles, embroidered with gold and silver bezants, robes of feathers, cotton cloth of fine texture, etc." We have already referred to the tasteful decorations of the walls of Grand Chimu. "Figures of colored birds and animals are said to have been painted on the walls of temples and palaces." At Pachacamac the remains of this color are still seen on a portion of the walls. This cut represents the head of a silver cylinder found in one of the coast valleys. The ornamentation is produced by hammering up from below.

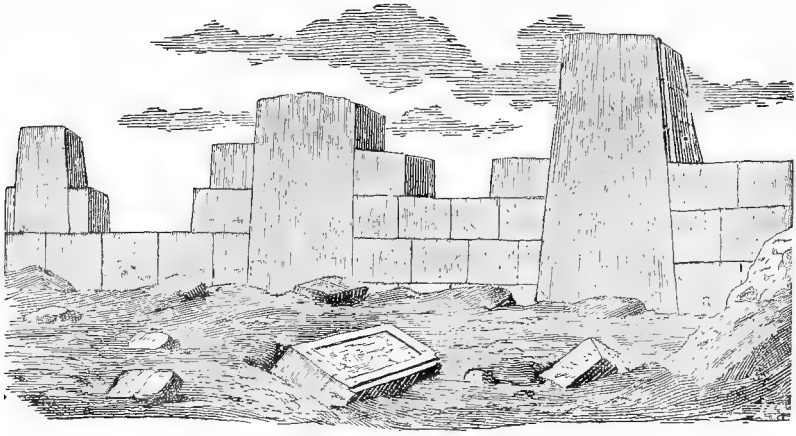
Silver Cylinder Head.

We must now leave the coast regions and investigate some ruins in the interior. We have already spoken of the Lake Titicaca region. Not far from the southern border of that lake we notice a place marked Tiahuanuco. Here occur a very interesting group of ruins. They consist of "rows of erect stones, some of them rough, or but rudely shaped by art, others accurately cut and fitted

[1] Markham, in Journal of the Royal Geog. Society, Vol. XLI.

in walls of admirable workmanship; long sections of foundations, with piers and portions of stairways; blocks of stone, with mouldings, cornices, and niches cut with geometrical precision, vast masses of sandstone, trachyte, and basalt, but partially hewn, and great monolithic doorways, bearing symbolical ornaments in relief, besides innumerable smaller rectangular and symmetrically shaped stones rise on every hand, or lie scattered in confusion over the plain."[1] In fact, all explorers are loud in their praise of the beautifully cut stones found in the ruins.

We have seen in our review how general has been the desire to raise foundations, sometimes of great extent, on



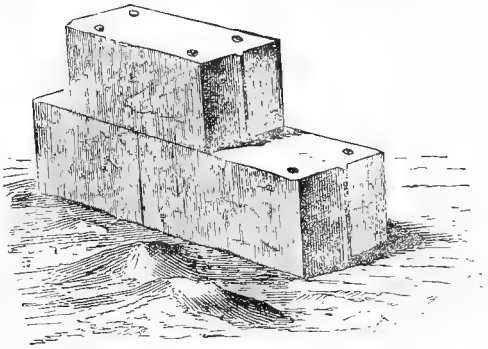
Terrace Wall, Tiahuanuco.

which to place buildings This is true of the ruins under consideration. Here the pyramid or foundation was faced with stone work. In this illustration we have a view of such a wall yet remaining in place. The labor expended on such a wall was very great. We notice in the cut three large standing stones. These are ranged along at regular intervals between. No mortar was used in the construction of

[1] Squier's "Peru," p. 375.

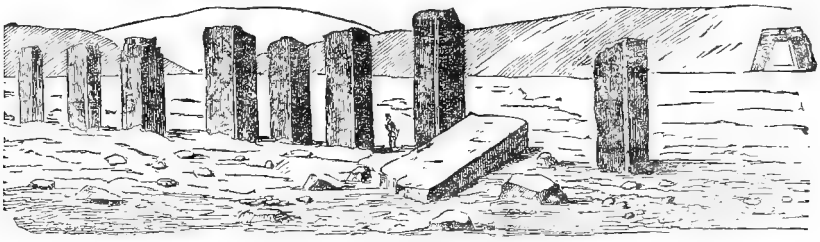
the wall. If we examine the large standing stone carefully we will notice on the side a sort of projecting shoulder. The stones of the wall that come in contact with this standing stone are cut to fit this shoulder.

The remaining stones in the wall were held in place by a peculiar arrangement, illustrated in this cut. Round holes were drilled in the bottom and top of each stone. There is reason to suppose that bronze pins fitted into these holes. Furthermore, each stone was cut with alternate grooves and projections, so as to fit immovably into each other.



Method of Joining Stone Tiahuanuco.

One case was observed where either the wall has entirely disappeared, or else it was left unfinished, and so we have a row of these standing stones, as seen in this illustration. This has been called the American Stonehenge This

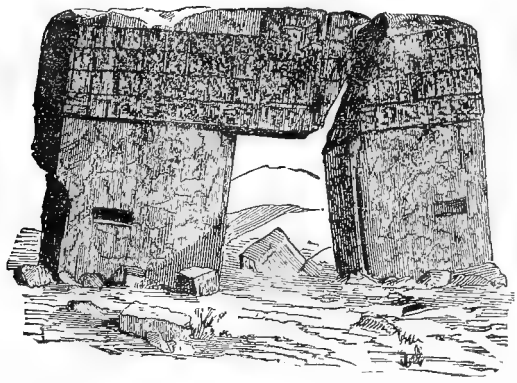


Pillars of Stone, Tiahuanuco.

name is inappropriate, because we have no reason to suppose the plans of the builders of the two structures were at all similar.

The most celebrated feature of these ruins is the presence of huge gateways, each one cut out of a solid mass of

stone. We give a view of the most noteworthy of these gateways. It is now broken, tradition says, by a stroke of lightning.[1] The upper portion is covered with carvings.



Gateway, at Tiahuanuco.

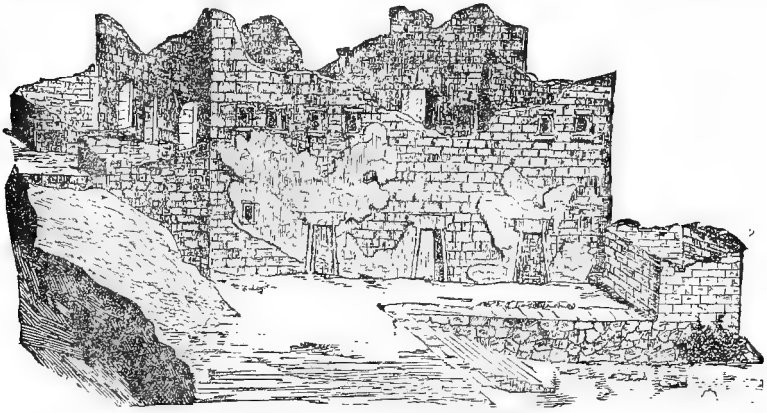
North of Tiahuanuco is Lake Titicaca. This was the sacred lake of the Incas. We have already referred to the probable origin of this feeling. Near the southern end of this lake, on the western side, is the peninsula of Copacabana. Separated by a narrow strait from the northern extremity of this peninsula is the sacred island, Titicaca. According to traditions, the Incas sought, in all ways, to beautify this island. They built temples, and laid out gardens. The hills were leveled as much as possible, terraced, and then covered with earth brought from afar. According to the statements of early writers, pilgrims were not permitted to land on its sacred soil until they had undergone certain preliminary fasts and purifications on the main-land. Landing on the island, they traversed a terrace, and by a narrow passage way they were conducted between two large buildings, where other ceremonies were performed.

The most sacred spot in all the island was a rock in the northern part. Only priests of especial sanctity were allowed near it. The rock to-day presents but the appearance of a weather-worn mass of red sandstone. It is

[1] The dimensions are: Length, thirteen feet five inches; height above ground, seven feet two inches; thickness, one foot six inches. (Squier.)

traditionally represented as having been plated all over with gold and silver, and covered, except on solemn occasions, with a mantle of rich color and material. Here the sun was believed to have first risen to dispel the primal darkness. To this day the Indians regard it with superstitious veneration. The traveler's guide, when he comes in sight of it, removes his hat, and reverently bows to it, and mutters to himself a few words of mystic import.[1]

The whole appearance of the island shows how highly it was regarded. In one place the remains of a drinking fountain were noticed. Streams from some unknown source were still bringing to it their limpid burden. Perhaps as noticeable a ruin as any is represented in this cut. It is

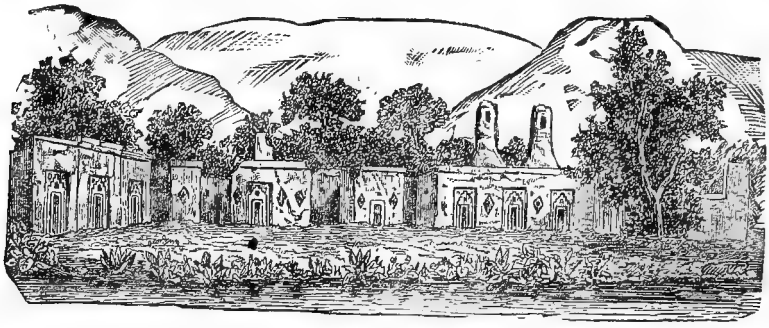


Ruins on the Island of Titicaca.

called the Palace. It is in a sheltered nook. The lake washes the very foot of the foundation on which it stands. It is two-storied. In the lower story were twelve rooms, so connected with each other that but four of them communicated by doors with the outside. The others were certainly dark and illy ventilated. The second story was entered by means of the terrace in the rear. The same

[1] Squier's "Peru," p. 336.

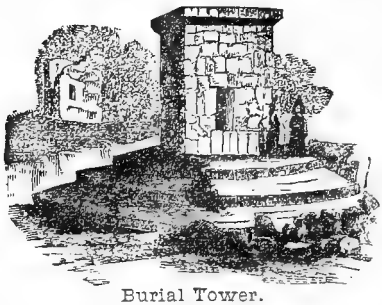
statement may be made in regard to its rooms; they did not, however, at all correspond in arrangement with the rooms below. The Island of Coati, but a short distance to the south-east, was sacred to the moon. It has also a num-



Ruins, Island of Coati.

ber of ruins. The approach to this was guarded by a number of terraces.

We will describe one more class of ruins found abundantly in the Collao region. These are burial towers, or chulpas. A view of one is here presented. The chulpas are common in the Titicaca basin, and usually occur in groups, and almost always in positions from which a large extent of country can be viewed. The great mass of a chulpa is solid, but within is a dome-shaped chamber, into which the opening seen in the cut leads. Sometimes the chulpas are round, and in some the masonry is of that variety we have already mentioned, called the Cyclopean. Another view of burial towers is given on page 788.

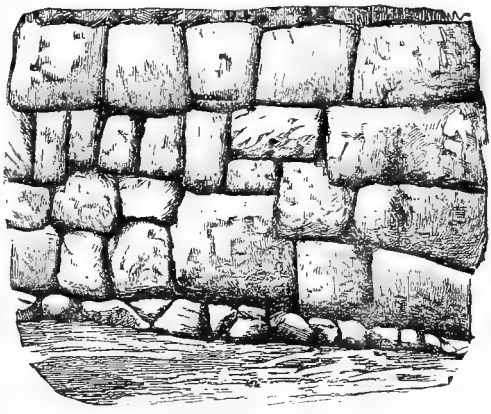


Burial Tower.

As a mere description of ruins becomes tiresome, we will now pass to Cuzco, and see of what we can learn of the

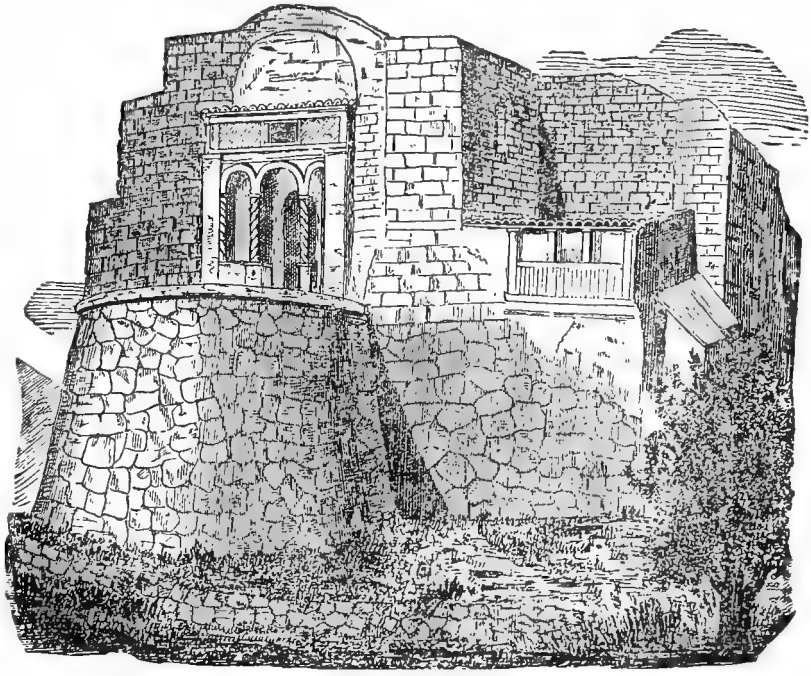
architecture of the Incas. The Incas were, of course, a very rich and a very powerful tribe. All the tribes of ancient Peru had to pay them tribute. We may therefore suppose that the pueblo of Cuzco was well built, the houses large, and imposing, and that the official buildings for worship and tribal business would be commensurate with their importance as a tribe. Yet we have but very few accounts of these buildings. Immediately after the conquest, many of the Spanish leaders settled in Cuzco. They made many changes in the various edifices, and introduced into them many improvements. At present in the modern city we still find portions of ancient walls, and can trace the foundation of various buildings.

The site of the city of Cuzco is very uneven. It stands on the slopes of three hills, where as many rivulets come together. The ancient builders had to resort to extensive terracing in order to secure level surfaces on which to build. These terraces, built in a substantial manner, and faced with stone, are still standing in many places. In this illustration we have a view of such a wall. Observe that the stones are not laid in regular courses, nor is there any regularity as to their size. This is a good example of a Cyclopean wall. Some of the stones must weigh several tons, and they are fitted together with marvelous precision, one stone having as many as twelve angles.



Terrace Wall at Cuzco.

All accounts agree that the temple of the sun was the grandest structure in Cuzco. We present an illustration of one end of it. This end is slightly curving. It is necessary to remark that this end now forms part of the Church of Santo Domingo. The fine-looking window and balcony are modern additions to this ancient building. According to Mr. Squier, the temple was an oblong building, nearly



Temple of the Sun.

three hundred feet long, by about fifty in width. It formed one side of a spacious court. It did not extend east and west, but rather north-east and south-west. Early chroniclers affirm that the inner walls of this temple were covered with gold. Portions of very thin plates of gold exist in private museums in Cuzco, said to have formed part of this covering. The end of the temple shown in our illustration was covered with a great plate of gold intended to represent

the sun. This plate was all in one piece, and spread from wall to wall.

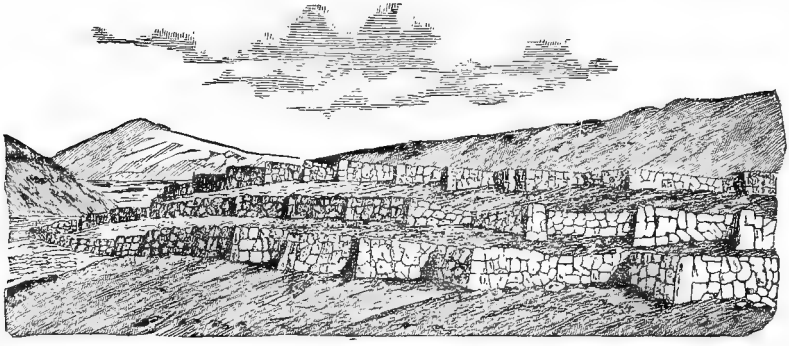
Only fragments of the ancient buildings of Cuzco now exist. But enough are at hand to enable us to describe their general characteristics. As a rule, they were built around a court, the outer surface presenting the appearance of an unbroken wall. These walls are excellent specimens of Inca masonry. All travelers speak in their praise. Mr. Squier says: "The world has nothing to show in the way of stone-cutting and fitting to surpass the skill and accuracy displayed in the Inca structures at Cuzco." There was but one gateway to the court. This entrance was broad and lofty. On the lintels, over the doorway, was frequently carved the figure of a serpent. The apartments were constructed so as to face the court, and nearly all opened upon the same. In some cases rooms were observed, to which access could be obtained only after passing through several outer rooms. Some of the walls yet remaining at Cuzco are from thirty-five to forty feet high. This would indicate houses of two or three stories.

It is here necessary to state that the structures we have been describing are considered by most writers as palaces of the Inca chiefs. Names have been bestowed upon them-such as the palace of Huayna Capac. It is asserted that each Inca chief built a separate palace. The credulous traveler is even pointed to a pile of ruins said to have been the palace of that mythical personage, Manco Capac. There is some conflict of authority as to the names of these palaces. Modern tradition names one of the most imposing piles as the palace of Inca Rocca, and as such it is described by Mr. Squier and others. Garcillasso De La Vega says this chief's palace was in an altogether different part of the city.[1] Those who

[1] Markham, in "Journal of Geog. Soc.," Vol. XLI.

call these buildings palaces, think the houses of the ordinary people have all disappeared. It is evident, however, that if our views of the state of society among the Incas be right, that it is a misnomer to call these structures palaces. Some of them may have been public buildings, devoted to tribal purposes. But we need not doubt but that this was the type of communal buildings erected by the natives of Cuzco.

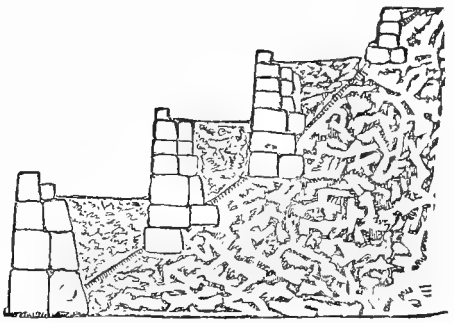
We must describe one more piece of aboriginal work. This is the celebrated Fortress of Cuzco. As we have



Fortress Walls.

stated, the ancient pueblo, or city, was built on the slopes of three hills. One of these, easily defended, was strongly fortified, and thus converted into a citadel. Though called a hill, it is in reality a projecting headland. Back of it rise still higher hills. The portion overhanging the city is very precipitous, in fact, almost incapable of ascent. There is, however, a pathway up this front, ascending in places by stone steps. On this front it did not need very strong fortifications, yet sections of stone wall, serving for this purpose, are to be seen. They have been mostly thrown down, and the stones rolled or tumbled down the hill to be utilized in building. The main defensive works are where the headland commences, from which point the city is not visible.

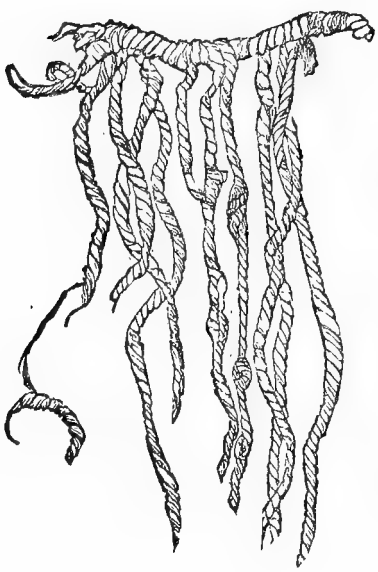
In this illustration we have a view of the three massive walls which defended the citadel. They are really wonderful works. In order to understand the construction, we will present an imaginary section of the walls. The walls support terraces, but they rose above the terraces so as to form a parapet. To prevent the accumulation of water behind the parapet, channels were cut through the walls at regular intervals to drain them. The height of the outer wall is at present twenty-seven feet; the width of the terrace thirty-five feet. The second wall is eighteen feet high; the width of its terrace is also eighteen feet. The height of the third wall is fourteen feet.



Section of Fortress Walls.

The Incas divided the year into twelve months, but we do not learn how they kept track of the years. In this respect they were behind the Mexicans. Neither do we know of any hieroglyphics for days, or months, or years. In the matter of keeping records, they must have been far below the Mexicans. Our next illustration is that of one of their knot records, or quippos. It is a very rude attempt to assist the memory. To the base cord are attached other threads of various colors, and tied in various ways. We, of course, know but very little about them. It is claimed, however, that a red thread signified a soldier, or war; a yellow one signified gold; a white one silver, or peace; a green one wheat, or maize. A single knot is said to have stood for ten; two knots, twenty; a knot doubly intertwined, one hundred, etc. Also the position of the knots on the threads was to be considered, their distance apart, the way the threads were

twisted, and many other details.[1] It is manifest, however, that this system of records is of very little value, and is way below the picture-writing of the Mexicans.



Quippos, or Knot Record.

Take it all in all, the Incas are indeed an interesting people. We believe, however, their culture has been greatly overrated. Our object in this chapter has been to give an outline of the Incas and the tribes subject to them. It is impossible in these few pages to give more than an outline. Should the reader, by the perusal of these pages, acquire an interest in the culture of the Andean people just before the Spanish invasion, and be thereby induced to continue his investigations, the writer will consider such a result reward enough, even though the conclusions reached should be totally opposed to those set forth in this chapter on Ancient Peru.

# PREFACE.

VOLUME is the second one of the series of four entitled THE HISTORY OF CIVILIZATION. We have found it necessary, in discussing the subjects here spoken of, to make two general divisions of the same. Many topics not usually considered by historical writers require a somewhat extensive examination at the hands of those who seek to investigate the rise and progress of Civilization. This extra work is not, however, of the nature of drudgery. The man of mature years takes a calm enjoyment in contemplating the advance from childhood's years. So there is enjoyment for the civilized man in surveying that long and wearisome road along which many generations of men have trodden, but which has led them from Savagism, through Barbarism, to Civilization.

When we allow ourselves to reflect on the events of the last few centuries, we quickly realize that within that time very great advance has been made in everything contributing to our physical well-being, and, indeed, in every department of human knowledge. Further reflection convinces us that what is true of recent times is true of the entire life of man on the earth. But since man has lived on the earth for a very extended time, indeed much longer than the few thousand years once supposed to cover this period, it follows that we may reasonably inquire as to the course of development of the several departments of culture, the whole of which constitutes that complex entity we call Civilization. We know of nothing which will more thoroughly impress on the investigator a

sense of the value of human life and its possibilities than the investigation here proposed.

Our efforts in this direction would be in vain if all men had advanced with equal rapidity and had made equal progress in the line of development. This, as is well known, is not the case. Some have halted at one stage of advancement, some at another. When an astronomer studies the starry heavens, he finds planetary and stellar worlds in all stages of development, from the scarcely luminous nebulous mass to the glowing sun that gives light and warmth to a train of attendant planets. So, if the student of human progress will but look around him, he finds people in nearly all stages of culture—from the lowest of existing savages to the most enlightened nations.

It is further evident that if we had before us a full account of all the various tribes and nations of men, we would be able to draw, by a careful analysis and comparison of the same, certain general conclusions as to the course of development of Civilization. This method has been pursued by some of the most eminent scholars of our times. At the present day, any work on Civilization deserving attention must take notice of these results and this method of work. In PART I. we have followed this method in treating of a few of the most prominent of the factors of Civilization; such as organization for social and governmental purposes, Primitive Culture and Primitive Religion.

Having thus laid the foundation for an understanding of the general course of development of Culture, in PART II. we take up the principal people in each of the great groups of races, and seek to determine their position in the scale and the part they took in advancing Civilization. Here we resume the thread of historical research of Volume I. We must bear in mind that for our purpose all that is required is an historical outline only. We are not concerned in writing a political history, and exact dates and full descriptions of campaigns are not so much required as is the connection between various people, and the degree of development each had reached in culture.

Here it is well to remark that the general division of our sub-

ject into Ancient, Medieval and Modern Worlds is not at all the same as the divisions of the same name made by many historical writers. We have reference solely to culture divisions. The difference will be at once noticed in the treatment of Greece and Rome. As far as mere antiquity is concerned, they belong to the Ancient World. But their culture is Aryan; and Aryan or European culture had almost nothing to do with the Ancient World in culture. We therefore pass them entirely by in this volume. It will be found, in the sequel, that the culture of the Ancient World is Asiatic, the foundation being laid by the Yellow Races, but carried to its greatest height by the Semitic Whites. The Ancient World, in history, ends with the fall of the Western Empire of Rome. The Ancient World, in culture, came to an end a thousand years before, when the Aryans overthrew the political power of the Semitic people in Western Asia.

"Diligence and accuracy," says GIBBON, "are the only merits which an historical writer may ascribe to himself." The author and his assistants feel that with due modesty they may lay claim to this merit. It has been our earnest endeavor to present the latest conclusions of our very best scholars on all questions here discussed. At the same time, we have not hesitated to show that the facts they state are in some instances best interpreted by conclusions other than those stated by them. We have freely given the sources of our information. At the present day, the people have the right to know on what authority statements are made.

This volume must, of course, stand on its own merits; but a few words as to the preparation of it will not be out of place. In preparing the first volume, the manuscript of many of the chapters was submitted to a number of eminent scholars for final revision. Some defects attended that method; not the least being that the reviser of one chapter, knowing nothing of the contents of the others, was in darkness as to the connection, and so could not criticise as intelligently as he desired. This objection was felt still stronger in this volume. Some gentlemen with whom we corresponded thought it best to have one or more scholars revise the whole.

Arrangements were made with EMIL REICH, D. C. L., Vienna University, Vienna, Austria, well known to many as a lecturer on topics connected with Civilization, to not only assist with valuable suggestions and revision of manuscript, but to prepare the material for a number of chapters. Arrangements were also made with WILLIS BOUGHTON, B. A., University of Michigan, Ann Arbor, Michigan, to devote his entire time in preparing material for the work. We have to thank him for many valuable suggestions and much careful work in revision. In this volume, while Mr. ALLEN is responsible for the form in which the chapters occur, yet the main points in each were discussed by all the gentlemen now named. We therefore feel that the public can rely with confidence on the statements of facts here given, and trust the conclusions drawn from them will commend themselves to the good judgment of all readers.

Our sincere thanks are due to A. W. WHELPLEY, Librarian of the Cincinnati Public Library, and his corps of assistants. Every advantage that this large and well-appointed library could afford us in prosecuting our researches was given. The value of this assistance will be seen when we remark that on the shelves of this library there are over *thirteen thousand volumes* treating topics connected with History and Civilization, not to mention numerous pamphlets and scientific reports. Special facilities for investigating this large and valuable mass of material were given us.

In conclusion, we might remark that we have been much pleased with the favorable reception given our first volume. Of course, on such a topic as this, probably no two minds see things in quite the same light. We have, however, received words of encouragement from representative men of all classes and professions. We think the times are eminently fitted for a discussion of the many problems connected with the rise and progress of Culture, and we trust that our work will awaken in the minds of its readers a desire to continue the investigation here begun.

E. A. Allen

CINCINNATI, *December* 1, 1887.

# TABLE OF CONTENTS.

## PART I.

## CHAPTER I.

### RACES OF MEN.

INTRODUCTION — Difficulties of classification — Color — Cranial measurements — Linguistic families — Relationships — Unity or diversity of species — Primitive type of man — Origination of races — Condition of life — Sexual selection — Time of origin of man — Original home of man — Primitive enlightenment — Degradation theory — Progression theory — The primitive race — Conclusions — Table of classification, . . . . . Page 19

## CHAPTER II.

### ANCIENT SOCIETY.

DIFFICULTY in understanding ancient society — Different forms of government — Tribal organization — The communal band — Group marriage — Systems of relationship — The Turanian system — The Indo-American system — The classificatory system — The customs in Australia — The class divisions of the tribes — Explanations of the Indo-American system — Africo-Polynesian system — Proves the communal band — Origin of the Australian classes — The Kamilaroi tribes in Australia — The classes the origin of the phratries — The origin of gentes — The tribes explained — Phratry explained — Gens explained — General prevalence of tribal society — Change of descent — Tribal

organizations of the Hebrews—Among the Persians—The Hindoos—The joint-family—The Celts—The Germanic tribes—The Slavonians—Joint-family among the Slavs—The ancient Greeks—Spartans—Change to political society among the Athenians—The Romans—Conclusions, . . . . . Page 87

## CHAPTER III.

### PRIMITIVE CULTURE.

INTRODUCTION—Study of the past—The Patriarchal form of government—First authority personal—Evolution of the gens chief—Evolution of tribal chief—The tribal council—Change from election to hereditary descent—The power of ancient kings—The development of ancient law—The chiefs the first judges—Individual rights and wrongs unknown—Power of the house-father—The status of the joint-family—Individual property at first unknown—Origin of law codes—Influence of property in developing Civilization—Origin of property in land—Influence of property in developing law—Development of the useful arts—Indian picture writing—The symbolical stage—Indian hieratic writing—Development of Chinese writing—Peculiarities of Chinese writing—Egyptian writing—Hieroglyphic writing—Cuneiform writing—Development from picture writing—Origin of the alphabet—General conclusions, . . . . 206

## CHAPTER IV.

### PRIMITIVE RELIGION.

INTRODUCTION—Different religious systems—Religious growth capable of study—Limitation of our subject—Definition of religion—Savage speculations—Primitive theory of dreams—Shadows, reflections and refractions—Savage idea of souls—Idea of death—Theory of sickness—Of trance—Location of the future world—In the earth—Above the sky—Journey of the soul—Theory as to the future life—The continuance theory—Souls of animals and objects—Transmigration—Retribution theory of future life—Morality not considered—Rise of belief in supernatural beings—Ancestor worship—Its universal prevalence—Rise of Fetichism—Its extensive prevalence—Belief in witchcraft, magic, sorcery, etc.—Worship of

animals and plants—Worship of images—Savage philosophy—Sickness—The savage priesthood—Spiritualism—Rise of Polytheism—The greater Fetich gods—Sky—Earth—Sea—Fire—Sun—Rise of Monotheism—Conclusions—Summary, . . . Page 257

## PART II.

## CHAPTER V.

### THE YELLOW RACES.

INTRODUCTORY—Development of the Black Races—Origin of the Yellow Races—When—Where—Home of Yellow Races—The Dravidians—The Accadians—Results of recent research—Beginning of Civilization in Mesopotamia—Divisions of the people—The Accadians, Turanians—The Kushites or Cushites—Accadian Civilization—Accadian religion—The Proto-Median tribes—The Hittites—First History—Bible references to the Hittites—Egyptian references—The Alarodians—The Vannic inscriptions—Hittite religion—The Finns——Finnic Mythology—China—Early Chinese history—Chinese classics—Probable Chinese history—Civilization of the Chinese tribes—Writing—Sketch of their development—The aboriginal tribes of China—The Chow dynasty—Traces of tribal society in China—General conclusions on the Yellow Races, . . 357

## CHAPTER VI.

### ANCIENT EGYPT.

INTRODUCTION — Physical geography of Egypt — Prehistoric Egypt—Ethnology of the Egyptians—Semitic influence—Antiquity of Egypt—Chronology of Egypt—Epoch of the Old Empire—The first dynasty—Second dynasty—Opening of the historic era—The Pyramid Builders—Tomb of Nofer-ma—Khufa—Khafra—Menka-ra—Ptah-ho-tep—The sixth dynasty—General survey of the six dynasties—The culture of the Old Empire—Powers of the king—The council—Egyptian pyramids—Egyptian religion—Animal worship—Ancestor worship—Polytheism—Egyptian gods—The Myth of Osiris—Egyptian sacred writings—General conclusions, . 453

## CHAPTER VII.

### EGYPT CONTINUED.

THE period of darkness—Rise of Thebes—The eleventh dynasty—The Middle Empire—The twelfth dynasty—Amen-emhat—The Obelisk kings—The Fayoum—Amen-emhat III.—The thirteenth dynasty—Religion of the Middle Empire—Civilization of the Middle Empire—The story of Saneha—The interval of time between the twelfth and eighteenth dynasties—The Hyksos invasion—The Shepherd kings—The Hittites the Shepherds—The details of this invasion—The culture of the Hyksos kings—The seventeenth dynasty—Expulsion of the Hyksos—The eighteenth dynasty—Invasion of Asia by Egypt—Queen Hatsu—Thothmes III.—Khuen-aten—Peculiarities of his reign—Culture of the eighteenth dynasty—Religion—Rise of the New Empire—The nineteenth dynasty—Seti I.—Rameses II.—The results of his wars—The decline of Egypt, . . . . . Page 529

## CHAPTER VIII.

### EGYPT CONTINUED.

INTRODUCTION—Egypt's Decline—Pelasgians—Menephthah—Invasion of Egypt by the Europeans—Seti II.—The twentieth dynasty—Invasion of Asia—Conspiracy against Rameses—Culture of the twentieth dynasty—Historical confusion in Egypt—The Assyrians—Conflict between Egypt and Assyria—Influence of Egypt on Civilization—Egyptian Civilization stationary—Egyptian society tribal—The priestly class—Egyptian ideas as to immortality—The judgment hall of Osiris—Egyptian sciences—Their social life—General conclusions, . . . . . 594

## CHAPTER IX.

### THE SEMITES.

INTRODUCTION—The Semitic Race—Home of Semitic people—The dispersion of the Semites—The northern Semites—The western branch—Beginning of Civilization in Chaldea—Mesopotamia—Abu

# PART I.

A Comparative
Study and Analysis of the
Attainments, Institutions and Beliefs of Primitive
Men.

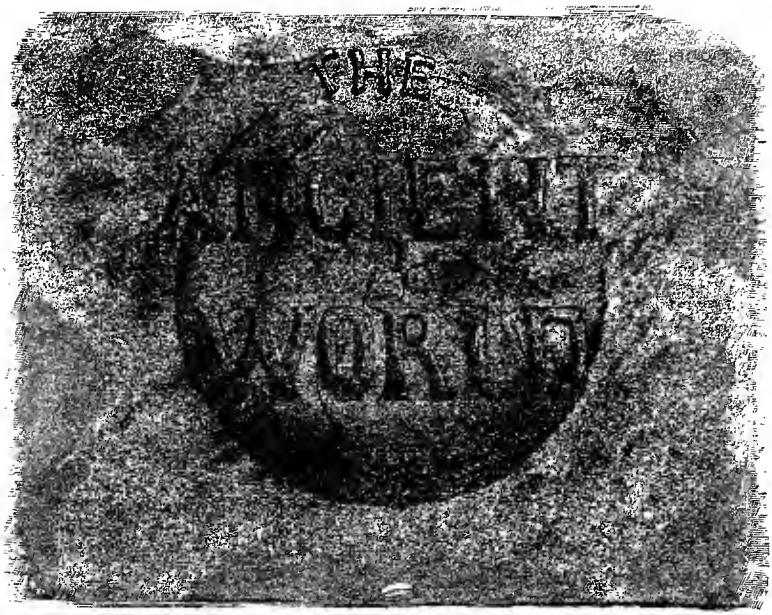
Races of Men.
Ancient Society.
Primitive Culture.
Primitive Religion.

Ancient of days, who hast from the beginning
Reigned in majestic silence o'er the infant world,
Guarding in some secret Eden the cradle of mankind,
Broken is the magic spell that bound thy lips
For chiliads of years. And thy enchanting tales
Have caused the very rocks to break their silence,
And reveal the hidden records graved thereon.
The rock-hewn tombs give up their royal dead.
Their inmost halls resound with tales of bloody wars.
The mummy ope's his lips and speaks of ancient days.
The solemn sphinx hath e'en its tale to tell.
Temple halls, in lichen covered grandeur
Rising from the very verge of desert sands,
Upward hurl their great cyclopean walls,—
Mute testimonials of boundless wealth and power—
Whose great foundation stones give up their storied tablets.

---

Read, then, oh man, the story of the Ancient Past,
And meditate upon thy great Creator's ways.

WILLIS BOUGHTON.



# CHAPTER I.

## RACES OF MEN.

INTRODUCTION—Difficulties of classification—Color—Cranial measurements—Linguistic families—Relationships—Unity or diversity of species—Primitive type of man—Origination of races—Condition of life—Sexual selection—Time of origin of man—Original home of man—Primitive enlightenment—Degradation theory—Progression theory—The primitive race—Conclusions—Table of classification.

FROM a mountain peak we cast our eye over a wide, extended scope of country, it is only the more prominent features that impress themselves on our view. The lesser details, the waving field, the blossoming bush, which attract the observation of the immediate passer-by, are lost in the distance; but the range of forest-clad hills, the

winding river, the wide expanse of fertile plain, or the purpling peaks in the distance, determine the landscape and claim our attention. We are to-day surrounded with the civilization of the nineteenth century; let us from this height glance back along the line of human progress and note what we can of our journey hither. We can, at best, only hope to perceive the more prominent lines of advance. To carefully trace the growth in all departments would not only greatly exceed the limited space at our command, but would confuse us by the very multiplicity of subjects demanding attention.

In the dim distance the darkness of prehistoric times shuts out the vision. In the preceding volume[1] we have seen that that extended period of time preceding the dawn of history is by no means lost to us. We have learned many facts in reference to primeval man, and have observed that the life of man on the globe has been one of progress. We have stood in amaze before the long term of years that seemed demanded to account for all the facts laid before us. The evidence has everywhere been that primeval man, though possessed of all the attributes of humanity, started at the very foot of the ladder of human progress. When we come to the wavering line that everywhere separates the historic from the prehistoric period, which line, as we have seen, varies in different countries, we find that it discloses man in very different states of society, and in very different stages of social enlightenment. It seems best, therefore, to take a comprehensive view of the situation at the dawn of history, and to note how we find the different races of men disposed over the earth; and it seems to us there are many questions at which we must at least glance, in order

[1] "The Prehistoric World."

to clear up our thoughts, which might at first be considered foreign to our subject. It is known, however, that no branch of learning stands by itself; each demands some assistance from others; so these inquiries will be found of great help to a clear understanding of the somewhat complex subject of civilization, and will help us to understand some of the otherwise dark points in the history of human progress.

If we are to study civilization as a whole, it will not do for us to commence with the civilization of the inhabitants of ancient Chaldea and the Valley of the Nile. When the light of history fell on these people they were already far advanced. We have, first of all, to consider other questions. The preceding volume was wholly taken up with questions of that nature. Our object in this chapter is to combine the results there obtained with some general statements as to races of men, the constitution of ancient society, and the development of civilization, and thus place ourselves in position to intelligently understand the earliest civilization that history reveals to us. This labor has generally been omitted by historical writers,[1] but it is of the utmost value, since such questions must exercise, as Lenormant points out, a great influence on the facts and interpretation of history.

Let us therefore commence with the question of race and the classification of men. Now, on this question, eminent scholars have spent years of travel, study, and observation. A great many volumes have been written. Items of information that in any way throw light on the manners of life amongst the most diverse tribes of men

[1] As Buckle observes, "Among them (historical writers) a strange idea prevails that their business is merely to relate events, which they may occasionally enliven by such moral and political reflections as seem likely to be useful." ("Hist. of Civ. in England," Vol. I, p. 3.)

have been put on record. The laws of plant and animal growth have been investigated to obtain what light we could from that source. Some of the keenest intellects of our day have given themselves to a consideration of the terms *species* and *race*, and have searched the entire realm of natural history for information on these topics. The science of language has been studied. In short, from all sources information has been gathered, in order, if possible, to come to a clear understanding of the various races of men and the degree of connection existing between them.

In spite of all this work, however, it must be admitted that a great diversity of opinion exists as to the question at issue. So true is this that, as to the number of races, good authority may be found for claiming almost any number from one to sixty-three;[1] and it is admitted that the classification of men is largely a matter of personal views,[2] and further increasing knowledge only makes it more plain that races of men are not separated from each other by exact differences, but that their peculiarities overlap and intermingle.[3]

Still, it is better for us to make an effort in this matter. A faulty classification would be better than none at all. We will therefore append to the end of this chapter a scheme showing the groupings of various races of men.

---

[1] Darwin: "Descent of Man," p. 174.

[2] "It must be confessed, however, that the circumscription of human races is a work which must be largely guided by the personal views of investigators." (Winchell: "Preadamites," p. 77.)

[3] "The different races of men are not distinguished from each other. . . . The diversities which exist are variable, and pass into each other by insensible gradations." (Prichard.) "The races of men graduate into each other. . . . It is hardly possible to discover clear, distinctive characters between them." (Darwin.) As to racial distinctions, "Endless intermixtures have involved the study of details in confusion inextricable, and difficulties, perhaps, insurmountable," (Winchell.)

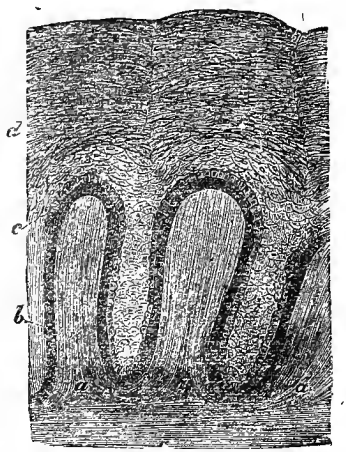
But it will be necessary to first take into account a great number of facts. With anthropologists, we will have to note the physical appearances of the different races of men. We will find it advisable to compare various measurements they have made. It also becomes necessary for us to learn what conclusion some of our scholars have come to in regard to the languages of men; that is to say, what languages, if any, can be grouped together in families, and whether the races speaking the languages thus grouped are found to bear any relation to the groupings we would form from a consideration of physical causes only.

Every one knows that all men are not of the same color. Somewhere over the earth we find tribes of men showing the various shades of color, from a dark-blue black to the fairest blonde type. It might at first be thought this character could be used in classifying men, and, in fact, it is much in favor; but more extensive research shows that it will not do to place too great a reliance on it. Sometimes, in the same section of country, tribes separated in distance but a few miles, speaking, perhaps, dialects of the same stock language, will be found to vary considerably in color. The most we can say is that large groups of races can be made, such as black, yellow, etc., in which the prevailing color is that of the main division. The general conclusion is that color, though regarded as "a most excellent secondary character," is too feeble a character to found a classification upon.[1] In this connection we need only recall that the dark-skinned

[1] Quatrefages: "The Human Species," p. 359. Waitz: "Anthropology," p. 232. Topinard: "Anthropology," p. 349. Prichard: "Nat. Hist. of Man," p. 645. Perhaps they have gone too far in this matter; as Prof. Winchell is inclined to believe, "it (color) possesses more significance than its seemingly capricious distribution in some cases would permit us to suppose." ("Preadamites," p. 298.)

Hindoos are closely related to the fair-skinned inhabitants of Europe.

It is probably well known that the skin in all races is much the same. We have first the scarf-skin, the outer layer of which is being constantly worked off; then what is called the mucous layer, in which the coloring matter is found, and then the skin proper. Now, the coloring matter in the mucous layer, which is the varying factor and the cause of the differences in color of the various races of men, depends on a great many circumstances. It is influenced by climate, but habits and mode of life regulate the force of this influence. Food has its share in the production of color, though in a subordinate degree. It makes a difference whether the body is exposed to climatic influence, or protected from the same by clothing and houses; especially is this true where there are great alterations of temperature and sudden changes from wet to dry, and in hot and damp countries unprotected by forests.[1] To the above and similar causes we must primarily look for the difference in color of the various races of men. But, these differences once established, the great law of inheritance, by virtue of which the child resembles its parents, comes into full force, and descent has a great controlling influence over color.[2]



**Much Magnified Section of Skin.**

*a* True skin; *b*, *c* Mucous layer; *d* Scarf skin.

The color and form of the hair have also been care-

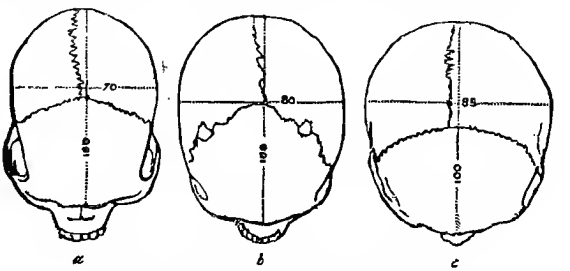
[1] Waitz: "Anthropology," p. 41., *et seq.* [2] Ibid., pp. 42, 52.

fully studied. This apparently insignificant feature has been found to possess considerable importance, and some rely on it as the most suitable natural character on which to base a classification. In general, the color of the hair may be regarded as the result of the same set of causes that affects the color of the skin. It will be found that dark hair generally accompanies a dark skin, though this statement, like all others of a general nature, is subject to exceptions. In all races we occasionally find individuals with fair, or even red, hair.[1] The form of the hair is, perhaps, more important. Neighboring tribes are sometimes separated by a difference in this respect. The Papuans and Australians are both among the black races; but the former are widely distinguished by their great crown of woolly, matted hair from the Australian, with his comparatively straight hair. We know that straight, coarse black hair is characteristic of our Indian tribes. More extensive reading shows us that this kind of hair characterizes the Mongolian or yellow races generally. On the other hand we know that the negroes have short, black hair, so tightly curled that we call it woolly, though it is still true hair. Between these two extremes are the white or fair races. That this difference in hair is a persistent character is also well known, since a person having so small an amount of African blood in his veins that he does not betray it in color may still possess black, curly hair, though we would not call it woolly. The Hungarians still betray their Asiatic origin by the tint and shape of the hair, though otherwise scarcely distinguished from the neighboring Aryans. We must therefore keep these facts in mind in grouping the races of men.

The dimensions and general shape of the skull have

[1] Waitz: "Anthropology," p. 218.

also been carefully studied. Skulls from all parts of the earth have been gathered, measured and compared. It seems to be generally admitted that, like color, no measurements can be obtained which will give us a good basis of classification;[1] yet some general facts have been obtained of interest. Not to go into details, we may state that one such result is obtained by comparing the width of the skull with the length. In this cut we have a top view of three skulls, one from each of the main groups. The diameter from front to back is considered in each case



*a* Black race; *b* White race; *c* Yellow race.

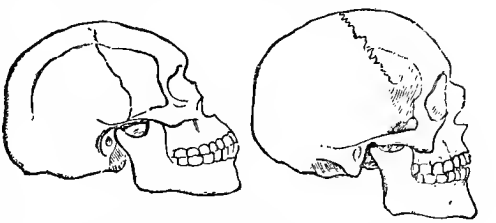
as 100. The cross diameter, when compared with this, gives us the index. It will be found that in general terms the white races occupy a middle position between the black races on the one hand and the yellow races on the other.[2]

If the investigator were confronted with a collection of skulls which had been gathered from various sources over the surface of the earth, he would not be very far out of the way if he were to divide them as here indi-

[1] Quatrefages: "The Human Species," p. 375. Waitz: "Anthropology," p. 235.

[2] The ratio thus obtained is called the *cephalic index*. When this index falls below 74, the skull is said to be long-headed, or *dolichocephalic*; between 74 and 79, it is characterized as middle-headed, or *mesocephalic*; above 79, the skull is broad-headed, *brachycephalic*. Any good work on Anthropology contains tables of these ratios, and the general truth of this statement can be deduced from the same. (Quatrefages: "Human Species," pp. 372–4. Winchell: "Preadamites," pp. 68, 166–7. Topinard's "Anthropology," pp. 240–1.)

cated and confidently predict the groups to which they belonged. Yet we must bear in mind that numerous exceptions exist, and we are not yet prepared to state what value this character has in determining the place of a race in the scale of civilization. Thus, among the very lowest of the black races is to be placed the broad-headed Negritos; and amongst the yellow races must be classed the Eskimos, who are narrow-headed people. As for the white races, there are some exceptions both ways.



Skulls of Members of Black and White Races.

In this cut is presented another feature; that is, the forward projection of the lower portions of the face. The extremes are found in the black and the white races. This feature is called prognathism. It is most pronounced among the black races, decreases somewhat among the yellow races, and is the least among the whites. Of course, in all races there are exceptions.[1]

A great many other measurements have been made, to which we need not refer. As to the capacity of the skull and weight of the brain, there is probably no dispute as to the general statements that both increase from the black races to the whites. Still, we are not prepared to place a value on these facts; for behind the material element here mentioned lie other factors which we can not at present estimate, such as quality of the brain and functional energy.

We have thus far been considering physical features, and we have passed by many points that could be made the

[1] Tables of measurement can be found in the authorities already quoted.

subject of comparison, as we can only hope to sketch the main points, so to speak, of our subject. Let us glance at the subject of language. Probably all are aware of the brilliant results attending the comparative study of the language of Europe—how it has been satisfactorily proved that the people speaking them have wandered from the same primeval home, and that the Hindoos of India were co-dwellers with them there in a forgotten long-ago. We need not be surprised then to learn that scholars eagerly equipped themselves with this new weapon—that is, the comparative study of languages, or, as it is called, Philology—and have sought in this manner to solve the problem and present a satisfactory classification of the races of men. Let us inquire of them concerning some of the conclusions reached.

The great law of inheritance imposes upon children the likeness of their parents. They are born members of a certain race. In color they may be black, or yellow, or white. They can not, of their own volition, change their race type; nor will culture or years of continuous effort bring about this result. Not so with language. This does not pass with the blood. An infant of any race will learn the language of any people amongst whom he is brought up, or, in mature years, another language may be acquired. By persistent effort this may be accomplished so perfectly that a person will habitually speak and think in the language of his adoption rather than that of his infancy. This at once shows the difference between linguistic and ethnical traits. The latter pass with the blood and are beyond our control. The former is an acquisition. It is the result of mental efforts. A child as truly learns the language that he speaks as does the adult learn a foreign language.

What is true of language now always has been true. We can no more conceive primeval man being endowed with a language, rich in grammatical forms and possessing a plentiful store of words, than we can conceive of him endowed with a knowledge of mathematics. Language, as far as we know it now, is an invention of the human intellect, before which all other human inventions shrink to utter insignificance. The crowning glory of man is that he was endowed by the Creator with intellectual powers capable of achieving such a wonderful result. We all know that those vocal sounds we call words are the instruments wherewith language accomplishes its end. But a word, in and by itself, has no meaning at all. It is only the common consent of the people who employ it as the sign of an idea that gives it force. This consent, expressed by usage, may in time be withdrawn, and another word be employed to convey the idea, or the older word may, from the operation of several causes, become so changed in pronunciation as to be scarcely recognized. We expect, then, a language to slowly change, and the degree and rapidity of this change will depend on several causes.

Now, when we look around the world to-day, we quickly learn there are a great many different languages. In any of our large cities we can find people representing a dozen or so, and in books of travel we learn of numerous others. Our first effort is to try and arrange these into some systematic order; to see what languages, if any, have such common features that we are justified in considering them related—descended from a common ancestor; and to learn what are so diverse in structure that we can scarcely conceive of them as being in any way connected. All of this, of course, may have an important

bearing on our ideas of the connection existing between various races of men.

The thoughts are comparatively few which in any language can be expressed by a single word. To express thought we have to employ a number of words combined in what we call a sentence; therefore, it seems natural to take the sentence as the basis of classification of language. The isolating family of language represented by the Chinese and the nations in the south-eastern part of Asia keeps each separate idea in the sentence distinct. The Chinese is often spoken of as a monosyllabic language, which statement is again denied by others. It is, of course, true that in the written language each character represents a syllable; but in the spoken language it is just as true that several of these syllables are often combined to form a single word. Thus, if *wân* is "to paint letters" and *lì* is "strength," it seems quite natural that *wân-lì* should express an author's style; though in written language this expression would represent two words, yet in speaking it is certainly one word of two syllables. Neither are we to understand that it is a language destitute of grammar, as it is sometimes asserted. They distinguish, where necessary, person, number, gender, and case, and the same is true of other grammatical properties. But the distinguishing peculiarity of these languages is that each idea in a sentence is kept distinct. Such a language is called an isolating speech.

The agglutinating class of language shows us another way of sentence development. The ideas which make up the sentence, though still kept distinct and independent, are brought into mutual relations. Some of them are loosely joined together. Suppose a Turk, for instance, who speaks a language of this group, wishes to use a

sentence containing the verb *love*. The root of this word is *sev*. It is wonderful how many modifications of idea he can produce by adding on terminations to this root *sev*. With *sev*, meaning love, we have *sev-mek*, to love; or *sev-er*, loving; or *sev-dir-mek*, to cause to love; or *sev-ish-mek*, to love one another; and so on of a great number of other expressions, even to such a cumbersome length as to express in one word the idea of "not-able-to-be-brought-to-love-one-another." Here we at once see the great difference between this and the preceding class of languages. In Chinese, for instance, there is but one form of the verb given, and all the variations of tense or mode will have to be expressed by auxiliary words. In the agglutinating language these changes are expressed by adding on terminations.

The peculiarity of these combinations is that the people using them always see in them two or more words. We have in English grammar, for instance, such expressions as this: "He might have been gone." Suppose, in accordance with custom, we wrote the four words together, "might-have-been-gone," so as to make but one word; for a long while, at least, we could not help but see and feel in this new compound, "mighthavebeengone," the four words which compose it. This illustrates our remark. Each part of a compound word in agglutinating languages is felt as a separate word.

This principle is carried still further in what are known as the polysynthetic languages, of which examples occur among the Indian tribes of our own country. Here we have the exact opposite of the isolating languages. All the ideas in a sentence are here represented by root words, but all are fused and reunited into one huge polysyllabic word. Tribes speaking languages of this family

do not speak in words, but in sentences. It is well to notice how each of the three types of languages of which we have thus far spoken are but different ways of looking at a sentence. In the last example, all the ideas in the sentence are fused together to make one word of unwieldy proportions. In the agglutinating languages, the ideas, though separate, are brought into mutual relations and harmony, and largely by suffixes the grammatical relations are expressed. In the isolating languages, each idea is kept distinct. It is by their position and the mutual bearing each has on the other that we determine the meaning of the sentence. Now, let us glance at some other types of language.

What is known as the inflected family of languages is not very large; but, when we turn to history, we find that it mainly concerns the races speaking inflected languages. People who developed this form of language seem primarily to have hit on the expedient of symbolizing the relation existing between the different words in a sentence by changing the vowel in the words. For instance, in the Hebrew, an inflectional tongue, we have *melech*, meaning "king." The consonants, we notice, are *m-l-ch*. Now we express many different meanings by a simple change of vowels: *malach* is "he reigned;" *malachu*, "they reigned;" *yimloch*, "he shall reign." And thus in this way different grammatical properties are expressed. In the Aryan family of inflected languages, the relations seem, from an early date, however, to have been expressed by means of vowels or syllables added onto the root word, though it is generally thought that internal vowel change was the first stage.

We have described the principal types of language. We will not at present consider the polysynthetic lan-

guages, since they concern only the New World. This leaves us, then, the inflective, the agglutinative, and the isolating languages to consider. These three great communities of language divide between themselves the languages of the Old World. It is, of course, impossible to make any exact classification. All languages possess qualities tending to unite them with each of these classes. No language is perfectly isolating or otherwise. The English, an inflected language, in many points approaches the isolating Chinese. But, in the main, languages can be classified on the basis here pointed out, all depending, we see, on the peculiar development which a sentence underwent in their grammar.[1]

We are now ready to continue the examination further and ask what languages are so closely connected that we have some reasonable ground for thinking that the people speaking them were once closely connected—constituted one people, in fact. In the inflected languages we find several closely-related families. The one most widely known is the Aryan or Indo-European family of languages. The civilization and culture of the world to-day are mainly Aryan. History, for the last two thousand years, has largely been taken up with a record of the doings of Aryan-speaking people. The nations of Europe, with a few exceptions, are all Aryan.[2] In Asia we find that the Persians, the Afghans, and the Hindoos of India, are all members of this same great family.

[1] On this subject, consult Max Müller: "Science of Language," first and second series, New York, 1868. Sayce: "Introduction to the Science of Language," London, 1880. Whitney: "Life and Growth of Language," New York, 1875. Douglass: "Language and Literature of China," London, 1875. Summers: "Rudiments of the Chinese Language," London, 1864.

[2] The Basques, Lapps, Finns, and some Turkish tribes in Russia, the Hungarians and Turks, with the Alarodian-speaking tribes in the Caucasus, are the exceptions.

That these various nations we have mentioned are closely connected—are, in fact, descended from a common ancestry—is considered established beyond all doubt. This is shown in the fact that the grammar in all the languages is substantially the same. They furthermore possess great stores of common words. They are slightly changed in form, to be sure, to suit the genius of the people using them; that is to say, the word appears in different dress according as it is used by English-speaking people, or German, or Russian, or the Indian Brahmins. But in all these cases the real part of the word, the root—the nucleus—can be quite easily traced from language to language. They have also a common mythology. Most surprising

Albanian Greek (Aryan).

results have attended the study of the languages in this group. We have been enabled in a measure to dispel the gloom of prehistoric times and become acquainted with the customs, social organizations, and degree of enlightenment of the far-away home tribe that afterwards split up into the people who in turn formed the principal nations of Europe, and firmly established themselves in India and Western Asia.

All the various languages of this group are, of course, inflected; but we must observe that the highest degree of inflection probably existed in the home tribe before it commenced to send out its great migrating bands, which, as Celts, commenced the invasion of Europe near the close of the Neolithic Age.[1] Certain it is that the languages of the various Aryan nations, as they have grown more modern in time, have departed more and more widely from the standard of pure inflections. In the English, indeed, we are presented with a language which is only partly an inflected language and in part isolating.

In physical features there will be found considerable diversity in color, the dark-colored Hindoos being at one extreme and the blonde Norwegians at the other. As only part of this diversity of color can be due to conditions of life, we shall have to allow some of it to be due to intermarriage with darker-colored aborigines with whom they came in contact.[2]

Another great family of inflected languages to which the world owes much is known as the Semitic family. It includes the languages of those ancient people, the Assyrians and Babylonians, the Phœnicians and Hebrews, and

[1] Vol. I, p. 213.

[2] See remarks by Dr. Winchell in "Preadamites," p. 79; also, Dawkins' "Early Man in Britain," p. 320, *et seq.*

the Syrian in the north; and the languages of Arabia in the south, which have made considerable progress in Africa. The Semitic languages form a compact group. In them the principle of inflections—that is, internal vowel changes—has remained in full force. We have already noticed one instance of it. We noticed in that instance that three consonants—*m-l-ch*—formed the internal skeleton, which was variously built upon to express different ideas. They constitute what is called a Semitic root. Nearly all roots in Semitic speech consist of three consonants. Thus, *k-t-l* are the consonants forming a root from which, by vowels, a number of words are formed, all expressive of some idea of killing; as, *kotel*, killing; *katala*, he killed; *kutila*, he was killed; *katl*, murderer, etc.

The parent speech from which the various Semitic tongues have been derived is unknown. Some of them are sister languages, showing evidence of a common growth after separation from the parent speech. Such are the Assyrian and Babylonian. In Palestine we found another group, which differed but slightly from each other. These were the various Canaanite tribes, of which Hebrew constituted a local dialect—destined, however, to become a very important one. The Phœnician and the Moabite belonged also to this group. The Syrian proper must have separated itself from the northern branch at an early day. The Semitic-speaking people played a very important part in the civilization and culture of the ancient world.

There is enough resemblance in physical features of the people speaking the Semitic language to classify them all in the same family;[1] but here, also, considerable diversity exists in regard to color. There are Semitic tribes in

[1] See table at end of chapter.

Africa as black as the blackest negro tribes. While some of this diversity in color may be due to conditions of life, the principal part must be ascribed to intermarriage.

As we have already remarked, these two inflected languages include in their ranks nations that have had most to do with civilization and history. Is it possible to trace any relations between them? Can we derive from a study of their languages any evidence that in some early time the pre-Aryans and the Semitics dwelt together as one people? We may be sure that most persevering research has been given to this subject. So far, all evidence tending to show any connection between these two people has been sought in vain.[1] Indeed, as far as we are able to judge from philology, such contact has never taken place. The primary idea of inflection seems to be different in the two families—the Semitic forming their inflection largely by means of internal vowel change; the Aryan basing theirs on terminations. In the Semitic languages, the roots consist almost invariably of three consonant letters. Illustrations have already been given. In the Aryan family, the great majority of roots are one-syllable words, such as *spas*, to see; *ard*, to hurt; *da*, to give.[2]

Such faint, indistinct light as history has to throw on this subject seems to show that they were separated widely and at a very early period. If we are justified in assigning any home to the pre-Aryan people, it was

[1] "The attempt to derive the Aryan and Semitic families from a common source must be pronounced scientifically worthless." (Sayce.) To the same effect, see Whitney's "Life and Growth of Language," p. 253. Prof. Max Müller shows from his point of view they could have been in contact only in the monosyllabic stage of their language, but fails to find any proof of such contact even then. ("Stratification of Langnage," p. 253.) It is, however, far from proved that they were ever in a monosyllabic stage.

[2] Müller's "Science of Langnage," First Series, p. 262.

to the east of the Caspian Sea. That of the pre-Semitic people seems to have been in Arabia.[1] To the west of the pre-Aryans was a considerable expanse of inland water, since it is probable that the Aral, Caspian and Black Seas were united.[2] To the south of them was the desert expanse of Persia. Had they crossed this and climbed the Zagros mountain range, they would not then have been in contact with the Semitic; for, occupying the fertile Tigris and Euphrates Valley, was probably a Turanian people, known as the Accadian race.[3] Thus, in the twilight preceding the dawn of history, we behold these two families of inflected language almost as widely separated as though inhabiting separate continents.

We must now turn our attention to a third family of inflected languages. This is the Hamitic. It includes the language of ancient Egypt; the Coptic of the Nile; a considerable group south and west of Abyssinia, with the Galla as a principal representative; the Libyan or Berber of North Africa; and the Haussa, south of the Sahara. This family is, however, much less clearly defined than either of the others. The ancient Egyptian is the principal language of this group. This comes before us as a language of great simplicity, but a step removed from the Chinese. Its roots are also its words. Neither noun nor verb, nor any part of speech, has a characteristic form. The same word may be used as one of several parts of speech. Thus, *seki* may mean to write, something written, or a writer. If a word is used as a noun, an article is generally prefixed to it. Pronouns added to a verb designate the person; mode and tense are indicated by auxiliary words. The personal ending

[1] Sayce: L. C., Vol. II, p. 167. [2] Ibid., p. 124. [3] Ibid., p. 189.

to the verb, of which we have just made mention, may be used to denote possession. Thus, *ran-i* means "my name," or, "I name," just as the sense requires.

It is evident from the foregoing that the Hamitic group falls considerably below the Aryan or Semitic families. Like them, however, it distinguishes gender. The value of this grammatical feature has been greatly overrated.[1] It has quite often been asserted that the Hamitic languages are intimately connected, and by some they are classed with the Semitic.[2] The strongest points of resemblance between the two languages is in the pronouns; but when we consider the exceeding difference between the languages in other respects, we can but doubt whether pronominal resemblances are sufficient to justify an assertion of connection.[3] Mr. Sayce thinks that, on the whole, we are certainly justified in asserting that a relationship of some kind existed between them.[4] But we are, at all events, safe in saying that this contact must have been, if at all, in very early times.

We have now described the most important families of inflected languages. Before passing to the agglutinative tongues, let us glance at some other families of inflected speech. In the extreme south of Africa we find a family of tongues which seem to belong to the inflected group. These are the Hottentot dialects. By some, this language has been considered as belonging to the Hamitic family, but it seems sufficient to say that they are probably inflected, and we leave the question of relationship one for further study. The inflections here take the form of suffixes, differing from the agglutinative compounds in that the suffixes are frequently merely classificatory or

[1] Whitney: "Life and Growth of Language," p. 285.
[2] Müller: L. C., p. 282. [3] Whitney: L. C., p. 343. [4] L. C., Vol. II, p. 178.

even meaningless. They have the same conception of gender that the Aryan has. In the neighborhood of Lake Van, in Western Asia, are found a great many inscriptions written in an inflected language. It is thought it will ultimately be found to be connected with the languages spoken in the Caucasus, known as the Alarodian, family, which has not, as yet, been connected with other families of inflected languages;[1] still, other families of inflected languages have probably passed away.

In the agglutinating class of languages, we will find by far the larger number of languages now spoken. We must remember the peculiarities of this class of languages given a few pages back. There may be several kinds of agglutination. The modifying elements may follow the stem, as in the example we gave on page 31. This will be found to be the case in the Turanian family; or they might precede the stem, as is true of some African families. In one large family of this group, the Malayo-Polynesian, we will discover that they have failed to develop a true verb. The most important family of this class of language, as far as history is concerned, is the one that we will call the Turanian, though it also goes by other names.[2]

This family is not only widely extended now, but we have good reason to suppose it was much more widely extended in prehistoric times. The Aryans probably found Europe in full possession of the Turanian tribes.[3] At the present day, tribes speaking languages of this family are found scattered from the eastern coast of Siberia to Scandinavia. As Mongols, Tartars, Tunguses,

[1] Whitney: "Study of Language," p. 354. Sayce: L. C., p. 184.

[2] Called also Ural-Altaic, or simply Altaic. Uralian, Mongolian, Tartaric, or Scythian are also applied to it.

[3] Vol. I, p. 212.

etc., they occupy nearly all of Asia north of India and China. As Osmanli Turks, they are found in Asia Minor, Egypt, and Turkey in Europe. As Lapps, Finns, and Esths, they are found in Northern Russia and Scandinavia. As Magyars, they formed the ancient kingdom of Hungary, now constituting the larger part of Austria. Finally, we would remark that there are good reasons for concluding that in early times the population of Media, Susiana, Elam, and Chaldea all spoke languages which must be connected with this wide-spread Turanian family.

As in the case of the Aryan and Semitic families, we seem justified in concluding that the widely scattered people whom we have just named had a common home and common ancestry. The parent language has disappeared. The common home seems to have been north of the center of Asia, as near as we can now decide. The following features may be named as possessed by the languages of this family in common: The agglutinated words are suffixed to the stem. In most cases each part of the compound retains an independent meaning. In some cases, however, in Finnic and Hungarian dialects, the compound has become so close that it is difficult to distinguish the primary words. In such cases there seems to be but little to separate them from an inflected language like the Aryan. Close study, however, shows that the two languages have traveled by different routes to nearly the same result.

The parts of the agglutinated compound have to observe what is called the law of vocalic harmony. An illustration will make this plain. The vowels are divided into two classes—the strong (*a*, *o*, *u*, etc.) and weak (*e*, *i*, *ü*, etc.). If the stem has strong vowels, then the vowel in each suffixed part must be strong also. Thus, *baba*

(strong vowels) means father; its plural form is *baba-lar*. But *dedeh* (weak vowels) is grandfather; its plural form, then, is *dede-ler*. Here we see the vowel of the suffixed part changes to agree with the vowel of the stem, and this law holds good no matter how many terminations we annex.

We can but barely mention some of the other families of agglutinating languages. The Dravidian languages in India form a most interesting group; indeed, their languages come very near the inflected form. They employ affixes instead of suffixes, as in the Turanian group. The Malayo-Polynesian is a very extensive group of languages. It is the language showing every sign of age; yet, strange to say, it is destitute of true verbs. The Dyak, for instance, can not say, "Your boat is beautiful," but must content himself with some such expression as this, "Your boat very-its-beauty." Tribes speaking agglutinating languages are found in Australia and Central and Southern Africa. No family resemblances are known to exist between them.

We have spent some time now in studying the general subject of language. We have gone as far as our present purpose requires. We come very far, indeed, from presenting even a full outline; but we believe we shall now be able to see in what directions, and how far, language will prove of assistance to us in classifying the races of men. One class of scholars is, perhaps, inclined to rely too much on linguistic traits; another, perhaps, goes too far the other extreme, and does not give to evidence derived from the study of language its due weight. In the Aryan family of languages, we have no hesitation in classing as members of one race people of considerable diversity of physical features. In this instance, we

feel confident that the physical differences must be due to conditions of life and sexual selection.

We will find that we apply the same reasoning to all families of languages—such as the Aryan, the Semitic, the Turanian, and, as far as it is worthy the name of a family, to the Hamitic. We feel confident that any classification of races must not separate, for instance, the Turanian people, and so of each of the others. Can we go any farther, and say, for instance, that no classification of races must be allowed to separate the inflected languages? When we reflect that the Hottentot and Aryan are both inflected, we at once see that we can indeed separate people speaking inflected languages into different races, provided physical characters call for such separation.

The eminent scholar Waitz[1] remarks that "it probably would never have occurred to a zoölogist to group the Indo-Germanic, Semitic, and other tribes in the same family." It seems to us that only zoölogical reasons justify this grouping. Philology gives us no warrant for grouping them together which would not justify us in uniting with them the Hottentots of South Africa. Indeed, Peschel[2] uses the following language: "No one who has studied the subject any longer doubts that the so-called Indo-European, the Semitics, the Bantu nations of South Africa, all derive the rudiments of their language from intercourse in a common home where they used a common vocabulary." On the contrary, we doubt whether there is any good reason for making such an assertion. In other words, inflection simply marks a stage of language development to which different races may have attained, and may have arrived at this result by following different lines of progress.

[1] "Anthropology," p. 238. [2] "Races of Men," p. 130.

Here, then, we see ethnology separating what philology might unite; but, on the other hand, in the Mongolian races, ethnology readily makes a group that includes in its members not only the principal bulk of the Asiatic tribes, but extends far out in Polynesia, and takes in all of the New World, or rather the New World as it was at the time of its discovery. Yet in this group of races we find the isolating monosyllabic languages of Eastern Asia, which, though very similar as regards character, show "a great and astonishing diversity of material," and "only scanty correspondence of form and meaning are found in their vocabularies."[1] We find also a great number of agglutinating languages, which, as yet, are not shown to be related. We have not only the Turanian family, but the Dravidian and the Malayo-Polynesian, and any reasoning which would unite all those tongues in one family would also bring in such agglutinating tongues as the Australian and some African.

So, without extending the comparison further, we conclude that the terms isolating, agglutinating and inflecting simply denote stages of development, and can be of no great assistance in helping us to classify the races of men. The case is different, we have seen, as regards linguistic families. But here a caution is necessary. There is no family of languages of which the boundaries are exactly known. Further study is required in every case. It is only lately that the Celtic language has been satisfactorily shown to be Aryan. The standing of the Albanian language may be still a question.[2] The Hamitic people have become so mixed up with the aboriginal inhabitants of Northern Africa that not only in features,

[1] Whitney: "Science of Language," p. 331.

[2] Whitney: L. C., 290.

Hungarian Girl (Turanian).

but in language, it is difficult to show a dividing line between the two. The boundary of what we call the Turanian family is in considerable dispute. Professor Müller[1] puts all the languages of Asia (except the isolating Chinese and neighboring dialects) into the Turanian family, dividing them into a northern and southern branch. Other scholars warn us against such a sweeping classification, and limit the word

[1] "Science of Language," First Series, p. 289.

Turanian to Professor Müller's northern branch, which is the limit we give it in this chapter.[1] The fact is, an immense amount of work is yet to be done in the science of language. We have described the Hottentot as an inflected language, and we have most excellent authority for so doing.[2] Nevertheless, there are not wanting those who deny it is an inflected language,[3] and so in a great many respects. Hence, we see with how much caution we must proceed.

At the best, when we come to reflect on the nature of language being an invention of the human intellect, we would expect it to change much more rapidly than race types. In the long lapse of years since man has been on the globe, but few race types have been developed. But languages are very numerous. Even in a very limited locality, among tribes incontestably belonging to the same race, languages have so widely diverged that we can not reduce them to the same stock. There is not a spoken language on the globe which is not in a process of change. In some cases this change proceeds at so rapid a rate that but few generations pass before dialects are formed widely differing. In short, we are to use the linguistic differences in the classification of men just as we do other points of comparison.

Another point which has not been very much considered we think capable of yielding considerable light on this vexed question. We refer to the system of relationship employed by various tribes of men. This might seem, at first thought, to be a trifling matter. An American scholar, Mr. Lewis H. Morgan, spent many years

of his life in collecting information on this subject.[1] As we expect to examine this point at considerable length in a subsequent chapter,[2] we will not dwell on it at present. The general conclusions to which Mr. Morgan's investigations tend are of no little interest, and some of them may be here noticed. He shows that there is a striking similarity between what we term the Turanian people[3] and the Aryan and Semitic people. They all employ the descriptive method in describing relationship—in this respect standing apart from the other nations of the world, who employ the classificatory method.

When we learn that these two methods, the descriptive and the classificatory, are radically distinct, and demand distinct social customs in reference to marriage to explain them, we can not help being struck with the connection here indicated. We must not forget that the descriptive system of relationship would almost necessarily arise when monogamy, or marriage between single pairs, came into vogue. But what influence was it that caused the Semitic, Aryan, and Turanian nations alone, of all the nations, to adopt monogamy as a form of marriage?

Another interesting inference can be drawn from Mr. Morgan's work in reference to the people of India. In India we have not only the Dravidian-speaking people in Southern Hindoostan, but tribes speaking the Guara language in Northern India. These latter people are usually considered as Aryans. A large per cent. of their words is undoubtedly drawn from Sanscritic sources. Their grammar, however, is not Aryan. Mr. Morgan shows us

---

[1] "Systems of Consanguinity and Affinity." "Smithsonian Contribution to Knowledge," No. xvii

[2] Chapter ii. [3] He designates them the Uralian.

that their system of relationship is certainly not Aryan or Sanscrit. Its features are such as to class it with the classificatory system; but it also shows the result of a conflict between this and the Aryan method. It makes it all the more plain to us that a great mixture of people has taken place in India. The Aryans were strong enough to force their words into common use, but they were not strong enough to change the grammar of the people or to greatly change their system of relationship.

So, also, of what he calls the Malayan system of relationship, which we think ought to be called the Africo-Polynesian. This system exists not only among the Kafirs in Southern Africa, and hence presumptively among the African people generally, except where modified by Semitic or Hamitic blood, but is found widely extended throughout Polynesia. Is there not in this fact strong confirmative evidence of the theory that a primitive negro population—the Papuan—in short, was once widely spread over these same islands? Migration of Malay people may have greatly changed the type of people, but the old customs in reference to relationship still continue. In short, systems of relationship are another element for us to bear in mind when arranging a classification of the races of men.

We have noticed some of the difficulties of classifying the various races of men. That differences do exist is plain and patent to all; and, when we contrast the extreme types, which are the black and white races, this difference becomes quite marked. We must examine one question which has caused a great deal of discussion in past years; that is to say, have these variously constituted races of men all descended from common ancestors, or were they created thus differently constituted "in the beginning?"

Now, this is a question for science alone to deal with. Some have unwisely sought to solve it by an appeal to the Bible. We have, however, long since learned that the statements in the Bible are always of a general nature, and are always found in accord with true science, and more than one rash investigator has been rebuked for losing sight of this fact.

Let us, then, examine this question in a candid way. Let us consider man just as we would an animal, and see what can be said on both sides of the question. We have learned that the various races of men differ in color of the skin, the texture of the hair, in form and capacity of skull, in position of facial bones, in weight of brain; and we need only examine the authorities to learn of a great many other differences, such as the relative proportions of different parts of the body. Volumes could be written on these minute points. We would learn of difference in constitution and temperament. They differ in liability to take certain diseases. Some are light-hearted and cheerful, some morose and taciturn. They differ, also, in mental powers, some being much more intellectual than others. We thus learn that races of men differ on many points, and that some of them are of considerable importance.

We further learn that the principal types of men have remained apparently unaltered for some thousands of years. In referring to the monumental remains of ancient Egypt, we find depicted on the same representations of the principal races that would serve equally well to define them to-day.[1]

We find further that man is very widely distributed over the globe—much more so, in fact, than any other

[1] Nott and Gliddon: "Indigenous Races;" "Types of Mankind."

mammalian species we are acquainted with; but races of men seem well fitted for the region they occupy. On further comparing the geographical range of man with animal, we can not help noticing how some of these so-called races accord in distribution with the range of some undoubtedly distinct species of animals. This view appealed very strongly to the eminent naturalist Agassiz.[1]

Examining the subject further, we find some excellent authorities claiming that the whole question is settled, because they have observed that the various races of men are fertile between themselves, and this they regard as conclusive of a common descent; yet others advise us not to place too much reliance on this fact, giving us good ground for concluding that it is indeed "an important, but not a decisive, mark of distinction between species and race,"[2] and, in fact, that that definition of species which persists in claiming that the members of a species have necessarily descended from common parents[3] is assuming too much.[4]

From the foregoing, we might be justified in classifying them as separate species. Other writers, however, remind us that the various races do not keep distinct when inhabiting the same country. Numerous examples of the truth of this recur to every one. We find the inhabitants of all Spanish-American States to be largely

[1] See his division into zoölogical realms, in "Types of Mankind." Mr. Darwin remarks that "Mr. Wallace has plainly shown that the Papuan and Malays are separated by nearly the same line which divides the Malay and Australian zoölogical provinces." ("Descent of Man," London, 1874, p. 169.)

[2] Waitz: "Anthropology," London, 1863, p. 32.

[3] Cuvier, Prichard, Quatrefages.

[4] Further, on this point, "Man, in many respects, may be compared with those animals which have been long domesticated, and a large body of evidence can be advanced in favor of the Pallasian doctrine that domestication tends to eliminate the sterility which is so general a result of the crossing of species in a state of nature." (Darwin: "Descent of Man," London, 1879, p. 169.)

mixed breeds. We see the same influence at work in other parts of the world. The yellow race of Malays have become largely mixed with the Oceanic negroes, giving rise on the one hand to the Polynesians, and perhaps on the other to the Negritos. The whole of Northern Africa has been profoundly influenced by admixture with Hamitic and Semitic people. We should scarcely expect such results if the races of men were of different species. Then, again, we learn that the distinctive characters of all races, weak though they are, are highly variable in the race. "Thus, the Aryan or Indo-European family of nations is of one origin; yet they include physical types as diverse as the dark Hindoo, the blonde Norwegian, the classic Greek, and the Irish. Color, size, feature, and shape of the head are all exceedingly different in these various types."[1]

These race characteristics, such as they are, we have seen graduate one into the other by such insensible degrees that we can not form an exact classification. This last argument is used with very great effect by Blumenbach, who shows that if the same laws determine the variability of type in animals as in man the latter necessarily constitutes but one species, since animals of the same species exhibit, as regards color, hair, size, cranial forms, no greater differences produced by climate, food, etc., than are presented by human beings.[2]

Turning to authorities to see what their individual conclusions have been, we do not find them all agreed. Blumenbach concludes as follows: "No doubt can any longer remain but that we are, with great probability,

[1] Brace's "Races of the Old World," p. 469.

[2] Waitz: "Anthropology," London, 1863; but see "Life and Works of Blumenbach," London, 1865, article on "The Natural Variety of Mankind;" also. see Quatrefages' "Human Species," New York, 1879, p. 47, *et seq.*

right in referring all, and, singular, as many varieties of men as are at present known to exist, to one and the same species."[1] To the same effect are the conclusions of a large number of eminent scholars.[2] But there is not uniformity by any means.[3] Topinard,[4] after a long discussion on the subject, finally decides in favor of diversity of species. Waitz,[5] who certainly seems to present both sides, shows, after much discussion, that we are not yet able to answer this question, inasmuch as a great amount of observation must be made on many different points before we can arrive at a satisfactory conclusion. Finally, we will remark that the writings of Mr. Darwin tend to simplify this question, since all who believe in any form of the doctrine of evolution will at once admit that all the diverse races of men have originated from common ancestors.

On this point the study of language gives us no aid. We must not lose sight of the fact that language is not a race mark, but only a culture mark. If we admit that it is an invention, then there might have been some time, at least, when man was destitute of language,[6] and during this period the race may have wandered forth to the various regions of the world. Therefore, if the study of language finally leaves us with a knowledge of several

---

[3] Agassiz, Nott, Gliddon. [4] "Anthropology," London, 1878, p. 511.

[5] "Anthropology," London, 1863, p. 33.

[6] "Language, in short, was not created until the several types of race had been fully fixed and determined." (Sayce: "Science of Language," Vol. II, p. 318.) To the same effect, see Whitney: "Life and Growth of Language," p. 270. There seems to be a very respectable body of evidence tending to show that gesture-language must have preceded sound-language. See Tyler: "Early History of Mankind," chaps. i, iii, and iv, especially p. 275, *et seq.;* also, same author: "Primitive Culture," Vol. I, p. 164.

families, between which we can trace no connection,[1] we can only say that this result would naturally follow from the statement just made. On the other hand, should we finally decide that all languages had a common origin (which idea is about given up by all), this would not demonstrate the unity of mankind, since one race only may have been sufficiently advanced to develop a language and to have imparted this knowledge to other races. So, in either case, the problem remains as before.[2]

Attempts have been made to reconcile the views of our scholars on this important question. Men of great learning take opposite ground, and we may be sure that they have good reasons for so doing. Mr. Wallace[3] thinks he can reconcile the two schools. After passing in review the main arguments on both sides, he gives in detail his reason for thinking that man was originally of one species. But this could only be true of him for a very limited time, and while he was certainly very low in the scale, and living "what might be called a mere animal existence." During such a period he would be as much subject to natural selection (conditions of life) as any animal; but at this early time "he must have been even then a dominant race, spreading widely over the warmer regions of the earth as it then existed, and, in agreement of what we see in the case of other dominant species, gradually becoming modified in accordance with local conditions. As he ranged farther from his original home, and became exposed to greater extremes of climate, to greater changes of food, and had to contend with new

[1] At present there are about seventy-five families of languages between which no connection has as yet been proved. Future study, instead of reducing this number, will probably increase it. (Sayce: L. C., p. 325.)

[2] Müller: "Science of Language," New York, 1866, p. 326.

[3] "Anthropological Review," London, 1864, p. 158, *et seq.*

enemies, organic and inorganic, useful variations in his constitution would be selected and rendered permanent. Thus arose those striking characteristics and especial modifications which still distinguish the chief races of mankind;" such as the variously colored skin, the diversity of hair, and the many little points of comparison.

But man was endowed by his Creator with a brain and the capacity of improvement; and, therefore, while the changes we have just mentioned were being produced, "his mental development had correspondingly advanced, and had now reached that condition in which it began powerfully to influence his existence." By its use he provides himself with clothing and weapons, and with fire wherewith to cook his food. He originates the social state, language becomes a more perfect instrument, the weak are assisted by the strong, the sick are cared for, and thus, in the power of natural selection (condition of life), is weakened, and virtually ceases to act as regards his physical features. In this way would Mr. Wallace admit the primary unity of man, also the development of the principal race types; but, as by his intellect man was enabled to overcome, in a large measure, the operation of the laws of natural selection, he can also account for that wonderful persistence of mere physical characters which appeals with strong force to those who advocate diversity of origin.

We thus reach the conclusion that, as far as our present knowledge extends, we are justified in concluding that the various races of men are the descendants of common parents. This conclusion at once suggests some other points. How did these differences arise? What was the primitive type of men? When and where did they make their first appearance? We must resort to speculation to some extent; yet this is a perfectly safe way of doing if

we will only not lose sight of facts. If the conclusion just reached in regard to the unity of man be a sound one, then man must have commenced his existence in limited numbers in some one locality. However low he may have been in the scale of civilization, we are safe in assuming that he was moved by much the same feelings, desires, and passions that work upon savage tribes to-day. As time passed on and population increased, migratory bands would go out from the original home. Now, however uniform in appearance we may suppose these primitive men to have been, which was doubtless considerable, owing to the fact that they were exposed to the same climatic influence, partook of the same food, and intermarried for many years, yet no sooner would migrations begin than differences in external form and appearances would commence to arise, for the conditions of life would begin to vary. By conditions of life we mean every circumstance which has an influence on the growth of an individual.

In this connection, we need only recall what surprising changes have been produced, for instance, in the vegetable world by cultivation. The same laws hold good in the animal world. From the very earliest stage of existence to the close of life, the organism is subject to the influences of what we call conditions of life.[1] It seems that a difference in nutrition alone is sufficient to cause a larva which would have developed into a worker bee to change and become a queen instead.[2] Sheep, when transported to a very warm country, only retain their fleeces on condition of being regularly shorn; if left to themselves, the wool is replaced by hair.[3] Similarly situated, European oxen

[1] The milieu of French writers; the natural selections of evolutionists.

[2] Kirby and Spence.

[3] Quatrefages: "Human Species," p. 248.

tend to lose their hair and become naked.[1] Man is able, as no other animal is, to protect himself from the influences here mentioned. But he can not escape them altogether.[2] If clans from the same tribe separate, and one goes to the highlands and the other chooses low-lying plains as a place of residence, but few generations will pass before a change will appear.[3] If at the present day, with all the resources of civilization, man is unable to escape altogether from the influence of condition of life, still less are savages able to escape; and the lower in the scale they are, the truer is this remark. Climate, whether it be warm or cold, wet or dry, healthy or unhealthy, exercises an influence on man. The physical geography of his land also molds his character, whether it be plateau or lowland, mountain or plain, continent or island, fertile or sterile—a region abounding in food or the reverse; although the influence from any one of these factors may be small, yet, in the aggregate, the result is not inconsiderable.[4]

And yet we must call into account the action of another force. We all know about the law of descent or heredity by virtue of which the child resembles his

[1] Ibid.

[2] On this point, we think Mr. Wallace's arguments are scarcely sound. See Lubbock's criticism of same: "Prehistoric Times," New York, 1872, p. 591.

[3] This is true of the Aryan tribes in India; also, of the Semitic in Abyssinia; also, compare the highlanders and lowlanders of Scotland. Of the first two cases mentioned, we must allow considerable, perhaps most, of the changes noticed to be due to intermarriage with darker aboriginal tribes.

[4] This matter is very thoroughly discussed by Waitz. Some of the older school of anthropologists evidently go too far, and maintain that each continent is only fitted to support its particular type. It is generally admitted, for instance, that the western continent has given rise to a type somewhat different from the Aryans in Europe. Some of this result must be due to the great intercrossing of various nationalities, but considerable is due to changed conditions of life. There is, however, no evidence that this change will continue until the people in America approach the Indian type; yet this is what Knox would have us believe.

parents. Now, when variations in type for any causes begin, these variations tend to be transmitted to the offspring. Thus, the change will go on from generation to generation, until finally the individual comes into full harmony with all his surroundings; then the conditions of life tend only to perpetuate and more firmly establish the changes already made.

Nubian.

We have, in the foregoing, given in a very condensed form some general statements upon the changes which would inevitably take place amongst the primitive people as soon as they commenced to spread themselves abroad over the earth. Probably there is no dispute amongst scholars that such changes would result; but there is a question, however, as to the permanency of any and all changes wrought by changing conditions of life. Thus, Topinard concludes, after a long discussion: "We have no proof . . . there has ever been produced an important and

hereditary change of a physical character under the influence of external circumstances."[1] Messrs. Nott and Gliddon insist in the strongest manner on the permanence of type, and show from the pictorial remains of ancient Egypt that the negro type has remained unchanged for some thousands of years, at least.[2] But, perhaps, a sufficient answer to this argument may be found in the fact that in this case the conditions of life have also remained unchanged;[3] or, we may deny it altogether and bring many statements to show "how valueless is that asserted fixity of the negro type," and claim that, "taken generally, it rests upon fancy."[4] In fact, the student who proposes to read on both sides of this question will cordially conclude with Mr. Darwin that "this is a most perplexing subject."

To illustrate some of the difficulties in our way, we need only recall some facts. The Eskimos live exclusively on animal food; they are clothed in thick fur, and are exposed to intense cold; their conditions of life have not greatly changed for a very long period of time; as cave-dwellers they probably hunted the reindeer in the valley of the Vezère, while yet considerable portions of Europe were incased in glacier ice; and in America we have found probable proof of their presence along the front of the great glacier of the Glacial Age.[5] The condition of life, then, has probably made what change it could in their characteristics, such as color, features, stature, hair, etc. What shall we say, then, when we learn that in no extreme degree do they differ from the inhabitants of Southern China, who, for certainly a very long

---

[4] Waitz: Op. cit., p. 213. [5] Vol. I, pp. 113, 300.

time, have been exposed to conditions of life very different indeed, inasmuch as they live almost entirely on vegetable food, and are exposed almost naked to a hot, glaring climate.

In the instance just given, then, we have seen that widely different conditions of life fail to greatly change the type. On the other hand, tribes living in the tropical regions of the western continent, such as the Botocudoes of Brazil, are exposed to very similar conditions as regards climate, and follow much the same mode of life as the various negro tribes of Africa. In both places, they have probably inhabited their respective countries for certainly a long time, but no striking resemblances in features and other characteristics are noticed. They are described as being "wholly different."[1]

It appears, then, that, though our best scholars are willing to admit that there is but one species of man, a question at once arises which as yet they have failed of solving. Mr. Darwin proposes, as a partial solution, one clearing up many difficulties—the theory of sexual selection. He points out that "the differences between the races of man, as in color, hairiness, forms of features, etc., are of a kind" which might be expected to arise as a result of sexual selection. He furthermore passes in review the whole animal kingdom, to show what surprising changes have probably been brought about in the course of time in the external appearances of animals by the action of this mode of selection, and remarks that "it would be an inexplicable fact if man had not been modified by this agency, which appears to have acted powerfully on innumerable animals." He particularly remarks that his theory will not account for all differences between races,

[1] Darwin: "Descent of Man," p. 197.

but that we still remain in ignorance of many points.

Let us now consider when and where man first appeared. The former question has been so carefully treated[1] that we have nothing to add to what has already been said. It may be well to repeat some of the conclusions already given. In the first place, then, we need only say that the probable existence of man on this globe goes back to a former geological age. We detect faint traces of his presence in the Miocene Age, and more decided proofs of his existence in the Pliocene.[2] It is no longer a question that he was living before the advent of the Glacial Age. When we ask for the result in years, we have seen how nearly impossible it is to answer that question. The probable date of the Glacial Age was fully considered,[3] and we have seen what an important bearing that has on the whole question. Aside from that, all the evidence simply serves to emphasize the fact that it was indeed long ago when man first arrived on the scene. No petty term, embracing a few thousand years, will suffice. We must rather conceive of the flight of unnumbered chiliads.

On this question the study of language can not fail to be of great help. Of course, it gives no hint as to the length of time when language was forming; but if we consider any family of languages, we can not shut our eyes to the fact that a great lapse of time is required to explain the facts before us. Mr. Sayce thus impressively states the argument as regards the Semitic family: "When we consider that the grammar of the Assyrian language, as found in inscriptions earlier than B. C. 2000, is in many respects less archaic and conservative than that of the languages spoken to-day by the tribes of Central Arabia—when we

[1] Vol. I. [2] Ibid., pp. 51, 58. [3] Ibid., chap. v.

consider further that the parent language which gave birth to Assyrian, Arabic, and other Semitic dialects must have passed through long periods of growth and decay, and that in all probability it was a sister of the parent tongues of old Egyptian and Libyan, springing in their turn from a common mother speech—we may gain some idea of the extreme antiquity to which we must refer the earliest form we can discover of a single family of speech; and behind this form must have lain unnumbered ages of progress and development. . . . The length of time required by the process will be most easily conceived if we remember how stationary the Arabic of illiterate Nomads has been during the last four thousand years, and that the language revealed by the oldest monuments of Egypt is already decrepit and outworn, already past the bloom of creative youth." Similar remarks could be made in reference to all of the great families of language.

Another question which we may profitably consider is the question of the original home of the human race. It is doubtful if this question can be settled with any degree of assurance. We can, however, clear up our thoughts on this subject. It seems necessary, in the first place, to assume some warm, tropical region as his birthplace. This is so because, as far as his physical constitution is concerned, primeval man must have been poorly qualified to contend with even a moderate degree of cold. The force of this reasoning is admitted by nearly all scholars of note.[1] In the next place, it is generally admitted that the primeval home of man was on a present existing continent, or near regions now occupied by continents.[2] Of Oceanic Islands proper, a large number were found by

[1] Winchell: "Preadamites," p. 356. Lubbock: "Prehistoric Times," p. 43.
[2] Peschel: "The Races of Men," p. 26. Darwin: "Descent of Man," p. 169.

early navigators to be uninhabited; and, in the case of others, we can generally prove that their inhabitants have been derived from other sources, as in the case of Polynesia.[1]

We are, therefore, to provisionally decide in favor of the tropical regions of some continental expanse of land. Here, again, other lines of evidence compel the rejection of the western continent. Geologists have no trouble in showing that from the very earliest times[2] the eastern continent has taken the lead in animal life. The western continent has, so to speak, lagged behind the eastern continent in the value and number of its animal forms.[3] The mammalian fauna of the eastern continent has always been, and is at present, the richest in those forms that make the nearest approximation to the type of man.[4] All this points with no little force to the conclusion that the original home of man was on the eastern continent.[5]

We are further to reflect that we are to take into account the geography of the Tertiary Age, for we have just stated that man probably dates from some portion of the widely extended time known as the Tertiary Age. It is, of course, extremely difficult to give exact details of the geography of the Tertiary Age. It was doubtless greatly different from the geography of to-day. Examining scholars to obtain their views, we learn that until middle Tertiary times Africa probably existed as an immense island,

[2] Paleozoic. See outline, p. 41, Vol. I.

[3] Prof. Dana: "Proc. Amer. Assoc.," 1855, Inaugural Address.

[4] See table of distribution of Primates and Carnivora in Dr. Winchell's "Preadamites," p. 358.

[5] This is entirely independent of any belief in the doctrine of evolution. Since all are willing to admit that man is the highest of created animals, it is eminently fitting that, primarily, he should have been placed in the same region of country where the higher animals were first placed,

much like Australia of to-day, and probably possessed a very poor mammalian fauna.[1] Furthermore, in the earlier portions of this age,[2] a large portion of both Europe and Asia was submerged.[3] Indeed, Europe existed as an archipelago;[4] much the same state of affairs obtained in what is now Asia, for we read that probably Hindoostan was an island, that a large portion of the plains of Thibet was beneath the waves, and that a wide arm of the sea extended from the Caspian north to the Arctic, submerging most of Northern Asia.[5] How long this condition of things lasted is not easy to decide. Speaking generally, both Europe and Asia were undergoing a process of elevation throughout all of Tertiary time, and the result must have shown itself in the formation of large land areas. Prof. Dana tells us that after the Eocene Age Europe was mostly dry land, its sea-coast being characterized by "numerous indentations and winding estuaries;"[6] and Mr. Wallace speaks of Europe, Northern Africa, and at least parts of Asia, as composing a continent in Miocene times, characterized as possessing a very rich mammalian fauna.[7]

There are also excellent reasons for concluding that at this time the eastern and south-eastern coast of Asia extended considerably farther than at present, stretching in a winding line from the Japanese Islands, taking in the Philippines and the islands of the Malay Archipelago;[8] and probably the main portion of what is now the Indian Ocean was occupied by islands, not widely separated, extending in a chain from Madagascar to Hindoostan,[9] or, as some think, a veritable continent existed in

---

[6] "Manual of Geology," p. 533. [7] "Island Life," p. 390. [8] Ibid., p. 509.
[9] Wallace. These last statements are not by any means "guess work." They are based on the present distribution of animals. Mr. Wallace spent many years

this region.[1] Probably, then, it was in some portion of this strangely-featured continent—with its indented shore, extending in its greatest length from north-west and south-east, with Southern Africa as a great island to the south-west, with large islands dotting the Indian Ocean—that in the fullness of time man appeared.[2]

Another question before us is the primitive state of man. Every one knows that the world of to-day is inhabited by tribes in very different stages of social enlightenment. There have been two theories to account for this fact. For convenience, they may be called the "progression" and the "degradation" theories. Those who hold to the progression theory think that the life of man on the globe has been one of progress. They think that primitive man started at the very foot of the ladder of human progress, and by the exercise of those powers implanted in him, by virtue of which he is a MAN, and not a brute, he has gradually risen from a state of abject savagism,

---

in study, travel, and observation on this question. His views are set forth with a wealth of learning in his works entitled "Geographical Distribution of Animals" and "Island Life."

[1] Winchell.

[2] We question, however, if, in accordance with the views presented on page 51, Vol. I, we must not separate, at least, the western portions of Europe from this continent. We wish, also, to remark that in several places in Vol. I, notably page 24, we speak of a submerged Pacific continent. A more guarded reference is also made on pages 276 and 278, and an opinion is expressed that there might have been the primeval home of man. The existence of this hypothetical continent seems questioned. (P. 155 of same volume.) We think now there never was a continental expanse of land in the Pacific. Here seems to be a good place to speak of "Lemuria." A number of writers have thought there were good reasons to conclude that a continental expanse of land formerly existed in what is now the Indian Ocean, and have not hesitated to express the opinion that there was the original home of man. Dr. Winchell gives a summary of this evidence and authorities in "Preadamites." (Pp. 359-363.) Mr. Wallace, however, is not willing to admit there was, properly speaking, a continent there. He insists the land areas were simply islands, not widely separated. ("Island Life," pp. 394-399.) We submit that, as far as the primeval home of man is concerned, there is not much difference between these views.

through barbarism, to that enlightened state we call civilization. The degradation theory assumes, on the contrary, that primitive man was possessed of a certain degree of enlightenment, from which plane of primitive enlightenment some races have gone on to higher stages of civilization, while others have fallen away and have become the savage, uncivilized races of to-day.

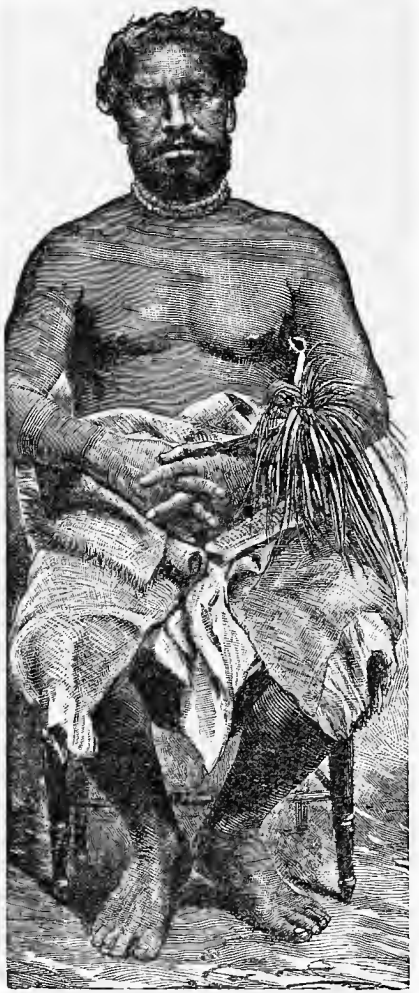
There is a lack of precision in the statement of both of these theories, and yet we have tried to state each as fairly as we could. It is not yet settled what was the condition of man in "abject savagism;" and, on the other hand, the holders of the degradation theory are by no means settled among themselves, and have nowhere defined the stage of enlightenment of which their theory supposes that primitive man was possessed. Two writers of recent date are much quoted as champions of the degradation theory. Archbishop Whately, in his somewhat celebrated lecture on the origin of civilization,[1] founds part of his argument on error. He asserts that "all experience proves that man, . . . in the lowest degree of barbarism, . . . never did and never can raise himself into a higher condition." But many writers have clearly proved that existing savages have certainly raised themselves a few steps in the scale. Thus, if the evidence of language be of any value at all, it shows that, in family relations, many savage tribes of to-day have advanced from the communal family to the group family, and many still further to the pairing family; and this advance has, at times, taken place where we can not suppose any aid from outside sources was given.[2] As for

[1] "Miscellaneous Lectures and Reviews," London, 1861.

[2] See Howitt's memoir on the Kurnai, a South Australian tribe, in "Kamilaroi and Kurnai," Melbourne, 1880.

mechanical arts, it seems clearly established that advance has taken place.

The remainder of this writer's argument fully illustrates what we had to say as to the indefiniteness of this theory. He expressly warns us that "the earliest generations of mankind were in a condition far short of what can be called 'high civilization,'" and points out that "he had received only very limited, and what may be called elementary, instructions—enough merely to enable him to make further advances afterwards by the exercise of his natural powers;" but he neglects to tell us in what these instructions consisted, and gives us no idea of what amount of "elementary instruction" was sufficient to render further advance, by the exercise of man's natural powers, possible.



Polynesian Chief.

Later, the Duke of Argyll writes in support of the degradation theory.[1] He abandons, as of no account, the arguments of Whately in reference to the inability of

[1] "Primeval Man," London, 1871.

savage tribes to advance. He admits the great antiquity of man, going back to the Glacial Age. We look in vain for any statement as to the probable condition of primitive man. We are told that, as regards knowledge, his condition "may have been one of mere childhood." He admits that "it probably is true that all nations, in the progress of the arts, have passed through the stages of using stone for implements before they were acquainted with the use of metals." But he insists that along with this childhood in knowledge (if we admit it to be true) there may have been clear conceptions of God and duty.

Polynesian Chief's Wife.

It is clear enough, however, that the duke believes that primitive man was possessed of a certain degree of civilization, though we can not, from his writings, determine what degree. He accounts for the existence of savage tribes by arguing that they are simply outcasts from society. He believes that man commenced his career in "some one or more of

those portions of the earth which are genial in climate, rich in natural fruits, and capable of yielding the most abundant return to the very simplest arts." Population would, under such circumstances rapidly increase, and soon migrations would begin; but he says "it would always be the weaker tribes who would be driven forth from the ground which had become overstocked, and, as the lands to which they went forth were less and less hospitable in climate and productions, the struggle for life would be always harder. And so it always happens, in the natural and necessary course of things, that the races which were driven farthest would be the rudest—the most engrossed in the pursuits of mere animal existence."

The duke's theory, however, fails in a number of points. It is not true that migrating bands are composed of the weaker tribes. As Lubbock argues, "the gradual extension of the human race has been effected, not by forces acting on any given race from without, but by internal necessity, and the pressure of population; by peaceful, not by hostile, force; and by prosperity, not by misfortune. . . . Of old, as now, founders of new colonies were men of energy and enterprise, animated by hope and courage, not by fear and despair."[1] Neither is it true that the lowest races are found at the outskirts of continents. The Botocudoes, inhabiting the finest position of Brazil, are as low in the scale as the miserable Fuegians of Patagonia. The Eskimos are one of these "outskirt" races, and the struggle for existence is certainly severe with them, yet they seem to have been quite as enlightened as some Indian tribes much farther south. We have seen that there is considerable evidence to show

[1] "Primitive Man," New York, 1871, p. 342.

that the Eskimos once inhabited the interior of what is now the United States.[1] It may be that the early Norse Sea kings found them on the eastern sea-coast. We need only add that as far as the evidence of the Sagas goes it shows that the Eskimos then were quite as low in the scale as now, though occupying quite a different country.

In short, this view seems to be but a restatement of the effect produced by a change in conditions of life. We have seen that condition of life, though exercising considerable influence, is not able to explain the differences in races as far as physical appearances are concerned.[2] So, also, we may observe that, though condition of life doubtless exercises some influence on the degree of enlightenment of a people, it is totally inadequate to explain all; in fact, the argument is capable of another reading. These tribes, being low in the scale of civilization, were driven out of the fairer regions of the world. We submit that this view is more in accordance with all the known facts in the case than to suppose they became degraded in consequence of such expulsion. Language, as far as it goes, is of some help to us in this matter. Thus, the Aryan races must have possessed a common home and a common parentage. They were living there at a time at least three thousand years before Christ, and had attained considerable civilization, as is shown by the evidence of language. We have no evidence of any tribe wandering off from this home and losing the civilization there attained. On the other hand, their descendants have progressed until they include in their ranks the most enlightened nations of the world. It is quite true that in India we find some degraded tribes, who

[1] Vol. I, p. 302. [2] Page 55.

speak a language allied to the Aryan; especially is this the case with the Veddahs of Ceylon, but it is well known that the Veddahs are, in the main, descendants from the indigenous non-Aryan tribes of Hindoostan.[1]

When we come to ask the history of these two theories, we find that the degradation theory is the one which early finds expression in the beliefs of civilized nations. It, therefore, comes to us invested with that peculiar sanction which age ever gives to beliefs, even though founded on error. Whatever reason we may give, the fact certainly remains that both the Aryan and Semitic nations, or such as achieved civilization, held, in substance, this theory. As from the Semitic Hebrews Christianity was given to the world, it is, perhaps, not strange that this theory was held in mind in explaining and interpreting many passages of Scripture; and thus it is that the advocates of this theory sometimes claim for it the sanction of religion. Sir Henry Maine, in a most interesting way,[2] shows how this theory passed from the philosophers of Greece to the jurists of Rome, and was considered as the natural foundation of the law of nations. Hence, we can readily see how, before science arose, this theory was the most acceptable one, and we see, also, the foundation of its power to-day; and we can understand how it is that, though it has no standing before the scientific knowledge of the present, yet it retains a considerable hold in popular belief.

[1] Tyler's "Primitive Culture," Boston, 1874, Vol. I, p. 51. The case of the Veddahs is one of the facts relied on by Rawlinson to sustain his position, that there are "grounds for believing broadly that savagery and civilization, the two opposite poles of our condition, are states between which men oscillate freely, passing from either to the other with almost equal ease, according to the external circumstances wherewith they are surrounded." ("Origin of Nations," New York, 1881, p. 8.) We can not see how the condition of the Veddahs tends to prove any such statement.

[2] "Ancient Law," New York, 1864, p. 52.

The progression theory is the child of modern study. Many lines of research unite in affirming this result. The social life, the manners and customs of savage and barbarous tribes all over the world have been collected and compared, and with them civilization has been passed in review. Our plan of government, our laws, the whole fabric of our social life, our marriage customs, our systems of consanguinity and affinity, our inventions and discoveries, which make civilization a delight, are found to be but the matured fruits, the fair flowers, growing on the vine of progress. But as the germ and the plant precede the flower, so we can detect the germ of modern civilization in the social organization and plan of life of savage tribes, and the growth can be observed in the customs and manners of barbarous nations.

Having thus examined this question as much as our limited space will allow, let us sum up the conclusion. We believe that our scholars are becoming more and more unanimous in the belief that, as regards primitive man, his starting point was the zero point of humanity; and, speaking broadly, his career through all the vast stretch of years that have elapsed since his appearance has been one of progress. This by no means denies the fact that instances of degradation have occurred. Nations may and probably have, at times, fallen away in civilization. Some tribes, having to contend with new conditions of life much less favorable than those to which they had been accustomed, may and probably have retrograded. We are to regard such instances as simply exceptions, to which nearly every general rule is subject. In no instance do such retrogressions become race-wide. We therefore conclude with Mr. Tyler that the history of civilization has "not been the history of a course of

degeneration, or even of equal oscillations to and fro, but of a movement which, in spite of frequent stops and relapses, has on the whole been forward; that there has been from age to age a growth in man's power over nature, which no degrading influence has been able permanently to check."[1]

Have we any evidence which of the great types of races was the primitive type? Did the first men belong to the white, or the black, or the yellow races? It is doubtful whether we have the necessary data from which to draw a conclusion; but let us see if we have any solid ground on which to venture. We probably will not reflect on this question long before we will decide that the white races must be left out of account. The rank they hold in the scale of civilization seems to show this. We have just seen that the first men were probably very low in the scale of civilization. While we would not be understood as saying that the white races were not once in a savage state, yet, if they were the primitive men, we would scarcely expect them to leave their descendants behind in the process of development. Further, the white races seem to be traced back to Western Asia. From here, they seem to have spread over the world. Wherever they went, they seem to have found other people ahead of them. In India, the Aryans found the Dravidians; in Europe, the Turanians. The tribes speaking the Semitic languages found the Turanians in Mesopotamia. That branch of them which, under the name of the Hamitics, went west to Egypt nearly lost their distinctive characters by their extensive mingling with the blacks.

Now, although we can not claim that these considerations are of such a character as to necessarily show that

[1] "Early History of Mankind," p. 191.

primitive men were not members of the white races, yet they certainly are of some weight. We must not lose sight of the fact that what we call the divisions of the white races—that is, Aryan, Semitic, and Hamitic—may be, and probably are, modern divisions, and that the type itself may, and probably does, go back much farther than the languages which they now speak. Perhaps we can yet trace it where, at present, we are in doubt. M. Quatrefages[1] thinks he has shown that the Malays are a mixed race, and that they are a mixture of white with other races. Still another scholar[2] extends this observation, and thinks he can show that the Polynesians properly belong to the same race. Should these views be accepted, we should have to extend our views in regard to the origin and antiquity of this race type. Yet, we would still have to give due weight to the fact that the white races, so far as we know them, are above the others in civilization; and, therefore, the probability remains that primitive man was not of this type.

We have still before us the yellow and the black races. M. Quatrefages gives the weight of his great authority in favor of the yellow races.[3] Two facts seem to influence him greatly in this conclusion; one is that the color yellow is present as an element of color in all races. On this point we might remark that a great diversity of color exists among the so-called black races; that it is only one among a group of characters by which we make our classification. It, therefore, seems to us not safe to base far-reaching conclusions on this character. His second fact is derived from the study of language. He thinks that isolating, one-syllable languages, such as are spoken

[1] "Human Species," New York, 1879, p. 433.
[2] Kean; "Nature," Vol. XXIII. [3] "Human Species," p. 242.

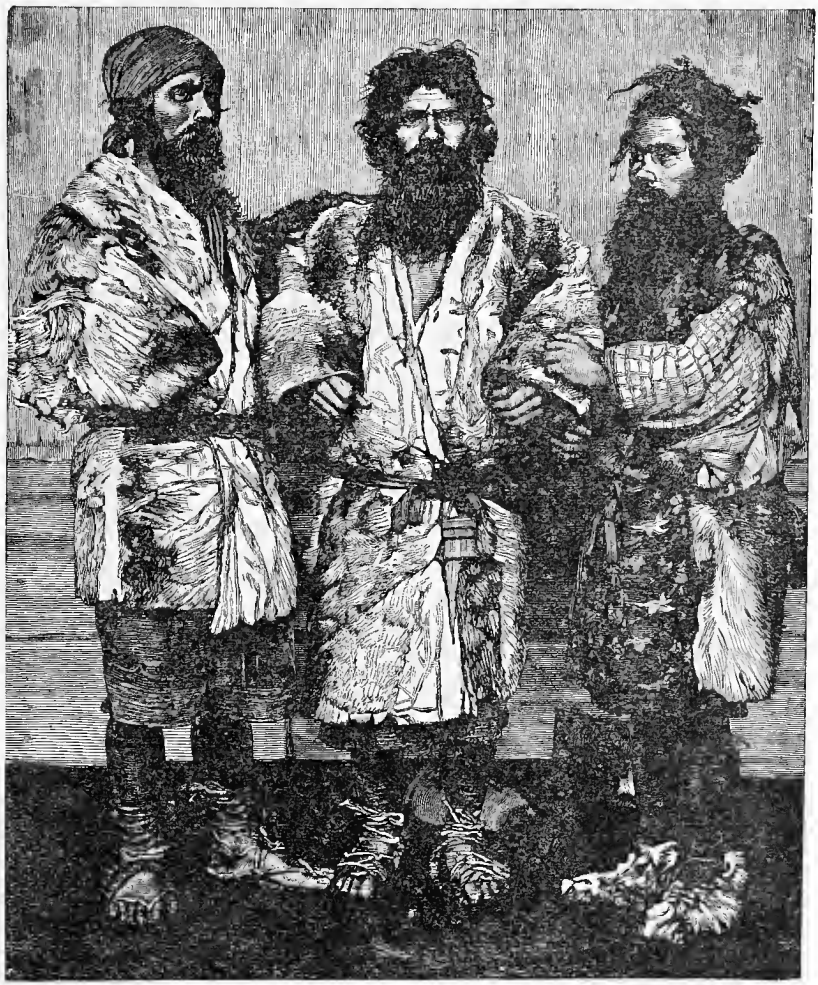
by some yellow races, mark the infantile stage of all languages. This conclusion, though supported by scholars of great ability, is far from proved. One needs only to read the literature on the subject to discover that there is equally as good authority for thinking that the stage of language development to which we have just referred has really nothing to do with other stages, as the agglutinating or inflecting, and therefore can not be used to show that the yellow races preceded the others in time.

For our part, we think the probabilities are that the black races were represented in the primeval race of men. This, of course, leaves the degree of color unsettled. It leaves unsettled the amount of prognathism; also, the character of the hair. Our reasons are based almost solely on the stage of enlightenment generally prevalent among the black races. Their social institutions are of the rudest and most archaic type. Some writers think that the Australians are the lowest in civilization of any.[1] Professor Owen would lay this distinction on the Andaman Islanders, and Professor Flowers[2] thinks it is not unlikely that these latter people are "representatives of the primitive negro type, which has been since altered in various points as it spread over its wide district of the world."[3]

The various African tribes are quite a ways from being savages, but it seems that they have derived almost everything that improves their condition from outside sources. Peschel tells us: "The negro possesses, in a high degree, both the power and the inclination to adopt the benefits of foreign civilization, but they are extremely deficient in inventions of their own. . . . Had this

[1] Tyler's "Primitive Culture," Vol. I, p. 27.
[2] "Nature," 1879. [3] Tyler's "Anthropology," p. 89.

race made its appearance in Australia, they would scarcely, by their own strength, have risen above the state of the Australian nations." We search in vain for



Kurile Islanders.

any evidence of the rise of any black races to be a source of culture and enlightenment to surrounding nations. It may be true that some Mongoloid tribes of men are, at

present, lower in the scale than the African generally; but China comes before us as an instance of the rise to quite a high degree of civilization of a Mongoloid people at a very early day, which continued for ages to be a source of enlightenment to surrounding people. It may be that in ancient times Western Asia had its China in Mesopotamia. Probably few will take exceptions to the general statement that, taken as a whole, the black races represent a lower, a more primitive, state of society than the yellow races.

We need not assert that the present low condition of the black races is a proof that their intellectual endowment is of such a nature that they are incapable of achieving civilization. In this, as in a great many other questions, we must be cautious in forming conclusions. It is a simple historical fact that the negro race in Africa has had a national existence for at least five thousand years. During that time, they have accomplished nothing of importance in developing native civilization.[1] We can not explain this by laying it to unfavorable surroundings. We have learned, of late years, that the interior of Africa is a very favorably situated country, for the possession of which the principal European nations are now vigorously contending. Nor can we conclude that "they are young in the immense period necessary for the historical development of races,"[2] for the probability is that they are very old. Waitz considers the following proved: "The various degrees of culture in various people depend in a much greater degree on the mode of life, the historical events, and other elements, than on their original mental

[1] Winchell: "Preadamites," pp. 256, 257. Hunt, on the Negro: "Anthropological Review," Dec., 1863. Pim, on the Negro: same journal, Feb., 1866.

[2] Brace's "Races of the Old World," New York, 1868, p. 312.

endowment."[1] He does not deny the influence of mental endowment, but thinks it not possible to demonstrate it. It certainly seems difficult to explain the generally low condition of the black races, unless you take into account the difference in mental capacity.

Now, let us see how our general subject is advanced by the inquiries of this chapter. We have divided the various tribes of men into groups, and are thus enabled to take a more comprehensive view of the inhabitants of the world in general. Further reflection will show us that, except for the purpose of illustrating the very earliest, and therefore rudest, states of society, we will have but little to do with the black races. The same remark is, in a measure, true of the yellow races. The exception will come in in the case of China. As before remarked, China was a source of culture to surrounding nations at a very early day. Our pages will be mainly concerned with the white races, for they only were enabled to achieve civilization. We shall further discover that the civilization and culture of the world are largely Aryan. This division of the white race seems to have been the first to cast off the constitution of ancient society—that is, tribal society—and founded political society in its stead; and to this fact is probably due the high position they assumed and held in the history of civilization. They were, of course, greatly influenced in their development by the culture of Egypt and Assyria; but to assume that all our civilization dates from those two countries is to ignore a large body of facts.

How do the facts set forth in this chapter agree with the general conclusions of the first volume? We think exceedingly well. They give added interest to the question of the racial connections of the River-Drift men.[2]

[1] "Anthropology," p. 381. [2] Vol. I, p. 93.

Perhaps the Paleolithic tribes, that spread over the world before the decline in temperature that brought about the Glacial Age began, were ethnically connected with the tribes now found in Australia. In thus tracing them to the black races, is there not added significance to the statement that they appeared not to have made appreciable advance during the long term of years known as the Paleolithic Age?[1] We saw further that, after the Glacial Age had passed away, Neolithic man appeared in Europe. It was furthermore rendered probable that Neolithic man in Europe belonged to the yellow (Turanian) race.[2] We at once perceived that we were dealing with more advanced people. This accords well with the actual facts of the case. The yellow races, in the main, are certainly more advanced than the black races. We may not be able to detect what it was that started them forward on the road to civilization. For a long time, at least, they were the ruling races in the ancient world. It is not unreasonable to suppose that the black races were driven out of Asia by them, and so are now found only in Africa and Australia, with adjacent islands. They reached their highest level in China, and not a few think that the inhabitants of ancient Chaldea were of the Turanian race; and to them they would trace the rudiments of the civilization that afterwards underwent so great a development in Egypt and Mesopotamia.

We must never forget, in thinking over these and similar questions, that the unknown is still a vastly greater quantity than the known. We are to hold our views subject to further information. With the most painstaking efforts, we are not yet in position to speak with any degree of assurance—we can only say that such and such

[1] Vol. I, p. 88. [2] Ibid, pp. 212, 213.

results are in keeping with present knowledge; but, even when imbued with this spirit, we allow ourselves to dwell on the probable condition of man during the infancy of his life on this globe, how strange the scene! If we can no longer think of a stage of enlightened innocence, we can see a primeval race making their first conquest over nature, entering on that stage of progress whose end is yet far off. The whole earth was, in truth, of one blood and one speech. We need not be sure we know when, nor where, nor how, the various race types arose, nor the order in which this occurred, nor all the stages in the growth and development of language, nor of all the steps leading up to our present civilization.

We may be reasonably sure that all this took a great many ages to accomplish. Families of languages were developed and passed away. Races doubtless arose, flourished, and became extinct. Incipient culture, perhaps, originated here and there, only to be lost again; but, with all, the movement was forward. The forms of ancient society were developed, and proved sufficient to conduct man from savagery to the confines of civilization. We shall find, therefore, that it will be necessary to study, to some extent, Ancient Society, which will form the subject of the next chapter.

# CLASSIFICATION OF MEN.

In the absence of any well marked characters which could serve as a basis of classification, we would naturally expect that different individuals would adopt different schemes. M. Quatrefages recognizes three main stocks, the same as here given, with numerous branches. ("Human Species.") Dr. Winchell gives the same classification, excepting what we call the yellow races he calls the brown. ("Preadamites.") One of the earliest divisions made was almost exactly the same as this, save that the yellow races were in that scheme called red. ("Life and Works of Blumenbach," London, 1865, p. 264.) Linnæus divides mankind into four groups, separating the red, or American, group from the yellow. Blumenbach gives three principal groups, as here stated, but also gives two transitional groups—the American and the Malay—thus making five in all. Kant took one dark-brown race as the primitive stock, from which subsequently arose the red, black, and olive-colored races. Cuvier assumed three principal races, the same, substantially, as here given, but he names them the Caucasian, the Mongolian, and the Ethiopian; he leaves undecided the ethnic standing of the Oceanic negroes.

**I. BLACK RACES.**—1. WOOLLY HAIRED. This division includes the various negro races in Africa; also, the inhabitants of a chain of islands extending from Tasmania eastward to Fiji, north to New Guinea, not including Australia; also, the Negritos, or the aboriginal inhabitants of the Andaman Islands, the peninsula of Malacca and the Philippine Islands.[1]

2. STRAIGHT HAIRED. This division includes the inhabitants of Australia, and we will also include it in the aboriginal inhabitants of India.[2]

### GENERAL CHARACTERISTICS.

The prevailing color is black, or dark brown. The Bushmen of Africa are yellow, and the Hottentots are sometimes described as being copper-colored. The heads of nearly all the members of this group are narrow as compared with their

[1] The ethnical standing of the Negritos is still in doubt. Prof. Flowers asserts ("Nature," July, 1879) that they form a race apart by themselves. Winchell quotes from recent investigators to show that they are, at the bottom, Papuans, mixed with Malay blood. ("Preadamites," p. 77.)

[2] Huxley, Broca, Topinard, and Tyler are some of the authorities for this last statement. Peschel does not unite these two people, yet his description of the physical characteristics of one fit well the other. Winchell classifies them separately, but shows the several points of resemblance between them. Flowers ("Nature") does not think there are cranial resemblances sufficiently strong to justify classing them together. There is no question but there has been very great intermixture of blood in India. Prichard shows that white, yellow, and black races have here commingled. Their color and development of the pilous system separate them from the yellow races, and we think justify this classification.

length. The Negritos are an exception, and so are some of the negro tribes in Africa. In all, the lower parts of the face project forward (prognathism) more than in the other two groups. The capacity of the skull and weight of brain are also less. Their institutions and state of society are of the rudest and most archaic types. The languages are mainly agglutinating. Some of the South African approach inflection, and some are said to be isolating. (Sayce.) Their system of relationship is the most primitive.

**II. YELLOW RACES.**—This division includes probably the majority of the world's inhabitants. It is difficult to make satisfactory subdivisions. The following may be considered as a convenient grouping:

1. TURANIANS. This division includes the various tribes in Northern Asia, extending over into Europe. They constitute a linguistic family, though not one so closely connected as the Aryans. Their system of relationship is the same as the Aryans. This family has the following subdivisions: Tungus, true Mongols; Turks, Finns, and Samoyedes. Each of these latter could be still further divided. The Japanese and Coreans are closely related to the Turanians, and by some their language is classed with the Tungus. (Sayce.)

2. ASIATICS. It is difficult to find a name for this group. It includes the Chinese, the inhabitants of Thibet and the southern slopes of the Himalayas, the Burmese, Siamese, and South-eastern Asia generally. The language of this group is isolating. (Sayce.) Little is known of their system of relationship.

3. MALAYO-POLYNESIAN. This division includes the inhabitants of Oceanica generally. It is largely a mixed race. A black race, represented by the Papuans, appears to have been the foundation. Relationship, still allied to the Kafirs of Africa. Languages, agglutinative.

4. BEHRING'S FAMILY. This "includes a number of North Asiatic and American tribes, which, for the most part, inhabit the shores of Behring's Strait, or have migrated, like the Eskimos, from its shores to Greenland." (Peschel.) It includes the Eskimos, Thlinkits, and Aleutians, of America; the Itelmes, Koriaks, and Namalls, of Asia. Language, polysynthetic.

5. AMERICAN FAMILY. This includes the numerous tribes of North and South America at the time of their discovery. Language, polysynthetic; some tribes in Mexico said to have been in the isolating state. (Sayce.) Relationship, allied to the Dravidian.

GENERAL CHARACTERISTICS.

Color of all the Old World families, yellow, leather yellow, or yellowish brown. The Behring family has "brownish, dark-colored skin." The American family varies from "a slight darkness to copper red." Very little hair on the body; hair of the head, black, coarse and straight; prominent cheek bones; eyes, oblique; heads, broad, as compared with the length—to this last the Eskimos are an exception.

**III. WHITE RACES.**—1. THE ARYANS. This includes the inhabitants of Europe generally, and the great bulk of the immigrant people in the New World. In Asia, the Brahmins of India, the Persians, Kurds, Armenians, and Afghans. Language, inflected. Relationship, descriptive.

2. THE SEMITES. The Abyssinians and many tribes in Eastern Africa; the Hebrews, Phœnicians, Syrians, Assyrians, Chaldeans, Babylonians, and Arabs. Language, inflected. Relationship, descriptive.

3. THE HAMITES. The Berbers and several tribes in Africa; the Copts and the ancient Egyptians. Language, inflected, though weakly so. Relationship, unknown; probably descriptive.

GENERAL CHARACTERISTICS.

Color, fair; lightest in the Aryans, darkest in the Hamites. Dimensions and weight of the brain, greatest among the white races. In shape of the head, they occupy an intermediate position between the black and the yellow races. They have the smallest degree of prognathism. They are the historic races. The culture and civilization of the ancient world was Hamitic and Semitic; that of the modern world is Aryan.

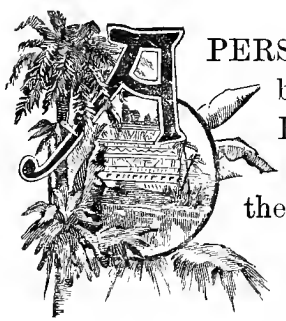
ANCIENT ARYAN

N BURIAL.

# CHAPTER II.

## ANCIENT SOCIETY.

Difficulty in understanding ancient society—Different forms of government—Tribal organization—The communal band—Group marriage—Systems of relationship—The Turanian system—The Indo-American system—The classificatory system—The customs in Australia—The class divisions of the tribes—Explanations of the Indo-American system—Africo-Polynesian system—Proves the communal band—Origin of the Australian classes—The Kamilaroi tribes in Australia—The classes the origin of the phratries—The origin of gentes—The tribes explained—Phratry explained—Gens explained—General prevalence of tribal society—Change of descent—Tribal organizations of the Hebrews—Among the Persians—The Hindoos—The Joint-family—The Celts—The Germanic tribes—The Slavonians—Joint-family among the Slavs—The ancient Greeks—Spartans—Change to political society among the Athenians—The Romans—Conclusions.



PERSON who has been blind from his birth can form no conception of color. He may hear most eloquent descriptions of the glorious color that flecks the sky when Summer's sun is setting, but the words convey no proper meaning to his mind. He may enjoy the perfume of the rose, but the exquisite painting that nature has bestowed on corolla and calyx exists not for him. Similarly, if nature has denied to him the gift of hearing, it is impossible for him to conceive of sound. He may enjoy the plumage of birds, and admire their power of flight; but their caroled songs

are not only not heard by him, but he can form no idea of what they are like. This world is very large, and its surface presents a great diversity of features. Many people, exhibiting a great variety of social life, live at different places. He who has never traveled, and at the same time is not given to reading and reflection, has but very crude ideas of other lands and people. If well read and thoughtful, he has formed mental conceptions of the same, but the probabilities are that they are far from being exact.

It is well-nigh impossible for the people of one nationality to thoroughly understand the thoughts and feelings of foreign nations. We fail to take into account national thought and feeling. Especially is this true when we have under consideration people of a different race and living in a different stage of social enlightenment. We are altogether too apt to assume that their manner of thought is the same as ours. We weigh their actions, customs, and manners by our standard. Hence it is that we meet with so many beliefs, social customs, habits of life, in the lower races of men, which seem to us to be foolish in the extreme. They may, indeed, be very foolish as viewed from our stand-point; but mankind, the world over, including even the lowest savages, as a rule, have good reasons for the course they pursue. We may see that they are foolish and childish reasons, but they never seem that way to savages.

We know that in all probability man was simply endowed with intellectual powers, which enabled him to progress. They could, therefore, no more commence their career with well-organized systems of government than they could supply those governments with the resources of modern science. In every department of human activ-

ity, in every thing which raises us above the brutes, we may be sure that mankind occupies its present vantage ground only as a result of experience gained by painful efforts. Nature took her feeble children by the hand and conducted their tottering footsteps along the road of progress. So we may be sure that no custom exists without some reason for its existence. It becomes, therefore, necessary to pass in review the savage or but partially civilized tribes, and examine their customs and manners, and see if we can determine what relation they sustain to the habits of civilized people.

And first in regard to government. It seems to us perfectly natural that bodies of men, finding themselves associated together, should at once proceed to organize themselves as a body politic. If we could conceive of one thousand Europeans of various nationalities suddenly finding themselves in possession of a large island, and cut off from communication with the rest of the world, we feel confident that some plan of organized government would appear among them before the lapse of any great length of time. And yet what seems to us as perfectly natural, is not so because of any instinctive feelings; it simply follows as a result of education and previous habits of life. Primitive man had to feel his way up to organized society.

The truth of this statement is probably not seriously questioned by any one at all conversant with the result of recent researches into primitive life and times. We are all familiar with political organizations of the most enlightened states at the present. This kind of government is territorial, and not personal; the state is in possession of a certain definite territory; in most cases its boundary is well defined; its code of laws takes effect in

that territory; all persons residing therein are under its sway, and are equally entitled to its protection; this territory is generally subdivided for the purpose of local government into smaller areas, such as counties, parishes, cantons, communes, etc.; but here again local government is simply a question of territory.

This seems to us perfectly simple and natural; yet ages passed before any people hit on this expedient. The Aryans were the first people to institute a state. The struggle of ancient Greece to throw off tribal society, and adopt modern political society, extended over some centuries of time, and forms one of the most interesting chapters in its history. The same is true of Rome. A state, in the modern significance of the term, first appeared in Greece, as a result of the legislation of Cleisthenes, B. C. 509. Before that time, there were but different forms of tribal society. This form of social organization had been able to accomplish considerable. It built up, at an early day, a wonderful civilization in Egypt; also, in Babylonia and Assyria. To this day more people are living under what is essentially a tribal organization than the other. They have not been able to grasp the idea of a state, or perhaps we had better say they have not felt the necessity of the same.

It is necessary, therefore, to define what we mean by tribal organization. This does not present an invariable form. Two people may both possess governments based on tribal organization, yet differ greatly in details. The specialization of the different departments of government may be much more forward in one than in another. This remark probably needs no illustration, but we might refer to the league of the Iroquois. This organization was worthy of admiration, but it was not the equal of the

Aztec confederacy in Mexico. Still, we can not suppose that even the simplest, the rudest, form of tribal organization was so simple that primitive man at once adopted it. It must necessarily be a growth out of some pre-existing state of society; it must have originated because it met some felt want.

The commencement of tribal organization is lost in the very night of time. In its more primitive form, it is probably seen in some of the more savage tribes of to-day. In its higher forms, it is to be found among the nomadic tribes of Asia. In its highest form, we will need to search the histories of ancient Greece and Rome to obtain clear ideas of the same. It was unable to meet the wants of a rich and varied civilization. Thus it is that at the dawn of history we perceive the principal Aryan nations engaged in the solution of a most difficult social problem. It was nothing less than the substitution of modern society for the ancient form under which mankind had lived from time immemorial.

It is doubtful if we appreciate the magnitude of this problem. At the present day, our most enlightened nations—our own country and Europe—find looming up before them most grave social problems. It remains to be seen whether our present civilization will successfully solve this problem. No one knows what changes may be in store for us. The people of ancient Greece and Rome had to consider much the same condition of things. At both Athens and Rome a state of affairs had gradually arisen that imperatively called for some change in government. But how were the rulers to form any conception of a government different from that they already had? There was no model for them to copy. To the reflective citizen of ancient Greece, the future must have

seemed full of most gloomy forebodings. His people were about to abandon the only form of social organization for governmental purposes he knew anything about, to enter on new and untried methods. No wonder it took some centuries of time and a succession of gifted men to make the adjustments. We must express our admiration that they were enabled to make this change without blasting their already high civilization. Let us hope their descendants of a later day may be equally as fortunate in dealing with their social problems.

We come, then, to the conclusion that in ancient times tribal organization for governmental purposes was the only form of government known. But this does not present an unvariable form. It varied according to the degree of enlightenment of the people—according to the advance they had made in other respects. It is, therefore, a developed organization, and consequently its growth is a question for study. We are at liberty to consider the probable origin of the same, and can study its probable archaic form among the ruder, less developed tribes of to-day. Its origin is, indeed, lost in the prehistoric ages, and we must resort to theory, which is allowable if we will only square our theory with ascertained facts. We will find that the investigation here proposed opens up a most interesting chapter in the history of man, and throws light on a great many primeval customs, some of which still influence us at the present day, though we have lost all knowledge of their origin.

Like a good many institutions, we have general ideas of what is meant by a tribe, but it is rather of a hard matter to express this meaning in words. It is not every wandering body of savages that constitutes a tribe. It is often quite a complex organization, and it need not sur-

prise us to know that it is only within the last few years that we have learned of its constituent parts. Older writers, and travelers generally, often used the word *tribe* where *gens* or *phratry* should have been used, and in this way some wrong conclusions were reached. Perhaps we can best understand the organization of a tribe, and the constituent parts of which it is composed, by considering its probable origin.

We do not want to keep dwelling on the low condition of primitive man, and yet we are in constant danger of reasoning, in regard to his probable actions during his primeval life, as if he were in possession of a large amount of information, which he could have gained only by experience. The only safe way is to assume that he started at the zero point of humanity, and in this way we must conceive of his primitive social organization. There is, of course, reasonable ground to differ as to what would be considered the primitive social organization. We may safely assume that man was always a sociable being. We may assume further that his passions were always active, and that he was always courageous, and was always ready to fight for his real or supposed rights; always ready to risk his life in defense of the band with whom he was associated.

But what were the relations of the members of this band to each other? That is the very point at issue. As even the very lowest of existing savage tribes have undoubtedly been able to make considerable advance, we need not expect to find any examples of a band organized on the same basis as were probably the men of primeval times. Scholars have differed considerably in their final conclusions in this matter. We will state what we think the relation was, give the lines of reasoning which conduct

to this conclusion, and examine authorities to see how we are sustained.

We will state, then, that at first the division could only have been made along the line of sex. Supposing we conceive of a band of these savages landing on a hitherto uninhabited island. We will suppose them to be of about the same age, and that the number of men and women was about the same. We must conceive of the entire absence of marriage, as we understand the term. None the less, however, did this relation exist; but it was what is called the communal marriage—every man, for instance, being, theoretically, the husband of every woman. As time passed on, the second generation would reach the stage of manhood and womanhood. Here, again, communal marriage would exist. Every male of this generation, for instance, being, theoretically, husband to every female. As marriage was in the group, so was relationship in the group. Between these two generations, or two groups, existed the relation of parent and child.

Theoretically, every male in the first group was father to every individual in the second group. Similarly, every female was mother to every individual in the second. Or, taken collectively, the first group was parent to the second group. The second group was not only husband and wife to each other, but they were brothers and sisters as well. In like manner, the third generation would form a brother and sister-group, and a marriage group as well. The first, or original, group would be grandparents to the third. The same relations would exist between the second and third groups as between the first and second. Thus would each generation form, by itself, a brother and sister-group, which

was also a marriage group, and it would stand in some direct lineal relationship to all the preceding and following groups. Practically, there would be but few of these groups living at the same time. Terms to express five groups only need be employed. Any individual group would recognize as preceding it a parent and a grandparent-group; as following it, a child and grandchild-group.

We have thus briefly sketched what we regard as the social organization of the primitive tribes, and are ready to discuss the position here assumed. But, in the first place, in regard to the name. Morgan calls such a state of society the "consanguine family."[1] Lubbock uses the term "hetairism," or the phrase "communal marriage," to designate this social state.[2] Bachofen[3] and McLennan[4] use the same language. Powell[5] styles it the "communal family." Howitt[6] expresses this state of society by the phrase "undivided commune." Here we have certainly a variety to choose from, but we make free to adopt one differing from any here given. We will call it the *communal band.* We will have to admit that no known example of a band organized just in this way exists. The organization of tribes among the lowest of existing savages has been studied in many parts of the world. Though we have thus learned many curious facts, yet we have come across no example of a communal band; nor do we find any instance of such a band in the pages of ancient history. It is true that Herodotus, Pliny, Strabo, and others mention instances of this kind,[7] but in all such

cases it is extremely probable that the writers did not have a clear understanding of the facts of the case. It is, then, necessary to present quite a body of facts, bearing on this question, which shall present strong evidence in favor of the social organization here proposed, before we accept it as probably true. But let us pause right here to notice one objection that may be brought forward. Some might think that, instinctively, mankind would revolt from such a relationship as this. Peschel[1] remarks that "the hypothesis that at a remote age marriage was unknown to the human race is hardly credible," and, he remarks, "that even among animals we sometimes find strict pairing," and refers to examples which are more or less familiar to all. Darwin,[2] judging from the principle of jealousy in the animal world, doubts the community of wives at an extremely early time. Both these writers' remarks, however, are aimed at a state of society that some suppose to lie back of even the communal band. Into that field we do not follow them. We are concerned only with the first organized society.[3]

Our ideas, as to what constitutes propriety in the matrimonial state, depend almost entirely on usage and custom. Civilized man revolts at certain states of society amongst rude tribes—not from instinctive feeling, but because their usages contravene his ideas of propriety, which have been fostered by the education and refinement of civilized lands Nature does not teach that polygamy is wrong, since we find it almost universally practiced amongst the lower races. The question of monogamy seems to some people a scandalous practice—"just like

[1] "Races of Men," New York, 1876, p. 229.
[2] "Descent of Man," London, 1879, p. 591.
[3] "Ancient Society," p. 418.

the monkeys," they exclaim.[1] The custom of one woman marrying several husbands[2] is thought by McLennan to have been almost universal once.[3] He gives a formidable list of people practicing it. We think, however, that many of his instances are really examples of communal marriage.[4]

The first missionaries to the Sandwich Islands were greatly shocked at what they found there, which was nothing more nor less than the survival, to a limited degree, of group marriage. Such a survival, as we will soon see, extends over a wide range of country. As far as any instinctive feeling was concerned, these natives were living in quite as proper a manner as the excellent missionaries themselves. In almost all of the lower races which have individual marriages, the strength of the tie is very feeble. Of some it is stated that the parties separate, "as a matter of course," when the child is weaned.[5] Generally speaking, divorce is at the pleasure of the parties. In short, we will find the most diverse customs in vogue in regard to marriage, and if we once set out to investigate them, we will soon come to the conclusion that as far as natural feelings are concerned in this matter, they revolt only at what is, to the individual, strange.

There is, then, no natural reason to object to group marriage. On the other hand, some customs of savage people seem to pave the way to a belief in group marriage. Is it not a group of persons that holds and inherits land? Where an office goes by inheritance, the right is to the group, and not the individual. It is a group that is

[5] Andaman Islanders. ("Primitive Man," p. 60.)

responsible to another group for the wrong-doings of one of its members. It is a group that demands that this wrong be righted. In short, a group is always the social unit in savage life. We ask, then, with Mr. Fison, "What difficulty is there in the way of our accepting the fact that it is the group which marries and is given in marriage?"[1]

But now we must address ourselves to questions of proof. It is not sufficient to show that there are no natural objections to the theory; or even that, for some reasons, we would naturally expect to find traces of such an organization among the lower races. Let us, then, see if this theoretical state of society will explain the probable origin of any of the institutions still existing among some of the ruder tribes. We will find that it does explain, in a very full and satisfactory manner, the strange system of relationship which we will call the Africo-Polynesian. Indeed, it seems difficult to otherwise account for this system. We will examine the general subject of relationships, and see wherein the peculiarities of the last named system consists.

It would seem, at first glance, as if a system of relationship was not only a dry and uninteresting subject, but of what avail would a knowledge of the same be in helping us to a clear understanding of the condition of society in early times? But investigation soon shows that we are laboring under wrong impressions in both cases. It not only proves a most interesting field of research, and sheds a flood of light on a vast number of savage and barbarian customs, but speaks as well, in no uncertain terms, of a condition of society which, happily, long since disappeared from the earth. Therefore, we

[1] "Kamilaroi and Kurnai," Melbourne, 1880, p. 158.

think it best to spend some time in trying to make clear the salient points of several systems of relationships, believing that the reader will find in the same much of profit.

Under the system of social life prevalent among ourselves and the Aryan nations generally, any individual, in general, readily recognizes that he stands in much closer relationship to some persons than to others. The primary, and what are, under our system of marriage (*i. e.*, monogamy), the natural, relationships are recognized by all Aryan nations. The same is true of other ethnic stocks, such as the Semitic and Turanian[1] people, who are essentially monogamous. These primary relationships are such as father and mother, brother and sister, son and daughter. But, aside from expressing these primary relationships, it is necessary in social life to distinguish many more The individual, besides seeing and expressing the relationship to his father and mother, wishes to express also his relationship to the brothers and sisters of his parents.

How shall we do this? We all know we use general terms—uncle and aunt—but not all of the Aryan people have such general terms, and, from a variety of reasonings, we conclude that there was a time when they were not generally used. To describe them, then, it was necessary to compound some of the primary terms and use such expressions as "father's brother" or "mother's sister." We can see, also, that by simply using several of these primary terms we could describe any individual to whom we were at all related—such, for instance, as "father's brother's son" (*i. e.*, cousin), or "father's father's father's son's son's son" (*i. e.*, third

[1] Remember, this stock is variously named. See p. 40.

cousin). Such a method as this is called the descriptive system, and is the system of the Aryan, Turanian, and Semitic people, but not, as far as we know, of other ethnic stocks.

But we can also readily see that such a system would tend to break down, by its own weight, when we have to use such a roundabout way as we have described to express the relationship of third cousin; we would naturally expect some general expression to appear and take the place of the several words; and, in effect, this is just what happened, though several nations remained true to the descriptive method, and none departed very widely therefrom.[1] The Erse and Gaelic retained the descriptive method. In most cases, however, general terms appeared for the near relations.

The table which we give fully illustrates the entire matter. It will be observed we have taken only near relatives in each case, and have given the designation of the same in ten of the principal families in the stocks named. The Erse, it will be noticed, remains descriptive throughout; but the others show a number of variations. We have uncles and aunts on the side of each of our parents. You will notice that while, in each example here given, aside from the Erse, general terms are employed to express this relation, yet considerable difference exists as to the degree of generalization expressed by the term. In the relation of uncle and aunt, the English, the French, and the Germans make no distinction of the uncles and aunts on father or mother's side. The Romans, the Greeks, and the Finns put each one in a class by itself. The Hebrew falls back on the descriptive

[1] Tables of the relationship of thirty-nine nations of the Aryan, Semitic, and Turanian (Uralian) people are given in "Systems of Consanguinity and Affinity."

1. The pronoun *my* used. 2. Descriptive. 3. Other term or terms also used. This is the preferred one. 4. Male speaking. A female would describe this same relative differently. 5. Not descriptive 6. The alternative word here is *consobrinus*, whence comes our word *cousin*. It is interesting to note how we have extended the meaning of this special term to the whole class. It is significant that the term on the mother's side survived.

method for the relation on the mother's side. The Arabic makes one class of these relatives on each parent's side (the only distinction being one of gender). The Turks assign different words to the relatives on the father's side, but one word, differing in gender, suffices for these relatives on the mother's side. So, if we examine the cousin groups, we observe that the English, the Greeks, and the Finns are the only examples given which make one general class for cousins. The French separate out the cousins on the father's brother's side. The Germans have a class of male and female cousins. The Hebrews, Arabs, Romans, and Turks fall back on the descriptive method. We see, from this table, that the system of relationship is plainly descriptive in the families we are considering; such general expressions as have come into use to avoid the inconvenient length of the descriptive phrases are but few, and always include natural groups.

Now let us see what conclusions seem strengthened by the facts already brought out. We will probably admit that some system of expressing relationship is a necessity amongst all races of men wherever organized society exists, and in consequence there are definitely established relations between the sexes; some individuals, or classes of individuals, would perceive that they stood in closer relationship or connection to other individuals than to mankind in general. They would as surely have words to express this state of things. When once such a system is established, it would be very slow indeed to change; nothing but universal consent could change it, and this consent would certainly be withheld unless some universal change in the social relations should occur, and even then this change would not necessarily register

itself in a change of the system. Within the last thousand years, no change of any importance has taken place in the Aryan system, and probably will not in a thousand years to come, unless the family itself should change.

The Roman lawyers had occasion to draw up a scheme showing the relationship existing in Rome many centuries ago. They could have done nothing more than to put in formal shape and language what was the ordinary custom of the times. The scheme, as it appears, is a perfect *expose* of the Ayran system in general; slight changes have, of course, occurred. They have no general word for cousin, yet our word cousin comes from a Latin word, *consobrinus*. Our word nephew comes from their word *nepos*, meaning grandson. Such changes as these are unimportant; they do not concern the substance of the system. Language may change—may come to be entirely different—but, unless the state of society changes, the system itself will remain unchanged.

In regard to the descriptive system in general, we want to observe that it is a perfectly natural system if we will only start with the assumption of marriage between single pairs. The primary relationships would then stand out very plainly—father and mother, brother and sister, son and daughter; such individuals would certainly be perceived; terms to express such relationship would certainly spring up. Further, at an early day, before the invention of general terms, an individual who wished to express the relation of uncle could do so in no other way than by saying "father's brother" or "mother's brother," which is the descriptive method. It is enough for our purpose to point out that this system of describing relations is a perfectly natural one given the mono-

gamian family. It would not be natural under any other state of society that we could imagine.

In the descriptive system, general terms to express relationship will not appear with that ease which we would naturally suppose they would. The table already given amply illustrates this point. When the various Aryan nations first commenced their wanderings, they undoubtedly had much the same family (monogamian) as now; yet it is a significant fact that they had not originated any general terms. These terms are not derived from some common word. Each nation had to originate them for itself. The Erse and Gaelic of the Celtic race, one of the first Aryan nations to commence its wanderings, remained true to this system. They kept faithfully the system as given them. What would be more convenient than to possess some common word to signify the same as my "brothers and sisters?" Yet no language has been able to coin such a word and give it general currency. We conclude, then, that systems of relationships can not be adopted, or modified, or laid aside at pleasure; that in their origin, at least, they must have correctly expressed the natural relations to which the social organization then in vogue would give rise; that when once established, they have a remarkable vitality, and resist any attempted change with great strength. We have decided further that the descriptive system is a natural result of the monogamian family; so much so that when informed of the presence of one of these institutions among any people, we are reasonably safe in presuming the presence of the other. We will now consider some other systems of relationship.

We have learned that all the lower races of men are extremely reluctant to enlighten travelers as to their social

customs. Even those who have lived among them for many years are seldom favored with this information; and when it is imparted, it is only under the most solemn promises of secrecy. After some centuries of contact with our Indian tribes, it was discovered that we knew nothing of the organization of the tribes, or of their system of relationship. Hence it is that we must receive with so many grains of allowance those highly-colored accounts of society, etc., among the Mexicans and Peruvians with which the early explorers satisfied the curiosity of Europe, and which, even at this day, charm so many. Educated missionaries who have lived among rude tribes long enough to learn their language thoroughly, so as to speak it fluently, have frequently learned, to their surprise, when their attention was turned to the subject, that they knew really nothing of much that was essential to a clear knowledge of the social customs of the people among whom they lived. Passing travelers, even those who are cautious in their statements, are seldom qualified to speak understandingly on these subjects.

From the foregoing, we see we need not be surprised to learn that it is only of late years that the existence of another and different system of relationship, implying greatly different social customs, has become known, nor need we feel surprised that a certain class of scholars are still loth to receive the same with all its necessary corollaries, but modern researches seem to be fast demonstrating the truth of this statement. Mr. Lewis H. Morgan, an adopted member of the Seneca-Iroquois Indian tribe, had his attention called to the singular system of describing relationship among the tribe of which he was a member. He subsequently found that this same method was in use among the Iroquois generally. Struck by its singularity,

and supposing it to be peculiar to these Indians, he gave an account of it in a work published as early as 1851.[1]

It was not until some years later, when he found himself among the Ojibway Indians, south of Lake Superior, speaking a different stock language than the Iroquois, that he made the discovery that they, too, had this same system. This suggested the possibility of its still greater extension. It suffices to say that Mr. Morgan was able in the course of a few years to show that it prevailed generally among the Indian tribes of the New World, excepting the Eskimos. To give his investigations a world-wide scope, a very extensive correspondence was opened with men in different parts of the globe who were qualified to give information. The good offices of the government were obtained and consuls were asked to get the customs of the people among whom they lived, in this respect. The various missionary societies were asked to allow their representatives to obtain the filling out of the schedules sent them. In this way, a great mass of information was obtained. The results were finally published with the assistance of the Smithsonian Institute.

We have been thus full in describing the source of our information, simply because the results following from it are too momentous to be based on anything but the best of evidence. We will present another table and then see what conclusions we can draw from it.

In this table we have taken two people, speaking entirely different languages, separated by many thousand miles of land and water. The first, the Seneca-Iroquois, is typical of Indian relations in general; but few variations from this standard occur. The second, the Tamil, is typical of the Dravidian tribes in India. The position of the

| " " Daughter | " " | " " | " Măittŭni | " " | |
| " Sister's Son | Hä'-je | elder Brother | " Tamaiyan | " elder Brother | If younger, term for younger brother used. |
| " " " Daughter | Ah'-je | " " Sister | " Akkarl | " Sister | If younger, term for younger sister used. |

Chinese is not as yet well settled. This system is called the classificatory. The primary terms are never used in composition to express relationship. All blood relations are arranged into great classes or categories. All individuals in a class are conceived as standing in the same relation to a certain individual.

Let us carefully notice the peculiarities of the classificatory system. All the relations are conceived in classes. You will notice a class of fathers, which includes not only the natural father, but all of his brothers; not only his natural brothers, but all of his brother-group. The same is true of the mother-group. Brother or sister means more than the same words in the descriptive system, since they include not only the natural brothers and sisters, but half of the cousins as well, and remember that this last term is itself the name of a group. The sister-group is of like extension. The son-group includes not only the sons of the individual, but the sons of all his brothers as well; that is, the sons of all his brother-group. The sister-group is of like extension. In short, relationships are in groups, and every individual in the group or class is supposed to stand in equal relationship to the individual. Every individual in the father-group is supposed to stand in as close relationship to the son as the natural father. Individual relationships are lost sight of, but the class relationships are kept alive.

We must notice that these relationships are in some cases different, according to the sex of the person speaking. A man speaks of his brother's son as son, of his brother's daughter as daughter; of his sister's son as nephew, of his sister's daughter as niece. A woman reverses these, and speaks of her brother's son as nephew, of his daughter as niece; of her sister's son as son, of her daughter as

daughter. An uncle, then, in this system, is the brother of my mother, but not of my father; so an aunt is sister of my father, but not of my mother. But, in each case, it is of a group that we are talking. The children of this uncle and aunt-group, as here defined, are cousins. But this includes only a part of the real cousins, since all the cousins on my father's brother's side and my mother's sister's side are my brothers and sisters. We must observe that we have two words for brother and sister, according as these individuals are older or younger than the person speaking. It would be well to notice that the lineal groups (father, mother, brother, sister, son, daughter) are larger than they are by nature. The father-group includes more than the natural father, and the same is true of each of the other lineal groups. But the reverse is true of the collateral (uncle, aunt, nephew, niece, cousin) groups. My uncle-group includes a part only of my natural uncles, and the same is true of each of the other collateral groups. We must observe that, as we recede from our system, the tendency is to merge the collateral groups in the lineal—a very important observation, since we will soon learn of a system that has no collateral group.

As to the name of this system and the people employing it. It is classificatory, as we have seen, but there are different kinds of classificatory systems. As this prevails extensively in both India and America, we may call it the Indo-American system. The Eskimos have a mixed system. It is like the Indo-American in some respects, but in others is like the Aryan. Perhaps the Eskimos have been influenced by contact with the Turanians. The Guara-speaking people in the north of India show all evidence in their system of relationship of a conflict between the Aryan (Sanscrit) and the Dravidian people. This, of

itself, shows a great intermixture of people in this section. The system of China is an anomalous one, but it presents several points of resemblance to this system, and in some respects it approaches a more primitive form still.

Now, what conclusions seem to follow from this system, which is found in such widely-scattered people? It seems evident that there must have been a time once when the relationships expressed by this system were the true ones. How else can we conceive of its origin, unless it truthfully expressed the relationships to which some form of social organization gave rise? McLennan thinks that[1] the terms of the classificatory system are simply ceremonial terms of address. It is certainly very hard to believe that the Indians of America and the Dravidians of India both hit on substantially the same form of ceremonial addresses! But, be that as it may, since McLennan wrote we have learned much of the social organization of the Australian tribes, and there we find ourselves face to face with a form of the family which as naturally gives rise to this method of designating kindred as does the monogamian family give use to the descriptive method.[2] Hence, we need have no hesitation in rejecting McLennan's theory. We will address ourselves, then, to a study of the Australian system.

Probably all are aware of the strange isolation of Australia. It seems to have had no connection with the continent of Asia since a very early geological age, and, consequently, forms of animal and plant life of that early era have survived in Australia, though they have long since passed away over the globe generally. In their

[1] "Studies in Ancient History," p. 372.

[2] Our facts in reference to the Australians are drawn mainly from the extremely valuable memoir of Fison and Howitt on the "Kamilaroi and Kurnai," Melbourne, 1880.

island home they have not had to come in competition with other and more vigorous forms, and so have held their own. It is fully in keeping with this state of facts that here we should also come across a form of society which is believed to have been once of wide extension, but which has given away, in most regions, to a much better form. It has, however, survived in Australia, and, with a knowledge of its characteristic features, we can obtain clear ideas of a most interesting phase of society in the early ages.

A large number of Australian tribes are divided primarily into two classes or divisions. Each class or division has a name, and every individual in that class has that for one of his names. These names are, of course, not the same in the various tribes, yet the classes themselves are considered the equivalents of each other; that is, a member of Class A, in one tribe, is considered as brother to Class B in a second tribe. As already remarked, most of these tribes are divided into two classes. Such a division is found not only in Australia, but in tribes widely scattered over Polynesia, and is true of tribes in Africa as well. Not every tribe in Australia has this division, but it extends clear across the continent in both directions. In quite a number of tribes, these primary classes are themselves divided into two classes, so that the tribes appear as if divided into four, instead of two, classes.

We are not to regard these classes as found in Australian tribes as the equivalent of phratries, as discussed in the previous volume. We may ultimately see fit to regard them as the starting point of the phratry, but they are something different from the phratry itself. The gens appear as subdivisions of these classes. Each

gens is distinguished by its totem. Yet, for all this, the class divisions are not phratries. Theoretically speaking, these classes are nothing more nor less than *intermarrying groups*. For instance, one large tribe in South Australia is divided into two classes, called the Kumite and Kroki classes. Every man in the first group is called a Kumite, and every man in the second group is a Kroki. Every woman in the first group is a Kumitegor, and every woman in the second group is a Krokigor. Every individual in the tribe belongs to one or the other of these divisions.

Now, marriage, as we understand the term, is theoretically unknown. The group Kumite is, theoretically, husband to the group Krokigor; the group Kroki husband to the group Kumitegor — meaning, in both cases, individuals of the same generation. We have used the word *theoretical*. This is because, in practical life, the present native usage is in advance of this, but this ancient communal right exists and frequently asserts itself. Informants from the most widely scattered parts of Australia join in confirming this fact. If a Kroki meets a Kumitegor, even though they be strangers to each other, yet they have the right to regard each other as husband and wife, and no one can deny tl 's right.

More than this can be asserted. As we have said, the names of the divisions in different tribes are generally different, yet they have a method of knowing which of the divisions are the equivalents of each other. Thus, if a Kumite goes on a friendly visit to another tribe, the natives have no difficulty in deciding to which of their classes he belongs, and during his stay in the tribe he has all the theoretical marriage rights that any member of that division has. Present usages are in advance of the

theory. Practically, these natives have a very loose form of polygamy; but this theoretical right is still active, and in the instance just given it is acknowledged. In many other cases it is also seen and acknowledged.

Yet we can not say that these Australians are licentious. They are simply following the customs of their country. They are very prompt to punish any violation of what is proper, as they understand it. Should one Kumite marry a Kumitegor, even though in reality there should be no relation between them, it is regarded by them as incest, and punished with death. These class divisions are strong enough to protect the female captive taken in war. Should a Kumite warrior capture a woman of a class the equivalent of his, he dare not marry her. His life might be the penalty should he disregard this custom.[1] We can easily see how the first explorers would fail of understanding this system, and so would represent the Australians as being in the lowest depths of social depravity. To avoid paining ears polite, they would resort to the Latin language when describing their manner of life. The Australians were, indeed, low down in savagery, but they were living quite properly, according to their customs. They were living in group marriage, and, further, this marriage exerted its sway across the entire continent, and held in theoretical marriage individuals who were complete strangers to each other. Hence the disgust of travelers generally, who knew nothing of this form of marriage. And even now, in spite of the strong testimony from many sources, some may doubt

[1] This last position is well established. ("Kamilaroi and Kurnai," pp. 65, 67; also, pp. 343–345.) It will be seen, then, that Sir John Lubbock is mistaken when he asserts "a warrior who had captured a beautiful girl would claim a peculiar right to her. . . . The tribe had no right to her." ("Primitive Man," p. 70.) We will return to this point.

it. It is, however, well established among many Australian tribes.

Here, then, we have a case of group marriage. Let us get this fully in our mind. It is not the individual Kumite that is married to the individual Krokigor, but the group Kumite to the group Krokigor. Marriage being thus in groups, what more natural than that relationships should also be in groups? Such is exactly what they are. Of the same generation, every Kumite is brother to each other; every Kumitegor is sister to the other; and, together, they form a brother and sister-group. The same is true of the Kroki class. Amongst the Australians and rude tribes, quite generally descent follows the mother; that is to say, if the mother is a Kumitegor, her children belong to the Kumite class. And so, also, of the children of a Krokigor. The group Kumite marries the group Krokigor. It follows, then, that the group Kroki of one generation regards the group Kumite of the preceding generation as father.

In short, every relationship given in the table on page 107, of the Indo-American series, follows as a natural consequence from the division of the Australian tribe into intermarrying classes, as here set forth. As this seems to be an important point, let us try and make it plain:

| | | | |
|---|---|---|---|
| Tribe. | 1. | Kumite (*a*) marries Krokigor (*a*). Kumitegor (*a*). | Kroki (*b*). Krokigor (*b*). |
| | 2. | Kroki (*a*) marries Kumitegor (*a*). Krokigor (*a*). | Kumite (*b*). Kumitegor (*b*). |

In the diagram given we have first the tribe, divided into two classes—Kumite and Kroki—showing the marriage relations of the groups, and the descendants constituting the second generation. Here we see that group Kumite of one generation is father to the class Kroki of the second generation; similarly, group Kroki is father to class Kumite. According to the strict law forbidding marriage in the classes, and the law of descent, group Kumitegor is never mother of class Kroki. It is, however, aunt to that class. Here we notice that the sister-group of the father-group is aunt, but that there are no other aunts. This explains how father's sister only is aunt. For a similar reason, group Kroki is never father of the following class Kroki. It is, however, uncle; or the brother-group of the mother-group is uncle. This explains how mother's brother only is uncle. Again, looking at the second generation, we see the classes are cousins to each other; for the father and mother-group of the Kroki class of the second generation are, as we have just seen, the uncles and aunts of the class Kumite of the second generation. We now see how it is that the cousin-group includes only the cousins on the mother's brother's and father's sister's side. Thus we see that every relationship in the Indo-American system is a logical result of a state of society similar to the class divisions of the Australian tribes.

It follows, then, that the ancestors of the Indo-American tribes must have once been in such a state of society themselves, though they have now left it so far behind that we have no proof to offer aside from the evidence of their system of relationships; this is, however, quite sufficient. We have been thus full on this subject because we wanted to plainly show that systems of relationships

are fully competent to furnish evidence that can not be gainsaid as to the state of society among the people where they originate. Perhaps this was not necessary, as we should have admitted to start with that such terms could only have come into use because they truthfully represented the relationships naturally resulting from the social customs of the people. This example should settle all doubt on the subject. The example shows us further that we can not carry into the investigation of savage and barbarian customs our meaning of many words expressive of social relations. The individual and the family both disappear as units in social life. Their place is taken by a group.

Having now become aware that systems of relationship are in existence vitally different from our own, it need occasion no surprise to learn of a third, still more primitive than the foregoing, which compels us to assume the former existence of a still lower social state than that of the Australians. We will present a table showing the system among two of the principal tribes, and then see what conclusions follow it.

We will call it the Africo-Polynesian, though Mr. Morgan calls it the Malayan. The Malays have, however, modified their system. As we find it widely prevalent in Africa, we do not think the word Malayan proper to describe it. We select the Rotuman form as typical of the Polynesia.[1] This form was found among the Hawaiians, the Maoris of New Zealand, and the islands of Micronesia generally. The Kafirs are a very extensive stock of South African people. It is, therefore, a most interesting fact to find their system of relationship identically the same, or with but two partial exceptions only.

[1] "Ancient Society," p. 418.

# AFRICO-POLYNESIAN RELATIONSHIPS.

| Description of Person. | Relation in Rotuman. | Translation. | Kafir (Zulu). | Translation. | Remarks. |
|---|---|---|---|---|---|
| My Father | Oi-fä | My Father | U-bä'-bä | My Father | U-bä'-bä is probably used in the sense of parent. In this way it also means father's sister (below). |
| " Mother | Oi-hon'-i | " Mother | U-mä'-me | My Mother | |
| " Son | Le'-e fa | " Child (male) | In-dö'-da-nä yä'-me | Son of me | |
| " Daughter | Le'-e hon'-i | " (female) | In-do-dä-kä'-ze Yä'-me | Daughter of me | |
| " Brother (elder) | Sä-sĭ-gi | " elder Brother | U'-mna wa'-tŭ | Elder Brother of us | Male speaking. |
| " " (younger) | Sa-sĭ-gi | " younger Brother | U-mna'-wa wä'-ma | Younger Brother of me | |
| " Sister (elder) | Sag-hon'-i | " Sister | U-dä'-da wa'tŭ | Sister of us | |
| " " (younger) | " " " | " " | " " " | " " | |
| " Brother (elder) | Sag'-ve-ven'-I | " Brother | U'-mua wa'-tŭ | Elder Brother of us | U'-mfo wa'tŭ (brother our) equivalent to my brothers. |
| " " (younger) | " " " " | " " | U-mnä'-wa wä'-ma | Younger Brother of me | |
| " Sister (elder) | Sa-sĭ-gi | " Sister | U-dä'-dä wa'tŭ | Sister of us | Female speaking. |
| " " (younger) | " " " | " " | " " " | " " | |
| " Brother's Son | Le'-e-fa | " Child (male) | In-do-dä'-nä Yä'-me | Son of me | Either male or female speaking. |
| " Daughter | Le'-e-hon'i | " (female) | In-do-dä-ka'-ze Yä'-me | Daughter of me | |
| " Sister's Son | Le'-e-fa | " " (male) | In-do-dä'-na yä'-me | Son of me | |
| " " Daughter | Le'-e-hon'-i | " " (female) | In-do-dä-kä'-ze Yä'-me | Daughter of me | |
| " Father's Brother's Son | Sä-sĭ-gi | " Brother (younger) | U'-mfo wa'-tŭ / U-mnä' wa wä'-me | Brother of us / Younger Brother of me | (elder). (younger). |
| " " " Daughter | Sag-hon'-i | " Sister | U-dä'-dä wä' tŭ | Sister of us | |
| " " Sister's Son | Sä-sĭ-gi | " Brother (younger) | U-mnä wä'tŭ / U-mfo wä'tŭ | Elder Brother of us / Brother of us | (younger). |
| " " " Daughter | Sag-hon'-i | " Sister | U-dä'-dä wä'tŭ | Sister of us | |
| " Mother's Brother's Son | Sä-sĭ-gi | " Brother (younger) | U-mzä'-lä wä'me | Cousin of me | |
| " " " Daughter | Sag-hon'-i | " Sister | " " " " | " " | |
| " " Sister's Son | Sä-sĭ-gi | " Brother (younger) | U'-mnä wä'me | Elder Brother | Form for younger brother if younger. |
| " " " Daughter | Sag-hon'-i | " Sister | U-dä'-dä wä'tu | Sister of us | |
| " Father's Brother | Oi-fä | " Father | U-bä-bä kä'sa | My Father | (The addition of *aze* does not change the significance. It means class.) |
| " " Sister | Oi-hon'-I | Mother | U-bä-bä | My Father (or Parent) | |
| " Mother's Brother | Oi-fä | Father | U-mä-lŭ'-ma | Maternal Uncle | |
| " " Sister | Oi-hon'I | " Mother | U-mä'-mä kä'ze | My Mother | |

Without doubt, we shall find this system prevalent among the black races generally. The mere fact that the Australians have departed from this system is to be borne in mind when classifying them.

Examining the table generally, we will notice that relations are in groups, the same as in the preceding system, but also observe that the collateral groups have disappeared. We have only natural groups left, such as father, mother, brother, sister, son, and daughter. The partial exceptions are in the Kafir stock. Here, indeed, we find that mother's brother is uncle, and his children are cousins; but, observe, though we call him uncle, he calls us child—though we may call his children cousin, they call us brother or sister. This shows at once that the relation is not reciprocal, and it renders it extremely probable that these instances are of recent introduction.

Now what shall we say to this relationship? It may well be that it is not true to present relationship anywhere; yet, when it first originated, it must have been true to the social organization of the people. We have seen that the descriptive system probably came in with the monogamian family, simply because it is true to the relations that arise under that form of the family. So, also, we have seen that the Indo-American relationships have a most natural origin in the class divisions of the Australians. This only makes us the more sure that such tribes and people as have the Africo-Polynesian form must once have lived in a social state which will give a natural explanation of the terms of this system. At present we do not know of any example of a tribe whose customs are such as this system of relationships would indicate.

If, however, we will turn back a few pages and read

the theoretical organization of the communal band, we see that it fully and completely explains this system. The tribe is not divided into classes at all—we have simply a male and a female group. Marriage, as we understand it, does not exist, but the male group of one generation is husband of the female group of the same generation. And in this tribe there can be no collateral relations; all must be lineal. An individual of the second generation calls all the males of the first generation father; all the females, mother. In his own generation, he knows only brothers and sisters; and in the following or third generation, only sons and daughters. Hence, the explanation of the terms: My father's brothers and my mother's brothers are alike my fathers. My father's sisters and my mother's sisters are alike my mothers. The sons and daughters of these individuals are not cousins, but my brothers and sisters, elder or younger; and hence, also, is it that the sons and daughters of these individuals are also my sons and daughters.

The last few pages have been written solely for the purpose of furnishing a proof of the former existence of the communal band. It seems to us that it is amply sufficient to establish it. As this is a most important conclusion, let us briefly recapitulate the points of the argument. All systems of consanguinity, when they originated, must have truthfully expressed the relationships naturally arising from the social organization of the people using them. When once established, they would be very slow to change, and so might, in course of time, fail to express the natural relationships, which would, of course, vary with changes in the social state. But still, in the beginning, we can not suppose that savages assumed fictitious relationships and then gave them names. We have found, on investigation,

three of these systems of relationship—the Aryan, the Indo-American and the Africo-Polynesian.[1] The first is fully explained by the social state peculiar to the Turanian and Aryan tribes; that is, marriage between single pairs, known as the monogamian family. In the second instance, not only do we find the system of relationship different from ours, but we are introduced to an altogether different social state in explanation of the same. We have to lose sight of the family as we are acquainted with it, and to substitute in its place a group. Having proved in these two cases the truth of the main assertion, we can not avoid the force of it in the third case, and therefore we must picture some theoretical organization capable of explaining its origin. We know of none which will do this in so complete a manner as the communal band; and it is another strong point in its favor that it is seen to be simply a more primitive form of the divided commune as it appears in the Australian tribes.

We are thus entitled to consider the existence of the communal band, as the primitive social state, abundantly proved. Scholars, generally, who have occasion to study into this matter, will not, we think, take exceptions to the views here stated. Many others, who have never interested themselves in the question, have taken it for granted that the form of the family under which we now live is

[1] In the matter of nomenclature, it will be found, on consulting "Systems of Consanguinity," that we have made some changes. The first, or descriptive, system, Mr. Morgan says, may be called indifferently the Aryan, Semitic, or Uralian. We will adopt the Aryan name. He calls the second system the Turanian, giving to it the name of the unwieldy Turanian group of Max Müller ("Science of Language"), but he restricts it to Müller's second division. Scholars have been quite free in making changes in Mr. Müller's Turanian group, and quite a number of them call the northern division the Turanian. We have followed this class; consequently, we can not call the second system the Turanian. We call it the Indo-American, which the geographical relation truthfully expresses. We have given the reason for calling the third the Africo-Polynesian.

the only natural one, and hence are hardly prepared, even now, to accept such statements. Peschel[1] argues from physiological reasons to show that this form of society could not have long continued; but it must be evident that in the band, as we have considered it, what are called brothers and sisters are often not at all or distantly related to each other. This band, as here defined, we are to regard as the primary social unit. From this we are to trace the development of tribes of more recent times, and eventually of our own form of government; and more than this—we are to trace from it the development of the family. Let us see if we can find any of the probable lines along which this advance was made.

When this form of society came into existence no one knows; whether laying back of it is a still lower social state is a question. How long it continued is also unknown. We have no reason to suppose that man passed rapidly through this experience. On the other hand, we have reasons for believing that it was an immensely long continued period. It probably came in in the infancy of the human race, and among the black races continued until a comparatively recent period, as witness their system of consanguinity. As to the condition of mankind during the continuance of this social state, it is largely a subject of speculation, yet we are not without some light. Their advance was probably not greater than that of the lowest of existing tribes. Consequently, a careful study of the present habits of the lowest tribes will help us to a knowledge of the probable condition of these primitive people.

In size, these primitive bands could not have been very large. Their facilities for obtaining a livelihood were

[1] "Races of Men," p. 231.

so poor that but small bands could have held together in one place. This is just what we find among many tribes to-day. Of the Andaman Islands, "They are generally divided into small groups; . . . the great majority . . . consists on an average of from thirty to fifty, . . . though sometimes as many as three hundred are found together."[1] Then from a mere increase of numbers would come a division, a smaller band going off from the mother colony. These wandering bands would recognize only the weakest ties uniting them. Their dialects would rapidly diverge, and they would soon become strangers to each other. When such was the condition of things generally, there could have been nothing like government. Each band would look out for itself. Hostilities must have been the rule, friendly relations the exception, and confined to bands but recently separated. This is not a very pleasant picture, we must confess, but such is what we seem compelled to believe was substantially the primitive social state.[2]

As to the relations of the members of the band to each other, we have probably described them as fully as is necessary. We will, however, quote from Spencer: "We have thus, to begin with, a state in which the family, as we understand it, can scarcely be said to exist. In the loose groups of men first formed, there is no established order of any kind; everything is indefinite, unsettled. As the relations of men to one another are undetermined, so are the relations of men to women. In either case, there are no guides save the passions of the moment, checked only by fears of consequences."[3]

---

[1] "Descriptive Sociology."

[2] On this point, see Spencer's "Principles of Sociology," New York, 1877, p. 484.

[3] "Principles of Sociology," p. 632.

There could have been no higher, no lower, classes in the primitive band. That is, indeed, no more than we observe among the lower races to-day. Of course, individual differences would exist then as now. One man was stronger than the others, or he had other qualities which fitted him to exercise some sort of authority, but this authority was wholly personal. In many cases age alone gave authority. Among the South Australians "a man's authority increases with his age. If without age he possessed naturally intelligence, cunning, bravery, beyond his fellows, he might become a man of note, weighty in council, and a leader in war, but this is exceptional."[1] Of the Veddahs we read, "Each party has a heads-man, the most energetic senior of the tribe."[2] Of the Tasmanians it is said, "The place of command was yielded up to the bully of the tribe."[3] Speaking of such people as the Australians and Bushmen, the assertion is made, "Their members are subject to no control but such as is temporarily acquired by the stronger, or more cunning, or more experienced."[4]

We have now fully sketched the social organization that prevailed at an early day, and have proved its existence. It is necessary to make a few modifying statements. Human nature is much the same the world over among savage or civilized people, in the early ages of human life on the globe, as at the present day. This communism in marriage relation which we have described would therefore be broken in upon at times. Individual preference would sometimes exist, and the result would be individual marriage to a limited extent. Still, along

[1] Howitt: "Kamilaroi and Kurnai," p. 211
[2] "Descriptive Sociology." [3] Ibid.
[4] Spencer: "Principles of Sociology," p. 490.

with this, the communal right probably existed. Such individual marriages as we have just mentioned, being certainly in a very precarious state, either party probably having the liberty to put an end to it, for this usage in reference to divorce is found among many people.

Let us now address ourselves to a consideration of the question of how this primitive social organization changed to other forms, and especially to the class systems of the Australians. We regard this as the second very widely spread social state which supervened on the first.

It may not be out of place to mention that some Australian tribes have a tradition of this change. The tradition is not of any especial value; still we will quote the opening paragraph of the account that contains it: "After the creation, brothers, sisters, and others of the closest kin intermarried promiscuously, until, the evil effects of these alliances becoming manifest, a council of chiefs was assembled to consider in what way they might be averted."[1] It is extremely doubtful about primitive man perceiving the evil effects of such a state of society, and especially of any general discussion of it with a view to remedying it. It is very difficult for us to understand by what means these savages were enabled to make the great social advance implied in changing from the communal band of small proportions to the larger tribe, with class divisions analogous to those of the Australian tribes.

Mr. Morgan gives a general statement which, in an off-hand way, solves the difficulty at once: "It may be affirmed, as a general proposition, that the principal customs and institutions of mankind have originated in great reformatory movements."[2] Tracing the history of this

[1] Gayson's "Dieyeri Tribe," p. 13.

[2] "Systems of Consanguinity," etc., p. 481.

stop, he speaks as follows: "The transition from one into the other was produced by the gradual exclusions of own brothers and sisters from the marriage relation, the evils of which could not forever escape human observation, . . . a difficult process, because it involved a radical change in the composition of the family; . . . it also required the surrender of a privilege which savages would be slow to make. Commencing, it may be supposed, in isolated cases, and with a slow recognition of its advantages, it remained an experiment through immense expanses of time, introduced partially at first, then becoming general, and finally universal, among the advancing tribes, still in savagery, among whom the movement originated."[1] Mr. Fison, though not fully accepting the communal band, thinks that, granted its existence, the only explanation for an advance out of it lies in accepting these great "reformatory movements" of Mr. Morgan,[2] and he premises that the impulse to such a movement must have been given by Divine assistance.

The difficulty with Mr. Morgan's statement is that it is wholly theoretical. Perhaps he has given the explanation, but it remains theory only, and is still to be proved by ascertained facts. In a great many respects, primitive man did not proceed in what seems to us a natural way, and so we are not sure that he did so in this case. As to the origin of the reform itself, Mr. Fison may be in the right; but it is never wise to explain any advance in human progress by such an appeal as this. Were such aid granted, we can scarcely see why man was permitted to remain in savagism at all. We may not be able to point out any more satisfactory way, but we must look further before accepting these views.

[1] "Ancient Society," p. 424. [2] "Kamilaroi and Kurnai," p. 160.

McLennan, Sir John Lubbock, and Bachofen all accept the communal band as the starting point of social advance, but they do not agree as to how advance out of this condition was made. Bachofen[1] seems to have been the first to attempt an explanation of the fact, observed in many savage tribes, that descent was in the female line. He gathered a great number of facts in reference to this and other customs of the lower races. He then submits theories to explain them. In brief, he starts with the communal band. The advance, he thinks, arose in this way: The women became shocked at such a state of affairs, and rebelled against it, and thus established a sort of female supremacy, with descent in the female line, and changed the marriage from group marriage to individual marriage. We are glad to accept his facts, but his theories have long since been abandoned.

McLennan wrote[2] at a time when interest was first being drawn to these subjects. He also sets out to explain the meaning of a number of strange customs observed in different parts of the world. Perhaps few are aware how extensive—indeed, almost universal—is the appearance in some part of the marriage ceremony of the capture of the bride by the bridegroom. Let us, as briefly as possible, outline the evidence on which this rests. Among some of the Australian tribes, and the tribes of neighboring islands, the capture is a reality to-day. The bridegroom lies in wait for his bride. When an opportune moment arrives, he rushes upon her, stuns her by a blow upon her head, and carries her off.[3] In most cases, however, this actual capture has given way to a sham one. In order

[1] "Das Mutterrecht." I have not been able to examine a copy of this work. Lubbock gives the outlines of it in "Primitive Man," p. 67.

[2] "Studies in Ancient History."

[3] "Primitive Man," p. 77.

to retain ancient customs, a show of resistance is made, though the parties are well pleased at the match. Among many of the hill tribes of India, when all is arranged, the bridegroom and a large party of his friends, with a great show of fighting, enter the bride's village and carry off the bride.[1] Among the Kalmucks, after the preliminaries are all settled, the bridegroom comes with his friends to carry off the bride, but "a sham resistance is always made by the people of her camp," the bride, however, being finally carried off on a finely caparisoned horse.[2]

It is not so long ago that similar scenes were enacted in Europe. We are given the following account of marriage customs among the Welsh not many years ago: "On the morning of the wedding day, the bridegroom, accompanied with his friends, on horseback, demands the bride. Her friends, who are likewise on horseback, give a positive refusal, on which a mock scuffle ensues. The bride, mounted behind her nearest kinsman, is carried off, and is pursued by the bridegroom and his friends with loud shouts. When they have fatigued themselves and their horses, the bridegroom is suffered to overtake his bride."[3] In short, without making further quotations, we can say that capture, either as a stern reality or as an important ceremony, was almost always found a part of the marriage ceremony among all races until recently. McLennan, struck with the wide prevalence of this strange custom, essayed to explain the same, and thus arrived at his theories as to primitive marriage.

He starts with the communal band. He thinks it extremely likely that such people would kill off many

[1] "Ethnological Society Transactions," Vol. VI, p. 24.
[2] "Primitive Man," p. 77. [3] Ibid., p. 84.

infants, and especially female infants, whom they would not regard as highly as the males. He tells us that such a custom is "common among savages everywhere;"[1] and hence he urges that it was probably so among the primitive tribes. This would lead to inequality between the sexes, to remedy which they would steal or capture women from neighboring tribes. "Usage, induced by necessity, would in time establish a prejudice among the tribes observing it—a prejudice strong as a principle of religion, as every prejudice relating to marriage is apt to be—against marrying women of their own stock,"[2] and thus would grow up the custom of forbidding marriage within the group at all; the men must seek for wives from some other tribe.[3] Mr. McLennan calls the system of marriage within the group only *endogamy;* the marriage without the group, *exogamy.*

Here is a theory, and it may, at first view, be thought quite adequate to explain the facts of the case. It is, however, unsatisfactory.[4] The principle on which it rests—namely, female infanticide—is not proved true of the lower races of savages. Infanticide is, of course, common, but it can not be shown that the female children are the preferred victims among lower savages. Indeed, among the Mota people of Banks' Island, we are told, the "male children are killed rather than the female."[5]

---

[1] "Studies in Ancient History," p. 111. [2] Ibid., p. 112.

[3] We have fairly stated one of McLennan's theories. He himself seems to present two theories. On page 42 of his work he affirms that exogamy must have given rise to wife-capture, thus reversing the sequence above given. Mr. Fison notices this same objection. ("Kamilaroi and Kurnai," pp. 133, 134.) Spencer ("Principles of Sociology," p. 646) also observes it. Many points in McLennan's work we do not touch upon.

[4] Spencer criticises it. ("Principles of Sociology," p. 648.)

[5] Amongst the Kafirs, girls are more valuable than boys. ("Descriptive Ethnology," Vol. II, p. 159. "Kamilaroi and Kurnai," pp. 135–138; also, pp. 171-176.)

But, aside from that, the terms exogamy and endogamy are misleading; indeed, are of no particular value. Their origin is a result of the confusion introduced by the wrong use of some of the divisions of a tribe for the tribe itself. Travelers come upon a band of people constituting a gens. They observe that their customs forbid them to marry a member of their own gens; they must seek a wife from some other gens. The tribe itself does not forbid marriage between its members—only between members of the same gens. But this distinction is not observed by the traveler. The announcement is made that here is a tribe that forbids intermarriage; they should have used the word *gens*. The fact is, amongst all people, civilized or uncivilized, certain people are forbidden to intermarry. Amongst ourselves, near of kindred are forbidden; amongst members of a tribe, members of the same gens are forbidden.[1]

Sir John Lubbock[2] accepts communal marriage as the first step. To explain its disappearance, he accepts substantially the view of McLennan, only he thinks that wife-capture explains the origin of individual marriage; taking the ground that the tribe would have no right to the captive, she was the property of her captor.[3] This, however, can be shown to be a mistake. Among savages the individual counts for nothing. Of the Australians, it is said "they maintain the tribal right against the individual with regard to war captives as strictly as they maintain it with regard to any other woman." If a warrior took to himself a captive who belonged to a forbidden class, he would be hunted down

[1] "Third Annual Report Bureau of Ethnology," p. 27: "Kamilaroi and Kurnai," p. 142; "Ancient Society," p. 510.

[2] "Primitive Man," chap. iii. [3] Ibid., p. 71.

like a wild beast, and, unless he kept out of the way until the hot wrath of the tribe had cooled down, he would be killed, and his captive with him.[1] Indeed, we very much doubt whether McLennan and Lubbock have not drawn the wrong or, at any rate, too strong a conclusion from the wide diffusion of capture as a part of the ceremony of marriage.[2]

In the last few pages we have seen how it is that some of our most recent writers and thinkers on these subjects fail to agree among themselves as to the steps by which primitive man achieved his first advance. This shows that the question is not a settled one, and we therefore feel at liberty to make some further suggestions. Those who are acquainted with the writings of Mr. Spencer know that he ranges over a wide field to show that, in whatever department of knowledge we are conducting investigations, if we are in any case enabled to trace the history of a growth, of a development, from a few simple germs to a matured product, we can in such case detect the workings of a few simple laws. It makes no difference whether we are considering development in the animal, the plant, the industrial, scientific, or social world; in each and all we can see the working of the same laws. They are world-embracing in their scope.

Now, our plan of government, our social and civil organizations, are the present results of growth that has been in progress from the very earliest times. Quite a large part of this growth is historical, such as the change

---

[1] "Kamilaroi and Kurnai," p. 66.

[2] On this point, consult Farrar's "Primitive Manners and Customs," New York, 1879, chap. vii; also, Spencer's "Principles of Sociology," New York, 1877, pp. 652–657; C. S. Wake, in "Anthropologia," p 73.

from tribal society to political society. But a still larger part is not historical. We are not able, for instance, to trace the stages of growth of tribal society, though we are certain it has passed through various stages. We may be reasonably sure, however, that this development has been made in accordance with the general laws of development to which we have just referred. A knowledge of these laws, then, will prove of assistance to us in forming a theory of the origin and growth of tribal society. Briefly speaking, progress is always from the simple to the compound, from the uniform to the diverse. Pages of striking examples could be given. The simplest form of animal or plant life is a cell, microscopical in size. Some plants consist entirely of a union of such cells, as, for instance, certain lichens—progress being from the simple to the compound. But a further step is noticeable. A divergence appears—some cells becoming fitted for one purpose, some for another; in the animals, some organs becoming fitted for locomotion, some to catch prey, and some to derive nourishment for the entire mass from the prey thus caught. Progress is from the uniform to the diverse.

Well, now, our social organization, developing from the communal band, must show the working of these simple laws. We would expect this development to take place along certain lines. In tribal society the organization is made on the basis of kin, or personal relationships. Mankind carried the development to the fullest extent possible under the workings of this system before it was finally abandoned. Now we have already stated that these primitive men were organized only along the line of sex—the group of men being married to the group of women. Progress would then take place in keeping with this idea;

they would do the very best they could with organization resting on sex before abandoning this basis for something else. Note, further, that the communal band is a simple uniform body of men, with no higher, no lower, classes.

The first step in advance would be in a union of two or more of these bands; this would be in full keeping with the first law of development. Division would not be a step in advance. Division was a perfectly natural process, but it resulted only in the formation of other communal bands. What forces were at work to bring about a union of two or more bands? The same force which has always proved a most potent factor in bringing about political unions—fear of surrounding enemies. A state of war must have been the normal relation between the different bands. A band located along the banks of a river swarming with fish could have held together as a much larger band than one located in the interior, where such natural supplies of food were lacking. Such a favored band would as surely be the bully of all the region. But two bands which were individually incapable of coping with this stronger one might unite their forces against their common enemy. Such an arrangement, at first temporary, tends inevitably to become permanent.

But such a union or combination needs to be marked in some definite way. These primitive bands were quite incapable of conceiving of a treaty or alliance, as a permanent arrangement, without by some means impressing the fact on their daily life. Mankind, the world over, seems to have cemented treaties of alliance and friendship by marriage between members of their respective royal houses. To this day the majority of the royal marriages

in Europe are made with this end in view, and a century ago this remark would have possessed greater force than now. Pages of history afford innumerable examples of the working of this principle. The men of the two uniting bands had no royal families to cement, by a marriage of their members, the new alliance. The only marriage they knew anything about was group marriage. They could do this, however: they could exchange their wives and agree to change the order of group marriage in the future.

Let us examine this theory closely. Is it unreasonable? We think not. An arrangement similar to the Australian class divisions was found to underlie the Indo-American system of relationships; consequently, it must have prevailed over a wide scope of country. We must, therefore, in some way account for its development out of the communal band. Powell[1] asserts that a union of bands as here claimed is the only way a tribe could have originated. Spencer[2] insists that progress only takes place by primary combinations. We observe further that the law of development is fully obeyed. Progress is from the simple to the compound; from the uniform to the diverse. It is further an advance along the line of the only idea of division that primitive men had—that was the division on the basis of sex. In view of all these facts, we feel justified in presenting it to the reader, and ask that it be borne in mind with other theories in this connection.

We are now fairly introduced to the Australian class system. Mankind had taken a very important step in their career of progress. A few moments' reflection will

[1] "Annual Report of Bureau of Ethnology," 1881–82, p. xvi.

[2] "Principles of Sociology," Part II.

show us the importance of this step. The older form, coming in with the infancy of the human race, had doubtless held its sway for many thousand years. Advance under its workings was very limited. The new arrangement broke up the old family arrangement. Own brothers and sisters were now excluded from the marriage relation. We all know that this was a most beneficial arrangement. The descendants of people with this new form of the family, in the course of a few generations, would certainly possess a marked degree of superiority over those still adhering to the old plan. This would bring into play the principles of natural selection, and so in course of time the class divisions would come to be the universal custom. Let us examine the subject to some extent and see what evidence we possess of its diffusion, and in this connection we do not refer to the theoretical evidence derived from systems of relationship.

In Australia, a large section of country is known to possess the class divisions. In Northern Australia, Mr. Bridgeman states, on the authority of his servant, who had traveled over nearly all of Australia, that the class divisions were substantially the same over the entire continent. Other correspondents sustain this statement.[1] Similar information comes from a great many sections in South Australia. We have authentic information of the existence of the class division among the inhabitants of the Salomon Islands, and thence, presumptively, among the Papuans generally. In Melanesia, the occurrence of the class divisions in the various islands of the New Hebrides group is vouched for.[2] It is stated that New, Burton and Du Chaillu mention the existence

[1] "Kamilaroi and Kurnai," p. 31. [2] Ibid., p. 32.

of the classes among various African tribes.[1] It will be noticed that we have been confined in the above observation to tribes belonging to the black races. It is very difficult to gather precise information on this somewhat difficult subject. Should future investigation show a more extensive prevalence of this class system in the direction here indicated, it will prove of great significance.

We have described the division into two classes. This is, perhaps, the more common form. But, along with this, it is known that a great many tribes exist which are subdivided into four classes. This is simply a further advance on the division into two groups. Certain peculiarity in regard to the class divisions of the children may, perhaps, give us a clew how this organization arose. Let us give it some examination. A Queensland tribe shows us the following four divisions:

| *Male.* | *Female.* |
|---|---|
| 1. Gurgela | Gurgelan. |
| 2. Wungo | Wungoan. |
| 3. Burbia | Burbian. |
| 4. Kuberu | Kuberuan. |

To explain the marriage and descent, let us suppose that two tribes lived near each other, one of which had the classes Gurgela and Wungo, the other tribe having the classes Burbia and Kuberu. Under the strict rules of class descent Gurgela marries Wungoan, and the children are Wungo and Wungoan. The marriages and descents in the other division, and in the divisions of the other tribe, need not be here followed out.

Supposing that for some reason these tribes conclude

[1] Ibid. I have not been able to verify this important statement.

to unite their forces. To mark the fact of this union, it is extremely likely they would exchange wives and change the order of future group marriages. But the group Gurgela had been used from time immemorial to having their children called Wungo and Wungoan. Savages are always very conservative, never changing established customs if possible. They might, then, have left the descent unchanged. The following table will illustrate the whole matter:

| | CLASSES. | | MARRIAGES. | | CHILDREN. | |
|---|---|---|---|---|---|---|
| | First Tribe. | | First Tribe. | | First Tribe. | |
| No. | *Male.* | *Female.* | *Male.* | *Female.* | *Male.* | *Female.* |
| 1. | Gurgela. | Gurgelan. | Gurgela. | Wungoan. | Wungo. | Wungoan. |
| 2. | Wungo. | Wungoan. | Wungo. | Gurgelan. | Gurgela. | Gurgelan. |
| | Second Tribe. | | Second Tribe. | | Second Tribe. | |
| 1. | Burbia. | Burbian. | Burbia. | Kuberuan. | Kuberu. | Kuberuan. |
| 2. | Kuberu. | Kuberuan. | Kuberu. | Burbian. | Burbia. | Burbian. |
| | United Tribe. | | United Tribe. | | United Tribe. | |
| 1. | Gurgela. | Gurgelan. | Gurgela. | Kuberuan. | Wungo. | Wungoan. |
| 2. | Wungo. | Wungoan. | Wungo. | Burbian. | Gurgela. | Gurgelan. |
| 3. | Burbia. | Burbian. | Burbia. | Wungoan. | Kuberu. | Kuberuan. |
| 4. | Kuberu. | Kuberuan. | Kuberu. | Gurgelan. | Burbia. | Burbian. |

This is exactly the result that appears among the Kamilaroi tribes and others that have the four divisions instead of two.

This introduced us to the most complex form of organization on the basis of sex that we are acquainted with. We have seen it develop from the communal band, first into the tribe with two class divisions, and lastly into the tribe with four divisions—a peculiar arrangement as

regards descent, as we have just seen. Speaking of it in its last complex form, Mr. Morgan observes: "The more closely this organization upon sex is scrutinized, the more remarkable it seems as the work of savages. When once established, and after that transmitted through a few generations, it would hold society with such power as to become difficult of displacement. It would require a similar and higher system and centuries of time to accomplish this result, particularly if the range of the conjugal system would thereby be abridged."[1] Still, we submit that it was a natural growth from the first simple form, obeying the laws of development from the simple to the compound, from the uniform to the diverse.

The importance of the subject justifies us in spending a little more time in considering this organization. It has been fully admitted that political society was everywhere preceded by tribal society. Probably few were aware that tribal society itself was preceded by organization on the basis of sex. It seems to us that we have abundant reasons for asserting such to have been the case. In addition to the evidence we have already presented, a great host of strange customs observable among savage people finds ready explanation when once we refer to this ancient organization. This explains, as nothing else can, the prevalence of female descent. It is well known that many rude tribes still reckon descent through the mother. The children are of the same gens as the mother. This was the case among our Indian tribes almost universally. The office of chief did not descend from father to son. The children inherited nothing from the father, because they were not of the same gens. This is the rule among many African tribes to-day. Callie,

[1] "Ancient Society," p. 55.

speaking of tribes near Sierra Leone, observes: "The sovereignty remains always in the same family, but the son never succeeds his father. They choose, in preference, a son of the king's sister, conceiving that by this method the sovereign power is more sure to be transmitted to one of the blood royal."[1] An examination of the group marriages among the Australians shows us the reason underlying this custom. It points back to a time when paternity might have been a matter of doubt, but maternity was always sure. Hence the general rule among savage people.

There is another custom widely extended, which is certainly a very curious one; that is, the avoidance of all social intercourse between a woman and her son-in-law. This is known to have been the rule, universally, among our Indians. It was considered extremely improper for a woman to speak to her son-in-law, or even to look at him.[2] "In Asia, among the Mongols and Kalmucks, a woman must not speak to her father-in-law, nor sit down in his presence."[3] "In China, the father-in-law, after the wedding day, never sees the face of his daughter-in-law again. He never visits her, and if they chance to meet he hides himself."[4] In Australia, Mr. Fison once saw a man "full of the utmost distress and disgust because his mother-in-law's shadow had fallen across his legs. He had been lying at the foot of an enormous gum tree, which hid him from the old lady's view as she approached, and so the catastrophe occurred."[5] Among other Australians, if absolutely necessary to address each other, they stand back to back and yell at the top of their voice, pretending to be far apart.[6]

[1] "Travels," etc., London, 1830, Vol. I, p. 153.
[2] Lubbock: "Primitive Man," p. 7. [3] Ibid., 8. [4] Ibid., 9.
[5] "Kamilaroi and Kurnai," p. 103. [6] Ibid.

It is the same in Africa. Callie observes, of the Haussa tribes, that when the arrangements for a marriage are completed, "from this moment the lover is not to see the father and mother of his future bride. He takes the greatest care to avoid them; and if by chance they perceive him, they cover their faces as if all the ties of friendship were broken."[1] "When a Kafir woman meets her son-in-law in the path, she squats behind a bush, while he hides his face behind his shield and passes by."[2] The prohibition of look and speech between a man and his mother-in-law is known to prevail extensively among the tribes of equatorial Africa.[3] Here, then, we have a custom which is almost universal among the lower races.

In explanation of this, Mr. Tyler remarks "that it is hard even to guess what state of things can have brought this custom into existence," and declares that he has "met with no interpretation which can be put forward with confidence." Sir John Lubbock thinks that it is "a natural consequence of marriage by capture. When the capture was a reality, the indignation of the parents would also be real; when it became a symbol, the parental anger would be symbolized also."[4] Yet, we think, Mr. Fison suggests the true reason. The class laws are very strict. There is the utmost liberty within the classes, but public wrath was visited on the man who went outside the class limits. Taking a tribe divided into two classes, a moment's reflection shows us "that a man's mother-in-law is a woman of the same class name as his wife; that is, she is one of a class of women who are his wives, but she herself is forbidden to him, and must, therefore, keep out of his way, as he must keep out of hers. The slightest

[1] "Travels," etc., Vol. I, p. 94. [2] "Kamilaroi and Kurnai," p. 103.
[3] Tyler: "Early History of Mankind," p. 290. [4] "Primitive Man," p. 84.

familiarity between them would be indecent; nay, more, it would be pollution. Hence the ludicrous shifts to which these relatives resort." [1]

Another custom finds its explanation in this old class division. To this day there are whole tribes in Australia which have individual marriage, but the couple must always elope. It is no use to try and get the parents' consent. It is the same among some of the hill tribes of India. "Among the Soligas," says McLennan, "when a girl consents to marry, the man runs away with her to some neighboring village." Some time must elapse before it is deemed proper to return.[2] He also describes similar customs among the Turkmans. Among the Kurnais of South Australia, "if the runaways were caught, the man had to stand as a target for the spears, boomerangs, and kullucks of her near kinsmen, while the poor girl was speared or beaten within an inch of her life." [3] We think there must be some reason for this strange custom. Can it not be that it is a tacit recognition of old communal rights? Does not the Australian custom point back to the time when the couple were considered as offenders against the common rights of the tribe?

This leads to a consideration of a great number of customs at which we can only glance. Sir John Lubbock briefly states the principal to be this: "Special marriage was an infringement of these communal rights, for which some compensation was due." [4] Perhaps the foregoing custom may be an instance in point. At any rate instances are numerous where this right revives among the Australians.[5] Perhaps in this way we are to under-

[1] "Kamilaroi and Kurnai," p. 104.

[4] "Primitive Man," p. 87.
[5] "Kamilaroi and Kurnai," p. 202, note, 281, 286, 310, 317, 326.

stand the customs attendant on the worship of Venus, among the Babylonians, and, indeed, amongst most of the people of antiquity.[1] In their case, the old customs had become almost obsolete, yet they still survived, and were required as a religious observance. We are not to regard this as an evidence of gross licentiousness, but a tribute to an old custom, the origin of which has long been forgotten. This charitable explanation we would extend to the numerous descriptions of Saturnalian scenes given by travelers generally of savages in the most widely separated parts of the world. It is quite customary to talk about the licentiousness of savages. Much of it can be explained as a tacit recognition of old communal rights.[2]

Primitive man had but few ideas, as compared with civilized man. It is hard to fully understand the force of this remark; yet, the more we reflect on it, the more readily we appreciate its bearings. It is difficult, perhaps impossible, for us to rightly conceive the motives that would influence primitive man to change any of his established customs. We are not at all sure that he would proceed as we would, for that is to endow him with the experience gained in the long years preceding civilization. Events have been such that organization of society on the basis of sex took its rise. Once started in this direction, they made the most they could of this foundation. We are not acquainted with any people, in which the class divisions are at all apparent, having more than four classes. This arrangement was sufficiently complex. It must have taxed to the utmost their intellect to so arrange the classes that the blood of the tribe should circulate in all.

---

[1] "Primitive Man," p. 87.

[2] See paper on this subject by C. S. Wake, in "Anthropologia," p. 156. His conclusions differ, however, from these here stated.

To still further increase the number of classes which would follow the union of three tribes, making at least six classes, and still keep the blood of the tribes circulating in all the classes, would require a complicated arrangement quite beyond the power of primitive man to make. It could only be done by having some alternating arrangements either in the names of the classes or in the class marriage—in either case difficult to manage without some system of records. Hence, we may suppose that a long period ensued with but little advance in tribal organization, long enough for tribes with class divisions to spread over the world—perhaps long enough for the yellow races to become divergent from the black races. But the defects of class organization are apparent to all. Great advance was impossible until it had been overthrown. How conservative primitive man would be in this matter becomes apparent when we reflect that throughout the entire continent of Australia, though the tribes had been separated long enough for their languages to become entirely distinct, and the class names entirely different, yet they still recognize the fact that the different classes are equivalents of each other.

A member of one class, for instance, visiting a tribe widely separated from his, had no difficulty in determining to which of their classes he belonged. This shows the great influence of the class system, and gives us an idea of the forces that would be arrayed against any proposed reduction of the same. Yet, as time passed on, the class system disappeared over most of the world. Even the Australians, when first discovered, possessed institutions that were encroaching on privileges of the classes. Whether we can successfully trace the steps leading to the formation of gentile society is a question.

Any attempt to do this must be considered in the light of a theory which will hold its ground only as it successfully accounts for ascertained facts. Growth, as we have thus far discussed it, begins by a process of combinations: two communal bands uniting to form the tribe with two classes; two of these latter, to form the tribe with four classes. Further combination seems to be improbable. The primary idea going along with this union—that is, intermarriage—must, therefore, be overthrown, and the idea must be formed, in the minds of primitive man, of political union, not carrying with it intermarriage rights.

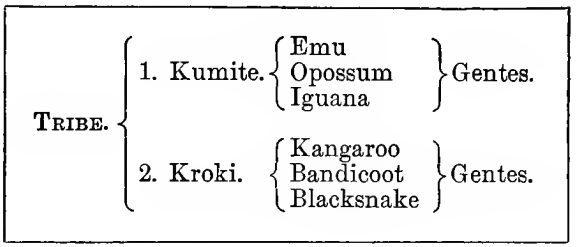
All savages and partially civilized people are fond of tracing descent back to some imaginary ancestor. By what process of reasoning it is that they satisfy themselves, we need not here stop to consider; but the fact is, amongst the lower tribes, this ancestor is generally an animal. The probabilities are that all of the class in Australia had such a fictitious ancestral animal. This animal we now call the totem of the class.[1] In some cases this totem in not known; we know only the name of the class. The tribe increases in number, the classes spread farther and farther; one band takes as its possession a certain river valley, another is located among a definite range of hills, while still a third takes possession of a lake and its islands. The tendency is for each of these bands to assume a definite name—not the name of the locality, but the name of some animal, which straightway becomes the totem of the band, and is soon regarded as the ancestor of the same.[2]

Let us notice what follows from this step. We will

[1] Vol. I, p. 486, note.

[2] Some of the South Australian tribes, as the Kurnai, name their bands according to their locality, or after some prominent individual. In such a case, however, descent has passed out of the female line.

suppose that a band of Kumite men chose as their hunting-ground a lake, with its shores and islands. Their wives are all Krokigor. In this locality a great many kangaroos are found; accordingly, they adopt as their totem the kangaroo. The children are all Kroki and Krokigor, but further distinguished as belonging to the Kangaroo gens. As these children belong to the same class, they, of course, can not intermarry; here we reach the first rule of the ancient gens—its members can not intermarry. But what has happened to this band has happened to other bands of the Kumite class. The same, also, has happened to bands of the Kroki class. Instead, therefore, of two large classes, we will, for instance, have the following arrangement:



However temporary such an arrangement may have been at first, it certainly would tend to become permanent. We will here remark that the outline sketched above is the typical organization of a people in a tribal state of society;[1] the classes are seen to be the phratries; the gentes, subdivisions of the same. We can see at a glance why it is that originally the gentes of the same phratry could not intermarry. Let us note what this organization would be in its incipient form, and what it inevitably tends to become as time passed on. Among

[1] Vol. I, p. 486, note.

the Australians, the classes have remained the most prominent part of the organization. We are expressly told in some cases that the totems did not interfere with the old rule of marriage.[1]

But, in general, this tendency would certainly appear: the classes would tend to lose their importance; the gens become more and more important. With that self-conceit common to humanity, the Emu men would care less and less for the fact that they were Kumite, but they glory in being Emu men. Of course, on grand occasions, the gentes would arrange themselves in their class order. But, in general, the gens would become a new unit of classification. The old class rule forbidding intermarriage within the gens seems always to have been observed. The like rule compelling a member of a gens to seek his wife from one of the gentes of the other phratry would lose its hold, just in proportion as the classes lost their importance. Some Australian tribes no longer observe it, and we find it losing its hold among others.

Having now reached the tribal state of society having descent in the female line, we can not do better than to examine that form of government at some length, even though we have, in the previous volume, devoted some space to it.[2] Our Indians, when the Europeans first came among them, possessed this social organization. It is a striking illustration of the statement that passing travelers are incapable of giving definite information on this point, when we reflect that it is only lately that we have learned the details of this organization. The like holds true in regard to the Aztecs and the Incas of Peru. The early Spanish conquerors and explorers tried to make the

[1] The Mount Gambier tribe. ("Kamilaroi and Kurnia," p. 42.)
[2] Vol. I, p. 677.

facts fit a preconceived theory. They generously bestowed on these countries a model government. A full assortment of the different orders of nobility was made out—emperor, princes of the blood royal, noble lords, royal governors, generals of the army, etc., etc. The first English colonies started with the same laudable end in view. *King* Powhatan in Virginia and *King* Phillip in Massachusetts illustrate the tendency. The English explorers soon perceived the incongruities of such a designation, and the simpler title of chief, or sachem, took its place.

We will take one of the Iroquois tribes to illustrate the organization of tribal society, using the same outline we did in the previous volume:[1]

| | | | |
|---|---|---|---|
| Seneca Tribe. | First Phratry or Brotherhood. | Bear, Wolf, Beaver, Turtle | Gentes. |
| | Second Phratry or Brotherhood. | Deer, Snipe, Heron, Hawk | Gentes. |

The above outline, which was the exact division of the Seneca-Iroquois tribe, is a typical one for all of our Indian tribes, at least before the advent of the whites. We notice, first of all, the tribe. It is not an easy matter to define a tribe; yet it is a clearly marked division. It has been found by investigation that it possesses certain qualities and rights, which we will use to define it.

All the members of a tribe speak the same dialect.

[1] Vol. I, p. 486, note.

A growing and prosperous tribe holds together as one organization as long as they speak the same dialect; but languages tend rapidly to diverge among all savage people. A few years' separation is quite sufficient to originate a new dialect, and consequently to mark the formation of a new tribe. The cases are extremely rare of an Indian tribe the members of which spoke different dialects. In some cases, however, a weaker tribe, speaking a closely related dialect, becomes absorbed in a larger tribe.[1] But, in general, however numerous an Indian tribe became, it remained one in organization as long as the dialects of its bands remained the same.

This body of people possessed a certain area that they regarded as their own, over which they alone had the right to hunt. This area they would defend against neighboring tribes. The boundaries of this area were not well defined, but a general knowledge of the same was had. This body of people further gave to themselves a certain name, which was determined by some peculiarity of their character or settlement, such as "sea-side people" (Mohegans) or "camp-movers" (Ogalallas). The name which they called themselves was not always the name by which they were known among the surrounding people. We must further remark that a tribe generally is the highest form of organization possessed by people in a tribal state of society. In a few cases only had a confederacy, or the union of several tribes, originated in America. In the Old World we know of several cases of the formation of a confederacy, which afterwards, by the still closer coalescing of its individual tribes, formed a nation. A tribe in general, then, is an independent, self-governing body of people. In quite a number of cases

[1] "Ancient Society," p. 103.

they were under tribute to a stronger tribe, but they were still free as regards self-government.

Turning now to the internal organization of a tribe, we see that the first division is into phratries. This word is from a Greek word meaning "brotherhood." According to the theory we are upholding, these phratries were originally the class divisions of the tribe. But, of course, when the organization of people in tribal form became the ruling form, phratries might be formed without passing through the class stage. We have already remarked the significant fact that as the classes lost their importance they would tend to disappear. Hence it is that the phratries are not a necessary part of the tribal organization. It was lacking in some of the Indian tribes, though most of the tribes had it; but in all it plays a subordinate part—just what we we would naturally expect. In a number of cases, the original rule was that a member of one phratry must seek a wife from one of the opposite phratries. The reason is quite plain; it is the old class rule forbidding marriage in the classes.

As showing that the influence of the phratries had long been on the decline, it is significant that about the only way it betrayed itself was in ceremonial and religious matters. It is well known that customs pertaining to such matters tend to change very slowly.[1] Among the Grecian tribes, the phratry looked after "the observance of special religious rites, the condonation or revenge of the murder of a phrator, and the purification of a murderer, after he had escaped the penalty of his crime, preparatory to his restoration to society."[2] Among the Iroquois, "the

[1] "As illustrated in the use of the flint knife for circumcision, religious usages are those which remain longest unchanged." (Spencer: "Principles of Sociology," p. 279.)

[2] "Ancient Society," p. 89.

phratry," we are told, "was partly for social and partly for religious purposes."[1] It showed itself in ceremonial matters. "At a council of the tribe, the sachems and chiefs in each phratry usually seated themselves on opposite sides of an imaginary council fire, and the speakers addressed the two opposite bodies as the representative of the phratries."[2] The phratric organization showed itself in ceremonial games and in religious matters, as in the holding of a medicine lodge, each phratry holding such a lodge, which was their highest religious act. Among the Incas, we have seen, the phratry displayed itself almost solely in ceremonial games.[3] The bearings of these remarks, as showing that the phratry had declined from a former more important position, should be observed.[4]

The unit of organization in a tribe is the gens. This is from a Latin word, the significance being that of kin. The members of a gens are all considered related to each other. They all trace their descent back to some common ancestor. Anciently the descent was always in the female line. The children belonged to the gens of the mother. This is a survival of the old class rule, and for the same reason. Marriage between members of the same gens was always prohibited. The ancient rule was that a wife must be sought from some gens of the opposite phratry, but this, in a great many cases, had become obsolete. It will be seen that a gens only included a part of the descendants of this supposed common ancestor. A man

[1] Ibid., 95. [2] Ibid. [3] Vol. I, p. 783.

[4] Those who are acquainted with the writings of Mr. Morgan will, at first glance, think that the position here assumed is greatly opposed to his. This opposition is, in reality, in appearance only. He derives the phratry from the subdivision of a former gens. We derive it from the subdivision of a class. The difference is simply one of names, since Mr. Morgan gives to the gens, in its archaic form, the same qualities we give to the class. As to which word is the better term to use, we leave to the judgment of the reader.

and his sister both belonged to the same gens. The man must seek a wife from some other gens, but his children will belong to the gens of their mother, therefore his descendants are not included in the original gens. Only the descendants of the female members of the gens continue in it. Many of the rights and duties of the gentes, we will not discuss here.

Our main object has been to trace social organization, but we have seen how in early times it was necessary to consider the marriage customs. It has probably occurred to some that communal marriage has disappeared. As the class divisions become dim, their marriage customs would tend to change also. The inevitable tendency is to break up old communal rights, which would only revive on special occasions; and, as a species of religious rite, we catch a glimpse of them among quite advanced people, illustrating in a most forcible manner the conservatism of religions. But as the communal family disappears, what takes its place? Why, polygamy for the more influential men of the tribe, individual marriage for the masses of the people, and then, in special cases, polyandry. In the case of individual marriage, is it not evident that at first the marriage will be a temporary one only? Refer to the customs of the Andaman Islanders, where this is still the rule. But the tendency is for this relation to become more and more permanent. Still divorce would remain at the pleasure of the parties, which is exactly the facts of the case among all the lower races.

In fact, the family, among people still in the tribal state of society, with descent in the female line, is called by Mr. Morgan the syndiasmian family. This was the pairing family; but observe: "The relation continued during the pleasure of the parties, and no longer. The hus-

band could put away his wife at pleasure, and take another without offense, and the woman enjoyed the equal right of leaving her husband and accepting another, in which the usages of her tribe and gens were not infringed. When alienation arose between a married pair, and their separation became imminent, the gentile kindred of each attempted a reconciliation of the parties, in which they were often successful; but if they were unable to remove the difficulty, their separation was approved." Such a family possessed too little coherence to face alone the hardships of life; hence "several of them were usually found in one house forming a communal household."[1] This family was a great advance over the communal family, but still below the monogamian.

The organization we have now briefly sketched out is that of tribal society in general. We have made the statement that descent was in the female line. The children belonging to the gens and phratry of the mother, they were considered as belonging solely to her. In case of a separation, she kept the children. The family, as we understand it, had not yet made its appearance. In all probability female descent was the ancient rule; but we shall soon see that quite early the custom changed in a number of tribes, descent passing over to the male side, the children belonging to the gens of their father. Change of descent did not, however, change tribal organization. Let us, before passing on, speak of this wide-spread tribal society. It was the one form of society in the New World at the time of the conquest. Variations in details were, of course, numerous. The phratric organization was wanting in some tribes; but it is not too much to say that from Cape Horn to the Arctic Ocean the numerous Indian

[1] Morgan's "Ancient Society," p. 453, *et seq.*; also, Vol. I, this series, p. 491.

tribes all had substantially the same organization, though in a few instances confederacies of tribes had been formed.

We will not take into account the Aryan tribes at present, but will simply remark that they possessed this full organization. Among the Chinese, the tribe and the phratry have both disappeared, but the gens still survives. Mr. Robert Hart, a high official at Canton, thus wrote: "As regards 'division into tribes,' I am not aware that the Chinese . . . recognize at this day any . . . tribal distinctions. . . . The Chinese expression, however, for the people is *pih-sing*, which means the 'hundred family names.' . . . At the present day there are about four hundred family names in this country, amongst which I find some that have reference to animals, fruits, metals, natural objects, etc., and which may be translated as horse, sheep, ox, . . . plum, flower, leaf, . . . etc., etc. In some parts of the country there are large villages, in each of which there exists but one family name. Thus, in one district will be found say three villages, each containing two or three thousand people, the one of the 'horse,' the second of the 'sheep,' and the third of the 'ox' family name, and two of the three will, in all probability, have a kind of a reciprocity treaty, offensive and defensive, and be continually at feud with the third. . . . Husband and wife are always of different families. . . . Custom and law alike prohibit intermarriage on the part of people having the same family surname."[1]

Speaking of the Nepaul tribe, known as the Magyars, Latham remarks: "A trace of a tribal division is to be found. There are twelve 'thums.' All individuals belong-

[1] Letter to Mr. Morgan. ("Systems of Consanguinity," etc., p. 424.)

ing to the same thum are supposed to be descended from the same . . . ancestor; . . . husband and wife must belong to different thums. Within one and the same there is no marriage."[1] The existence among the Karens of the gens is evident. "They reckon themselves by families. . . . Each family occupies but one house, . . . large enough to contain three or four hundred individuals." This family is the gens. Intermarriage is prohibited, because "cousins marry, but not brothers and sisters." The same is true of other Indian tribes. Col. Dalton tells us that the "Hos, Moondahs, and Oraons are divided into classes, or keelis, and may not take to wife a girl of the same keeli."[2] Of the tribes in Mongolia we read: "In no part of the world is the tribal system more developed than in Mongolia. . . . The connection between the members of a tribe is that of blood. . . . The tribe is a large division falling into many banners." Intermarriage between these "banners" is doubtless prohibited, for Latham remarks that the Kalmucks have the same "social constitution,"[3] and we read that these latter "are divided into hordes, and no man can marry a woman of the same horde."

The Siberian tribes subdivide into clans. "When a Jakut wishes to marry, he must choose a girl from another clan. No one is permitted to marry a woman from his own clan." "The Ostiaks consider it a crime to marry a woman of the same family, or even of the same name." Klaproth gives us the divisions of the Russian Samoyeds, and further remarks: "This division of the kinsmanships is so rigidly observed that no Samoyed takes a wife

[1] "Descriptive Ethnology," Vol. I, p. 80.
[2] Lubbock: "Primitive Man," p. 95.
[3] "Descriptive Ethnology," Vol. I, p. 328.

from the kinsmanship to which he himself belongs."[1] The subdivisions of the Afghan tribes is very plainly marked. The divisions are called *kheils*. The rule of marriage is not given, though we read that "one of the commoner causes of war between tribe and tribe arises out of the abduction of a woman from one ulus to another, . . . abduction being common."[2] This shows the working of an exogamous rule.

In Africa the usual tribal divisions appear in full force. One of the Fulla tribe comes before us as divided into fourteen gentes reunited in four phratries.[3] The customs in reference to marriage and descent are not well known, but Du Chaillu observes: "Each tribe is divided into clans; the children in most of the tribes belong to the clan of the mother, and these can not by any possible law marry among themselves, however removed in degree they may have been connected."[4]

We have thus found the tribal state of society in the most widely separated parts of the world. We have reserved the Semitic and the Aryan tribes for a special discussion. We have found everywhere divisions of the tribe itself. We are not at all surprised that the phratry is, in many cases, wanting. The gens is always found, and, in the great majority of cases, the old rule prohibiting marriage within the gens is still observed. It is instructive to notice the course of development. The progress has been, on the one hand, towards the individual. The communal band, as it first appeared, knew nothing of the individual. The first step resulted in the class divisions. Division appears within the tribe. When the gens arose this division was carried still further. We

[1] "Descriptive Ethnology," Vol. I, p. 475. [2] Ibid., Vol. II, p. 215.
[3] Ibid., p. 119. [4] "Primitive Man," p. 95.

will notice a steady reduction of conjugal rights. In the first place, this right was as extensive as the tribe. The first step in advance reduced this right to a part only of the tribe, while the organization of the gentes tended to overthrow it altogether. The constant tendency has been to bring the individual and individual rights more and more to the front.

Let us now take notice of a change that would naturally take place in the gens; this is, the change of descent. The reason generally given to account for female descent is the one we give. That is, that as long as the family was communal maternity only would be sure; paternity might be doubtful. But as soon as the gens was firmly established as the unit of organization, communal marriage was largely overthrown. The pairing family, in a feeble state, makes its appearance, and we have stated that the tendency would be for this family to become more and more permanent. The reason, then, for female descent loses its hold. Hence, we are not at all surprised to learn that a large number of tribes, yet low in the scale of enlightenment, had descent in the male line.

Thus all the Aryan tribes, originally having descent in the female line, at an early day changed their descent to the male line. Judging from the fact that Abraham married his half-sister,[1] Nahor his niece,[2] and Amram his aunt,[3] we conclude that, anciently, descent was in the female line among the Semitic Hebrews, since in such a case all these relations would be of different gentes. This ancient rule had certainly become modified when the Book of Numbers was written, and descent was in the male line. Amongst our Northern Indian tribes, descent, in the majority of cases, was in the female line; but

[1] Genesis xi, 29. [2] Genesis xx, 12. [3] Exodus vi, 20.

numerous exceptions occur. Missionary influence is known in some places to have changed the ancient rule. The partially civilized tribes of Mexico and Central America had descent in the male line.[1] The majority of the South American Indian tribes had descent in the female line. The Incas of Peru seem to have had male descent. We find the two systems of descent side by side throughout Africa, Asia, and Australia. Two facts stand out clearly. A people reckoning descent in the female line often changes to descent in the male line, such a change generally following increase in culture. We know of no exceptions to the above rule—no instance of change going the other way. If a list were to be had of all people, both ancient and modern, who reckoned descent in the male line, and also a list of such people as still reckon descent in the female line, there is little doubt that the first list would be greatly the superior of the second in point of culture.

Mr. Tyler, discussing this subject, remarks: "In practice, the races of the world . . . have had to elect which of the two lines, male or female, they will keep up by the family name or sign."[2] We may be quite sure that if there were any "election" about this matter there never would have been any female descent known. Quite a number of theories have been put forth in explanation of the change from the female to the male line. It seems to us easy of explanation. When the gentes, with their rights and privileges, were fairly established, we have seen that the syndiasmian family came into existence. Why not agree with Sir John Lubbock,

---

[1] Bandelier: "Peabody Museum Reports," Vol. II, p. 429. Morgan: "Ancient Society," p. 184.

[2] "Early History of Mankind," p. 285.

that "gradually and from force of circumstances, aided by the impulse of natural affections," parental responsibility would spring up? Then, as this form of the family gained in permanence, and advance in culture continues to be made, the idea of personal property comes into existence. There would exist, also, a natural desire on the part of the father to transmit his inheritance to his children; or, if he held the office of chief, he would desire his son to succeed him; or, yet again, we might say that along with the growth of parental responsibility and affection there would be a natural desire on the part of the father to consider the children as belonging to him. All these considerations tend to the overthrow of female descent. In a great many instances they succeeded in bringing about the change. Still, they had to contend with customs established from time immemorial, sanctioned by such religious ideas as they possessed; so it is not strange that the old plan held its own generally among the less civilized races. This change of descent did not overthrow the gentile system—it worked no change in that direction. Still, this change is regarded as a most important one for primitive man, as we will learn in the sequel.

It is interesting to note the tribal organization of the Hebrews. This can be gathered from the historic books of the Old Testament. The names of the collective tribes are not territorial, but personal. They are the "Children of Israel." In Afghanistan we find the same principle active to-day, where, by the "Children of Joseph," is understood a reference in a collective sense to eight independent tribes.[1] Each of the Hebrew tribes was independent in its own affairs. In the presence of great danger, they confederated together under one leader, such as Moses,

[1] Latham: "Descriptive Ethnology," Vol. II, p. 212.

Joshua, and the several judges. But most of the time they were disunited, and occasionally at enmity with each other.[1] The official head of each tribe was called *nasi*, meaning "prince," or "exalted one."[2] This chief was commander of the tribal forces in the time of war.[3]

Each of these tribes further possessed the phratric organization. The name of this division was *bethaboth*, meaning "house of the fathers." But one of the meanings of "house" is kindred,[4] so we can call it "father's kindred."[5] The official head of the phratry was *reshebeth*, meaning "head of the house," or we might express it "chief of the kindred."[6] In battle the forces of the phratry formed a division by themselves.[7] These phratries finally subdivided into gentes called *mishpachah*, the meaning of this word being exactly that of our own gens or clan. Our translators use for this the word *family;* not a good word to use, since we at once apply to it the meaning of our word family, whereas it meant a number of our families. The chief of the gens was called *reshob*, a term signifying "head father."[8]

The law of inheritance[9] plainly shows that descent at this time was in the male line. Of the laws of marriage we know but little; but notice that one of the last questions coming before Moses for settlement was in regard to the marriage of heiresses. And as a result of special legislation the daughters of Zelophehad married into their own gens; *i. e.*, their "father's brother's sons." Obviously, then, the ancient rule forbade this marriage.

[8] Numbers xxxvi, 1. [9] Numbers xxvii.

The organization of the tribe of Levi is given in full; we will give an outline of it:[1]

| | | | | |
|---|---|---|---|---|
| Tribe of Levi. | Phratries. | Gershon. | Libni, Shimei | Gentes. |
| | | Kohath. | Amram, Izehar, Hebron, Uzziel | |
| | | Merari. | Mahli, Mushi | |

It remains to discuss the conditions of ancient society among the Aryans—the people who have had most to do with advancing civilization, and with whom history is most concerned. We must clear the way to an understanding by a few preliminary remarks. We are in the position of those who would decipher some palimpsest old and rare; only traces of the original writing can be made out—they are but faint and indistinct. The story of modern life and times, written in strong, clear characters, renders it most difficult to read what few traces of the older writing escaped the efforts of the eraser. All the great Aryan nations long ago passed from ancient to modern society. Their laws, their customs, their institutions, have conformed themselves to the new mould. We

[1] Mr. Morgan (in "Ancient Society," pp. 369, 370, and 545) concludes that "house of the fathers" is the gens, and that "families" is the phratry. We are at a loss to see the grounds of this conclusion. In Numbers iii, 14–27, we read: "And the Lord spake unto Moses, . . . saying, Number the children of Levi after the house of their fathers, by their families. . . . And these were the sons of Levi by their names, Gershon, Kohath, and Merari. . . . Of Gershon was the family of the Libnites, and the family of the Shimites: these are the families of the Gershonites. . . . And the chief of the 'house of the fathers' of the Gershonites," etc. This seems to show conclusively that the phrase *betha-both*, or "house of the fathers," denotes the first division of the tribe, and that *mishpachah*, or "family," denotes the second.

can, then, but see how difficult it must be to detect or interpret what few and faint traces yet remain of an older state. Nor can the pages of ancient history be of any great help to us. The ancient historians were Greeks and Romans. They wrote at a time when their own people had lost most of the vestiges of a tribal state. They would, therefore, explain ancient customs among their own people, or the customs they observed among the yet barbarian tribes around them, by the means of language which did not exactly fit the case. They, in short, made exactly the same error as the early explorers did in the New World. When the Spaniards called Montezuma the king or emperor of Mexico, instead of using the native title "tlaca-tecuhtli," or translating it by the phrase "chief-of-man," and explaining his powers, they made the same mistake Tacitus did when he speaks of the kings and generals of the German tribes, instead of using the native title *ealderman* for the civil chief of the tribe, and *heretoga* for the war-chief[1]—a mistake which we, at the present day, still make when we talk about some African or Australian "king."

"It is often said that it takes two or three years before a governor-general [of India] learns that the vast Indian population is an aggregate of natural groups, and not the mixed multitude he left at home."[2] If this be true of the present day, we may feel at ease in criticising Cæsar's description of the political society in Gaul. He tells us substantially that there were three orders of people. He calls them *Equites*, *Druids*, and *Plebeians*.[3] Cæsar describes them in a natural way for a Roman acquainted with

[1] Freeman: "Comparative Politics," p. 118.
[2] Maine: "Early History of Institutions," New York, 1875, p. 30.
[3] Book VI, chap. xiii.

Roman society. With fuller light, we at the present day understand the Equites, or knights, to be simply the numerous chiefs; the Plebeians, the people generally of the various tribes. In short, we reject his classes or orders; the only natural division of the people was the tribe and its subdivision. As Maine expresses it, his mistake was the effect of "mental distance."

Though the difficulties be great, we need not despair of still gaining light on the early state of society amongst our own race. We need only examine carefully the writings of older historians and examine a multitude of curious customs to learn the facts in the case. There is, indeed, a short cut we might take, which seems perfectly legitimate. If all the Aryan people are descendants of some common tribe, then if we can show this state of society to be true of any considerable body of Aryan people it would follow that all were once in that state. We prefer, however, to pass in review of the principal Aryan people.

It is necessary, however, to explain two divisions of people in ancient society still further. We have mentioned the tribe, phratry, and gens. In the former volume we spoke of confederacies. We examined the league of the Iroquois and Aztec confederacy. Let us briefly mention wherein a nation differs from a confederacy. In the presence of a great danger, tribes speaking dialects of the same stock language confederate together for mutual protection. Such a union tends to become permanent. When that point in advancing civilization is reached at which the union is not only permanent, but the individuality of the separate tribes is losing itself in the life of the greater aggregate, we may say these tribes have coalesced into a nation. Tacitus shows us a Germany of many scattered

tribes; a hundred years later we read of the Saxons, Burgundians, and Lombards.[1] The tribes had coalesced into nations.

Another division we wish to speak of is more important still. We refer to divisions taking place in the gens itself. We will call it the joint-family. Most writers speak of it as the patriarchal family; that, however, is only one form of its development. We have referred to and explained the syndiasmian family. In its archaic form all the members of a gens are brothers and sisters to each other, yet even then it must have tended to break up into groups living together for mutual help and protection. Advancing civilization would tend to consolidate and individualize these groups. The growth in strength of the family ties, the change from pastoral to agricultural life, the change in descent from the female to the male line, would all work to this end. The result was the formation of a new social unit. The gens was no longer the unit, but each gens is itself composed of a number of family groups. Each joint-family consisted, in the main, but not wholly, of the descendants of some common ancestor; each group has at its head a chief, who represents it in council and in other respects.[2] This office is generally, in theory at least, elective; practically, it generally passes by inheritance.

Let us explain a little in regard to this last statement about inheritance. In the archaic form of the gens, when descent was in the female line, and before the family ties had gained strength, all the various grades of chiefs, all tribal offices, were filled by election. The gens, in council assembled, elected its own officers. The same was true

[1] Freeman: "Comparative Politics," p. 122.
[2] Gomme: "Primitive Folk-moots," p. 16.

of the phratry, where the phratric organization was well developed. Finally, the various gentes of the tribe elected the tribal officers. If you reflect on the rule of marriage, you see that a chief's sons could not succeed him in office simply because they belonged to different gentes. There could be no inheritance in office, then, further than this: some one gens in the phratry had the right to furnish phratric officers; so, also, some one gens in some one phratry had the right to furnish tribal officers.

The change of descent from the female to the male line, thereby making it possible for sons to succeed their father in office, wrought a great change. It not only tended to build up the joint-family, but it tended to the formation of privileged classes within the gens. The head of some one joint-family becomes, by election, the chief of the gens. On his death the son becomes eligible for office; if unobjectionable, he is probably elected. This process, repeated for a few generations, tends steadily to establish an hereditary right of succession. The same process is repeated with all the offices of the tribe. At an early stage, the election of tribal chief became fixed in a certain gens; at a later stage, this election is confined to a certain joint-family of that gens, and finally it passes by inheritance. We are now fairly started on the formation of different orders of nobility. Processes are discovered at work which will inevitably tend to break up the old system. It is, therefore, not strange to discover various stages of the above process. Some tribes have clung tenaciously to the right of election, at least for some of their officers; others exercise the right of election within certain limits; others, still, have allowed all right of election to lapse.

Tacitus observed that the Germans chose their *ealder-*

*man—i. e.*, their civil chief—according to nobility; that is, election from a limited number of eligible personages. But their *heretoga—i. e.*, their war chief—they chose for his valor.[1] As this latter chief was the more important one for them, being almost constantly at war, they had not allowed this office to pass by inheritance. Similarly among the Scandinavians, at a far later day; when the Scandinavians invaded Northumberland, there fell in one battle five kings and seven earls. "We are told that the kings were young; we hear nothing of the age of the earls. Surely this is another form of the distinction drawn long before by Tacitus. The kings were chosen for their birth; they might, therefore, well be young. The earls, we may well believe, were still chosen for their personal strength and valor."[2]

As all we have to guide us are traces only of a vanished state of society, we need not hesitate to examine still another element of change. We refer to the change which takes place when the transition is made from a pastoral to an agricultural stage of living. We think the mere fact of settling down upon some definite expanse of territory tends to overthrow the very foundation of tribal society. As Sir Henry Maine observes: "The land begins to be the basis of society in the place of kinship. The change is extremely gradual, and in some particulars it has not even now been fully accomplished; but it has been going on through the whole course of history; . . . for all groups of men larger than the family, the land on which they live tends to become the bond of union between them, at the expense of kinship, ever more and more vaguely conceived."[3] We must constantly bear this judicious

[3] "Early History of Institutions," p. 72.

observation in mind, since in many cases the gens of ancient society will exist simply as an agricultural community. We will now pass in review some of the principal Aryan people.

Let us first look at the state of ancient society among the Aryans of Asia. The ancient Persians were an important branch of the Aryans. An inscription of Shalmaneser II, about the middle of the ninth century B. C., notices the Persians as independent tribes, having no single head over all, but under the government of numerous petty chieftains, each ruling in a small section of country.[1] Later inscriptions, about 650 B. C., show that these tribes had, at that time, coalesced into a nation. Herodotus tells that there were ten tribes of the Persians. Of these, one tribe, the Parsagadæ, held the first position. They were the ruling tribe in fact. They gave their name to the capitol of the new nation, and from them probably comes the word Persian. We know, further, that this tribe consisted of seven gentes. In one of these gentes, the Achæmenidæ, the kingly office passed by inheritance.

The chiefs of these seven gentes formed the king's council. They had the privilege of free communication at any and all times with the king, unless he was in his harem.[2] The king could select legitimate wives only from the ruling families of these gentes.[3] In the Bible the chiefs appear as the "seven princes"[4] or the "seven councilors."[5] They sat next to the king on festive occasions.[6] Their advice was asked and given on important points. We know of at least one instance in which they

[6] Notice their position at Ahasuerus' feast. (Esther i, 14.)

exercised the right, probably at all times inherent in them, of deposing the reigning king, and electing one in his stead.[1] Perhaps it would not be too venturesome to suggest that the phratry also makes it appearance. It is apparent, from the account of Herodotus, that the gens of which the house of Otanes was the ruling one at the election of Darius enjoyed powers and privileges second only to those of the kingly clan of the Achæmenidæ. They had, doubtless, enjoyed such privileges from an early time.[2] To our notion, the easiest explanation is that these two gentes were the leading ones in the phratries of the Parsagadæ tribe of the Persians. The Zend-avesta, or sacred books of the Persians, mentions, in an incidental sort of way, four classes or stages of social organization. They are translated as houses, kins, villages, and provinces. We submit that, in view of what is known of tribal society in general, we can translate these four divisions better by the words *joint-families*, *gentes*, *phratries*, and *tribes*.[3]

In India we find Aryan-speaking people, and here we must remember we are dealing with a greatly mixed people; but throughout the whole mass, from the purer Aryan people to the aboriginal tribes, we detect the tribal organization. We learn that there are thirty-six so-called pure Aryan tribes. Most of them, not all, are divided into phratries, called *sachas*, and these sachas are subdivided into many gentes,[4] called *gotras*. In Bengal we are dealing with a mixed population, but we learn that the four castes are first subdivided into classes. Each class is in turn divided into smaller bodies, the exact

[1] The pseudo-Smerdis was deposed, and Darius elected in his stead.

[2] See Rawlinson's note: "Herodotus," Vol. II, p. 477.

[4] Ibid., p. 115.

analogue of a gens.[1] In the Sanscrit, four degrees in the social scale are mentioned, corresponding exactly to the four divisions of the Persians.[2] Each of these divisions appears as a regularly organized body, with a chief at its head.

India has been greatly overrun by conquerors, and for over one hundred years has been a part of the British Empire. Their ancient institutions have become greatly changed; still, at the present day, two of these divisions stand out plainly. These are the joint-family and the gens. This makes it necessary to explain about the village community of India. Scattered all over India are found small villages, each of which is self-governing, and their laws are simply the immemorial customs of the village. They claim a right of possession in the land surrounding their village. The government varies; sometimes it is a village council, sometimes an elected headsman, sometimes an hereditary chief.[3] Anciently the land was subdivided at stated periods among the households entitled to share. From neglecting the ancient customs of making new subdivisions, these separate lots now pass by inheritance.[4]

We must notice that these villages contain in their midst all that is necessary for their isolated, independent existence. "Besides their headsman or council, they contain a village police. . . . They include several families of hereditary traders—the blacksmith, the harness-maker, the shoe-maker; . . . but the person practicing any one of these hereditary employments is a servant of the community."[5] He also possesses a share

[1] Letter from Rev. G. Mundy, a native Bengalese, to Mr. Morgan: "Ancient Society," p. 363. [2] "Aryan Household," p. 289.
[3] Maine: "Village Communities," p. 122.
[4] Ibid., p. 112. [5] Ibid., p. 126.

in the common land, which he holds at a very low rent.[1] The price of his wares or services is fixed by custom, not by competition. We must notice that some callings, such, for instance, as the grain-dealer, who was not needed in primitive times, do not appear as hereditary ones in the community.

This village community is simply the ancient gens. There are the clearest signs of an original equality between all the households composing the gens; but in quite a number of instances the office of chief, or headsman, has become hereditary, at least in certain families. We also notice the trades becoming hereditary; this all works a change in the gens. One great cause tending to break up the gens entirely is that the plots of land have now become hereditary; under English laws they can be taken for debts. Whether the ancient rule of marriage within the gens is still enforced, I can not say; but in almost all accounts of marriage ceremonies in India we notice the bride and groom are from different villages.

We must also notice the joint-family, or subdivisions of the gens. In a Bengal village each joint-family occupies what we might call a homestead. It consists of generally four huts, arranged around the four sides of a slightly elevated platform.[2] The number of members of a joint-family varies according to circumstances. They include the descendants, both natural and adopted, of a common ancestor; also, servants and dependents. The richer the family may be in land or trade, the longer it can hold together. Instances occur in Calcutta of families numbering as high as four hundred individuals.[3] In the

[1] Phear: "Aryan Village," London, 1880, p. 60.
[2] Ibid., p. 7. [3] Ibid., p. 79.

great majority of cases but two generations live together, because the limited amount of land belonging to the family can not support them. The younger members must give up or sell their portion, and seek a living as best they can; but as long as the family coheres, it is under the rule of the family chief, who is usually the eldest individual of the eldest branch. This chief represents the family in all public affairs; he manages the joint property. Some writers represent his rule as being a despotic one,[1] but others tell us that he is "theoretically responsible, in a certain vague way, to the entire body of joint co-sharers." Probably his power varies in different sections.

Turning to Europe, we will be compelled to pass rapidly along. The Celts were probably the first division of the Aryan race to arrive in Europe. They have had consequently to withstand the pressure of invasion from the other stocks. The Irish, Scotch Highlanders, and Welsh are the most important remnants of this once numerous people. The ancient laws of Ireland, fragments of which still remain to us, give us an insight into the social organization of the people some five hundred years ago. The larger division—the tribe proper—was called the *fine;* this same word is, however, applicable to all of the subdivisions.[2] At the head of the tribe was a chief, whom the traditions style a king. This tribe was further subdivided into branches; at the head of each was also a chief.[3] The unit of division finally appears as the *sept.* This last division—the sept—corresponds quite closely with the village community of India.[4] The lands

[1] Maine: "Village Communities," p. 113.

[4] Maine: "Early History of Institutions," p. 122.

of the sept were divided among the households of which it was composed. This occupation was, however, only temporary.[1] The individual did not have the power of disposing of his land. The sept is, in fact, a gens, consisting of a number of related households, governed by a chief, responsible for the acts of one of its numbers or demanding redress for any injury done to one.[2] The joint-family among the ancient Irish appears in a curiously complicated shape. It consisted of seventeen male members divided into four classes. Each class had a separate name. When the classes were all full, the birth of another male descendant pushed out the oldest member of the first group.

The Scottish Highlanders long retained the tribal system. The following description was written of the Highlanders about 1730: "The Highlanders are divided into tribes or clans, under chiefs or chieftains, and each clan again divided into branches from the main stock, who have chieftains over them. These are subdivided into smaller branches of fifty or sixty men, who deduce their original from their particular chieftains, and rely upon them as their more immediate protectors and defenders."[3] Mr. Skene's researches show that there were originally six great Highland tribes, containing eighteen great clans (phratries), and that five of these latter were again divided into seventeen small clans (gentes.)[4] At the head of each of these divisions was a chief. The smaller clans or gentes

[1] "Primitive Property," p. 125.

[2] Laveleye ("Primitive Property," p. 122) decides that the first division of the tribe given above is the gens. It seems to us that everything we know about it is equally true of the phratric division. This same writer also decides that the sept is the equivalent of the "joint undivided family" of the Hindoos. Maine qualifies this statement, as we have shown. We think the sept is the gens.

[3] Skene: "Highlanders of Scotland," London, 1837, Vol. I, p. 156.

[4] Ibid., Vol. II, p. 305.

formed village communities. The lands were divided among the families which composed the gens. A new division was made at stated intervals.[1]

Passing now to the Germanic nations of Aryan descent, we can do but little more than glance at the wide field; still, among all the modern nations of old Germanic stock, we trace the elements of the tribal government. In the first century, Tacitus wrote a treatise on the manners and customs of the Germans, and from this we gather much information. At an earlier date still, Cæsar had noted many of their peculiarities. Both of these Romans, however, wrote at a time when their own people had long passed from the tribal stage; hence, in their accounts we have to make due allowance for "mental distance." They describe to us a country inhabited by many independent tribes. In some cases confederacies, or the union of several tribes forming nations, governed by what they called a king, had arisen; still, this was not the universal rule.[2]

In Cæsar[3] we see the principle on which this confederation was brought about: "When a state either repels war waged against it or wages it against another, magistrates are chosen to preside over that war with such authority that they have the power of life and death. In peace there is no common magistrate, but the chiefs of provinces and cantons administer justice and determine controversies among their own people."

Tacitus was struck with the large share that the people still retained of original liberty: "On affairs of smaller moment the chiefs consult; on those of greater

[3] "Gallic War," Book VI, p. 23.

importance the whole community. . . . They assemble, unless on some sudden emergency, on stated days. . . . An inconvenience produced by their liberty is that they do not all assemble at a stated time, as if it were in obedience to a command, but two or three days are lost in the delays of convening. When they all think fit they sit down. . . . Then the king or chief, and such others as are conspicuous for age, birth, military renown, or eloquence are heard, and gain attention rather from their ability to persuade than their authority to command."[1] We detect but slight references to the smaller divisions of the tribe. Reference is made to cantons and subdivisions. Of their armies we read: "Their squadrons and battalions are not formed by men fortuitously collected, but by the assemblage of families and clans."[2] In a religious observance by one tribe, we read that "at a stated time all the people of the same lineage assemble by their delegates in a wood."[3] This seems to refer to the phratry. Of their agricultural habits, Cæsar observes: "Nor has any one a fixed quantity of land or his own individual limits, but the magistrates and the leading men each year apportion to the gens and families living in communities as much land as, and in the place in which, they think proper, and in the year after compel them to remove elsewhere."[4]

Of late years many writers have been investigating the traces of tribal society among the modern nations of Europe. In this connection we must remember that settled agricultural habits tend to make the land the basis of kinship instead of personal relations. Hence it is that most of the old tribal divisions appear as the names

[1] "Germania," § 11. [2] Ibid., § 7.
[3] Ibid, § 39. [4] "Gallic War," Book VI, p. 22.

of certain territorial expanses. The tribe proper, and the land which it held, were called the *pagus*, or, more commonly, the *gau;* in ancient England the *shire.*[1] This was the territory of an independent people. At its head was the *ealderman*, or civil chief; its forces in war were under the management of the *heretoga*, who might or might not be the same as the *ealderman.* In some cases the *gau-graf* has descended to modern times as a title of nobility —the count.[2] We might remark that England is full of places which, by their name, indicate that they once were the place of meeting of the shire court.[3] The first division of the gau was the *hundreds*, "a name to be found in one shape or another in most lands into which the Teutonic race has spread itself."[4] Each hundred had also its chief.[5] In full keeping with the fact that the phratric organization generally tends to fall to pieces at an early date is an interesting observation by Mr. Gomme: "Among modern institutions, the hundred has always had a tendency to decay. . . . This tendency began early. . . . The hundred was never called upon, as the shire has been, to take part in the movements of modern political necessities."[6] In general we know much less about the hundreds than we do about the gau.[7] The "districts" and "townships" divisions of the German cantons (corresponding to the gau) were hundreds.[8]

The gens finally appears under several names, as the *mark*, the *gemeinde*, the *commune*, or the *parish.* It is an agricultural community exactly like the village communi-

[8] Tacitus: "Germania," §§ 12, 26.

ties of India. Traces of the mark are found in all Germanic countries. The territory of the mark was divided among the joint-families of the gens. This partition was at first temporary only. In some portions of Germany these farming communities still exist, and in others only recently has the practice of periodical partitions been lost.[1] The *allmends* of Switzerland at present are simply the old German marks, but slightly modified. Each mark was under the rule of its elected chief. All through England we come on traces of the old mark system,[2] but, unhappily, the people have allowed their rights to lapse, and thus the lands have accumulated in the hands of a privileged class.

The joint-family among the Germanic nations can also be detected. Cæsar noticed families "living in association." It is needless to remark that each of the households was represented in council and public assemblies by its chief or leader; he it is who drew by lot the portion of land the family was entitled to.[3] The power of this house-father was very great, extending in some cases to the power of life and death;[4] but the children were released from the control of the house-father when the tribe took them as its members.[5] We thus find among the Germanic nations clear traces of all the divisions of ancient society: the tribe, the phratry, the gens, and joint-family. We also notice confederacies and nations. Descent was in the male line, and many offices passed by inheritance, thus steadily tending to break up the ancient system.

Turning now to the Slavonians, we will stop to notice

---

[1] Laveleye: "Primitive Property, p. 112.

[5] Tacitus: "Germania," § 13.

only two survivals of tribal society. The first is the gens. Tribe and phratry appear to have both disappeared; or, at any rate, the investigation necessary to bring them to light has not yet been made. The gens appears as an agricultural community called the *mir*. It is a complete, independent, and self-governing body, still in active existence. The heads of the joint-families assemble in council, elect their chief or mayor, and discuss and regulate all the affairs of the commune.[1] As, in most of the agricultural communities formed from the old form of the gens, the land is not held in individual ownership, the Russians have resisted the tendency to allow the land to pass by inheritance. Anciently, the land was divided every three years, "and in some parts this ancient custom is still maintained. The period of partition varies at the present day in the different districts. In certain localities partition takes place every six years; in others, every twelve or fifteen years. Every nine years is the most usual period."[2]

As we might expect, we find in Russia also the joint-family as an existing institution. We read: "Family ties have maintained a force among the Russians . . . which they have lost elsewhere. The family is a sort of perpetual corporation; it is governed by a chief called 'the ancient,' with almost absolute authority. All property is common. There is usually neither succession nor partition. The house, the garden, the agricultural implements, the stock, the produce, movables of every description, remain the collective property of all the members of the family; no one thinks of claiming a separate share. On the death of the father of a family, his authority and administration devolves on the eldest member of the

[1] "Primitive Property," p. 9. [2] Ibid., p. 10.

house; in some districts, on the eldest son; in others, on the eldest brother of the deceased, provided he lives under the same roof. In some parts, too, the members themselves elect the new chief. If all the survivors are under age, a relative establishes himself with them and becomes a co-proprietor."[1]

Amongst some people, all the divisions of tribal society have disappeared except the joint-family, but this has shown considerable vitality. This is the case among all the Balkan states of Europe, the inhabitants of which are essentially Slavonian.[2] In these states the joint-family exists at the present day. It includes, generally, three generations, and comprises from ten to twenty persons; in exceptional cases, as many as fifty or sixty are noted. The amount of land belonging to the family consists of from forty to fifty acres. The dwellings consist of one principal house, the residence of the family chief, containing the large room where the common meals are eaten, and where the family gathers for social purposes; around this are grouped the other dwelling houses. Such a joint-family is called a *zadruga*, the word meaning an association. The chief is called the *gospodar* or *starchina*, the latter word meaning the "older." It is instructive to notice his powers, as they are not at all despotic.

He is elected by the members of the family. He may be removed from office if his rule is distasteful. He generally resigns when he gets too old to manage the business as it should be done. He is the general manager of the family, buying and selling as occasion requires, and regu-

[1] "Primitive Property," p. 17.

[2] The states are Slavonia, Cretia, Servia, Bosnia, Bulgaria, Dalmatia, Herzegovina, and Montenegro.

lates the work to be done. But in all this he acts in accordance with the wishes of the family members, and is careful to consult with them on all matters of moment. A matron is also elected to superintend the domestic economy. She is not necessarily the wife of the *gospodar*, but such is the general rule. She directs the education of the young, and is to be consulted in regard to all marriages. The *gospodar* submits from time to time, to the assembled family, a report of his management. Such is the joint-family to-day among the Southern Slavs.

We think, furthermore, that if all the facts were known the rule of the house-father among the Germanic tribes was much less arbitrary than some writers state. They have been too much influenced by what is known of his power among the Romans. At any rate, joint-families exactly on the same plan as the *zadruga* are known to have existed universally throughout France until well into the eighteenth century. A writer as late as 1788, describing one, says: "All the members of the community assemble; a chief is elected by the majority of voices, who takes the title of 'master.' . . . The master, in his character of chief, receives the moneys, sells and buys, ordains reparation, allots to each his tasks, regulates all that concerns the houses, the vintage, and the herds; . . . but . . . having only a deputed authority intrusted to him, he is responsible to those of whom he holds it, and can lose it in the same way as he received it. . . . The internal domestic details are intrusted to a woman. . . . She bears the title of 'mistress;' she directs the women as the 'master' does the men; like him, she is chosen by the majority of votes, and like him may be deposed." At least one such joint-family was described in 1840, and indeed at the present day in Brittany, and in the depart-

ment of Jura, traces still exist. We learn that in Northern Italy substantially similar families are found to-day. "These associations are usually composed of four or five couples living in common in a large farmstead. They recognize the authority of a chief and of a housewife," whose duties are the same as those above described.[1]

We will now turn our attention to the ancient Greeks and Romans, and we must preface our remarks by a few words of explanation. A host of eminent scholars have written on the history of these two people. As far as the mere recording of events is concerned they leave little to be desired, but when they undertake to tell us about the social institutions they are not always correct. In regard to Greece, we must reflect that its history was not written until after the political institutions of Cleisthenes (B. C. 509) had become fully established. "Even before the Peloponnesian war, the Greek constitution had ceased to be a development of the ancient institutions. The ancient basis had consumed itself."[2] History is said to commence with the Olympic games celebrated in the year 776 B. C., but our knowledge of events in Athens before the time of Solon (B. C. 683) is almost a blank.[3] Lying back of that time is a long lapse of years, how many we will never know, and our knowledge of the ancient institutions has to be deduced solely from legends and myths which the ancient poets embalmed in verse. It is surely not presumption to ask for a review of their descriptions, and to read their accounts with the fuller knowledge we have now obtained of ancient society.[4]

---

[1] The facts in regard to the Slavs and others are gathered from Laveleye's valuable work, "Primitive Property," pp. 180–214.

[2] Niebuhr: "Ancient History," Philadelphia, 1852, Vol. II, p. 394.

[3] Greene: "History of Greece," New York, 1855, p. 88.

[4] This has been well done by Mr. Morgan, in "Ancient Society."

As is well known, the Greeks are a branch of the great Aryan stream. Even the earliest historical gleams show us two principal races of the Greeks—the Dorians and the Ionians.[1] Of the Ionians, the Athenians will be taken as typical; of the Dorians, the Spartans. As far back as we can trace the Athenians, they appear as a nation composed of four tribes. There are traditions of the time when this coalescence took place, which is said to have been caused by the influence of Theseus; but the time at which it occurred long precedes historical records.[2]

The Ionian tribes first made their appearance in Attica as invaders. The same is true of the Dorians in Peloponnesus. Like all successful invaders, they held the original inhabitants in a state of subjection. At least some of the subject tribes were practically independent, and in course of time they began to urge their claim for a share in the government, and the history of this conflict may be traced in the social revolutions of the ancient cities.

Let us first consider the probable government in the first or heroic age—the age lying beyond the light of history. They were probably in much the same state of life as the Germanic tribes in the time of Tacitus. At the head of the tribe, or confederacy, was a *basileus*. This word is generally translated *king*, but his powers were entirely different from what we generally understand by the powers of a king. Often at least two of these personages appear,[3] as among the Spartans. We think the probabilities are that, in the majority of cases, two officers were chosen—one the civil head, the other

[1] Herodotus i, 56.

[2] Greene: "History of Greece," p. 88.

[3] Thirlwall: "History of Greece," New York, 1851, Vol. I, p. 133.

the war chief.[1] The basileus was elected, though the office was doubtless hereditary at first in a certain gens, subsequently in a certain family, and finally it tends to pass by succession from father to son. Though birth might give the son a presumptive right to the office of basileus, it was still necessary for him to be elected.[2] If therefor unsuited, by reason of age or bodily infirmities, or if personal character was such as not to command respect, the office went to another person.[3] The office was for life, but subsequently acquired infirmities of mind or body, by reason of age or accident, necessitated its relinquishment.[4]

The basileus is often described as ruling just as he saw fit. Thus, Greene says: "The authority of the king was not limited by any laws, . . . for the exercise of it he was responsible only to Jove. . . . He had the sole command of his people in war. . . . He was general, judge, and priest."[5] To the same effect writes Curtius.[6] There are excellent reasons, however, for denying that the basileus possessed such powers as are here set forth. Thirlwall observes: "It is evident that the kings took no measures and transacted no affairs in their official capacity without the assistance and sanction of the chiefs and people."[7] In fact it is easy to discover the limited power of the basileus. He appears as directly subordinate to the council.[8] As their general, he possessed great power in times of war; also, as priest, he

[8] Gillie's "History of Ancient Greece," Philadelphia, 1831, p. 27.

was a very influential and respected person.[1] Mitford[2] makes such a judicious observation that we quote it entire. Speaking of the basileus in ancient times, he observes: "In all civil concerns their authority appears very limited. Everything that remains, concerning government, in the oldest Grecian poets and historians, tends to demonstrate that the general spirit of it among the early Greeks was nearly the same as among our Teutonic ancestors. The ordinary business of the community was directed by the chiefs. Concerning extraordinary matters and more essential interests, the multitude claimed a right to be consulted, and it was commonly found expedient to consult them." In short, we see in the basileus the official head of the confederacy or nation. The same title exactly was used for the tribal chief. He was an elected officer, the first among equals.

Let us now treat of the tribes composing the confederacy or nation. Each appears as a fully organized body, composed of phratries subdivided into gentes. Each gens had its chief, who generally bore the title of *archon*.[3] It had its common feast days and its assemblies, where it passed laws binding on all of its members.[4] The gentes were reunited in phratries, and we notice that the phratries, in some cases, had disappeared. Although it existed in full vitality among the Doric tribes at Sparta, yet it was not found among the Dorians generally.[5] Among the Spartans this division was called an *obe*. Among the Athenians our word *phratry* makes its appearance. Each phratry had its chief, or *phratriarch*. It had its assemblies and tribunals, and could pass decrees.[6] Each tribe

had at its head a *tribe-basileus*. It bore a name significant of descent from some supposed common ancestor. When tribes coalesced to form a nation, they naturally lost their individuality, but we can detect many references to them.

Almost all writers on Grecian history speak of the tribes and their subdivisions; but not being acquainted with the tribe, phratry, and gens among partially civilized tribes, they have failed to clearly understand and describe them. To still further complicate the question, we must remember that the ancient institutions were early broken down. Back in legendary times the powers in both Sparta and Athens had to break in on the ancient order and make concessions to some of their subject tribes, so that from this time on the divisions appear as modified by legislative enactments. We have seen that each of the divisions and subdivisions of the Grecian tribes were headed by chiefs. It is not necessary to recount how these offices, originally filled by election, tend to become hereditary and descend from father to son. In the accounts of heroic times these chiefs generally appear as the "nobles;" and so early Greece is plentifully provided with "kings" and "noble lords." The accounts given by some writers, thoroughly imbued with European ideas of royalty and nobility, of the charming simplicity of the Greeks of the heroic age are really amusing.

Even kings and nobles, it is said, did not consider it derogatory to acquire skill in the manual arts. "We find it related that Achilles cooked the dinner for the ambassadors who were sent by Agamemnon to visit him in his tent. Ulysses carved and ornamented his bedstead for his bridal chamber; and Nausicaa went to her

father when sitting in the council of his chiefs to ask that she might go down to the river with her handmaids to wash the linen of her household."[1] We have to observe, on this pleasant state of affairs, that in early times any assumption of superiority on the part of the chief or his family would probably have led to his overthrow.

At some unknown time in the past the Dorians invaded the Peloponnesus. In the course of time they acquired the mastery of the greater portion of the peninsula. They were mainly in three tribes—Hylleis, Dymanes and Pamphyli.[2] These three tribes seem to have coalesced into a nation before the invasion, because each of the invading bands appear to have contained portions of these three tribes, and hence they are found generally in the Dorian cities.[3] They found the country already inhabited. Some tribes appear to have been completely subject to them, as the Helots in Sparta; others obtained better terms, as the Periæci of the same state, and in some cases they seemed to have forced an alliance with their Doric conquerors, and even at Sparta we detect traces of such alliance. Subsequently, Sparta, by her military prowess, obtained the supremacy in the peninsula. Sparta was always very conservative in her form of government, clinging to the traditions of the past; consequently, it will well repay close examination.

We note first the signficant fact that the confederation or nation had two official heads—two "kings." The probabilities are that, especially at an early day, one represented the civil power and one the military power, though in process of time they appear as equals. The office passed by succession. It is instructive to notice the

[1] Frost: "Greece," Philadelphia, 1842, p. 23.
[2] Müller's "Dorians," Vol. II. [3] Ibid., p. 77.

powers of these "kings." In time of war their power was certainly very great; when they had passed the boundaries of Sparta they had no superior. They were also national priests. As such they interpreted the oracles and presided over the sacrifices. As judges they presided in those cases where the general government was concerned. In civil affairs their power was nothing more than any other phratric chief. They formed part of the council, but their vote counted no more than any other individual. Their power and its limitation is most significant when we consider that it was probably similar to the royal power of the heroic age.[1]

The tribes composing the nation retained to a late day a considerable degree of individuality or power. It is generally stated that there were three tribes at Sparta; the fact is, we do not know the exact number.[2] We think there are good reasons for concluding that there were five tribes; this because five superior officers, representing the civil power, known as *ephors*, make their appearance. It is generally stated that one was chosen from each of the divisions of the city. But if we only reflect on the power they exercised, we see that they must have each represented a tribe or a division of a tribe; furthermore, the divisions of the city of Sparta can only represent the tribes composing it.[3] In short, the easiest way is to conclude that the five ephors represent the five chiefs of the five Spartan tribes.[4]

These ephors certainly represent the whole collected

---

[1] Müller: L. C., Vol. II, p. 100.

[2] Thirlwall: "History of Greece," New York, 1851, p. 131; also, appendix to same. [3] Müller; L. C., p. 48.

[4] Grote ("Greece," Vol. II, p. 362, note 1) shows that we have no certain knowledge of the number of tribes at Sparta, but states that Barthelemy makes this number five.

body of the Spartan nation. Their powers are generally spoken of as gradually encroaching on those of the kings. We think they always had more power in civil affairs. They transacted business with foreign embassadors. They, as representatives of the people, signed treaties of peace. Once every month they required from the kings an oath by which they bound themselves to rule according to law, and in return for this they promised, in the name of the people, to uphold their authority. They gave instructions relative to carrying on war. They remained seated when the kings passed by, but the kings were bound to rise in honor of them. The kings were liable to be called before them for trial, and punishment was inflicted on them if found guilty. They even suspended the kings from office if they thought the gods were displeased with them.[1] In fact, the Spartan kings appear simply as hereditary generals and priests.

We are not to suppose, however, that the ephors possessed arbitrary authority. They were simply executive officers, each probably representing a tribe. The old council of chiefs remained as a most essential part of the government. Here, however, it is not the chiefs of the gentes that form the main part of the council, but the chiefs of the phratries, or the *obes*. This council was known as the *gerusia* or "assembly of elders." It is generally stated to have consisted of thirty members;[2] but Grote shows that there is no real authority for this conclusion.[3] Originally, it is not probable that each tribe would contain the same number of phratries, but by legislative enactments this might have been brought about.

[1] Smith: "Dictionary of Antiquities," article on Ephors; also, Müller's "Dorians," Vol. II, p. 122.

[2] Müller: L. C., p. 80; Greene's "Greece," p. 65.

[3] "History of Greece," Vol. I, p. 361.

To this assembly the kings, as representing the nation, belonged and presided over its sessions. It is not stated anywhere that the ephors sat in this council, yet they probably did. Müller observes: "They must, in early times, have had the privilege of proposing laws." This could only have been to the gerusia; besides, when the gerusia sat as a court to try noted offenders, as a king, the ephors sat with them.[1] The conservatism of Sparta appears in that they did not allow this office of chief of the phratries to become hereditary; it was always elective. This council prepared laws to be laid before the assembly. It also exercised judicial authority.

Still, a law passed in due form by the gerusia had to meet the approval of the popular assembly before it was duly enacted. This assembly was composed of all citizens above the age of thirty. They did not originate measures; their power was to vote on measures submitted to them by the gerusia. The only ones who could address them were the ephors and members of the gerusia. Yet this assembly was supreme. It only could declare war, or make a binding treaty of peace. All affairs of great moment had to be settled by its vote. The time of meeting was at each full moon, but on occasions of emergency it could be called at any time.

We have now discussed the most strongly marked characteristics of the Spartans that betray the organization of ancient society. We do not know what part the gentes, as such, took in the government. They undoubtedly were in existence. It is supposed that there were thirty in each *obe*, or phratry. They must have been fully organized, each with its own chief. We know that the army was marshaled according to tribes, phratries, and

[1] Müller: L. C., pp. 123–125.

gentes.[1] It is probable, though we have no authority for the statement, that when a general assembly convened the people assembled by gentes. Neither do we know very much about the joint-family. Indeed, at Sparta, the authority of the state overrode family ties. Yet the custom in relation to holding land gives us considerable light on the point.

When the Dorians possessed themselves of Peloponnesus, the territory was divided among the tribes; and thus Sparta had a communal domain of great extent. But when history throws a light on the scene, the only owners of property seem to have been the gentes.[2] Land seems to have been divided by the officers of the gentes among the families composing them. Plutarch tells us that when a child was born the elders of the tribe assigned it a lot. But the officers he here speaks of were probably officers of the gens.[3] On the death of the head of the family there was no partition. All the children remained grouped around the common hearth. One of the brothers, the most capable, and, as a rule, the oldest, by reason of the sacred privileges of his birth, regulated the community, and was called the "lord of the hearth."[4]

If Sparta shows us the conservative element in Grecian history, Athens shows us the progressive element; and hence a review of her institutions and history will show us the conflict between ancient society and the forces of advancing civilization, before which the organization of ancient times gave way for those of modern society. When the Ionians entered Attica is unknown; as there is so much doubt and uncertainty and clashing of opinion on the part of those who are entitled to express an opinion,

[1] Müller: L. C., Vol. II, p. 244. [2] Laveleye: "Primitive Property," p. 159.
[3] Müller: L. C., p. 209. [4] Laveleye: L. C.

we can only make general reference. There seems to have been once a time when there were twelve independent tribes in what is now Attica. They were, however, probably loosely confederated under the head of the Cecropidæ at Athens. Thucydides thus describes this period: "People . . . lived in cities having their own prytaneums and archons, and when not in fear of danger did not consult their basileus, but governed their own affairs separately, according to their own councils."[1] In this description we are to recognize the *prytaneums* as the tribal chiefs and archons as the gens chiefs. In times of danger we notice they confederate under a common basileus, or war chief.

Time passed on, and four tribes in the immediate vicinity of Athens seem to have acquired a closer union, and, perhaps, gained a supremacy over the remaining tribes. The four coalescing tribes were the *Geleontes*, *Hopletes*, *Argades*, and *Ægicores*. They coalesced into one people, having a common basileus; yet each tribe was fully organized, having a tribe basileus, and having both phratries and gentes with appropriate officers. We are not for a moment to suppose that the common basileus had the powers of a king. But all historical knowledge of these early times was long ago lost. The neighboring tribes (perhaps they were not fully organized tribes) were closely related to these four. Whatever degree of subjection, if any, there was between them tended to wear away in time. They were continually pressing for a share in the government. Finally, when that legendary personage Theseus was basileus, he made the first concessions to them. The four tribes, the ruling class, were set aside by themselves as a class known as *Eupatrides;* the

[1] Laveleye: Book II, chap. xv.

surrounding tribes, or portions of tribes, formed two other classes, known as *Geomori* and *Demirugi.* They were probably given some share in the government, but the great part of power still lay in the four tribes first set forth.[1]

From the time of Theseus to Solon is an unknown period, probably extending over several centuries. During all this time we know but very little of the society or government at Athens. We know of some changes taking place, and we will probably not be in error if we ascribe these changes to the growing influence of the mass of the people, and especially of those without the pale of the four dominant or Eupatride tribes, who were continually pressing for the overthrow of the old established order of things. We notice a change in the title of the basileus; he was called the *archon.* As far as we can make out, this was simply a change of name, and not of authority;[2] but we may imagine that the people generally had something to do with this change. This office was still hereditary and for life, but we see plainly that it was of limited power only. A further change was in limiting its duration to a period of ten

---

[1] This is saying a good deal. However, this view seems consistent with all accounts obtainable. Remember, this was all before the dawn of history. For authority for rejecting the generally received story of Ionian invasion, see Coulanges' "The Ancient City," p. 172, note p. 173. For authority that the first four tribes formed the Eupatride class, and had nothing to do with the other two classes, see Malden's "History of Rome," p. 140. This view will explain the six legislative archons at the time of Solon. See Smith's "Dictionary," article on Tribes. This explains the opposition to Theseus on the part of the Eupatrides; they were no longer the sole power in the government. This will clear away the difficulty arising from the fact that the four tribe-basileuses were all Eupatrides. See Thirlwall, "Greece," Vol. II, p. 10. The two classes Geomori and Demirugi may have largely consisted of individuals, families, and gentes not connected with any tribe. See Morgan's "Ancient Society," pp. 26, 657; Grote's "Greece," Vol. III, p. 65.

[2] Coulanges: "Ancient City," p. 322.

years. The right seems still to have remained hereditary in a certain gens. At length we come to a great change in the government which we can only explain as the result of the continued agitation on the part of the mass of the people not connected with the four Eupatride tribes for a share in the government.

The office of archon was limited to one year's time; but the office was thrown open to the mass of the people generally, and, further, nine archons were chosen in the place of one. We must examine this number of archons; they certainly had some good reason for taking that number. We may be very sure that each tribe would demand an equal representation in this executive board. We gain an insight into the facts of the case when we learn the names and titles of the archons. Three of them represented the nation in its collective capacity, and divided between them the powers of the old basileus. The first was called, by way of preëminence, *the* archon; the year was named after him; he represented the civil power. The second one represented the priestly power of the king; he was called the *archon-basileus;* he was the high priest. The third one represented the war chief; he was the commander-in-chief; his title was the *polemarch.* The remaining six archons bore the significant title of *thesmothetes*, literally meaning "legislators." Now these are the ones that must have represented divisions of the Athenian people. In other words, they must each have represented a tribe.[1] We see in this revolution

[1] Herodotus, relating an insurrection supposed to have taken place B. C. 620, says that Athens was then under the direction of the "prytanes of the naucraries." The naucraries were political divisions analogous to the gentes, so that this expression means "tribal chiefs." Thucydides, in describing the same event, states that Athens was under the control of the archons. Much effort has been made to reconcile these statements. In our opinion both are right. The six archons represented tribes; each was a "prytane of the naucraries."

simply the admission to equal political rights, along with the old Eupatride tribes of the two classes of Theseus, the Geomori and the Demirugi. They had at length achieved political recognition.

But these two classes, who had finally forced their way into a share of the government, compelling an unwilling recognition from the four Eupatride tribes, were probably composed, to some extent, of unrelated individuals, families, and gentes. They were unacquainted with any form of organization except that of tribes, phratries, and gentes; they were, therefore, organized on substantially the same basis. But a new set of names make their appearance; the *naucrary* is used for gens, and *trittyarch* for a tribe. Whether these names took the place of the older divisions in the Eupatride tribes we can not say. In these two organizations were contained the germs of the township and county. They were in a sense territorial divisions. This institution is generally accredited to Solon, but we know that these divisions long precede his time.[1] We would prefer to trace it, at least, as far back as the substitution of nine archons in place of one.

This executive board of archons possessed no arbitrary power. Our knowledge of these far-away times is so very limited that we can not speak with assurance on this subject. However, we detect in the dim past a council or court of Ephetæ. Its number is generally stated to have been fifty-one, but this is probably true only of the latter stages. We have but little doubt that at its origin it was a council of chiefs of phratries. When the commonalty had succeeded in their efforts to share in the government, this old court continued to exist, but with dimin-

[1] Smith's "Dictionary," article on Naucrary.

ished functions. It seems quite evident that for a time the government of the four Eupatride tribes would continue to exist side by side with the new government, though always with decreasing influence; such, at any rate, was the fate of this old council. But when the government of the six tribes came into existence, it also required some such a select council. From its place of meeting, it was called the "Council of the Areopagus." It also must have represented tribal divisions. In addition to this select council, corresponding to the gerusia of Sparta, we have traces of another larger council, composed of probably three hundred members.[1] These members could only have represented divisions of the tribes. If we are correct in supposing six tribes, there must have been fifty to the tribe.

When we finally emerge into the light of history, the first figure that strikes us is that of Solon. When he became archon the social evils in Attica had become almost unbearable. He attempted a reformation. The laws he produced, bearing on the internal affairs, we need not here discuss; but if we interpret his laws in reference to government, it seems to have been a step backward. He seems to have left, for most purposes, the old organization in tribes as he found it. He made a division of the people into four classes, founded upon wealth in land. Now, if we will reflect on ancient customs in regard to holding land—how in most cases alienation was impossible, and how in Greece the "Roman idea of absolute property was always foreign;"[2] how property descended from family to family, not to individuals; how the gens is the absolute owner and divides up the land among the

[1] Thirlwall's "Greece," Vol. II, p. 41.

[2] Laveleye: "Primitive Property," p. 158.

families composing it—we will probably be ready to admit with Niebuhr[1] that the first effect of his division was to remove from a share in the government those members in the existing tribes who had become poor.

These classes were simply different grades of the people in regard to eligibility of office. From the first class only could be elected the archons and highest magistrates. We do not know wherein the second class surpassed the third in privileges, but it probably did surpass them.[2] The fourth class was excluded from all offices, but they were permitted to take part in the public assemblies and in some forms of judicial proceedings. There is certainly no advance in political life here set forth. But we can go further: he composed his senate of four hundred members, taking one hundred from each of the four Eupatride tribes. This was certainly a backward step. He formed, however, the popular assembly in which all the citizens met to discuss and determine public matters. This assembly did not originate new measures; only discussed and modified, if deemed advisable, those submitted to them from the senate. All classes of citizens were by this law given a share in the government. We must also notice the court of the Areopagus, composed of the ex-archons (probably not wholly so), who exercised not only criminal jurisdiction, but exercised a sort of superintendency over public morals.

On the whole, the legislation of Solon was a strange mixture of progressive and antiquated ideas; that is, in reference to their political effect; his fame chiefly rests on his laws concerning internal economy. Like most compromises, it failed of pleasing either party, and his

[1] "History of Rome," Vol. II, p. 307.

[2] Niebuhr: L. C., Vol. I, note 1017.

laws had scarcely gone into effect before trouble commenced. The same results occurred in Athens that had taken place in so many other Grecian states. The masses of the people, dissatisfied with the existing government, combined with an ambitious member of one of the elder tribes and made him their *tyrant*, who answers very nearly to what we understand by a king. Almost all the ancient tyrannies originated in this way. They were the results of efforts of individuals, families, gentes, possibly tribes, for a participation in the government, which the elder tribes, who had first coalesced to form the city, were unwilling to grant. Peisistratus became tyrant of Athens. We must not understand by this some harsh ruler, for this was not the case. For fifty years he and his family held this power. Their rule was in the main just. They upheld the laws of Solon, and Athens flourished. Sparta at length interfered, and the family of Peisistratus was banished.

Cleisthenes, who now came to the head of affairs, succeeded in making the change from tribal society to modern political society. He dispensed with the old tribal divisions altogether. He divided Attica into ten tribes, the tribes being subdivided into *demes*. These resembled the old tribes and gentes. Like the old gens, each deme was fully organized. It elected its *demarch* and other magistrates. It even had its own worship, its priest and its temple. But, and in this consists the great innovation, in the first place, all the freemen of Athens, whether they had formerly been connected with a tribe and gens or not, belonged to some deme; and secondly, men were distributed in these demes, not according to birth or property, but according to locality.

Ten of these demes made up a local tribe, in a large

measure an independent body, electing its tribal officers; but here, also, it was locality which determined the tribe to which a person belonged. Thus, after some centuries of almost steady progress towards this end, the old government, resting on personal relations, was overthrown. Whatever organization of the old tribes that still remained grew fainter and fainter. Of course survivals of old times meet us far down in history, but the new order of things was firmly established. This event is supposed to have occurred about 509 B. C., and marks a most important event in the history of Greece. Athens rose rapidly into influence and distinction under the new political system.

For the purpose of illustrating the former general prevalence of tribal society and the gradual growth of modern political society, no people would serve for a better example than the Romans. We can not do better, then, than to give a brief outline of as much of their history as will serve this purpose; at the same time, only the most general outline can be given. An entire volume would not suffice for all the details. From a very early time, Italy was doubtless thickly settled. The light of history only penetrates a few centuries before Christ with any clearness of detail. We speedily come to the debatable ground between history and fable, and finally perceive that almost all the elements of true history have vanished. We are not lacking so-called histories going back to the supposed foundation of Rome, placed about the middle of the eighth century B. C. It is now generally admitted that the accounts given by Livy and others of those early times rest on nothing but traditions, and are not to be understood as true accounts. We are at perfect liberty to review these traditions and see how they fall in with our present knowledge.

The first inhabitants of Italy, with the possible exception of the Etruscans, of which we have any definite knowledge, were off-shoots of the great Aryan stream. Like all the members of this family, their primary divisions were the tribe, phratry, and gens. They were agricultural and grazing people, and hence their organization shows itself in their customs in reference to the holding of land. The gens appears as a village community laying claim to a definite expanse of surrounding territory. The gens was a fully organized body, having its elective chief, who was also its high priest. The land of the gens was divided among the joint-families composing it.[1] A small amount only was private property. It comprised the space necessary for a house, court-yard, and garden. This is stated to have been two *jugura* (about one and a quarter acres) in extent. The remainder of the gens land was held in joint ownership.[2]

The joint-family of which we have just spoken, doubtless much like the joint-families we have already described, underwent some modifications among the Romans. The household chief came to have more and more despotic power. We are told that he was supreme in his household. "He was amenable to no earthly tribunal; no authority, either public or private, could stay his hand or punish his severity. He might divorce his wife or kill his son, and no person could question his conduct."[3] And such is the general conclusion of writers on this subject, and yet we think this gives a wrong impression. We find clear traces of a family council, and, beyond a doubt, the house chief was expected to act by its advice.[4] In

[1] Laveleye: "Primitive Property," p. 164.
[2] Mommsen: "History of Rome," New York, 1861, Vol. I, p. 63.
[3] Hearne: "Aryan Household," p. 97. [4] Ibid.

Roman law a son was never free from the authority of his father while his father's life continued. The daughter passed, by marriage, from the authority of her father to that of her husband. We know very little indeed in regard to the law of property. In early ages the head of the family was simply steward of the family property. He could not dispose of the land. The land and the family remained together. Only at a subsequent day was family property permitted to be divided among several sons.[1]

A number of gentes were reunited as a phratry. In the majority of cases we have no knowledge whatever of the phratry. Remember that it is a constant tendency of this organization to disappear. It revives, however, as we shall soon see, in the case of the three tribes at Rome, and probably it was a constant phenomena among all the tribes in ancient Italy;[2] but the tribes appear as composed of a number of these village communities having a common stronghold. The government was that which we have already fully discussed. At its head was an elected chief, governing not by any arbitrary right, but by the assistance of a council of the chiefs of the gentes, and back of this still lay the assembly of warriors.[3] This was an exact picture of the state of affairs discovered by Tacitus some centuries afterwards among the Germans, and it is illustrative of the great advance made by the Romans at his time that he failed to understand the organization of the Germans, which had once been that of his own people. Each of these tribes was independent, save that it might have been subject to tribute to some

[1] Coulanges: "Ancient City," p. 91.
[2] See on this point Niebuhr: "Rome," London, 1851, p. 26.
[3] Mommsen: Op. cit., Vol. I, p. 66.

stronger tribe. Confederacies, or the union of several tribes under a common head, were not unknown. We have a tradition of such a confederacy, of which, however, we possess almost no historical knowledge, in the confederacy of thirty Latin tribes under the leadership of the tribe at Alba.

Turning our attention more particularly to Rome, we conclude, from all accounts attainable, that at a time long preceding the dawn of authentic history a Latin tribe, which afterwards was called *Ramnes* (what its name was in the earlier stages we perhaps do not know with certainty), had its stronghold on the Palatine hill. The gentes composing this tribe must have had their locations along the left bank of the Tiber towards the sea, for in that direction only did her territory extend.[1] This was a fully organized independent tribe. How many gentes composed it at first we do not know; afterwards, when it had assumed a more or less artificial form, it consisted of one hundred gentes, reunited in ten phratries called *curies*. At its head was the tribal chief, called *rex*, who was the leader of its forces in war, its high priest, and executive officer.

Its senate, consisting of one hundred members, was composed of the chiefs of the gentes. Its general assembly was called the *meeting of the curies*. The votes were taken by curies; probably those having the right to vote were simply the heads or chiefs of the joint households. This assembly did not discuss measures, but simply voted on them after their purport had been explained by the rex. Yet it was the supreme body, and no important step would be taken by the council until it had been consulted.

Far back in the ages, we find evidence that the Sabines,

[1] Niebuhr: Op. cit., Vol. I, p. 289.

a people closely related to the Latins, appeared as an invading and conquering host. A tribe of these people, the *Tities*, took possession of a hill adjoining that on which the Ramnes had settled. It, too, was a completely organized independent tribe, divided into gentes and curies, under the leadership of a rex. For a time, we may suppose, the strongholds of these two people defiantly faced each other—one on the Palatine, the other on the Quirinal, hill; but, judging from traditions, they soon confederated together. This confederacy was at first a loose one, each remaining independent in government, each under the leadership of its own rex. But soon the union grew stronger. The senates of the two tribes form one united body of two hundred members; a common rex is chosen to command the common forces. A third tribe also appears in the traditions—the *Luceres*. But we know but very little about this tribe, or when it joined the confederacy, or what elements composed it. The first two tribes seem to have considered themselves the superiors of the third.

By legislative enactments these three tribes—the Ramnes, Tities, and Luceres—who long before the dawn of history had thus coalesced into one nation, were divided each into one hundred gentes, reunited in each tribe into ten curies. Each tribe had its appropriate officers, but as the tribal union became more complete, they tend to disappear, but even to a late day we recognize them in the names and titles of the military leaders.[1] The executive officer appears in traditions as the *king*. It is generally supposed that but one of these officers was elected at a time. We question, however, if the traditions do not show the existence of at least two of these officials—one to represent the civil and priestly power, and one to command the

[1] Ihne's "Rome," London, 1871, p. 114.

forces. Dr. Ihne thinks it probable that a general was appointed by the priest-king to command the army.[1] It is far from likely that such an important officer would be appointed by the king; more probably he was elected by the senate or the general assembly. It is well known that the city warden, in the absence of the king, exercised almost exactly his powers.[2] This officer was probably the same as the first senator. Ten of the senators of the Ramnes were known as the "Ten First;" they were probably the chiefs of the ten curies, and the first one among them was the *first senator*. He was the president of the senate. On the death of the king, the government at once devolved on him, but at the end of five days another of the ten took his place. He was probably one of the tribal chiefs, in early days probably chief of the Ramnes.[3] We shall probably not err if we conclude that he was really a second executive officer.[4] The legislative power appears in the senate composed of three hundred members, in which we at once recognize the chiefs of the gentes composing the three tribes, one hundred in each tribe. The supreme authority finally appears in the *comitia curiata*, or general assembly of the three tribes, where they met and voted by curies. They did not discuss measures decreed by the senate, but simply voted to accept or reject the same.

The three tribes organized as above set forth formed the nucleus of the Roman power. They were the *Patrician* class, like the four Eupatride tribes at Athens. They were the only privileged class in ancient Rome. From

[1] "Early Rome," New York, 1875, p. 106.

[2] Mommsen: "History of Rome," Vol. I, p. 98.

[3] Niebuhr: "Rome," Vol. I, p. 331.

[4] He was *Tribunus-Celeram*, and *Celeres* was but another name for the three tribes in a military sense. (Niebuhr.)

their strong, easily defended positions on the hills of Rome they commenced to send out their marauding bands, with the object of reducing the surrounding country to subjection. The petty tribes inhabiting the immediate vicinity were either driven off or subjected. Their ancient organization was largely broken up; their land was largely confiscated for use of the Patrician tribes. Such of the inhabitants as remained were allowed to hold a small portion of land and cultivate other portions for the benefit of the Patricians. In some cases, prisoners taken in war were also settled on these lands. This subject population was known as the *Plebeians;* some of the Plebeians, as a special mark of favor, perhaps, were allowed to attach themselves to Patrician households, in which case they were known as *Clients.*[1]

We are now presented with a state of things almost exactly similar to what prevailed in Athens, and events took almost exactly the same course of development. A struggle commences between the ruling and subject classes; between the Patricians and the Plebeians a struggle extending over an unknown period of time, ending in the final triumph of the people; and, in the course of that struggle, ancient society gave way to modern political society.

Unfortunately we have only the faintest historical light to aid us to a clear understanding of the gradual progress of this struggle. A very great advance was made towards the close of the kingly period, yet before the dawn of history. This advance was effected by means of a reorganization of the army. The Plebes had been called upon to serve in the army. They no doubt were the means of winning many substantial victories for Rome.

[1] Ihne's "History of Rome," Vol. I, p. 109.

But the only ones to profit by the same were the Patricians. The confiscated lands were tilled for their benefit; the tribute wrung from subject tribes went to increase their comfort and wealth. We may well suppose the Plebes were not pleased with this arrangement. But what could they do? The only organized government was in the hands of the Patricians. The army was largely composed of Patricians.

Several writers have supposed that the kings were anxious to increase their power by attaching the Plebes to their cause. In Grecian states we have seen how tyrannies arose in this way. One writer passes in review the traditional history of the kings to show that in general the kings sided with the Plebes, and consequently acquired the enmity of the Patricians.[1] We can easily understand the motives which influenced them. "The ambition of the kings was to cut loose from the old principle of government, which limited the exercise of their power. The ambition of the Plebeians was to break the ancient barriers which excluded them from the religious and political associations." Hence the tacit alliance.

The king who appears in traditions as the special ally of the Plebeians was Servius Tullius. A number of important changes are connected with his reign. We know, perhaps, nothing positively about this king or his reign, but the following account is consistent with all attainable traditions: He gained possession of the throne by stratagem. The senate appears never to have recognized his rule. He proceeded to make friends with the Plebeians, at that time the most numerous class. He proceeded to organize this commonalty as local tribes. He formed thirty local tribes, each being territorial and having known boundaries. Twenty-six of these tribes

[1] Coulanges: "The Ancient City," pp. 324, 327.

were country tribes; four were from the city. These local tribes did not contain any of the old Patrician tribes; they still retained their ancient organization. Here was the germ of modern political society, but it failed in several respects. It did not break up the old tribes and include their members in the ranks of the local tribes. The government still remained in the hands of the Patricians. They still had the senate, and all offices of the general government were filled by Patricians.

Still another step was taken by this king which subsequently proved of great assistance to the Plebeians. He reorganized the army. Remember that in early times the army and the people are the same thing. He arranged all the people into five classes, on the basis of wealth. To these five classes must be added the Equestrian order. The military duties of the people, their position in the army, was now made dependent on wealth. In the army, then, the Patricians and Plebeians now fought side by side. They obeyed a common officer, belonged to the same division, were arranged under the same banner. A most important change went along with this reorganization. The army, as reorganized, formed the new general assembly, to which was confided the final decisions of all important questions.

We are here presented with an anomalous government. The three Patrician tribes, strictly organized on the basis of ancient society, were really the ruling class; they still held the senate and all general offices. The commonalty was organized in territorial tribes, but as such they had no share in the government. The military organization was the only arrangement which gave the Plebeians a share in the government; and here the equality was largely in appearance only, for the Patricians

belonged almost wholly to the wealthier classes. The Plebeians, doubtless, were almost confined to the four lower classes,[1] and these four classes together did not probably have more votes than the first class.[2] Still, a great advance had been won by the common people.

We have suggested that the kings were largely concerned in advancing the interests of the Plebeians. The Patricians, therefore, detested the kings. It is not surprising, consequently, to read of a change in the government occurring soon after the changes above set forth. Exactly the same change takes place as did at Athens. The kings for life are replaced by year kings; that is, with the exception of the priest-king, who was still chosen for life. The civil and military powers of the king (or kings, as the case may be) were confided to two consuls, who held office for one year at a time.

It is not necessary to carry this investigation further. The whole history would simply show the growing importance and power of the Plebeians; they gradually force a share in the government. Tribunes are appointed to represent them, as the consuls do the Patricians. The Patricians are always jealous of their rights and privileges, but one after another they have to be shared with the Plebeians. The senate and highest offices of the state are at length thrown open to them. They obtain equal rights in the eyes of the law, and at length force a recognition of equal social privileges; but their organization, we must remember, was territorial, and not personal, and so their triumph meant the overthrow of ancient society among the Romans.[3]

---

[1] Ihne's "Rome," Vol. I, p. 140. [2] Ibid., p. 68, note 1.

[3] In this brief sketch we have given an outline which we think consistent with all the traditions of early Rome. The student should consult Niebuhr's

Our object in this chapter has been to trace the gradual evolution of social organization for governmental purposes. We have found that three different systems have been employed. At first society was organized on the basis of sex. Manifesty this was suited only for tribes in a very low scale of development. That form of society has mainly disappeared, though plain traces of it still exist in the class divisions of the Australian system. Judging from the system of relationship, it was once of very wide, probably universal, extent. It was succeeded by tribal society, based on kin; that is, personal relations. This latter system has in part given way to modern political society, based on territory, which change can be clearly traced among all the Aryan nations.

Each of these changes represents a great advance—a conquest achieved by man. Going along with advance in the direction here pointed out, we may be quite sure, was a corresponding advance in culture. Improved weapons and tools, the domestication of animals, and a knowledge of agriculture, were a part of the achievements keeping company with this advance in social organization. We may be sure that advance, as here designated, was not the result of spasmodic effort, nor the fruit of a few years' exertion. Slowly, almost imperceptibly, advancing intelligence called into being new wants, new aspirations; suggested modification of previous customs; demanded new measures. As the night grows into the day, so did the darkness of barbarism grow into the light of civilization.

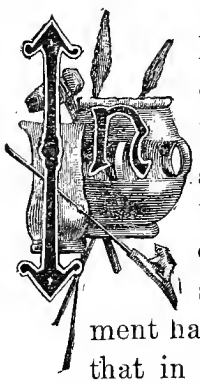
---

"History of Rome;" Ihne's "History of Rome;" also, by same author, "Early Rome;" and Schwegler's "Römische Geschichte." These authors all represent modern ideas in regard to Rome. Dyer's "History of the Kings of Rome" presents the other side. Mommsen's "History of Rome" is valuable, but we can not agree with his sketch of the kingly office and power.

# CHAPTER III.

## PRIMITIVE CULTURE

Introduction—Study of the Past—The Patriarchal form of Government—First Authority Personal—Evolution of the Gens Chief--Evolution of Tribal Chief—The Tribal Council—Change from election to hereditary descent—The power of ancient kings—The development of ancient law—The chiefs the first judges—Individual rights and wrongs unknown—Power of the House-father—The status of the joint family--Individual property at first unknown--Origin of law codes--Influence of property in developing civilization--Origin of property in land—Influence of property in developing law--Development of the useful arts--Indian picture writing--The symbolical stage--Indian hieratic writing—Development of Chinese writing—Peculiarities of Chinese writing—Egyptian writing—Hieroglyphic writing--Cuneiform writing—Development from picture writing—Origin of the alphabet--General conclusions.



PREPARING the way for a clear knowledge of ancient life and times, it seems necessary to pass in review the gradual growth in culture of people in prehistoric times. In this connection only the briefest outline can be given. Such a review will show that certain great laws of development have always been at work, and will also show that in general a race does not make advance in any given direction, without a corresponding advance in all directions. If improvement takes place in social organization, we straightway notice a corresponding improvement in the art of government, in law, and in religious conceptions. What further conclusions follow from this statement, we will discuss further on.

We seem to have clearly established the fact that the

progress of human life on the globe has been continued throughout a long period of time. We are not to picture to ourselves a series of great and sudden changes during this past time, or imagine that natural laws, or the course of nature were different from what they have been during the historic period. The older school of geologists imagined the change from one geological age to another to be due to some sudden and awful cataclysm. Their disciples to-day know of nothing but slow acting causes. There are volcanoes and earthquakes to-day, and there always have been these agents of destruction, carrying desolation to a large area of country; but, after all, the effect they produce is not for a moment to be compared to the majestic uplift of continents continued throughout unknown thousands of years.

Distance lends enchantment to the view and this is true of distance in time, or culture as well as in space. We must not picture to ourselves any imposing movement of people in prehistoric times. There were to be sure immigrations, invasions and conquests, but these movements were slow and deliberate, and conquests were not the foundations of empires but the conquered tribes were simply driven away or exterminated, it was only when a comparatively high stage of culture had been reached that they were allowed to keep possession of their ancient homes, on condition of paying tribute to their conquerors. The movement which carried the Aryans from Asia to Europe was doubtless spread over many centuries of time, much slower than that subsequent migration which, within the last few centuries, has so largely peopled the new world with their descendants.

The picture we would form of the past has nothing in it that is strange or phenomenal. We can but dimly pic-

ture to ourselves the slow spread of the black races over the eastern world. We notice their low development, their scanty culture, their stationary life. We picture to ourselves the ages come and go while they were the only ones to enjoy this fair world of ours. When the yellow races appear, they seem to every where have pushed the black races before them. An advance in culture is at once noticed. Improved tools announce that the Neolithic age is at hand. The yellow races spread themselves over the world. Later still the white races appear on the scene. When they commenced to spread, they found themselves confronted everywhere by the yellow races. They carried to successful termination, the art of working metals. Thus a great progressive career is made possible. Letters are invented, coins are struck; the light of civilization begins to glow here and there, in many cases only to expire in night, but finally the conquest is made permanent.

It may be well to see what results follow from an investigation of the evolution of the different departments of government. By the word government we understand the several departments of the State, as the Legislative, Executive, Judicial, etc. If we have never had occasion to think over the question, it probably strikes us at first that all these departments are perfectly natural, and that men would make provisions for them as soon as they felt the necessity for any government at all. This, however, is far from the facts of the case. Men had to feel their way cautiously and slowly to all the departments of governmental activity.

Our ideas in this respect vary somewhat, according to our views in regard to social organization, as set forth in the previous chapter. Some, probably the most, of the old writers started with the assumption that the family

(in our modern sense) was the starting point of all society; and, as the family developed into the gens, and the gens into the tribe, there was always an official head to this growing and developing society. They assumed further that this "head" simply exercised in a larger sphere the powers of a house-father among the Romans. That is to say that he possessed arbitrary, despotic power governing all under him according to his own will and pleasure. As the father governed his family, so did the chief govern his clan, and the king his people; with no one to review his actions.[1]

This was called the patriarchal form of government, and was supposed to be the natural one, the most ancient in point of time, the one from whence all others were derived. But if we are not mistaken in the conclusions set forth in the preceding chapter, the patriarchal is but one form of the joint family, which did not come into existence until a comparatively recent time.[2]

Nor has society taken this form of development in all cases. We can not therefore acquiesce in these views. Whether we can indicate the probable lines of advance, or the order in which the various departments of government made their appearance as something distinct from the general mass is perhaps doubtful. We will, however, attempt it, keeping constantly in mind the social organization as already mapped out, though we must be very brief in this matter.

It is only when considerable relative advance had been gained that we detect the beginning of government. At first, authority is only personal and temporary. It is ac-

1 See Quarterly Review, January, 1886.

2 In addition to authorities quoted in previous chapter consult "The Patriarchal Theory" by McLennan, London, 1885.

quired by reason of age, strength, or sagacity. Within the communal band, already treated of, this could have been the only form of authority known. It to-day characterizes a number of races who are low in development. It is true of Bushmen, Fuegians, Andaman Islanders, Veddahs, most Australian tribes, Tasmanians, New Guinea tribes, some tribes in Northern Asia (Kamtschadales) Eskimos, and some of our Indian tribes.[1]

Some of these tribes have made considerable advance in social organization, yet government proper has not arisen. When threatened by some sudden danger, the band consults, and a temporary authority is vested in one of their number, conspicuous by reason of age, bodily strength, or sagacity. We have an illustration in an Australian tribe where the king's authority seems to rest on such things as his ability to tell just where in a hollow tree to cut for an opossum.[2] We read that among the Greenlanders it was noticed that when several families lived together all winter, one weatherwise, old fisherman, would have the north end of the snow house for his place, and be appointed to look after the inmates, taking care about their keeping the snow walls in repair, and going in together, so as not to waste heat.[3]

It is instructive thus to notice that people, who have well developed forms of tribal organization, have yet nothing like a regular official head, and none of the departments of government can be said to exist apart from the general mass. When that stage of advancement is reached, where the various gentes of a tribe feel the need of some

---

2 Mitchell "Australia" Vol. I., p. 203.

3 Tylor "Anthropology," N. Y., 1886, p. 429. Such is primitive royalty.

official head to represent them, there is simply an extension of the authority of this temporary headsman. The office remains after the danger, or emergency has passed away, and the chief continues to represent his gens, as long as he maintains his reputation for the possession of superior bodily and mental qulities. When these fail, he is quietly set aside for some else. This stage of organization was in existence among a number of our Indian tribes and among some Asiatic pople. It appears in the description of the Nomadic Arabs, the Dyaks and some of the mixed tribes of Hindoostan, such as the Todas, Karens, and Nagas.[1]

Now from this stage advance takes place in several directions. We have seen that the gens did not feel the need for an official head until considerable advance had been attained. So, also, it was only at an advanced stage that a need was felt for an official head of the tribe. The same stages exactly are passed through, as in evolving the office of gens chief. In time of war or danger, the command of the forces of the different gentes was entrusted to the most renowned chief among them. His authority tends to become more and more permanent. These people are apt to loose sight of their early history, and hence it is that in so many descriptions of tribes, we find that, though some chief is recognizable as the head one, yet his authority is in reality not greater than that of his subjects.[2] The

---

[1] See tables in work already quoted. See Spencer "Elements of Sociology," p. 571, table. If we make a list of tribes having no regular official head, and compare it with a list of those having such heads even of an unstable nature, we will at once notice that the latter list contains the more advanced people.

[2] Here are some people to whom this last statement applies Tasmanians, New Caledonians, American (hunting) Indians, New Guineans, Damaras, Nomadic Arabs, Khonds, Naga's (Descriptive Sociology.)

office of head chief existed in a number of our Indian tribes, but his authority was always very limited.[1] Of course we see that it was largely personal, and therefore one head chief might exercise more authority than another. This is the form of organization amongst most of the Asiatic tribes and also among the African tribes, though confederacies are also very frequent. We must notice two important results following from the rise of the head chief. The first is the tribal council composed of chiefs of gentes. In the great majority of cases, this is the superior of the tribe chief. In a great many instances where we are informed that the king or the chief rules by arbitrary or despotic right, closer reading reveals the presence of this council.

Another change is still in progress. As we have remarked, these offices tend to become hereditary. When descent is in the male line it tends to go, without election, or but formal one, to the son. Where descent is in the female line, to the nephew. But here the election would be more of a reality. Still we can see that this hereditary chief might not be a good warrior. Hence in all affairs relating to the handling of troops, the tendency is to separate the war chief from the civil. We here see one reason why it is that the tendency is that the military department of government, as separate from the civil does not arise until the tribes have attained a considerable degree of enlightenment.[2]

We have now briefly outlined the origin of the executive legislative and military department of government. Not considering the judicial at present, let us notice further

1 Morgan's "Ancient Society," p. 119.

2 It is not among people like Fuegians, Andaman Islanders and Australians, that the military as separate from the civil exists, but among people such as Nomadic Arabs, Karens and higher races.

change. Confederacies, under the head of one tribe, or the mutual share in government by several tribes show us exactly the same stages. At first a temporary union only, which tends to become permanent, and gradually requiring an official head, at first elective coming to pass by inheritance. A common war-chief also is elected, and we can see how it is that when the civil chief took possession of his office by inheritance, the war chief would still be elected as among the Germans. This war chief was probably the official who finally developed into the king, at least among the Germanic tribes.[1] As long as tribes remained simply united in a confederacy, not much change would take place in the council. But the union grows stronger and a nation is formed. The tribal council in each tribe exists as the national council, the germ of our senate or upper house. The general assembly reappears in several ways, the germ of our congress or lower house.

Before leaving this part of our subject, let us speak once more about the real power of so-called kings in ancient times and at present among partially civilized people. This has been in both cases exaggerated. There is of course a great deal of cruelty and unreasonable rule among partially civilized people. But the chief is everywhere hedged in by customs which he dare not disobey, and in the majority of cases he must rule according to his council. We learn that the theoretically absolute chief of the Kaffirs is obliged to consider "what effect his command will have on his followers." In Ashanti we read that the king is a despot, yet there is a superior council of four, and a house of "Captains" and they claim to be heard on all important questions. The absolute chief of the Bechuanas is liable to be severely criticized in his

[1] Freeman "Comparative Politics."

parliament by one of his chiefs, and "an able speaker will some times turn the scale even against the king."[1]

The quotations could be extended to almost any length. Liberty, equality and fraternity were cardinal principles among all people when first organized in society. Despotism only came in when a comparatively high degree of enlightenment had been reached. Many writers holding wrong theories as to the starting point of government (that is the family) are bound to see despotism where nothing of the kind exists. That partially civilized people are cruel in executing their laws is admitted, but this is not despotism. Madam De Stael is right when she observes that "Liberty is ancient, despotism is modern."

The legislative and judicial departments of government are inseparably connected with the subject of ancient law, at the development of which, we will now glance. This will, of course, partake of the same general unfolding as the organization of society. As long as society rested on sex as a basis, about all of law that could have existed was a few customs in regard to the relation of the sexes. With only temporary chiefs in times of emergency, no one was particularly concerned with seeing that customs were followed. This duty rested on the whole tribe. Any one knowing of a disregard of these rules could kill offenders without thereby committing a crime.[2]

When society organized on the basis of kin, or tribal society arose, anything like a system of laws was still far in the future. Laws were nothing but immemorial customs. We can only discover a few general principles. The gens

---

1 "Descriptive Ethnology" and authorities there quoted.

2 For example of such a summary justice see "Kamilaroi and Kurnai." We would seriously err were we to suppose that customs were not enforced. Public opinion exercises as great a force in uncivilized states of society as in the most enlightened.

was the unit of political life. The individual was never considered. Hence to wrong a person was to wrong the entire gens, and further, a wrong committed by a person was committed by the whole gens to which he belonged. A few moments reflection will show us how very meager must have been the subjects of customary law. Individual property had not yet come into existence. Consequently, the innumerable sources of actions arising therefrom, which comprise so large a part of modern law, were unknown. Individual rights and individual wrongs were unknown.[1]

When we arrive at that stage of organization, when chiefs for the gens and tribes make their appearance, then we can first detect something like order. The chief always appears as judge in primitive society, but he is as much bound up by precedents as the modern judge. In his case precedents are simply the customs of his clan. All the men of the gens participate in the trial which is presided over by the chief, and the question of guilt or innocence is decided by votes of those present. When the office of head chief of the tribes exists, whenever two different gentes are involved in a quarrel, the case is generally brought before the tribal council consisting of the chiefs of the gentes, but nothing like a regular right of appeal can exist among the majority of savage tribes.[2]

Let us pass at once from the consideration of the partially civilized people to the early Aryans, and see how in their case these customs grow into law; and finally something like the modern system appears. We of course cannot enter into the minutiæ of this subject. We need only to point out how the influence of the older state of

---

[1] It seems perfectly natural to primitive men that one individual should suffer for the wrong doings of another. See "Kamilaroi and Kurnai."

[2] The customs of the Mexicans in this respect exactly illustrate this matter. See Vol. I., p. 690-1.

affairs continued to mold the laws, and even after the overthrow of tribal society, its powers continued, for law like religion is conservative, and clings to the traditions of the past. We must recall what was written of the gradual evolution of political society at Athens and Rome. We can see at once that as long as power remained strictly in the hands of the ruling tribes, (that is, Eupatrides at Athens, the Patricians at Rome) law would remain just about in the stage last disclosed, the exception arises from the growing individuality of the family.

This family, as we have seen, takes its rise within the gens as soon as descent passes into the male line. We have found it well developed among all the Aryan people. It becomes, in a sense the unit of society. In the older form of tribal organization the gens, as we have seen, settled all disputes arising between its own members. When the joint family becomes well developed, it also takes upon itself to settle all disputes and cause of action arising between its members. Public law does not concern itself with the family individuals. The family chief or the housefather represents the family on all the important occasions.[1] He has the power of judge concerning all affairs arising within his family. But beyond a doubt in all important cases he only voices the decisions of the family council.

Let us understand the anomalous position of the joint family in the eye of law. It occupies the same position as the gens of more archaic society. As each gens was an independent self-governing body, so was each joint family composing a gens. This family was not the same amongst all the Aryan people. Among the Romans it seems to

---

1 see Gommes "Primitive Folk Motes."

have long survived, and held its own against advancing civilization, and explains much that is strange in their laws. Being self-governing, as far as concerns its own affairs, and the house-father acting the part of judge and executive officer, it is not at all singular that he appears as a despotic ruler. It was his province to pronounce sentence of death if the occasion called for it, even against his own son, and the State was powerless to interfere, any more than in an earlier stage the tribe could interfere in the judgment of a gens chief, concerning a member of his gens. Only we must understand that judgment in important cases was in accordance with the decree of the family council.

We cannot understand the peculiar status of the joint family unless we keep constantly in mind the whole frame work of ancient society. Each tribe recognized no superior power as far as governing its members was concerned. They might pay tribute to a stronger tribe, but in internal government they were independent. In an early day no tribe claimed or exercised the right of interfering in the affairs of the gentes composing it. Similarly no gens claimed or exercised the right of interfering in the affairs of the joint families of which it was composed. Hence it is that among Aryan people, of whatever nationality, (all developed some form of the joint family) the house or home had such a peculiar sanctity in law.

At the present day, we constantly repeat the old maxim that "every man's house is his castle." No one has the right to enter it without the owner's permission unless armed with authority by law. Late in the eleventh century it was enacted of households that "no person shall rashly inquire after those that are set therein. If any fugitive shall have entered the inclosure he shall abide

therein in security."[1] In Sparta it was a maxim that "without, (the house) all owned the authority of the State; within, the master of the house ruled as lord on his own ground."[2] In Rome it was the same. The house-father was supreme in his own home. "He was responsible for the conduct of all persons who were within his gates. No other person, whether official or non-official, could exercise any form of process within his jurisdiction."[3]

The official head of this independent self-governing family, the one who speaks in its name, represents it in the gens' council, manages its property, is its high-priest and judge; is the house-father. Among many ancient people, and especially among the Romans, he is represented as ruling with despotic authority. Whatever might have been the facts of the case among the Romans, we think we are much nearer the truth when we assume that he was simply its executive officer, hedged in by custom, and in all important cases advised by his family council.

As this is an important point, and is, almost without exception, represented by writers entirely different we will quote Prof. Hearn. "It seems, however, that the house-father, in the exercise of his authority, was expected to act in a juidicial capacity. He was not to follow his own caprice, but he was the administrator of the customs of his clan. He usually acted with the advice and consent of a family council. Even when he proceeded in a summary manner, as in the case of offending slaves, the severer punishments .... were not capriciously inflicted, but sentence was pronounced and executed after a semi-judicial investigation. In the case of any serious offense

---

1 Hearn "Aryan Household," p. 358.
2 Müller "Dorians" Vol. II., p. 296.
3 Hearn op. cit., p. 357.

by the wife or by the children, the house-father acted with the aid of his family council. We know little of the council and less of its procedure." [1]

Let us here pause to observe how true it is that the whole process of civilization has been to bring to the front more and more plainly individuals and individual rights. The progress is clearly seen, when we consider the communal band of the first stage, and tribal society resting ultimately on a number of equal, independent joint families, of the stage reached by the Romans and Greeks just before the advent of political society. Each of these ultimate unites bears a strong likeness to the original body. In this connection we of course do not refer to the relalations between the sexes for that had long been regulated, nor do we refer to the custom of savage and barbarous people, these had disappeared before advancing intelligence. But this likeness is plainly apparent in a legal aspect.

If we examine any ancient code of laws, such for instance as the various Teutonic codes, and the fragmentary codes of Greece and Rome, we will discover that they are almost wholly concerned with criminal law.[2] This is doubtless the meaning of the traditions that cluster around the sanguinary code of Draco. It is said that they were written in blood. They probably were almost wholly taken up with criminal law. In general it may be said that the older a code of laws is the more it is concerned with criminal legislation to the exclusion of civil affairs. It will not do to explain this fact by laying it to the lawlessness of early times. We must rather explain it as due to the fact

---

1 Yet, strange to say, Prof Hearn constantly writes of the house-father as if he were a very despot—ruling according to his own pleasure.

2 Maine "Ancient Law," New York, 1864, p. 355.

that the ruling powers had nothing else, or but a trifling amount, to legislate about.

Let us see the truth of this statement. Individual property was a thing of slow growth. The property of the individual belonged to the family. An individual could not contract with another individual. One family might enter into contract relations with another family but this was a wery ceremonious formal affair. When we talk about the cumbersome legal method in use now, we should bear in mind that law has been simplifying itself from the very earliest times. An individual, not owning property, had nothing to dispose of after death, therefore the idea of a will never occurred to the primitive Aryan. His property simply remained in the family of which he was a member, and was managed by the new family chief. If a family died out, the gens to which he belonged took possession of its property.

Now the great conflict of advancing civilization was to change the foregoing. It exerted itself to break up this family, and with such success that, at the present day, the relation of husband and wife is the only one not regarded as a contract. We all know that is a *status*. The relation of parent and child is supposed to be a contract one. This was not the case in ancient Rome. Civilization also gradually evolved the right of personal, private property. It also called into being the new law of contract, and gradually clothed a person with the power to direct by a will the disposal of his property after his death.

We have spoken of codes of laws, let us examine the causes at work to produce codes. Some have entertained the strange idea that certain noted men, such as Draco, Solon, Lycurgus and Moses were law-givers, and gave to the people what they had not before posessed.

Ancient laws were never produced that way. Ancient codes, from whatever source obtained, were simply expressions in writing of immemorial customs and habits. They were reduced to writing and given out for public inspection, because there was a demand for them. A few moments reflection on the state of affairs at Athens and Rome when codes made their appearance will enable us to understand the nature of this demand in many cases at least.

We refer to these two countries because, in a certain sense, what is true of their history is true of nearly all the European communities. We must recall the fact that in each of these countries there was, in the first place, a confederacy of tribes, coalescing into a nation, which thereupon subjugated the surrounding people. The history of these early times shows us a conflict in progress between these subject tribes and the ruling class. The former constantly acquiring more and more power. But considerable advance had been made before any participation in law-making power, was given to the Plebeians. One reason being that law and religion were so intimately united[1] and, as we shall see further on, religion, as understood by the early Aryans, could not be said to exist unless there was a full tribal organization. The gods were tribal gods, having no care for those who were not members of the tribe.

One of the strongest arguments that the ruling class had, wherewith to answer the claims of the commonalty for a share in the government, was that, as they did not have a share in the religion, they could not expect to share in the government or partake of the benefit of the laws. Yet a time came when this answer would not suffice. The Ple-

1 Coulanges "Ancient City," p. 250.

beians had become too strong to be denied. The laws had to be revealed to them. They were no longer to be left the exclusive and secret knowledge of the ruling class. To meet this demand, codes were produced, which are simply the orderly arrangements in writing of the customs and usages of the tribes. When this step was taken, law and religion were separated. The Aryan Hindoos who invaded India, at an early day relinquished their claim to government but remained in possession of religion and law. In consequence, these two departments were never separated, and so the code of Menu combines both religion and law. The same result occurred among the Hebrews, but from the working of a different cause. They had no subject tribes at all. It was a part of their policy to exterminate or drive off subject people, so when (probably at a comparatively late date) [1] a code of laws made its appearance among the Hebrews, it quite naturally, was largely a mixture of religion and law.[2]

It is difficult to overestimate the influence that property has exerted in furthering civilization, and this makes it necessary to glance at the rise and progress of ideas in relation to property, ideas which constantly reacted on the laws, and customs of the people. In order to render the acquisition of wealth more easy and certain, colonies were started off for distant lands, navigation became a science, researches of all kinds were instituted, and thus knowledge and civilization advanced. We can, at most, only give an outline, reserving the minor topics for other pages.

The ideas in reference to property must follow the line of development we have already found true in regard to government and law. In the infancy of the human race, or

1 See "Descriptive Ethnology."

2 On this point consult Maine "Ancient Law," p. 13, 14. Coulange "Ancient City," p. 402. Prichard and Nasmith "Hist. of Roman Law," London, 1871, p. 96-98.

better speaking, as long as mankind remained in the primitive, undeveloped, infantile stage, the idea of property can scarcely be said to have existed. Just in proportion as individual rights broke down communal rights, advance took place in regard to property; and, on the other hand, the acquisition of property was one of the most efficient agents, in bringing about a reduction of communal rights. Our first object is to show the truth of this statement.

As no example of a communal band is known to exist, we can only speak theoretically of their ideas of property. Yet we may feel considerable confidence in this respect. They of course had no ideas of property in land, such an idea was still far in the future. Of personal property, only the faintest conception existed. The articles composing their scanty wearing apparel, some simple weapons and tools, must have included all. One individual could not become rich another poor. All stood on the same level. Even game killed by a fortunate hunter was not his exclusive property, custom compelled him to divide with the other members of his band.[1] That the above represents the substantial facts of the case, we have no doubt for it is true of people in a much more advanced stage. When the gentes supervened upon the classes, mankind had still only the most feeble conceptions of property. This might be illustrated by the conditions of affairs among our Indian tribes at the discovery of America, or by the present condition of many of the lower races who have not advanced to the pastoral or agricultural stage of life.

The line separating barbarism and civilization is a very poorly defined one, but one distinguishing feature is the predominance of the passion for the possession of property over

1 See examples of this in "Kamilaroi and Kurnai," Melbourne, 1880.

all other human possessions.[1] This could not take place until advancing civilization had shown wherein the possession of property was desirable, which occurred only at a comparatively late date in that long lapse of years that intervened between the origin of man and of civilization. Hence it is that the growth of the idea of property was so slow during the period of savagery and far into the period of barbarism. When the discovery was made by Asiatic tribes that many of the animals pursued for game could be successfully tamed, and, when kept in herds and flocks, become a permanent means of subsistance, we can see at a glance that the tribes making use of this discovery, took a very great step in the line of human progress.

Let us trace the influence of this discovery in property. The possession of flocks and herds was a source of power. A tribe having these could hold together as a much larger body than one destitute of them. The warriors being well clothed and fed would be more formidable, and thus in all ways, would such a tribe be prosperous. Here then was an object to excite human cupidity. Now would all ideas in reference to property become more clear and corresponding advance be taken. Custom, which is but another word for law, would change to suit the new ideas. The divisions of the tribe would become more sharply marked off, and, as this was a step in the direction of individual rights, it was an important result.

A moment's reflection shows the truth of this statement. Ownership was not in the individual, but in a group. At this stage, the family, even in the archaic form, had not appeared. But the other tribal divisions were undoubtedly fully developed. There were both phratries and gentes. The right of property was in the

[1] Morgan "Ancient Society," p. 6.

gens. There is no difficulty in showing this fact. This is one of the oldest rules of inheritance. When property in land appears, it is the gens that owns the *mark, gemeinde, or commune,*[1] that is subdivided among its joint families. The laws of both Solon and Moses contain regulations for the marriage of heiresses, so as to keep the property in the gens. The property-owning gens requires officers to conduct its business. And thus the office of civil chief arises, as we have seen a few pages back, in treating of government, and this illustrates one of the many points wherein the idea of property advances civilization.

We can also see how the desire for wealth would tend to subdivide the gens into smaller groups consisting of several syndiasmian families,[2] the germ of the future joint family. Such bodies were at first formed for convenience, as for the erection of a common joint tenemant house, or to unite their forces to battle with the hardships of life. This exactly expresses the facts of the case among our Indian tribes at the time of their discovery. The reason why these smaller groups had not become more closely organized, with some official head, and composed mainly of descendants of a common ancestor, may be traced almost directly to the absence of property.

Let us inquire into this. We have in the preceding chapter shown the wide prevalence of female descent and have seen that such was universally the ancient rule; we have further observed that, as soon as any considerable degree of advancement took place, descent changed to the male line.[3] Now the possession of property tends most powerfully to break up this old rule of descent. In the first instance, the children were of the same gens as their mother, consequently they could inherit none of their father's

1 Page 173. 2 Page 150. 3 Page 155.

wealth. That must remain in the gens of the father. As long as property was virtually nothing no inconvenience followed from this rule; but, when the objects of ownership became of value, all sorts of shifts were made to evade it. This could be illustrated among our Indian tribes, within the last few years. Somtimes the father divided his effects among his children before his death, which gifts they could keep. Sometimes a favorite son was formally adopted into his father's gens.[1] Finally, to settle this matter, the more advanced tribes abandoned the old rule of descent altogether, and placed the children in the gens of the father.

We ought to see clearly that this advance was largely brought about by the increasing value of property. Along with this change of descent, arises the joint family, which is simply the several syndiasmian families of the former stage, which now consists mainly of the descendants of a common ancestor. The organization is closer. A family chief appears to manage the common property. A great many of the races of men have not yet been able to reach this stage. Perhaps the first to pass it were some of the white races, though on this point we cannot speak with confidence, only as they were the first to achieve civilization proper, they probably were also the first to reach this point.

Property in flocks and herds must have preceded property in land. Of course we can see that even among the very lowest savages, the tribe claims, and exercises the right to a particular tract of land, such as a river valley, as their hunting ground. But no idea of individual right existed. Such could not arise until considerable advance had been made in other directions. For nothing occurred to make land an object of value. We have already treated

1 See instances of both cases in "Ancient Society," p. 163, 170.

of the domestication of animals. In general such knowledge preceded a knowledge of agriculture though there are exceptions to this rule. Let us observe, however, that flocks and herds at once invest land with a new value. It is now used for grazing purposes. Among wandering pastoral tribes, this pasturage is carefully divided and their rights jealously guarded.

A greater advance took place when agriculture arose. This knowledge did not long lag behind the possession of domestic animals. In the new world there were no animals capable of domestication, and so the various tribes had to learn the art of agriculture, independent of the possession of domestic animals. Perhaps this is one explanation why advance in the Eastern world was relatively greater than in the Western. Be that as it may, all tribes in the possession of a knowledge of agriculture, at once attach an increased value to land, and now the progressive force of civilization, always tending to bring the individual to the front, begins at once that conflict which in most cases has now resulted in procuring for individuals the right of private ownership in the soil. A right unknown in the earlier ages of the world's history.

The advance made by all people before arriving at a knowledge of agriculture, was sufficient to give them the full tribal subdivisions, phratries and gentes. The gentes, being really the unit of organization, always appear in the first instance as the body having the right of ownership. It will be sufficient to notice the development among the Aryans alone. They reached the knowledge of agriculture before their separation, with the possible exception of the Celts. When, therefore, the tribes commenced their migrations from their primitive home, spreading throughout Europe, and Western Asia, they carried this knowledge

with them, and along with it their idea of landed property. And so it is, that when we investigate Aryan customs no matter in what country, we speedily come upon the gens under various names, as the land-holding body.

We need not doubt that originally all the members of the gens stood on equal footing in regard to this land. The chief had no more or better land than other members of his gens. Land being a very important kind of property customs in regard to it would change slowly. So it is that we find among many people arrangements for periodical redistributions. That is the land was in the first place divided among the individual (male) members of the gens, but every few years, a fresh division was made. That is of tillable land as a large part of the gens' possession was reserved for common purposes. There is plain evidence that this was the custom among all the primitive Aryans. Tacitus discovered it among the Germanic tribes of his day.[1] It is still the theoretical rule of the Russian commune though it is fast passing into neglect.[2] The rise of the joint family tends to break up this arrangement, because such a family becomes the new unit of society. We have seen this true of government and law. It became a property-holding group, and consequently the land of the gens was divided among its joint families.

But this family ownership is still a long ways from being individual ownership. The family was in the nature of a corporation. Its chief managed the common property, in which all its members were interested only just as this family has been broken down has this right passed into individual rights. We have now considered the origin of property, both personal and real, down

1 Germania, 26.
2 Laveleye "Primitive Property," p. 10.

to the rise of the joint family. Consider how different was this ownership from our idea of ownership. It was not an individual owning and holding property, but a close corporation with an elected or hereditary chief as manager. If a member by any means acquired property, it was covered into the general treasury. Wills were unknown because no one had any property he could thus control.

This joint family is no sooner established than it becomes in turn the point of attack of advancing intelligence. Individuals are released from the control of the family. We have referred some pages back to the curious form of the ancient Irish family. It was full when there were seventeen male members, and thereafter the birth of another male, liberated the oldest member (not the chief, probably) who passed out of the family control.[1] Among the Germanic tribes the son was liberated from the control of the family when he became a warrior.[2] The Greeks liberated the son when he reached his majority. The Romans liberated the son only on the death of the father. These liberated sons were capable of forming families of their own. Ideas of property also slowly underwent a change. We have stated the older rule that whatever an individual acquired, simply went to swell the family property. This seems to have been the first point of attack. What an individual gained by his own exertion became his individual property. We find this principle early inculcated among the Hindoos.[3] In Rome what a son gained in the service of the State became his private property. And thus one people after another devise some way to break in upon the old rule. So between

1 Hearn "Aryan Household."
2 Tacitus "Germania," 13.
3 Hearn "Aryan Household," p 236.

both of these causes, on the one hand breaking down the joint family, and on the other, destroying its property, we at last arrive at the stage of individual property, gained first in regard to chattels, finally allowed in reference to land, which is thus seen to be only the last step in a long line of development, and not yet accepted by many people.

We have now seen how much the passion for property has had to do in influencing and advancing civilization. At the present day the victories of peace are of more importance than those of war. It has always been so. Commence, trade and navigation have done more to advance mankind, than all the wars put together. We will become convinced of the truth of this statement, if we stop and consider the course of events. To-day the inventor wrestles with scientific problems in the hope that some fortunate combination of materials, or new arrangement of appliances will put into his possession some secret, by means of which he may gather a great store of wealth. Scholars are delving into all fields of research, in the majority of cases, with the same object in view. Continents are spanned with railroads, cables traverse the beds of the oceans, but the inciting motive in all these arrangements is gain. It is quite outside the main question that civilization in general is greatly advanced by the researches of the inventors and scholars, or yet again that in many cases, the love of knowledge alone has proved a sufficient incentive.

This, which is true of social advance now, always has been true. It was the commercial spirit which sent out the first colonies; which organized the first trading expedition, ultimately developing into the caravans of the East, which again was the first means of diffusing information. Long before the dawn of history in Europe, there was quite

a developed commerce. Amber from the Baltic found its way to the higher civilized countries of the South. Bronze was brought into Europe from Asia Minor, and some of the old trade routes have been brought to light by the researches of archæologists.[1] Commerce sent the first ship coasting along the shore, which was the first step in the formation of that merchant marine which whitens every sea.

A great commercial city like Rome desire to attract to its borders merchants from all lands. This could only be accomplished by treating them justly, and hence the necessity for breaking down the old ideas of justice and equity, and recognizing the principle that individuals not belonging to one's own tribe or nation were still entitled to be treated with justice. This lesson the Romans had to learn even in historic times. All ancient people emphatically believed that "they were the people." Their gods were the only true and powerful ones. All outside people were barbarians, entitled to no rights or privileges. Commerce first broke down this spirit, and, in the case of Rome, we find equity, or the "jus gentium," or in effect, the "law for foreigners," attacking many of the customs of Roman law. We have since lost this distinction, though there is still a fluctuating and illy defined line between equity and law.[2] We could extend this part of our subject to great length, but enough has now been set forth for our present purpose. We have seen, on the one hand, the great influence that the desire for wealth exerts in advancing civilization, and, on the other, how true it is that the evolution of property follows the same line of development that we have already found to be true in so many other respects; and have had occasion to observe once more that the process of civiliza-

1 Dawkins "Early man in Britain," London, 1880, p. 412.

2 Maine "Ancient Law," p. 55-58.

tion is one that constantly tends to separate out the individual from the mass.

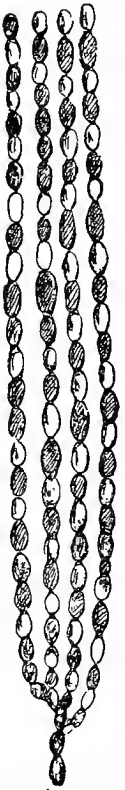
Let us now consider some of the useful arts. We cannot make an exhaustive study, but only illustrate the general truth that our present knowledge is the result of a gradual growth. The individual must first creep before he can walk; so primitive man had to make a slow and painful progress, where we, his descendants, profiting by the experience of the past, move forward more rapidly. If we were asked to name an art contributing greatly to our advancement, we would name printing, and point out how greatly general intelligence is advanced by the same. When it came into practical use, a new era in civilization was inaugerated. We can quite clearly trace the steps leading up to this great invention.

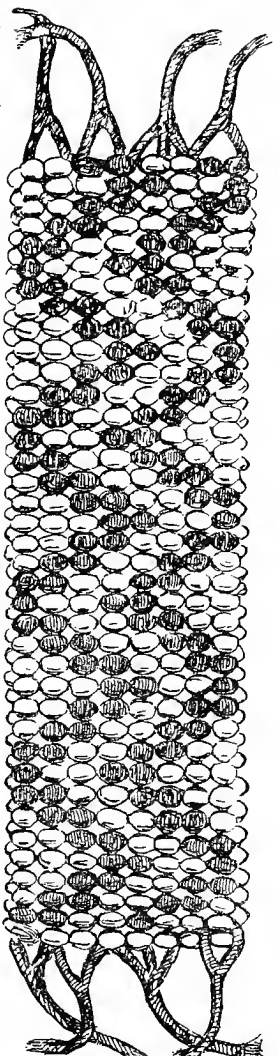
In devices to assist the memory, we find the first starting point of this art. We have seen that the Peruvians used for this purpose the quippos.[1] This was not peculiar to the Peruvians however, for we find that rude tribes in widely distant localities made use of it. The Ostyaks, a tribe in Northern Asia, use it. Erman observes of them, "Knots on a cord or thong of leather serve to mark numbers and conventionally things also."[2] The Chinese legends assert that in ancient times, their people "used little cords marked by different knots, which by their number and distances, served them instead of writing;"[3] and Bastian also observes its use in Africa. Herodotus relates that Darius took a thong and tied it in sixty knots and gave it to his allies, with instructions to untie one each day; and, if he had not returned when all were untied, they might go their way.[4] This was a quippos, and these several examples show how

1 See illustration p. 820, Vol. 1.
2 "Travels in Siberia," London, 1848, Vol. 1, p. 492.
3 Tylor "Early History of Mankind," New York, 1878, p. 154.
4 Bk. IV; 98.

perfectly natural is such a method. The rosary used at the present day, is also a quippos.

Several writers have recorded examples of the quippos among the North American Indians,[1] but among the Eastern Indians the strings of wampum took its place. These illustrations show the tasty way in which wampum was arranged. They are composed of pieces of variously colored shells, cut to a nearly uniform size, smoothed and polished and strung together. The colors were significant, red pertaining to war; white to peace and friendship. The length and breadth of these girdles, and the arrangement of the differently colored strings were all significant.[2] But at most, these were simply aids to the memory, and required some explanation, in order to be understood.





Indian Wampum.

Such strings of wampum were of great use among the Indians. They formed the archives of the tribes. When a messenger from one tribe had an important announcement to make to another, at the conclusion of his address he presented a string of wampum for a memorial.

[1] Charlevoix Vol. VI., p. 151. Long's Exp. Vol. I., p 235. [2] See Wuttke "Entstehung der Schrift." Leipsie, 1872, p. 150.

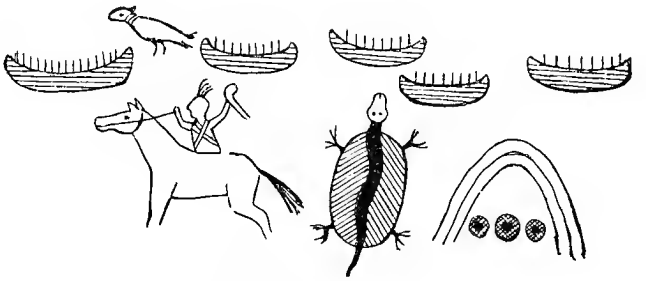
By its form and composition such a string was significant of the address, but its main office was to recall to memory his sayings. On some occasions, the orators would take the wampum strings and explain to the assembly what each was significant of. "A good reader," says the missionary Heckwelder," is able to point out the part in a girdle to which each of his sentences refer, just the same as we could in a book," [1] but still it remains that this was simply an exercise of memory.

While rude tribes were thus finding aids to memory, they also made use of pictures, and this seems to be a perfectly natural method of conveying information. Primitive people everywhere have employed it. Refering to our own Indian tribes, we find that this art had reached quite a degree of development. Let us examine this matter, as from picture writing has come our alphabet. A picture may express, besides the meaning we would naturally give to it, a symbolical meaning also. A picture of a lynx may represent not only the animal, but a magician as well. It is just at this point where pictures cease to be pure pictures that they become a species of writing.[2]

Our Indians, in order to convey information, drew on rocks and on pieces of bark a succession of symbolical figures, though the symbolism was of a very simple sort. A band, for instance, expresses the number of individuals composing it, by a succession of rude figures standing for men, the gens to which they belong may be shown by the figure of their totem. Or the business of the band may be shown, whether engaged in war or peace. Footsteps may show the number of days of their journey. Headless bodies may show how many of the enemy they have slain.

1 Abid. 152.
2 Ibid. 153.

Color also is significant; enemies being painted red, friends white; a red hand expressing wounds, a black hand death.[1]



Picture Writing.

In this cut we have a portion of such a picture record. It records the passage of a war party over Lake Superior headed by a chief who was also a famous medicine-man. He is on horse back and flourishes a magical drum stick in his hand. The party of the fifty-one men were in five canoes. In the first canoe was his principal sub-chief, "king fisher." It took three days to accomplish this expedition, shown by the over-arching sky and three suns. The Tortoise seems to show the reaching of dry land.[2] We must notice the combination of pure pictures and symbolical representations; the bird for the chief, the tortoise for the dry land, etc. We observe the same kind of writing on some of the grave posts.

The following cut is that of the grave post of a famous chief, who died about 1793, on the southern shore of Lake Superior. His totem appears at the top, its reversed position signifying death. The marks to the left denote the number of war parties he led. The right hand

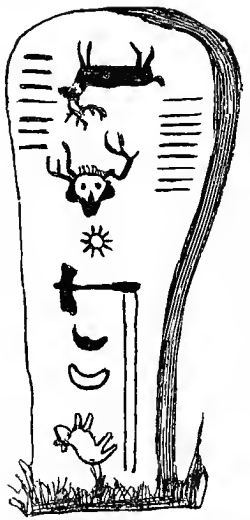
2 See Schoolcraft "Archives, etc." Vol. I., p. 406. Plate 57. Also Wuttke p. 158.



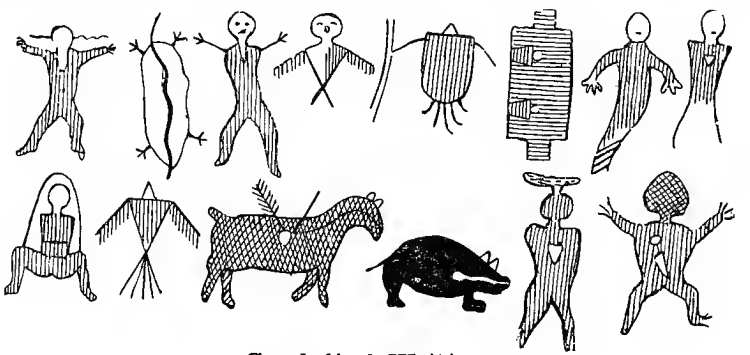
Indian Grave Post.

lines show how many times he was wounded in battle. The moose head relates to a conflict with that animal. The symbols below represent his influence in war and peace.

Such are some of the more common picture writings of the North American Indians. They represent a low stage of the art. It was practiced almost universally from Florida to the Hudson Bay. In common Indian speech such writings were known as *Kekeewin*.

But to show how picure writing develops still further, it will be necessary to show the influence of the priesthood, and the purposes, to which they applied this art.

It is necessary to remark that partially civilized people generally believe in a multiplicity of supernatural spiritual beings, whose influence is most potent in all affairs of life. Such

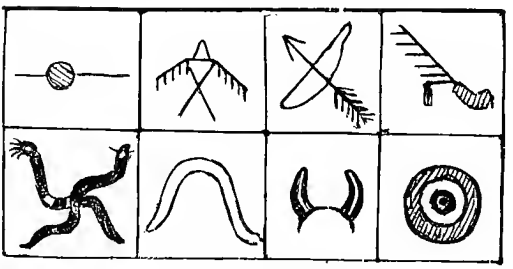


Symbolical Writing.

powers are to be propitiated, coerced or restrained by means, amongst other things, of set words and songs. To assist the memory in these songs, symbolic pictures were drawn, each picture calling to mind a few words of the song. To

illustrate this, we introduce the preceding cut; only we must understand that each figure there shown was painted in some bright color.[1] The fifth sign, for instance, represents a human body with wings for arms, holding an arrow. To the singer this stood for the following line; "I fly at will, and if I see an animal, I can shoot him."

These songs were not generally known to the majority of the people. They were imparted only by the priests to deserving individuals, and for a valuable consideration. Now if we reflect that the words of the song or charm must be in nowise altered, they must be repeated exactly as handed down by the priest, and further that the songs and the magic pictures must both be employed to get the full force of the magical influence;[2] we can see at a glance that such pictures would tend to become more and more symbolical, they would loose more and more their resemblance to the original objects, tend more and more to become such hieroglyphics as confront the traveler on the forrests of Yucatan.[3]



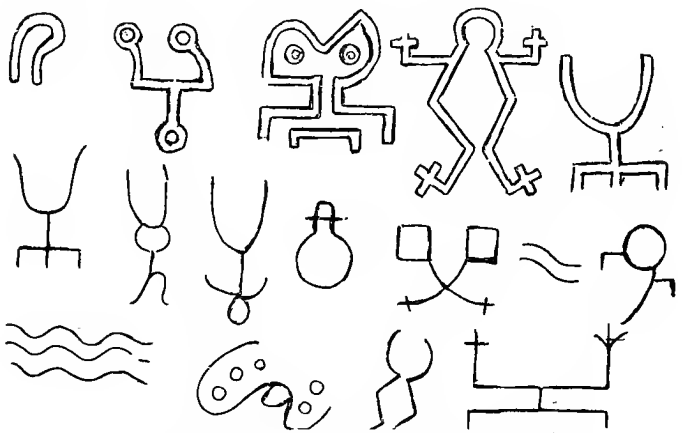
Hieratic Writing.

In proof of this last statement, let us glance at some of the symbols of Indian hieratic writing. Number 1, is the symbol of attention, a head with waving lines from each ear. 2, the outline figures of a man with an arrow-point

1 See Schoolcraft "Archives, Etc." Vol. I., p. 53.
2 See Wuttke "Entstehung der Schrift," p. 166-7.
3 This Series, Vol. I., p. 754.

for a head, and wings for the arms, symbol of a spirit. 3 is the symbol of war, and 4, that of peace. 5, two serpents crossed, is significant of wariness. 6 is the sky. 7, a head surmounted with horns, denotes power. 8 is a symbol of time.[1]

The development of the art among the northern tribes was stopped at this point by the arrival of the whites. We can see that the tendency would be for such figures to become more and more meaningless in outline. In this cut we have a specimen of picture writing of the South Ameri-



South American Picture Writing.

can tribes. The tribes at the present day, however, know nothing of its meaning; and when the traveler Schomburgh attempted to remove a portion of the rock containing it, his Indian guides looked on with terror, expecting each minute to see fire from heaven destroy him.[2]

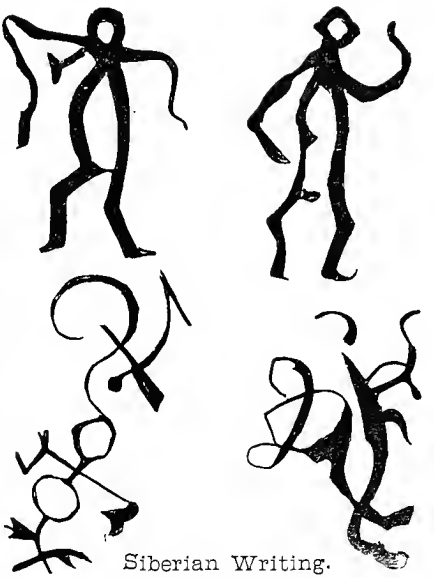
That this stage of picture writing is of very common use among the rude tribes is well known. In this cut we

---

1 See Schoolcraft, Op., cit., p. 58-9.

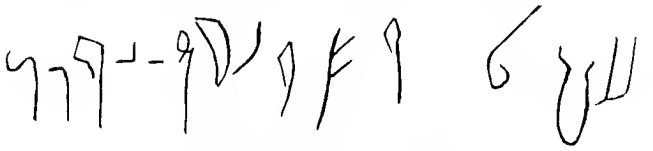
2 Wuttke Op. cit., p. 177.

have a portion of a picture record painted on the rocks of the Irtish River; utterly unmeaning to us, we do not doubt it conveyed a meaning once. In the next cut is still another illustration taken from the deserts of Arabia.



Siberian Writing.

Turning now to the Old World, we find three systems of writing at which we must glance, the Chinese, Egyptian and Chaldean. These will all illustrate the general truth that mankind has passed through the same stages of thought. Let us consider the Chinese first. Amongst other means, the Chinese, at an early date, made extensive use of the quippos.[1] Their scholars assert that they brought this art to quite a high



Hieroglyphics from Asia.

point. They even give the name of the inventor,[2] this illustrates the tendency among all people to ascribe important results to individuals. On the borders of China, the quippos is still in active use. In regard to the origin of

---

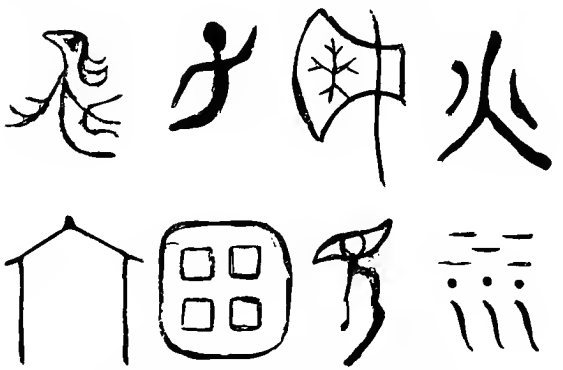
1 But see J. R. A. S. for 1885. La Couperie "Beginning of Writing around Thibet."

2 Wuttke Op. cit., p. 243.

their written characters, they record how in ancient times *Tsangkie* observed the foot-prints of the birds on the ground, and the markings on the shell of the tortoise, and imitated them in his signs.

It is the universal tendency of the human mind, in the lower stages of culture, to explain what is to them strange by myths like the foregoing.[1] We can now show by comparison of the earlier forms with those of the later stage, that the starting point of the Chinese writing was pictured representation of the subject, [2] that these developed with the development of the Chinese language and general intelligence.

We introduce some cuts to illustrate the first stage.



Primitive Chinese Characters.

Some of these pictures are quite plain. We have (1) a flying bird, (2) a child, (3) a hatchet, (4) flame, (5) house, (6) palace, (7) "sight" or "seeing" and (8) rain. A subsequent step is easy to take. In this we have to give a symbolical meaning to each little picture; thus "above," — "below," — "middle," ▽ "union."

This last stage would naturally develop more and more. Two limbs would stand for "going," a man with

1 Tylor "Early History of Mankind."
2 Wuttke Op cit., p. 251.

a stick, would signify "father." A plant growing out of the ground would be understood as "growing" or "increase." A sun pictured above a tree means "clear weather;" under a tree, "darkness." If waving lines represent water we can see why the same inclosed in a circle would signify "deep water," or placed under an arch should mean "rain." We can appreciate their feelings that connecting the signs for a field and children would express thereby "happiness" or "good fortune;" or by joining the picture of the sun and moon would express "brilliancy," "magnificence;" or that pictured sorrow by the two figures for knife and heart.

The characters, or pictures, we have thus far represented all belong to ancient writing. We know that the inevitable tendency is to change and alter the outlines until they come to have but little resemblance to the original. We illustrate that change in the following cut: the first line is the ancient representation of the various subjects there named; the second line is the modern way.

Ancient and Modern Characters.

To understand the significance of another change we must refer to a peculiarity of the Chinese language. A large number of Chinese words have several meanings. In ordinary conversation this meaning is made clear by the tone of voice in which it is pronounced. For instance the sound *Fu* signifies either the word "*father*" or "*man*" or "*woman*," in talking no confusion arises, simply because the tone of voice indicates which meaning is meant. In the first stage of picture writing each of these meanings of *Fu* had a separate picture. In a later stage of their art, the Chinese hit on the expedient

of making compound characters, pictures and sounds combined. One character simply designated the sound wanted, but a second character gives us the meaning.

Thus the sound *chow* has several meanings, such as ship, fluff, flickering, basin, loquacity. In the following cut the first figure is *chow* meaning ship. We notice this repeated with an additional character to designate the other meanings. Two feathers added to it make it *fluff*.[1] The sign of fire prefixed shows that, in the third case, the sound chow means *flickering*. The sign of water in the fourth, and of speech in the fifth, similarly modify the meaning of chow.[2]

Sounds of Chow.

Turning our attention to Egypt, we find a most interesting field of research. However, we can not make a close study at this point. From the very earliest times, the Egyptians resorted to hieroglyphic writing, and we can but imperfectly trace the steps leading up to this invention. We need not doubt that it went through all the stages of development. The priests, who doubtless developed this art, chose as objects to represent the tones of the voice, simple materials—different parts of the body, plants, different mathematical figures and some of those simple figures which naturally occur to people at all times and places, such as a circle for the sun, the well-known figure of a star, a waving line for water, etc.

That Egyptian writing had the same origin, that is symbolical picture writing, is only what we would

[1] In general the character expressing meaning is placed to the left. Wuttke, p. 259.

[2] Tylor "Anthropology," p. 171. It seems, however, that a number of scholars come to another conclusion in regard to Chinese writing, regarding it as originating amongst the Turanian tribes that developed the culture of ancient Chaldea. See "Yellow Races."

expect. But in the case of these people, or rather as far back as we can trace their writing, we observe that they had largely turned their attention to some means of expressing sound, not the thought or meaning. This method carries with it a most important train of consequences, as we will soon see. We all know that the elementary sounds of a word may be divided into two great classes, the consonants and the vowels. The Egyptians were aware of this fact. In the first stage of their writing no attention was paid to the vowels, they only represented the consonants, and this was the way they set about it. They painted some well-known object which contained the consonants of the word they desired to express. It follows that the same hieroglyphic could express several different words.

To illustrate this, the hieroglyphic of the finger, for instance which was called *tep*, gave the consonants *t-p*, consequently it could be used to express the word *taipe*, meaning "reservoir;" or *tpa* meaning "ten thousand." So the hieroglyphic of a palm tree which furnished the consonants *p-t* could be used to express "division of time," "month" or "year." Or just the reverse can be said, and we can see how several different hieroglyphics could be used indifferently for the same word.

We can see that such signs could be greatly increased. The serpent "hope" gives as the consonants *h-p* and thus might express, amongst other words, "*hepi*," meaning "depth." The obelisk "*maen*" gives us *m-n*, and consequently might stand for the name of the god *Amun*. Such signs would be increased as general knowledge would increase. When they became acquainted with the use of papyrus, the papyrus roll takes its place as an important hieroglyphic.

But to avoid confusion, it was necessary in some places to indicate the vowel. They painted some well-known object in the name of which occurred the wished for vowel. Thus for instance, a palm leaf "*asch*," could be used to signify the vowel *a*, if necessary, as well as the consonants *s-c-h*. It is to be noticed that the vowel sign was placed to the left of the consonant sign no matter what the natural order was. It might be wanted in the beginning, middle or end of a word, yet it was always placed at the left of the consonant hieroglyphics.

The hieroglyphics we have thus far spoken of, we see indicate syllables, and such remained true of the larger number of Egyptian hieroglyphics. Causes were at work, however, in some cases to change this syllable writing to alphabet writing. Suppose they wished to express a two-syllable word containing three consonants. Two hieroglyphics were necessary. But of these two, one hieroglyphic would be used for but one of its consonant signs, the other was lost sight of. In still other cases the like would happen, since many words of but one syllable require only one consonant. The Egyptian word corresponding to our conjunction "and" was "ke." Amongst other means of expressing this word they used the hieroglyphic of a basket, *kote*, but in this case all it stood for was the consonant k. Similar cases must have been quite numerous and yet this failed to result in an alphabet.[1]

We must now consider one means employed by the Egyptians to avoid confusion. It was the use of one hieroglyphic to make plain the meaning of another, much the same way as the Chinese used one picture to explain another. To show that a hieroglyphic was to be used as a

1 See on this point Wuttke "Entstehung der Schrift," p. 502.

syllable they sometimes placed after it this sign the hieroglpyhic of hill, the word for which "*to*" stood for "many" or "several." Sometimes to give the same meaning they repeated the hieroglyphic. Sometimes after spelling out a word it was deemed best to add still another hieroglyphic to give the meaning. If, for instance, it was desired to represent a crocodile, (Sukhi) they made these two hieroglyphics which would give us the consonants *s-p-k*. Now in order to remove doubt they drew paint after the two hieroglphics above given the picture of a crocodile. Or, instead of painting a picture of the object itself, they painted another well-known hieroglyphic, which repeated the consonants wanted. To illustrate this method look at this series of pictures, the meaning of which is "*hepi*," house.  We have first a chain "*hoite*," second the serpent "*op*," and under it a track or street "*isch*." Now here we have the elements of our work *h-t-p-i* or *h-t-p-s-c-h*, but the last hieroglphic throws a new light on the subject, it gives us *h-p*, and shows us that "*isch*" is a vowel, and gives us "*hepi*."

The Egyptians were never able to do away with these determinative signs. Almost all grammatical properties, person, number, gender and case, were expressed by such means. As time passed we can see how the tendency would be to shorten these signs as much as possible. Here, for instance, are three representations of a garden. It does not need an expert to tell which is the oldest form used. The head of an animal would do service for the entire animal, only the merest outline would suffice. Finally when writing on paper was introduced, this change went forward rapidly, everything obstructing speed was thrown away. In this cut we give some of the older forms on one side, and the forms result-

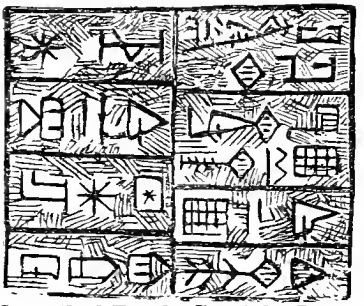
Hieroglyphic Development.

ing therefrom, on the other. These few last pages show us that the Egyptians started from a stage of picture-writing. We need not doubt that lying beyond the first stage known to us was still a ruder, more barbaric stage, much like that through which the Indians were passing. Nor need we doubt that had the Egyptians themselves been allowed time to continue the development it would have resulted in an alphabet. As it is, not a few think that our alphabet is a lineal descendant of the Egyptian hieroglyphics, modified by the skill of the Phœnicians.

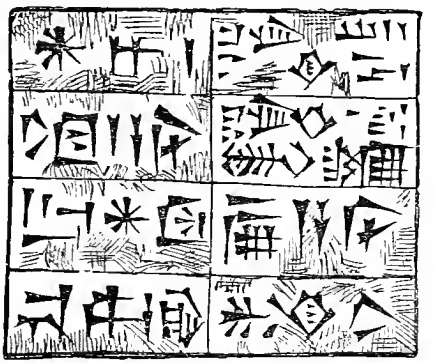
Turning to ancient Chaldea, we will not make a close study, just let us observe that here also we find that the people developed their knowledge by means of such simple devices as we have already mentioned. The system of writing, or expressing thought graphically, employed throughout a large extent of the country in Southwestern Asia is known as the cuneiform, because the element of the writing is a wedge or arrow-shaped figure. We are sure that in this area, people of different notionalities successively held sway, who adopted and modified the same system, and hence it is that so much confusion exists in regard to this writing. Into that question we do not propose to enter. We will simply show some of the changes through which this very extensive system of writing passed.

The origin of this system may perhaps be hopelessly lost, yet some significant facts remain which we think give us the clew to the whole process. In the first stage of the writing the arrow formed characters do not appear. Instead of them we see simply straight lines. Here, for

instance, is a brick containing an inscription belonging to very early times. The writing we notice is by means of straight lines. In the next cut is a brick from the same locality, containing evidently the same inscription, as can be seen on comparison, but here the wedges appear.[1]



Inscribed Brick, Straight Lines.



Inscribed Brick Wedges.

Now from what were these symbols derived? In some cases at least, it seems possible to trace them back to the pictures of the objects they represent. In the first inscription we notice at the beginning an eight rayed star. This was a determinative sign and indicated that the name of a god was about to follow. When wedges take the place of the lines, the resemblance still continues, but later writing unites the oblique wedges thus; and finally throws them away altogether and the result is this form. Again one of the characters, representing the word "hand," is in the rectilinear writing, clearly the thumb and four fingers. In the older wedge writing it appears as, later still as follows:

1 It may be interesting to know the meaning of this inscription. Rawlinson gives it as follows: "Beltis, his lady has caused urukh (?) the pious chief, king of Hur, and king of land (?) of the Akkad to build a temple to her. "Seven Great Monarchies," New York, Vol. I. p. 43

The original ground plan of a house stood for "house." In wedge writing it appears as. It would seem perfectly natural to represent the sun by a circle, the nearest straight line writing could come to it was a square, thus. Wedge writing represents the square as follows: subsequently contracting the latter sign, and finally this form appears for the word sun.  A curiously complex sign for a woman (or rather the feminine form of the indefinite pronoun "one") can be traced through a succession of forms to the following:  which is probably a double-toothed comb, a toilet article peculiar to a woman; and therefore a fit symbolical representation for one.[1]

Such facts as the foregoing seem to show that the origin of wedge writing was in picture writing. Yet it may be that they early departed from such symbols as these, and adopted new forms, appealing to the reason rather than the eye;[2] and there are not wanting those who think that the origin of this writing is not to be found in picture writing, but in simple mathematical figures not suggested by pictographs. Certain it is that this wedge or cuneiform writing grew into a very extensive system. Some of these combinations stood for words, as, for instance, the star for the word "god." Such words as man, king, father, mother, son, brother were expressed in this way. Some words had several different forms. Some signs were what are called determinatives, that is by their use gave us a clew as to the meaning of the following word. Such signs used before proper names informed the reader whether the name was that of god, or of a town, etc. But most of

1 Rawlinson "Seven Great Monarchies," Vol. I., p. 45.

2 See Wuttke "Entstehung der Schrift," p. 609.

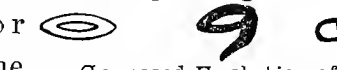
the signs were syllables, which by their combination spelt out words.

We have now considered the general subject of writing as it appears among savage tribes, and the reduction of the same to more definite systems among the principal old world people. Let us briefly review our ground before passing on to consider the origin of our alphabet. In all we find satisfactory evidence that the starting point was picture writing. When such simple pictures come to have a symbolical meaning as well, the first great step is taken. Our Northern tribes had taken this step. When the idea expressed by the picture itself was lost sight of, and the sound of the thing pictured was recalled to mind, a second very important step was reached. The more civilized tribes of Mexico and Central America were just entering on this stage. The Chinese are not further advanced than this stage, though they have brought it to great perfection in combination with the preceding stage.

The nature of the Chinese language was a great obstacle to further advance. It belongs, as we have seen, to the monosyllabic group of languages. Writing consists in representing the sounds of the language. But Chinese words cannot be resolved into simpler sounds, the Chinese therefore had done all that could be expected with a people having a language such as theirs. Further development is found among the people in Southwestern Asia, and in Northern Africa, speaking languages possessing words of several syllables. This was the stage of syllable writing, reached by both the Egyptians and the people making use of the cuneiform characters. We have seen that the Egyptians, and in fact the ancient Chaldeans also, had some characters belonging to the alphabetical stage; and yet they failed of understanding the real principle involved in

an alphabet.[1] At present the origin of our alphabet is unsettled, or rather we may say the origin of the Phoenician alphabet. A number of eminent scholars think it was derived from the Egyptian hieroglyphics, through the hieratic writing, specimens of this latter writing being shown some pages back.[2] But the difficulties are not by any means all cleared up. It is possible that the Phœnician alphabet was developed out of a system of hieroglpyhic writing used by the Semitic people, but if so, we have lost all traces of that system. The Phœnicians were the great traders of antiquity, they had commercial dealings with Babylon as well as Egypt. Always ready to turn to account the inventions of other people, it is quite possible that they borrowed the idea, on which their alphabet rests from one of these two sources.

In some cases it seems almost evident that the Phœnican letters are derived from the Egyptian. In the following cut we illustrate one possible derivation. In the Egyptian language the sound expressing "mouth" was "hro" or "ro." Notice the following changes. The first is the hieroglyphic for mouth, that is the lips. The second is the cursive or hieratic form, the third is the Phœnician form, and finally the fourth is the English equivalent. A number of such illustrations could be given.

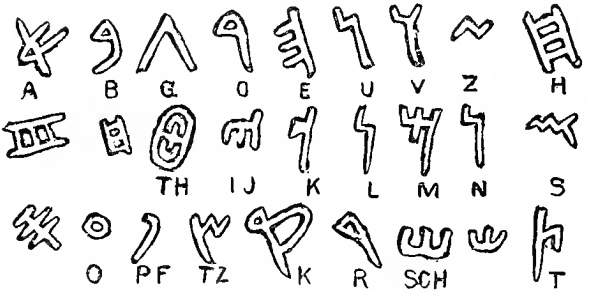


Supposed Evolution of "R."

[1] On this point consult Wuttke, "Entstehung der Schrift," p. 502, 709. But the reader must consult our chapter on the Yellow Races. In J. R. A. S. for 1885, Professor T. De La Couperie seems to show that Chinese writing had the same origin as the cuneiform and that the oldest writing in China, the Yh-king, is really a syllabary, like the Assyrian, and further that the history of writing in China is really a change from phonetic writing back to picture writing. "Origin of Writing in and around Thibet."

[2] Such scholars as M. De Rouge, M. Francis Lenormant and English scholars quite generally.

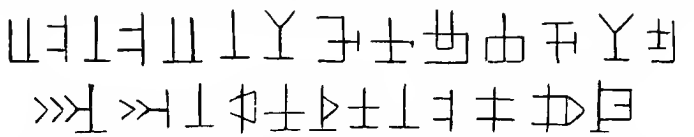
But let us consider the ancient alphabet as a whole as it appears on a coffin of King Eshmunazar of Sidon, as early as 900 B. C. The principal element of this alphabet is a straight line generally in an oblique direction. To this



Phoenician Alphabet.

straight line there are added other straight or slightly curved lines generally on the left side, as the writing reads from right to left. Only in a few cases do curved lines make their appearance.

We must recall that the original form of the wedge writing was straight lines, if then we compare this alphabet as a whole with the following inscription from the palace wall at Nineveh, it would seem quite as likely that the



Inscription at Nineveh.

Phœnicians got their idea of an alphabet from that source, as from the Egyptians.[1]

[1] In this discussion we have aimed simply to illustrate the fact that our present writing is a development arising from long continued efforts towards improvement of pre-existing picture writing. We have not aimed to settle the matter. Dr. Taylor in his recent learned work, "The Alphabet," exhaustively treats of the whole question, and seems to settle the matter in favor of the Egyptian writing. But on the other hand consult Hommel "Babylonien und Assyrien."

We have taken some pains with this one subject, the origin of writing, since in a certain sense it illustrates the development of all arts and sciences. Our present knowledge is simply the result of long, slow, continued growth; and in many cases the starting point of that growth is found in that stage of culture known as savagism, and from thence on every increase in culture shows increase in knowledge. The development of the idea of government law and property, has been glanced at; and we have now finished the brief investigation of one of the most useful arts, the one on which our present civilization seems so largely to depend. The art of cultivating the ground, and thus providing a supply of food, not depending on the chances of the chase, an art of the very highest importance, has been learned by man, only by taking a few, feeble steps at a time.

Preparing food for consumption, whether animal or vegetable, a most important process in itself, and which many times doubles our available food supplies and renders harmless what otherwise might be hurtful, is an art which man had to learn step by step. Were we to consider all these points, this volume would not suffice. The purposes of this chapter will be served if we have succeeded in showing that the laws of thought among savages are after all much the same as among civilized men. They constantly reason from the known to the unknown. The difference being that they have no accumulated wisdom to guide them.

If one carefully considers the difficulties, with which primitive man had to contend, it is indeed a suprising thing that any race achieved civilization. And, after all, probably the most advanced have only made a beginning in this work. If savages are children playing on the

shore we are but a short distance removed, the breakers are yet around us, the great ocean is still before us.

In this, as well as in the preceding chapter, we have presented some facts showing how greatly we are apt to err in reasoning about the probable actions of savages. Our source of error is in a failure to see how greatly their ideas may differ from ours. States of life that we are accustomed to seem to be *natural*, meaning by this word that they are just such states of life as nature would teach. Accustomed as we are to the modern family, we assume at once that this is in accordance with the dictates of nature. On the contrary, this form of the family was only reached after passing through at least two other forms. Accustomed to settled government, what more natural than that men thrown together by whatever cause should at once organize some government? On the contrary, the idea of government was of slow growth. Older writers used to talk about certain laws being according to nature. There is not a law in existence but what is the result of development.

When we talk about the "childhood of the race," our words carry a deeper meaning than most people are aware. They do not refer simply to some time long ago, but they also refer to the fact that primitive man in all his intellectual, emotional, social, and moral faculties, was but a child. And this saying, which was true of primitive man generally, is still true of savages and but partially civilized people. When we observe of children generally, that they are impulsive, thoughtless, careless of the future, light hearted, bent on present enjoyment; we are also describing savages, and consequently primitive man. As it takes years of education to train the child thus outlined to be a sober, judicious, thoughtful, far-seeing man, denying to himself present gratifications for the sake of some future,

greater good ; so has it taken the flight of unknown ages to develop from the savage races of primitive times the more enlightened races of to-day.[1]

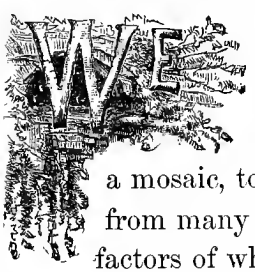
# CHAPTER IV.

## PRIMITIVE RELIGION.

Introduction—Different Religious Systems—Religious Growth Capable of study—Limitation of our Subject—Definition of Religion—Savage Speculations—Primitive Theory of Dreams—Shadows, Reflections and Refractions—Savage idea of Souls—Idea of Death—Theory of Sickness—Of Trance—Location of the Future World—In the Earth—Above the Sky—Journey of the Soul-Theory as to the Future Life—The Continuance Theory—Souls of Animals and Objects—Transmigration — Retribution Theory of Future Life—Morality not considered—Rise of belief in Supernatural Beings—Ancestor Worship—Its universal prevalence—Rise of Fetichism—Its extensive prevalence—Belief in Witchraft, Magic, Sorcery, Etc.—Worship of Animals and Plants—Worship of Images—Savage Philosophy—Sickness—The Savage Priesthood—Spiritualism—Rise of Polytheism—The Greater-Fetish Gods—Sky—Earth—Sea—Fire—Sun—Rise of Monotheism—Conclusions—Summary.



ARE in error when we ascribe civilization to any one cause, however important that may be. Civilization is a mosaic, to compose which, materials are drawn from many different sources. It is a product, the factors of which are many. As these factors vary from age to age, so does civilization vary. Amongst these factors or causes, two are found of surpassing importance. They are Science and Religion. They act and react on each other, and together determine, to a great extent, the civilization of a country. Let us now turn our attention more particularly to the subject of religion.

At present, the most enlightened portion of the world's inhabitants profess the religion of Christianity. It is true

that considerable difference of detail exists among the different sects of professing Christians, but on further investigation these differences are found to concern unimportant points only. All are further aware that other great systems of religious belief are in existence. They have heard more or less of Mohammedanism, of the religious systems of the Persians, of Brahmanism in India, and of that great system of the Oriental nations known as Buddhism. And it is generally known that a considerable fraction of the entire population of the world is in a yet lower stage of religious development, which, in its higher form, is known as Shamanism, and in its lower form as Fetichism.

It is not our present purpose to explain and define these different systems, or to show wherein one surpasses the others. The problem we propose to ourselves lies even deeper than that. We propose to discuss the origin and progress of religious belief, to show how it has molded civilization on one hand, and in turn been molded by it. This is a perfectly legitimate field of inquiry, and one that we may most profitable consider. It will show us the workings of the human mind when it first dimly comprehended that it was confronting some unknown power; and how these vague conceptions gradually crystalize into shape, finally, guided by inspiration, resulting in the higher and purer systems of belief. That this has been the course of events, no one need doubt.

The Apostle Paul when he addressed the cultivated and skeptical Athenians asserted that men were constituted so as to "Seek the Lord if happily they might feel after him and find him, though he be not far from every one of us." The great Apostle to the Gentiles here makes a statement which is found to be in exact accord with modern research. Men have everywhere and at all times been feeling after

that unknown, mysterious Power. The results come before us in the beliefs and creeds of the world, those of savage tribes as well as those of the most enlightened nations. Of necessity then there must have been a time when these conceptions first originated, and clearer ideas and views must have gone hand in hand with every advance in culture.

We may be sure that this growth can be studied the same as we study advance in any other department of culture. We are to go among the lowest and rudest tribes and study their religious beliefs, and then review in succession the beliefs of people higher in the scale. There is no belief so childish, no custom so foolish, no superstition so low, but that we can learn from it, and when we take a comprehensive view of the field, we will find that one of the most interesting chapters in the history of human development lies open before us. An understanding being obtained of it—so pleasant and easy to gain —will prove of great help to us in tracing the course of civilization.

Writing on civilization in general, we cannot pass this question by. We would glady do so if possible, since it so concerns the great majority of people that it is only by the exercise of the greatest care, that a writer who treats it from a scientific stand point can avoid giving offence. Our feelings and prejudice are aroused, and we can scarcely weigh clearly and impartially the evidence before us. We have observed in many important points, that our preconceived opinions have been found in error, when tested by the knowledge gained by investigating the lower races of men. Let us apply this same method to the question before us, and, for the time being, loose sight of the momentuous questions incidentally attaching to our subject.

When we have a difficult task before us, we should observe well our surroundings, and see what established conclusions are within reach, from which we can start on our new investigations. In the present case, we assume as proved the great antiquity of man, that primeval man was in the lowest depths of savagism, and further that advance in any and all directions has been in each case gradual and is the result of slowly accumulated experience. It is further assumed as proved that the lowest existing savages best represent the probable condition of primitive man, and that the course of development is quite fairly outlined in the customs and habits of successively higher and more developed people.[1]

Probably few scholars of note would take exception to the foregoing assumptions as long as they were not applied to statements of religious belief. But some might argue that belief in a god, or gods, or spritual beings is natural or instinctive to all men at all times. Possibly this may be so, certainly a great many think so, but we have no proof of it, and perhaps there may be no good reason for thinking that such is the fact of the case. One trouble is that when we once begin to make such exceptions, we do not know where to stop, and we might as well assume, as many do, that man in the infancy of the human race was, comparatively speaking, a highly civilized being possessing clear ideas of god and duty.

We cannot all see things in the same light, but to our mind no necessity whatever exists for making religious beliefs an exception to the general law. No great moral principle is here at stake. Belief in an over-ruling Provi-

[1] When we assume these statements as proved, we do not mean that there is no question about them. But they are the results that seem established by the researches in preceding portions of This Series.

dence, or in the soul's immortality ought in no wise to be affected by questions whether such beliefs are instinctive with man or not. We can even go further than this and hold that, if such beliefs appeared in a rudimentary form in tribes low down in savagery, but grew stronger with every advance in culture, this fact is one of the surest signs that such beliefs are reasonable. We will therefore look on these primitive savages, as beings destitute of religious beliefs, and, in accordance with this theory, we wish to trace the rise and progress of such beliefs. In this connection we want to explain that we are to deal only with people in the lower stage of culture, and hence are not called on to consider or discuss the claims of the higher systems of religion, and consequently all special questions such, for instance, as the inspiration and infallibility of the Bible, are entirely foreign to our purpose. We range only along lower levels of thought, confining ourselves solely to what may be called "natural" religion, disclaiming at the start any consideration of the great philosophical systems of belief, in which division fall all those claiming to be inspired. We want this point to be clearly understood so that no one will judge our statements in this chapter from a wrong basis.

In accordance with above statements we will now search about for some cause which could have suggested to man religious beliefs, granting that he was originally destitute of them. We quickly discover several, and considerable can be said in favor of each. Perhaps we are to recognize each as assisting in this matter. Streams from many sources finally united to produce the various great religious systems of the world. "Fear," say the ancient philosophers, "first made the gods." This statement is certainly one-sided. The feeling of dependence on some supernatural power which would find an object of worship

in the fears of humanity, would also find expression in feelings of love and thankfulness for many blessings.[1] But how did this feeling of dependence arise? Is it natural or instinctive to man? Or does it arise only after the conception has been formed of other states of existence than that usually known and visible?

We will find the same question confronting us when we consider other theories. "Man," says Baring-Gould, "conceives the notion of a great cause guided by his feelings by a process of selection, he conceives an ideal, and this ideal becomes to him an object of passionate devotion."[2] Such statements, it seems to us, are true only when considerable advance has been made, and our author in question recognizes the fact.[3] In this question we must be more than usually careful in imputing to primitive man our thoughts and feelings. Savages are not given to pondering over the mysteries of their surroundings, still less then primitive man. It therefore is not probable that religious conceptions originated in that way. Such speculations are impossible until considerable advance has been gained.

Some pathetic examples of savages wondering in their child-like way over the mysteries of life are indeed given. Of a Kaffir chief, we read that years before he met the white men he asked himself these sorrowful questions, sorrowful because he could not answer them: "Who has touched the stars with his hands? On what pillars do they rest? The waters are never weary, they know no other law than to flow without ceasing from morning until night, and from night till morning, but where do they stop? and who makes them flow thus? The clouds also come and go, and burst in water

1 Wachsmuth "Culture Geschichte," Leipsic, Vol. I., p. 22.
2 "Origin and Development of Religious Belief," New York, 1870 p. 76,
3 Ibid, 78-79.

over the earth. Whence come they? Who sends them?" In the midst of other examples, of which all are doubtless familiar, let us note the following, said to be the puzzled thoughts of a Greenlander: "From whence do the earth, sun, sea, moon and stars proceed? There must necessarily be some one who has created everything, who has always existed, and can have no end. He must be inconceivably more powerful and skillful than the wisest of men. He must also be very good, because everything that he has made is so useful and necessary for us. Did I but know him, what love and respect I should feel for him. But who has seen or conversed with him?"[1]

Whatever of truth there may be in these statements, we are sure they are very exceptional cases. As a general thing the lower savages are very little given to speculations. They have neither the power to think nor the desire for knowledge, and consequently do not concern themselves with attempts to explain even the ordinary surroundings, much less such questions as worried the Kaffir chief. Spencer has shown that the lower races generally have not a sufficiently developed mind to be surprised at novelties.[2] Consequently they do not concern themselves in trying to explain what is to them strange. Park, for instance, observed of some negroes whom he tried to have answer the question whether the sun they saw from day to day was the same or a different sun, that they "considered the question as very childish—they had never indulged a conjecture, nor formed any hypothesis about the matter."[3]

Taking now the broadest definition of what constitutes religion, that is "the belief in spiritual beings,"[4] it seems

1 Crantz "Greenlanders," Vol. I., p. 183.
2 "Principles of Sociology," p. 98.
3 Ibid 99.
4 Tylor "Primitive Culture," London, 1871, p. 383.

evident that primitive man only reached that stage of belief, because of some events happening sufficiently often to cause even his childish reason to adopt that explanation. Now it is sufficient for us to point out some way or ways in which such a belief might originate. There may of course be several such causes at work.[1] This belief in spiritual beings amongst all the lower tribes has for its root the belief in "another-self." Quite a number of causes are at work to produce this effect. Dreams are a most potent factor.[2] All savage tribes are great dreamers. Their habits of life conduce to such results; and further the value they set on dreams and the habit of constantly talking about them, only makes them more frequent.[3]

But now primitive man has no one to explain to him the nature of a dream. He knows nothing about the mind as something distinct from the body. He has no conception of the imagination, he has formed no theory on any of these points. He goes to sleep and dreams that he is fishing on some distant lake. What has happened to this individual savage, is continually happening to others. Even their infantile intellect at length frames some theory to account for these dreams. The theory they form is that "another-self" ordinarily invisible, lives with their body, and that dreams are the experience of this wandering "other-self" who some times goes abroad when the individual is asleep.[4]

---

1 Here we wish to repeat that from our stand-point we have no dispute with those who insist that such beliefs are instinctive with mau, or that God endowed him with them. Our sole problem is to show how they might have arisen and advanced with advancing culture.

2 Fiske "The Idea of God," Boston, 1886, p. 67. Spencer "Principles of Sociology," p. 147, et seq. Lubbock "Primitive Man," p. 126. Tylor "Primitive Culture," Vol. I., p. 397.

3 Tylor "Primitive Culture," Vol. I., p, 400.

4 A more scientific term for this theory of "Another-Self," is "Animism," and in this sense is used by such writers as Tiele and Tylor.

Before going farther, let us see that this is actually the primitive theory of dreams. Crantz asserts that the Greenlanders believe that during the night the soul "forsakes the body and goes a hunting, dancing or visiting;" and he further observes that their dreams, "which are numerous, lively, and often remarkably curious, have given rise to this notion."[1] The Indians of North America generally hold that the dreamer's soul leaves the body and goes in search of attractive things.[2]

The Ancient Peruvians "asserted that the soul could not sleep, and that the things we dream are what the soul sees in the world while the body sleeps."[3] And we find also in the Old World that this same theory is widely held. Not to make too extensive quotations, such people as the New Zealanders, Figians, Dyaks of Boroneo, Karens of India, all hold to the belief that in dreams the "other-self" of the sleeper actually experiences what is dreamt about.

Nor is it from dreams alone that such a theory, that is of "another-self," would arise. Many other savage experiences are thus explained. Shadows, reflections and refractions all seem to lead to this belief in "another-self" ordinarily invisible, but at times capable of being seen. A savage finds on bright days and bright nights that he is accompanied by an attendant "something" that moves as he moves. On looking into a lake he sees his own image there reflected. Or in certain unusual states of the atmosphere he sees some uncouth figure outlined against the clouds, which by its movements is seen to sustain some relation to himself.

Here then this "other-self" is sometimes actually

---

2 Waitz "Anthropology, etc," Leipsic, 1862, Vol. III., p. 195.
3 Spencer "Principles of Sociology," p. 151.

visible. No one is at hand to explain these optical effects, they simply go to confirm the "dream theory." Evidence from the most distant localities show us that the shadow is often regarded as the soul. The Greenlanders believe that the shadow seen in the day is the soul that wanders forth in dreams.[1] The Bennin Negroes "call a man's shadow his passadoor, or conductor, and believe it will witness if they live well or ill,"[2] and this belief is widely extended among the Negroes.[3] Language is here of great help. Tribes in the most widely separated portions of the earth use the same word for shadow and soul.[4] The Zulus believe the shadow is the soul, and that a dead body, from which the soul is gone will cast no shadow.[5] Still other tribes think it not safe to walk so near a river that a crocodile could sieze the shadow.[6] The case is much the same as regards reflections. Williams, speaking of the Figians, says: "I once placed a good-looking native before a mirror. He stood delighted. 'Now,' said he softly,' I can see into the world of spirits.'"[7]

Thus we see, that in seeking for some cause which might give rise to the idea of a "soul," supposing that no revelation were vouchsafed to man, we easily discover several at work in the case of each and every individual savage which would naturally give rise to confused ideas of "another-self." We have now mentioned but one set of causes, out of the many, which bring about this belief. Probably primitive man is more affected by these

considerations than by any other. There are mysterious events happening in the lives of all, in the life of the savage as well as the civilized man, which when fairly considered, lead directly to the belief of the existence of supernatural beings. Or in a higher stage of culture still, the mysterious powers of nature, eloquently proclaim a "God of nature." This truth finds expression in such sayings as that "an undevout astronomer is mad." All this is gladly admitted, but we must guard against the assumption that primitive man is capable of reasoning in this way, or is affected by such circumstances. But the causes we have described are found by patient investigation, as we have pointed out, to influence even the lowest of existing savages. It is therefore not surprising that men everywhere, even in the most debased condition, are found to have some sort of religious belief, though in some cases it may be scarcely more than a confused belief in this "other-self." Probably no tribes are known to be destitute of at least such beliefs. The statements sometimes made of the existence of whole tribes entirely destitute of religious beliefs, is based upon a definition of religion involving something higher than this.[1]

Supposing now the conception of a soul once formed, we will trace the development of this idea. This course will illustrate to us in a very striking manner the working of the savage mind, and we will see that savages do not form conclusions without what seems to them good reasons for the same. In what part of the body does this "other-self" reside? A number of rude tribes think the heart is the place. Such is the belief of the Tongans and the Bæsutos, of Africa.[2] Others connect it with the blood, and

1 On this point see Lubbock "Primitive Man," p. 121, et seq. Darwin "Descent of Man," New York, 1875, p. 93, and compare with Tylor "Primitive Culture," Vol. I., p. 377, et seq.

2 Tylor "Primitive Culture," Vol. I., p. 389.

especially the pulses. This conception appears in Jewish and Arabic philosophy.[1] A vast number of people have identified the soul with the breath or act of breathing. It is surprising in how many languages, including our own, we can trace a connection between the words signifying breath or wind and spirit.[2]

These confused notions of the soul sometimes lead to the belief that man has several souls. Thus the Greenlanders "believe in two souls, namely the shadow and the breath of men."[3] A variety of beliefs appear among the Indian tribes. Some said there were two souls; "one goes out and sees dreams, the other remains behind.[4] Others thought there were three souls—a good soul which went to a warm land, a bad soul which went to a cold land and a soul which remained with the body;[5] and finally the Dakotas believed in four souls, of which one goes to the spirit world, one wanders in the air, one remains with the body, and one continues to reside in the village.[6] Of the Figians, "some speak of man as having two souls. His shadow is called the dark spirit which goes to Hades. The other is his likeness reflected in water" and is supposed to stay near the place in which a man dies.[7] Similar beliefs are found among the aboriginal inhabitants of India. One of the four souls of the Khonds passes, after the death of the individual, into the body of a new born child. One of the formal questions asked by the priest is, "what member of the tribe has returned?" and means are taken to satisfy

7 Williams "Figi and the Figians," p. 189.

themselves on this point.[1] Most people, however, confine their belief to but one "other-self."

In general, rude tribes hold, as we have seen, that the soul is not necessarily connected with the life of the body, but that, for instance during sleep, it sometimes leaves the body for a short period. In such cases it is generally easily induced to return to the body, sometimes even calling by name is sufficient, or at most a slight shaking will suffice. But numerous phenomena occur which convince savages that it can not always be readily induced to return. There is even danger that it will stay away altogether. Such for instance, are fainting spells, apoplexy, catalepsy, coma and all those spells of unconsciousness produced by disease or accidents.[2] In numerous cases they have seen this "other-self" recalled by various means. Hence the actions of some savages in case of death to induce if possible the return of this "other-self."

The Hottentots, if they think death is at hand, seek to deter the soul's separation by making known their displeasure at this course. So "they reproach and ill use the dying and those just dead, for going away."[3] In some cases they even treat the body in a way which would cause the living intense pain. The object is if possible to induce the soul's return. The tribes in Northern Asia, when they suspect death is at hand, "the friends and relations go thrice around the dwelling, affectionately calling back the soul by name, while as a further inducement the Lama reads from his book descriptions of the pains of Hell, and the dangers incurred by a soul which willfully abandons its body."[4] And thus can we understand those scenes

[1] Spencer "Sociology," p. 157, et seq.
[2] Ibid. 168.
[3] Tylor Op. cit. p. 392.
[4] Tylor "Primitive Culture," Vol. p. 395.

witnessed in various, widely separated portions of the earth, where the body itself is addressed as though it could hear, asking it to declare the cause of its death, imploring it to return to life—all these various scenes are due to the belief that the "other-self" is away and might be induced to return.

In all these cases the absence of the soul has as a result the insensibility of the body. Such, however, is not always held to be the case. The soul may be absent from the body and its absence be scarcely noticed. The Greenlanders explain home sickness on the theory that one of their souls has remained at home.[1] The Salish Indians of Oregon think that the soul may wander away without the individual being conscious of it. The priest, however, informs him of the facts of the case, and to prevent unpleasant consequences kindly uses his power to restore it to him, putting it down through the top of the head.[2] When the Karens of India return from burying a member of their band, they provide themselves with little hooked sticks, by the aid of which they prevent their souls staying behind with the soul of their dead companion.[3] In Figi the spectacle is sometimes witnessed of a lusty native calling out most piteously for the return of his own soul.[4]

This belief in the temporary departure of the soul forms one side of the savage belief in sickness. It is the temporary absence of the soul. This belief is found all over the world. The Indians accounted for sickness as the "shadow" being unsettled, and if the convalescent exposed himself unnecessarily, he was censured for so doing before

4 Williams "Figi and Figians," p. 190.

his "shadow" was well settled.[1] Some tribes held that in cases of prolonged unconsciousness, but with final recovery, that the soul had turned back when on the boundary of the spirit land, or after a short visit thither.[2] This primitive belief is found in Africa, India and Australia, showing how true it is that the laws of thought are much the same everywhere.

Still another view of this theory of a wandering "other-self" must be taken. We have reference to those extraordinary subjective states of the mind known as ecstasy or trance, and which the priesthood among all partially civilized people have employed to more firmly establish their power. Thus among the Greenlanders the *angekok* or priest prepares for his office only after gaining the proper knowledge while in a trance. When consulted on various questions, he sends his soul to hold intercourse with the deity.[3] The Australian "doctor," must also visit the world of spirits and he had the power of sending his soul there to obtain information when wanted.[4] The magicians among the Finns can pass readily into this state and discover concealed things.[5] The same is true of Indian medicine-men and Siberian shamans. We have no reason to suppose those wizzards are all deceivers. In many cases they are no doubt sincere in their belief. They have simply put the wrong interpretation on a state of the mind of which their philosophy tells them nothing. Indeed this is the identical explanation given to-day to some cases of trance.

We make a very great mistake if we fail to see the

5 Bastian "Mensch," Vol. II., p. 319.

deep significance of these beliefs which are gathered from such widely different sources. They are far more than simply curious bits of superstition. When we thus pass in review the beliefs of tribes in about the same stage of development from Greenland to Africa, from Australia to North America, and find them to be thus *identically* the same, it affords a most instructive example of the working of the mind in a primitive state. It accepts the only explanation that ignorance presents of the most ordinary circumstances. Thus in a most natural manner is found to arise the belief in "another-self," ordinarily invisible but not always so, which can exist apart from the body; and these examples should satisfy us once for all that savages do not come to their beliefs as the results of deep speculations. Primitive man does not stand in wondering awe contemplating the mysterious forces of nature. He forms no hypotheses about them.

Though it is scarcely necessary we wish to make a remark which it is well to bear in mind throughout this chapter. The great mission of the inspired word of God, the great mission of Christianity itself is simply to correct the false conclusions drawn from nature. The ideas of God, immortality, of duty, etc., were in the world long before the Hebrew people separated themselves from the Semitic people in general, and are found to exist among tribes who never had any supernaturally given revelations. Christianity goes forth to these rude savages. It does not begin by destroying their principal, fundamental beliefs, but frees them from error and teaches a more excellent way. Bearing this thought in mind, let us continue on our way. We have seen how ideas of the soul arise among rude people. This constitutes the lowest form of religious belief. Let us see how this belief developed with advancing custom.

Let us now notice a conclusion which would naturally present itself when once this doctrine of "another-self" had arisen. We have already seen that the soul is considered as capable of existing apart from the body, and, further, death itself is but an aggravated case of such absence, so long continued that the body suffers dissolution. How long can this "other-self" remain away from the body? Evidently considerable time, for in some cases days have passed and the unconscious one has revived. Therefore, in death the "other-self" is supposed to be still in existence. Here the savage theory of dreams strengthens this conclusion. The savage dreams that his comrade who died and was buried is with him once more. The only explanation he can give is that the "other-self" of his dead comrade appeared in his sleep.

But now, how about the life which this "other-self" lives apart from the body, now for days at a time, and now for an indefinite time, so long that the body decays? Savages, of course, are unable to conceive of a life quite unlike their own. Hence the first stage of belief that the life led by this "other-self" after death is much like that before death; and, as for the place of abode, in the first instance, this is supposed to be the old accustomed haunts, with frequent visits to the place where his body may be. This belief comes out particularly strong among the Africans. Nearly all the wild tribes suppose that the souls of the dead remain near the place of burial. Livingston asserts of the tribes north of the Zambesi River "all believe that the souls of the departed still mingle among the living."[1] The same is true of the inhabitants of the Aleutian Islands;[2] and, we saw some pages back, that our Indians, in some

1 Spencer "Sociology," p. 217.
2 Ibid.

cases, held that at least one of the souls of the departed remained in the village.[1]

But this belief changes at an early stage. The "other-self" is supposed to haunt the accustomed place for a short time only and then goes away. The Greenlanders "affirmed that souls loiter near the graves of the bodies which they animated for five days,"[2] after which they went to another world. The Indians universally held that the soul of the dead remained for some time near its old home. The Iroquois made a small hole in the grave so that the soul could go in and out. Other tribes provided for its wants for a year at least.[3] Williams tells us that the Figians, when a native dies of whom they were afraid, "hide themselves for a few days until they suppose the spirit is at rest."[4] In old Calabar the son inherited the hut of his deceased father, but he did not occupy it for two years, by that time the soul was supposed to have gone away.[5] With a kindly feeling the Congo Negroes did not sweep the house for a year after death, lest the dust should disturb the soul.[6]

But, in general, the souls of the departed soon take their way to a place regarded as their special abode. Sometimes this special abode is only a little ways off. "In New Caledonia the spirits of the departed are supposed to go to the bush, and Turner says 'that in Samoa, spirits were supposed to roam the bush.'"[7] In general, however, the home of the soul is some distance removed, though still considered near. Often mountains are set aside by popular superstition for this purpose. The tribes of Oregon

1 On this point also, Tylor "Primitive Culture,"
2 Crantz "Greenland," Vol. I., p. 189.

7 Spencer "Sociology," p. 218.

placed the abode of spirits in the Rocky Mountains.[1] So the ancient Mexicans supposed the land of the blessed to be among the mountains of Mexico.[2] So also the natives of Hayti pointed out to the Spaniards lovely valleys in their island where the souls of the departed lived, and feasted on the tropical fruits there growing.[3] On the island of Borneo, the traveler may visit the happy land and see the moss on which the spirits feed.[4] So also the beliefs of the Brazillians, whose happy land is behind the mountains.[5]

But the constant tendency of advancing intelligence is to remove the spirit land some distance away. Perhaps Spencer is right when he asserts that the explanation of this constant tendency is to be found in the migration of rude people. As time passes on, and the knowledge of their early home fades away, there would still exist among them traditions of a far away place which is thought of as better than their present location; and after death the "other-self" would set off for that other land.[6] One of the most beautiful forms of this belief is some happy island far away. This conception is met with in Australia where some of the natives believe in an island of souls to the West.[7] The inhabitants of the Tonga Islands "believe in the existence of a large island to the northwest of their group, but which no mortal can find unless such be the will of the gods. This island is supposed to be much larger than all their own islands put together, to be well stocked with all kinds of useful and ornamental plants, always in a state of high perfection, and always bearing the richest fruits

and most beautiful flowers according to their respective natures; that when these fruits or flowers are plucked others immediately occupy their place, and that the whole atmosphere is filled with the most delightful fragrance that the imagination can conceive.[1] Traces of this same conception are met among people much farther advanced.

It is but a step from this belief to the conceptions of more remote regions still. A vast number of people have hit on the idea that the spirit world is beneath the earth. Perhaps cave-burial, which has been very extensively practiced has had considerable to do with the genesis of this belief.[2] However that may be, the belief in question is very wide spread. Some of the Greenlanders place the spirit land "in the depths of the ocean or under the earth, and suppose the deep chasms in the rocks to be its avenues.... there is perpetual summer, and clear sunshine uninterrupted by night. There are limpid streams and a superabundance of birds, fishes, seals and reindeers, which may be caught without trouble, or even found boiling alive in a large kettle."[3] This belief re-appears in many Indian tribes. The Tacullis believe that the soul continues to live in the interior of the earth.[4] The Sioux believe that the cavern near the falls of St. Anthony leads to the underground world.[5] The Navajos believe in an "underground world of plenty stocked with game and covered with corn."[6]

---

1 Mariner "Tonga Islanders," London, 1818, Vol. II., p. 101. In this case we are to note the significant fact that the migration to these islands was from the northwest. The name of this blissful island is nothing else than a form of Bouro, the small island, from which centuries before their ancestors started in their migrations, lying between Celebes and Guinea.

4 Waitz "Anthropology, etc." Vol. III., p. 197.

5 Tylor "Primitive Culture," Vol. II., p. 60.

6 Brinton "Myths of the New World," p. 241.

This belief is found among the South American tribes, Polynesian Islanders and in Africa.[1] The Karens of India likewise hold that when the sun set on earth, it rises in the underground world of spirits.

The next step is to remove this spirit world to some far off region. For this purpose, the sun, the moon and the heavens are chosen. Some of the Greenlanders, as we have seen, believe in a subterranean spirit world, but others place "the happy residence of the dead in the highest heavens, above the rainbow."[2] Dr. Brinton thinks that the Indian race universally held that the sun was the place of their happy land.[3] It is well-known that rude tribes almost universally conceive of the blue firmament above us as a material, solid substance. Above this firmament many people have placed the spirit world. "The Iroquois speak of the soul going upward and westward, till it comes out on the beautious plains of heaven with people and trees and things as on earth,"[4] and the like conception of heaven above the firmament, survives among people of a far higher culture.

We can readily see that among rude people, when the spirit land is considered as removed some distance away, there would naturally arise the idea of the soul's journey to this land. A journey which is generally attended with many adventures, and in many cases the newly emancipated souls are liable to suffer a second death which ends all life. The Figians believe that the road to their Elysian fields is long and difficult, and its accomplishment is dependent on many contingencies. In a certain stage of

---

3 "Myths of the New World," p. 243.

4 Tylor, Vol. II., p. 66.

their journey they have to meet the "Killer of Souls" in combat. Only those who escape unharmed in this combat go further. If the soul be that of an unmarried man the case is nearly hopeless. "They are dashed in pieces on a large black stone, just as one shatters rotten fire wood."[1]

We read in Crantz of the singular belief of the Greenlanders. Departed souls do not go at once to the happy underground heaven. "They must first slide for the space of five days—down a rough rock. They always lament the fate of those poor souls who have to undertake their journey in cold, stormy weather, during which they may easily perish."[2] And how pathetic is the statement that they kill a dog and bury its body with the body of a little child. It is so easy for a dog to find its way home, and thither it will conduct the little soul entrusted to its care.

There is one feature in this journey of the departed which calls for special mention. The belief in a passage across a body of water, river, lake or sea is of very frequent occurrence. Commencing with tribes very low indeed in the state of civilization, it is found in all stages of culture, and to-day we constantly talk of the "river of death." Spencer suggests that this belief arises from the fact that no extensive migration could take place without crossing some body of water; and, therefore, if death be regarded as a home-going of the "other-self," the soul must recross such water.[3] Others see in this notion a deeper meaning. Regarding the spirit world as the place where the sun shines when it is night here, it is natural to suppose that the journey to the same is towards the place where

---

1 Williams "Figi," p. 186.

2 "Greenland," Vol. I., p. 186.

3 "Sociology," p. 224.

the sun sets. But this is far away across the waters.[1] This river of death constantly meets us, whether in Africa, Polynesia, India or America, and its crossing is attended with many difficulties which we will examine further on.

Let us pause a minute to review the ground over which we have now gone. We are in constant danger of loosing sight of the real lesson underlying these statements of primitive belief. We have seen how this belief in "another-self" would arise and gradually assume definite prortions, and how a very important part of this belief was that this "other-self" was generally invisible, but was capable of existence apart from the body, and that its absence generally caused unconsciousness of the body. Hence arises the natural conclusion that death is simply the permanent absence of this "other-self," which was supposed to be still in existence elsewhere. We have now seen how this "other-self," is supposed, in the first stage of culture, to still haunt its accustomed place; but with advancing culture it is conceived as going to a spirit land, which is variously located, sometimes in a near neighborhood, but is generally considered as somewhat difficult of access; and then is located in some distant region of the earth, finally under the earth, or far removed from it. Let us now examine the ideas of future life and see what form they took.

The first stage of belief almost universally held is that the future life is simply a continuation of the present. Savages cannot conceive of a completely imaterial existence. True the "other-self" cannot generally be seen, and in their dream experiences they know that it has mysterious powers. A shake of a comrade suffices to recall in a

[1] Tylor "Primitive Culture," Vol. II., p. 84. Brinton "Myths of the New World," p. 248.

moment's time the wandering "other-self," though it were miles away. But they are quite incapable of reducing their conception to any orderly system, and the result is confused notions as to its existence and the life it is supposed to live. The easiest explanation that appears to primitive man, the only life of which he can possibly conceive, in fact, is simply a life like the one he is now living. The "other-self" is imagined as a material body and has, of course, material appetites, passions and wants.

The "other-self" will, then, need all those articles conducing to his comfort while in the body. Hence the custom of burying with the body the means of supplying these wants. The practice of thus burying food, clothing and utensils is so well-known that it is scarcely necessary to cite examples. We know that universally among partially civilized people this custom prevails. Sometimes it is stated generally that the property of the deceased is buried with him.[1] In other cases only what was more highly prized or neceessary; with the warrior his weapons, with the women household articles, with all what was considered necessary.

Along with this idea of a future life like the present, comes necessarily the idea of souls of animals and objects. Other causes were at work to produce such conceptions. Does not the "other-self," see animals, trees, houses and all manner of articles in dreams? Obviously, then, these objects so seen must be the "other-selves" of the real objects. At any rate the idea of animal and object souls is found fully developed at an early stage. We have in the Indian chief's vision of heaven, the spirits of

1 Spencer "Sociology," p. 202. Waitz "Anthropology, etc.," Vol. II., p. 193.

birds and animals, and the long train of arriving spirits is deeply burdened with the spirits of the articles buried with them.[1] So the Navajos believe that the reason why some seeds and germs fall on earth but do not sprout, is because their souls have gone to sprout and grow in the underground paradise.[2] The Figi Islanders show the traveler a deep well or "hole in the ground at one of their islands, across the bottom of which runs a stream of water, in which you may clearly perceive the souls of men and women, beasts and plants, of stocks and stones, canoes and houses, and of all the broken utensils of this frail world," swimming past on their way to the spirit world.[3] The Karens of India suppose that every object has a soul; axes, knives, trees, plants all alike have souls to be used in the future world.[4]

We can easily understand how the first step of change in the idea of a future life took place. The "other-self" instead of making use of the literal articles of food, drink, etc., used the souls of such objects. The Indians knew well enough that the kettles, furs and weapons buried with their warriors remained in the tomb, but they explained that the souls of such objects went to the dead who used them.[5] So the Polynesian Islanders explained to inquiring whites, that there was a spiritual as well as a material part to the food presented to the dead, and that spiritual part was for the use of the spirits.[6] And thus we understand the spirit world of rude tribes generally. "The dead Karen with the soul of his axe and cleaver,

1 Schoolcraft "Indian Tribes," Vol. II., p. 68.

6 Ellis "Polynesian Research," London, 1859, Vol. II., p. 404.

builds his house and cuts his rice; the shade of the Algonquin hunter hunts souls of beaver and elk, walking on the souls of his snow-shoes over the soul of the snow; the fur wrapped Kamschadal drives his dog-sledge; the Zulu milks his cows and drives his cattle to the kraal.[1]

Some people accept the idea that the future life is to be but a continuation of this life in its most literal sense. It was to be a continuation of the condition of the individual at the time of death. The chief continues to rule, the subject to obey. The rich retain their wealth, and the poor struggle with poverty. Hence the Figians, who believe that "as they die such will be their condition in another world,"[2] are not anxious to experience the infirmities of old age. It would never do to pass into the spirit world with the decrepitude of age, so they destroy their relations and friends long before the natural close of life. It is stated that this custom was so extensive that only one instance of death from natural causes occurred during quite a long period.[3] For a similar reason, the Negro fears long sickness before death, since it would send him in an enfeebled condition to the next world.[4] When an Australian has slain an enemy, he cuts off the right thumb so that the soul may not be able to throw a spear.[5] And we can understand the feelings of the Indian mother, whose grief at the death of her little child was greatly relieved when its father died also, he would now provide for its wants.[6]

6 Waitz "Anthropology, etc.," Vol. III., p. 196.

Regarding future life as a continuation of this life, we at once understand scenes witnessed in so many parts of the world, of slaves and attendants being sacrificed to accompany their dead master. This terrible custom is extremely prevalent throughout Africa, especially in Dahomey. Hundreds of attendants are slain to serve the departed monarch in the spirit land.[1] But this same custom re-appears all over the world; in Figi, in our own country among the Peruvians, Mexicans and Southern Indians. It survived into higher stages of culture. Traces of it are recognized in China, and widow burning in Hindoostan shows that the Aryans themselves advanced through this stage of thought.[2] The genesis of these horrid customs is not hard to find. Believing in a future life like their own, they wished to provide the departed lord with attendants, companions, wives and slaves.

Here we must stop to notice one line of development of belief in a future life, which has no immediate connection with our present subject, yet this belief re-appears so extensively in some of the higher systems that it is necessary to speak about it. That is the doctrine of transmigration of souls. Amongst the confused notions that the Indians entertained of souls we saw, some pages back, that one was supposed to remain with the tribe and pass into the body of a new born child. In one tribe the medicine-man places his hand upon the breast of the dying or just dead, and then upon the head of a near relative. The child next born is supposed to have the soul of the dead relative and receives his name and rank.[3] In order

---

[1] Ibid, Vol. II., p. 192.

[2] The laws of Menu do not favor widow burning, and in this respect the custom may be said to have been foisted on the Aryans.

[3] Waitz "Anthropology, etc.," Vol. III., p. 195.

that the mother's spirit might pass to the child, the Seminole Indians held the new-born babe over the face of the dying mother.[1] For a similar reason, "the women among the Algonquin Indians generally flocked to the couch of the dying, so that the new soul might enter some one and thus find a new home in the body of some unborn child."[2] This belief re-appears amongst the most widely separated people.

The Greenlanders along with their other notions hold it. It is said that "as soon as a person dies, his soul is supposed to animate a new-born infant."[3] It is the same with African tribes. "The Yorubas greet a new born infant with the exclamation, 'Thou art come,' and look for signs to show what ancestral soul has returned."[4] We saw some pages back that the Khonds of India believe that one of the four souls of human beings is re-born in the tribe, the priest knows how to determine which one has returned. Some tribes account in this way for the resemblance of the child to the parent.

We have seen that savage philosophy allows that both animals and material objects have souls. That being so, it is not strange that we should find the belief that the souls of the departed sometimes re-appear in animal and even material shapes. The Australians quite generally believe that the whites are simply the re-appearance of the ghosts of the blacks. The explorer Howett was frequently greeted as a "walking ghost."[5] An Australian condemned to death comforted himself with the belief that he would rise a white man and have plenty of money.[6] They sometimes recog-

1 Brinton "Myths of the New World," p. 253. 2 Ibid.

4 Tylor "Culture," Vol. II., p. 4.
5 "Kamilaroi and Kurnai," p. 248. 6 Spencer "Sociology," p. 186.

nize a departed relative in some white person. Governor Grey was wept over by a native woman as her deceased son come back to life.[1] A settler having a bent arm was at once recognized as a native not long dead.[2] A shipwrecked woman was adopted by a native tribe. The children would sometimes tease her, when the men would tell them to let her alone, "poor thing! she is nothing only a ghost."[3] This belief is widely prevalent in Polynesia,[4] and re-appears in Africa.[5]

As to re-appearance in animal shape, the evidence is equally abundant. Such a belief was quite common among the Indians, who generally found a place for one of their souls in some animal. In some cases we find the belief that after the funeral feast, one of the souls takes the form of a turtle dove.[6] The same conception, that is of doves being the residence of human souls after death, re-appears in Brazil.[7] A trace of this belief is to be seen in a beautiful custom among the Iroquois Indians; they captured a bird and freed "it over the grave on the evening of the burial, tobear away the spirit to its heavenly rest."[8] The Powhattans of Virginia held that a certain small bird received the souls of their princes at death,[9] but the souls could pass into other animals as well.[10]

It is scarcely necessary to show how widely this idea prevailed in the ancient world. We find it generally stated of Negro tribes, that they believed that souls of the dead

could take the form of animals.[1] The Zulus held that a snake was the form most assumed by the departed.[2] If the snake has any particular mark corresponding to some scar or other deformity of some departed one, it is at once recognized as his ghost.[3] Should a native see one near a grave, he at once speaks of "seeing" the person buried there.[4] But when the idea of object souls arises, nothing is to hinder the conception of human beings passing after death into such objects. The Dyaks of Borneo speak of "the human soul entering the trunks of trees where it may be seen damp and blood-like, but no longer personal and sentient,"[5] and some of the tribes in Bengal believe fruit trees are the abodes of the souls of good men.[6] One more observation on the belief of a Mexican tribe will bring this part of our subject to a close. We read "they worshiped every stone as a god, as they said that all men were converted into stones after death, and that a day was coming when all stones would be raised as men."[7]

Let us not at present dwell on these suggestive facts. We seem to be in position to understand and discuss the worship of animals, plants and stones, but we are not yet ready. Neither do we care at present to show how extensively this theory of transmigration enters into some of the higher systems of religion. In reviewing the ground thus far gone over, let us bear in mind only the main points. Many experiences of savage life led them to believe in the existence of "another-self" ordinarily invisible, at times however visible, residing in the body. Death is the pro-

longed absence of this "other-self," which is thought of as still in existence, leading a life the same as his previous one, in some unknown place, generally far away; though he sometimes seeks again the land of the living, now in human form, now in animal shape, and yet again as some material object, as tree, plant or stone.

We have examined the first stage of savage belief, that is, that the future life was to be but the continuation of the present life, or a life in all respects like it. This conception soon gives way to slightly contrasted views. In general, mankind forms the conception of a future world which is to be the idealization of earthly good. The conception of what is good, varies, of course, with the culture and surroundings. The Greenlanders hope for a land of clear sunshine abounding with fat seals and reindeers which can be caught without trouble.[1]

The language of the Indian tribes was exhausted in picturing forth the happy hunting ground; plains dotted with lakes, through which rolled great rivers, on which grazed herds of buffalo, elk and all manner of game. The tree dwelling tribes of Brazil hope to find a forest full of Calabash trees and game.[2] Further south the Patagonians hope to be "eternally drunk."[3] We need not illustrate with quotations from other sections. There is, however, another and sader side to this picture which consists in representing the other world as a dismal abode, "where the soul experiences neither joy nor sorrow."

We have seen that not all the dead are able to reach the spirit world. The Greenlander who died in Winter runs great danger of perishing on his way, while the unmarried

Figian was doomed to the second death. The Tonga islanders thought that immortality was to be the lot of the chiefs only, the ordinary folks were denied this boon.[1] In general, among rude tribes, we find a trace only, of the belief that a person's condition after life depends upon his manner of life. It is most interesting to notice how this belief in a life after death just like the present, to which all are admitted, gradually changes with advancing culture, until finally two future worlds are presented to our view; one of happiness to which the good souls go, one of misery the place of the doomed. The theory that the future state is dependent on the manner of life lived here seems to be an outgrowth of the older theory. If it be true that the rich will continue rich, the poor remain in poverty, the servant to serve and the master to rule; why then it follows that the kind of life that would lead to success and happiness here, will be equally effective there. Then surely it is but a step to the further belief that the posession of those qualities leading to success and happiness here would pre-eminently fit their possessor for a residence in the happy land of spirits.

At this stage of development, which is pre-eminently the savage stage, the question of morality does not enter. Indeed, the student who takes a comprehensive view of religion will quickly make the discovery that morality and religion are strangers to each other in the ruder states of society. The savage pays very great regard to bravery, cunning and other qualities leading to success in hunting or in war. It is only in higher states of society that the gentler virtues of morality are appreciated. We must furthermore observe, in order to understand savage belief,

[1] Mariner "Tonga Islanders," p, 128,

that those not worthy of entrance to the better land were not by any means peremptorily shut out; they were simply left to shift for themselves, if they could overcome the great difficulties of their journey thither well and good.

The Greenlanders admitted to their heaven only those who were good workers and successful hunters.[1] These were excellent qualities, but observe that no question of morality was considered. The general belief of the Indians was that the "good" were in some way assisted by the good spirit, while the bad were left to shift for themselves;[2] but to understand what the Indians meant by "good," we must notice the Pawnee chief's definition that "The good are good warriors and hunters."[3] The assistance they are supposed to receive is largely in overcoming the dangers incurred in the passage to the spirit land. One idea that constantly re-appears in the Indian belief is that of a stream to be crossed in some portion of the journey, the only passage of which is over a slippery log with the bark peeled off; or sometimes a writhing, twisting snake takes the place of the log,[4] but the good are assisted in these passages.

In short, without going all over the ground, we can assert at once that the characteristic savage conception of the spirit land shows only the beginning of the idea that the future life was to be, in any important sense, a place where the individual would answer for the deeds done in the body. Advancing intelligence, which finally carried the White and Yellow races out of Savagery into Barbarism and Civilization, gradually united morality and religion, and so permitted the rise and progress of what is known as

---

1 Crantz "Greenland, Vol. I., p. 186. 2 Brinton "Myths," p. 242.
3 Ibid. 300. 4 Waitz "Anthropology," etc., Vol. III., p. 197.

the "Retribution" theory of future life, a theory embraced by all the great systems of religion of the present.

We have been considering what we might call natural religion. Probably few would take exception to what has thus far been said. We have both revealed and natural religion. Rude tribes the world over are found to have ideas of a human soul, a spirit world and generally a belief in immortality. The problem is to account for the existence of such ideas and beliefs. There is, of course, a temptation to solve the question by looking on such beliefs as the fragments left of purer religious beliefs, referring to a time of primeval innocence, before death, sin and unbelief entered the world. This is to claim for religious culture a position long since abandoned for culture in general. We have no desire to discuss this question in detail. In our opinion it is unwise to make any such claims. Nature takes her feeble children by the hand and in many ways leads man, even while yet a savage, to hope for immortality, and dream of infinite good. It is not surprising that man should have mistaken many parts of Nature's teachings, and missed many points of her lesson. These errors are corrected with advancing culture. But man is finite, the question before him partakes of the infinite. It is only when here and there great and good men climb so high in thought that they stand bathed in the sunshine of inspiration, that a clear and consistent explanation is given to man.

Belief in immortality has exercised a tremendous influence on the culture of the world. This influence among the lower races has not always been healthy. A few moments reflection will show us why, as far as the savage world is concerned, this should be the case. Largely because savages failed to connect morality with this belief, or perhaps

we had better say, because their conceptions of morality were still of such a low grade. Nothing is clearer than that what constitutes morality changes with advancing culture. Communal marriage—a perfectly innocent mode of life for the Australians—appears to civilized man as the very cess-pool of iniquity. The cruel massacre of the Amalekites receives the sanction of Samuel, civilized man at the present day condems it. Savage morality, like savage culture in general, is of a very low grade. But such as it is, it is virtually unconnected with the belief in immortality. Only in a rudimentary form does the belief appear that a man's actions here influenced his life hereafter.

When the belief prevails, as it does among the majority of savages, that the future life is simply a continuation of this life, it can exercise little influence for good. Such people, like the Indians of Yucatan, look on death almost with indifference. It is with them only an "accident of life." On the other hand, indirectly it has had an enormous and disastrous influence on people in the lower stages of society. It leads to the slaughter of slaves, wives and companions, and the destruction of property. Those who regard the future life as like the present only surpassing it in excellence may have less reason to fear death than those who look forward to a gloomy hereafter, but in both cases we see how old and sick people are put out of the way so that they may not enter the spirit world burdened with infirmities. Finally, when in the higher range of Savagery, the idea prevails that the exercise of those qualities conducing to success here influences for good the life hereafter, then also we see that this belief, which in subsequent stages of culture exercises a power for good, here fails of that effect for it simply exalts sav-

age virtues, such as bravery, success in hunting and in war. But when the idea prevails, as it does among the higher races, that the exercise of morality leads to a life of happiness hereafter, then the belief in immortality has a tremendous influence for good.

A large part of our subject has not yet been touched upon. We have now to see how the belief in beings posessing supernatural powers arose; and, going along with this belief, many superstitious beliefs and customs, such as witchcraft, magic, astrology, on the one hand; and, on the other, the appearance of great systems of belief, first in a crude and savage stage, but assuming higher forms as civilization advanced. A most interesting field of research lies before us, and even a hurried examination of it will enable us to understand many otherwise dark points in the early culture history of mankind.

Many savage experiences conduce to the belief that the "other-self" has mysterious powers. In the course of a few hours sleep, it goes a distance of many miles, has most exciting adventures, and returns in an inappreciably short time when called by name or at the shake of a companion. Conceptions of the savage brain are doubtless more grotesque than those of civilized man. Now this "other-self" is flying in the air, now, armed with superhuman strength, it easily defends itself against most formidable enemies. Clearly, then, this "other-self" has powers greatly superior to those posessed by the real self in the body.

Death is the abandoning of the body by this mysterous "other-self," which is still conceived of as existing in the near neighborhood. Is there not danger of it exercising its mysterious power in favor of, or adversely to, its old neighbors and associates? Certainly there is. It

has now become a being to be propitiated, its anger is to be dreaded, its favor sought. A great host of savage customs clearly show that this is the prevailing idea in the savage world, and we can trace these ideas into higher stages of thought. Many savage customs are very foolish, for savages, like children, are not consistent in their conceptions. Conceiving the "other-self" as absent from the body yet lingering near it, let us notice the treatment of the body in some instances. The Tupis, among our Indian tribes, tried in several ways to prevent the dead from bothering them. In some cases they tied all the limbs fast so that they would not be able to rise and trouble their friends.[1]

In another tribe they hurried the scarcely dead body to the nearest pool of water and tossed it in.[2] Probably in this case the idea was that water would drown the spirit. This was the belief of the Lapps who consigned the bodies of their enemies to a watery grave.[3] So also the Matiamba Negroes believe that the souls of the dead are destroyed if the body is flung in the water.[4] But, in general, the dead are not thought of as being gotten rid of in any such way as this. So the place of death is simply abandoned along with the body. The Akanzas burn the lodge and its contents with the body.[5] The Kamtschadals often abandon the hut and the body together.[6] African tribes quite generally abandon the hut or even the village in which a death occurs.

Here we have clearly expressed the fear of the dead. In some cases this fear finds expression in a group of

strange customs, which can be explained only as an effort to confuse the "other-self" so that it can not find its way back. From the most widely separated parts of the earth we find the custom of carrying the body from the house, not through the door, but by an opening made on purpose. Williams could not understand why the side of the house in Figi was broken down to allow the king's body to pass through when there were sufficient doorways close at hand.[1] This was so that the ghost might not find its way back and annoy the living. The Algonquin Indians generally carried it forth by a hole cut opposite the door, beating the walls with sticks to frighten away the lingering ghost.[2] Of the Greenlanders Crantz says, "The corpse is carried out, not through the usual entrance, but through the window. If they are living in tents at the time an opening is made for it by loosening one of the skins in the back part."[3] Perhaps an echo of this world-wide custom is found in some German states, where a window of the house must be opened after death.[4]

The instances we have now quoted show us that among savage people there is a fear of the dead. In some instances this assumes a sad form, as when some New Zealanders suppose that death so changes the nature of the soul that it will hate and try to injure those who were its dearest friends in life.[5] Such conceptions, however, are but seldom formed. The savage doctrine of continuance exercises a stronger influence than this, and fear of the dead is not the universal rule, though they are everywhere

regarded with awe. The loves and hates of this world are transferred to the spirit world. The interests of kindred will be watched over by departed kindred, the welfare of the tribe guarded by deceased tribesmen. The dead chief guards the interests of his people. He uses his mysterious powers to reward his friends and punish his enemies. His favors must be invoked, his blessing sought, his anger placated. Here we come at once on the simplest form of worship known, one that meets us low down in Savagery, continues into higher levels of thought, co-exists side by side with other systems. That is Ancestor worship. This will be found to be the starting point from which other systems diverge. It is the key which will explain many bits of superstition. Let us first gather some facts showing its extremely great prevalence in the earlier stages of culture.

No matter where we begin, we find plain traces of this ancient world-wide culture, and to-day it is the basis of belief of the larger portion of the world's inhabitants. We read that the Micronesian Islanders "worship the spirits of their ancestors,"[1] and "in Tahiti the dead are elevated to the ranks of the gods."[2] The Tonga Islanders believe that their chiefs after death become gods. They consider their graves sacred places and there invoke their aid.[3] The Australians believe quite fully in the wandering ghost theory of dead ancestors, but they had no established worship. In many cases they were supposed to be able to warn their friends of approaching danger, and the natives invoked their aid in this connection.[4] In New Zealand the spirits of the dead are supposed to attend the army and di-

4 "Kamilaroi and Kurnai," p. 244.

rect its movements while on the march by communicating advice or warning. In battle they inspire courage in the hearts of the combatants.[1]

In Africa Ancestor worship prevails almost universally.[2] The Zulus charge all their ill luck to their dead brothers, who at times appear in the form of snakes, to conciliate them cattle are offered up in sacrifice.[3] Among the Maravi the principal objects of worship are the souls of the departed, all good and ill luck are ascribed to them, to them the first fruits of the harvest are offered.[4] In southern Guinea the worship of ancestors is one of the leading features of their religion.[5] They are noted for the very great respect they show to aged persons. This respect outlasts life itself. "It is not supposed that they are divested of their power and influence by death, but on the contrary, they are raised to a more powerful sphere of influence, and hence the natural disposition of the living, and especially those related to them in any way in this world, to look to them and call upon them for aid in all the emergencies and trials of life. It is no uncommon thing to see large groups of men and women, in times of peril or distress, assembled along the brow of some commanding eminence, or along the skirts of some dense forest, calling in the most piteous and touching tones, upon the spirits of their ancestors."[6]

The like belief re-appears among the Zulus who explain that they do not worship all the dead of their tribe. "Speaking generally, the head of each house is worshiped

by the children of that house, for they do not know the ancients who are dead, nor their laud giving names. But their father whom they knew is the head by whom they begin and end their prayer for they know him best, and his love for his children, they remember his kindness to them whilst he was living, they compare his treatment of them, and say ' He will treat us in the same way now he is dead. We do not know why he should regard others besides us; he will regard us only.'"[1] Among the Kaffirs generally, "the principal object of religious veneration is the spirit of the deceased chief, which appears in the form of certain harmless snakes. On many occasions they are invoked, thanks are rendered and offerings given to conciliate them."[2]

Turning to Asia, we find everywhere evidence of this primitive Ancestor worship. The statement is made that the "worship of ancestors appears to be more or less prevalent among all the aboriginal tribes of Central India."[3] Of the Santals, we are told that "each household worships the ghosts of its ancestors."[4] In Ceylon, the spirits of the dead were honored as gods.[5] In every calamity and want, the Dyaks "call for aid on kindred spirits, and especially the shades of departed children."[6] Among the northern Turanian tribes, the same state of affairs is shown to exist. In some cases, though outwardly Mohammedans, their belief consists in reality of worshipping at the shrine of "holy men."[7] The Tartars make pilgrimages to the tombs of the Mohommedan saints in the ruins of Balghars.[8] The

Mongol tribes generally worshiped as good deities the princely souls of Genghis Khan's family.[1]

Among American Indian tribes, this same cult was wide spread.[2] The Nachez went so far as to erect temples to the honor of noted chiefs.[3] One form in which their anxiety to show honor to the dead found expression was by means of feasts to the dead.[4] Schoolcraft relates that among the Dakotas the natives sometimes refrained from murder for fear of the departed soul.[5] Similar conceptions exist in South America.[6] The Patagonians greatly fear the souls of their magicians, who, after death, are supposed to be transformed into evil demons, and all misfortune is charged up to them.[7]

It may not be out of place to show how persistent this Ancestor worship is. It survived into far higher stages of culture, and the most numerous sect of the Christian church has not wholly abandoned it. As is well known, this is the principal religion in China to-day. Among this people, the worship of ancestors is no simple rite of affection. They want the help of the ancestral spirit who rewards virtue and punishes vice.[8] To this day, the Emperor of China formally invites his dead ancestor to sit with him in banquet.[9] Of all religious ceremonies, the Chinese think Ancestor worship the most important. To look upon his ancestral "tablets is to a Chinese like an appeal to his honor.... It is reverence for them that constitutes the most powerful religious sentiment in his mind."[10] If no help comes in time of need, the Chinese will reproach his an-

cestor saying, "Father, mother, ancestor, how could you calmly bear this?"[1]

Turning to the White Races, we have just as abundant testimony that they all passed through this stage of culture. The Egyptians, as is well known, made offerings to the dead and invoked their aid. The Semitic Bedouins to-day offer sacrifices at the tombs of deceased ancestors, and it is well known that this statement is true of the Arabs in general.[2] More than one passage in the Bible indicates that this was one form of Idolatry in which the Hebrews sometimes fell.[3] As for the Aryans, the evidence is full and complete. "Among the Hindoos the Vedas distinctly recognize the ancient religion of the Pitris or fathers. The Pitris are invoked almost like gods, oblations are offered them."[4] It is an active feeling among the Hindoos to-day. The worship of famous ancestors is still prevalent and all their heroes are more or less deified.[5] In the Tinnevelly district the natives are known to make offerings of cigars and brandy upon the grave of a noted British officer, to concilliate his ghost.[6]

So the ancient Persian worshiped the ghosts of their departed. "There cannot be any doubt that the worship of the spirits of the dead played an important part with the Iranians, though perhaps more in private than in public." Hero worship was certainly general, and perhaps there was combined with it the worship of the ghosts of the royal dead. Ancestor worship was of a more private character. These departed souls are considered of very great

help to the living, but they must be propitiated, they must be called upon, and have oblations offered to them.[1]

Passing to the Aryans of Europe, this is one of the most pronounced features in their religion. Their great mythological systems of belief cut very little figure in practical life compared with Ancestor worship. The

Aryan Ancestor Worship. Offerings to the Lares and Penates.

dead were held to be sacred beings. To these the ancients applied the most respectful epithets that could be thought of. Cicero warns his countrymen to consider them as divine beings. Tombs were the temples of these divinities. Be-

CHARLEMAGNE ORDERS THE CUTTING DOWN OF THE SACRED OAK OF THE SAXONS.

fore the tomb, there was an altar for the sacrifices, as before the temples of the gods. This worship existed among the Greek tribes, the Latins and the Sabines.[1]

In the early culture history of the other European Aryans, this worship appears with less distinctness, but there is no doubt about its reality. Ralston observes of the Russians "that there is no doubt about their belief that the souls of the fathers watched over their children and their children's children; and that therefore departed spirits and especially those of ancestors ought always to be regarded with pious veneration and sometimes solaced by prayer and sacrifice."[2] Without extending the discussion farther, we need simply repeat that Ancestor worship is very conspicuous in the early culture history of all the Aryan people.

One form of survival of this old world-wide belief may be worth glancing at. We refer to feasts for the dead. This custom prevails among barbarian people and lasts well on into Civilization. We have seen that primitive people suppose the dead "other-self" needs the provisions, clothes and other comforts, which surviving friends place on his grave. From hence the custom arises of furnishing supplies at varying intervals of time, which is apt to assume the form of feasts for the dead and in this form the custom long outlasts the stage of culture in which it arose. In the month of December, called the month of shades, the Karens make a general feast for the dead.[3] Other tribes in this section make the feast at the end of the harvest.[4] In Africa, the Gold Coast Negroes hold a general feast for the dead at the time of yam-harvest which is a season of merry

making.[1] After an abundant harvest, the head man of a Zulu village sometimes dreams that an ancestral ghost appears to him and says; "How is it when you have been given so much food that you do not give thanks," in consequence a feast is offered for the dead.[2]

But now let us notice the survival of this custom into higher stages of culture where we would scarcely look for it. In China, we have a description of an elaborate feast which wealthy individuals sometimes furnish for the spirits generally. The spirits are notified by the beating of drums and ringing of bells. Lighted lanterns and charms drawn on paper show the spirits the way. Arriving at the house, the spirits find water provided for a bath, and paste, wine and cake for a repast. Headless spirits are given spoons with which to put the nourishment down their throats.[3]

This custom long survived among the Aryan nations. The ancient Persians believed that about the end of the year the spirits returned to earth for about ten days and expected to be met with appropriate offerings of meat and clothes.[4] It is well known, and we shall show in another part of this work, that the public festivals of the ancient Greeks and Romans were of this nature. "In their midst their ancestors are present, and the protecting gods share the meal."[5] The Russian peasant to-day still celebrates his feast for the dead. The inhabitants of a village join in this act. They spread the tables and then go forth to meet their invisible guests. The master of ceremonies

greets them, saying; "Ye are tired, our own ones, take something to eat." Entering the house he continues; "Warm yourselves, our own ones, at the stove." At the conclusion of the feast, he adds; "Now it is time for you to go home.... in God's name farewell."[1]

Christian Europe, in its festival of All-Souls Day, gave new life to old superstitions. The East Prussian believes that on midnight of said day the souls of the dead gather in the parish church and listen to a sermon from the dead pastor.[2] In Tyrol, food is left upon the table, and the room made warm and comfortable for their convenience.[3] In northern France, this superstitious custom is at its height. "The crowds pour into the church yard at evening, to kneel bareheaded at the graves of dead kinfolks, to fill the hollow of the tombstone with holy water, or to pour libations of milk upon it. All night the church bells clang, and sometimes a solemn procession of the clergy goes round to bless the graves. In no household that night is the cloth removed, for the supper must be left for the souls to come and take their part, nor must the fire be put out where they will come to warm themselves."[4]

The importance of our subject has justified us in making this part of our examination somewhat thorough. To avoid descriptions that may become tedious, we must desist. Let us examine our surroundings. We have seen how, among primitive men, the idea of soul, the spirit world and personal immortality might originate. We have now shown that the mysterious powers supposed to reside in the "other-self" tend to give birth to a form of worship, which is properly called Ancestor worship. We

1 Ralston "Songs of Russia," London, 1872, p. 322,
2 Wuttke "Volks Aberglaube," p. 616. 3 Ibid.
4 Tylor "Culture," Vol. II., p. 34.

have also shown by numerous quotations from writers of acknowledged ability the wide extension of this worship. We meet it low down in culture, we found it exerting its influence among higher civilizations and in one form find that it survives extensively in civilized countries to-day. Let us, therefore, conlude with a recent writer, that among all races of men, as far as can now be determined, this was the earliest form of worship known.[1]

From this conclusion as a new basis, let us proceed on our way. We are now in position to understand savage philosophy in general and see how this philosophy has changed with advancing civilization. We shall see how it has been freed from error little by little, and here and there given place to higher forms of belief; and we are confident that this philosophy, once thoroughly comprehended, will show us how easy and natural it was for men to entertain the superstitions of the past; superstitions from which the civilization of to-day, and the highest and best form of religion known, Christianity, have but partially freed the world.

Previous to the passage of descent into the male line, as explained in a previous chapter, the savage has very little conception of ancestors, or pays but little regard to them. Practically the child was not regarded as related to his father. Therefore, though he might recognize a confused mass of ancestors to whom he should pray, and from whom he might expect assistance, yet he formed no clear conceptions of his duty to them, or in what manner they exercised their power. The savage's memory is short. His father and the recent dead of his gens and tribe are borne in mind; he dreads their power, he makes suppli-

1 Fiske "The Idea of God," Boston, 1886, p. 69.

cation to them. "Ask the Negro where is the spirit of his great-grandfather, he says he does not know, it is done. Ask him about the spirit of his father or brother who died yesterday, then he is full of fear and terror."[1]

But these forgotten dead, though they may thus pass out of mind, are not supposed to be powerless. Though, as we have seen, many of these people entertain conceptions of a spirit land far away, yet with equal facility they imagine spiritual agents as ever swarming about them. These spirits may be either friendly or hostile, and by them everything is supposed to be accomplished. Success in hunting or in war, sickness, death itself and the thousand ills to which flesh is heir; fruitful seasons, pleasant weather, rain, sunshine, cold, heat,—are all under the control of spirits. The great burden of savage life is to avoid giving offense to these spirits, which are so all-powerful, to gain the protection of some spirit who will watch over his interests and guard him against those spirits who would do him injury.

In order to understand how he proceeds to accomplish his purpose, we must point out some of his peculiar beliefs. We have seen what confused notions savages generally entertain of the soul, some supposing it to reside in one part of the body, some in another; some dividing the various parts of the body among different souls, as the Caribs who lodged one soul in the heart, one in the head and one in the arms;[2] or, indeed, as some assert of these people, they think a soul resides wherever they find a pulse.[3] But the general savage belief is that all parts of the body are connected with the soul; and, indeed, that some mysterious con-

[1] Chaillu from Lubbock "Primitive Man," p. 139.
[2] Waitz "Anthropology, etc.," Vol III., p. 387.
[3] Müller "Urreligionnen," p. 208.

nection exists between the soul and external objects such as clothes worn, weapons used, footsteps, images, names, etc.

These are, indeed, singular ideas to hold, but let us be careful in passing judgment since many such superstitious ideas still exist among civilized man; wonderous acts of healing can be performed at a distance, given only a lock of hair to operate on. This connection between the body, soul and external objects receives a further meaning when we reflect on the doctrine of continuance. The old, sick and feeble in this life are subject to the same infirmities in the future life. Bodily mutilation here is repeated in the spirit world. Now bearing all this in mind, we can understand many superstitious customs everywhere observable. In how many parts of the world do we find the belief that the pairing of the nails, the hair and beard cut off, and all the natural excretions of the body must be carefully concealed? The savage method of reasoning is plain—suppose they are left exposed and some enemy find them; a charm might be said over them, or they might be misused in some way and thus the life, health and fortune of the individual might be endangered.

One illustration will suffice. In the Island of Tanna, in the New Hebrides, Mr. Turner observed a singular custom. The sorcerer collected what they called rubbish of a person. "Such as the skin of a banana he had eaten, wrapped it in a leaf like a cigar, and burnt it slowly at one end. As it burnt the owner got worse and worse, and if it was burnt to the end he died. When a man fell ill, he knew that some sorcerer was burning his rubbish, and shell trumpets which could be heard for miles, were blown to signal the sorcerer to stop and wait for the presents which would be sent next morning."[1] Similar examples

[1] Turner "Polynesia," from Tylor "Early Hist. of Mankind," p. 128.

could be quoted from books of travel throughout Polynesia, Africa, India and North and South America.[1]

Even death does not break the connection. It is true savages conceive the soul as existing apart from the body, but still the spirit can be operated on through the body or parts of the body. Perhaps no further illustrations are needed on this point when we recall the instances of bodily mutilation, done with the professed object of mutilating the soul. Remember the Australian cutting off the thumb of the right hand of his fallen enemy so that he might not be able to throw his invisible spear; or the Chinese, who prefers death by crucifixion to decapitation, for his spirit will then have a head; or the Figian, who believes if the body is eaten the soul is destroyed entirely; or the African, who fastens the skull of his enemy to his big drum, in order that every crash may send a thrill of agony through his ghost.[2] Hence the widely extended belief that, if you can only get posession of some relic of the departed, you, in effect, exert an influence over his spirit. You are, at any rate, put in communication with his ghost and can expect him to aid you provided you pay him due reverence. Several grades of this conception appear. Savages, the world over, carry about with them some of the bones or other portions of deceased ancestors and friends. The Australian carries with him the hand of a deceased ancestor; "The belief being that such a hand on the approach of an enemy would pinch or push the wearer."[3] So "the soul of a dead Carib might be thought to abide in one of his bones, taken from the grave and carefully wrapped in cotton, in which state it could answer questions,

---

1 Ibid. 2 Tylor, "Early Hist. of Mankind," p. 129.
3 "Kamilaroi and Kurni," p. 244.

and even bewitch an enemy if a morsel of his property were wrapped up in it.[1]

One step further and such relic worship as this passes into what is known as Fetichism. This step is taken when the conception is formed that the souls of the dead may be induced to take up their abode in some immaterial object. We saw, some pages back, that certain Indian tribes of Oregon believed that the souls might leave the body without the owners knowing it.[2] In such cases, the priest entices them back in the shape of little bones, stones and splinters. In some cases, objects are taken to the grave for the express purpose of becoming the receptacle of the soul, which can then be carried around as an object of worship. Thus, the Malays of Keeling Island take a wooden spoon to the grave, which spoon is afterwards dressed up as a doll.[3] But the air swarms with invisible spirits. What now is to hinder such spirits from taking up their abode in some material object no matter how insignificant it may be? To the savage, there is no difficulty at all; for, as we have seen, all objects have souls, and some wandering spirit may easily usurp the place of such a soul. This introduces us to Fetichism, which is simply an extremely low form of idolatry.[4]

Fetichism exists over a wide region of the world. The material object supposed to contain a spirit may be any strange object which strikes the individuals fancy. In the lower stages of Fetichism, the belief freely prevails that possession of the object in which the spirit resides gives the posessor power over the spirit. Armed with this, the individual imagines he can compel the spirit's service.

3 Tylor Op. cit, Vol. II., p. 139.
4 See Baring-Gould "Origin of Religious Belief," p. 176.

Such is the belief of the African fetich worshipers.[1] A Negro thus explained to the traveler Bosman in regard to their Fetichism. "If we resolve to undertake anything of importance, we first of all search out a god to prosper our designed undertaking, and going out of doors with this design, take the first creature that presents itself to our eyes, whether dog, cat, or most contemptible animal in the world, for our god, or perhaps instead of that, any inanimate object that falls in our way, whether a stone or piece of wood or anything else of the same nature. This new chosen god is immediately presented with an offering, which is accompanied with a solemn vow, that if he pleases to prosper our undertakings, for the future we will always worship and esteem him as a god. If our design prove successful, we have discovered a new and assisting god, which is daily presented with fresh offerings, but if the contrary happen, the new god is rejected as a useless tool, and consequently returns to his primitive estate—we make and break our gods daily."[2]

In all this, however, we must understand that the Negro can distinguish the spirit from the object itself.[3] Practically, however, in the lower stages of thought this distinction is largely lost sight of. The fetich is supposed to "see and hear, and understand and act, its posessor so worships it, talks familiarly with it as to a dear and faithful friend, pours libations of rum over it, and in times of danger calls loudly and earnestly on it as if to wake up its spirit and energy."[4] The traveler in Africa, says Wilson, finds fetiches "suspended along every path he walks, at every junction of two or more roads, at the crossing place

4 Tylor "Culture," Vol. II. p. 144.

of every stream, at the base of every large rock or overgrown forest tree, at the gate of every village, over the door of every house, and around the neck of every human being."[1]

Fetichism was a large part of the religion of our Indians. Catlin assures us that every Indian in a primitive state carries his *medicine* bag, which is nothing else than his fetich, "to which he looks for the preservation of his life, in battle or other danger." He differs from the Negro in this, that he chooses his fetich once for all. When about fifteen years of age, the boy wanders forth on the prairie, and prays and fasts until he dreams of some animal, bird or reptile. Such animal is his *medicine*, and from the skin is made his medicine bag.[2]

It is apparent to all that the same state of belief which gave rise to Fetichism gave rise also to witchcraft, magic sorcery, etc. The belief, like the custom, survives into higher stages of culture; and, just as at the present day there is still among the ignorant classes a lingering belief in witchcraft and magic, so, in many ways, you can still detect a survival of Fetichism where you least expect to find it. The potato carried in the pocket to ward off rheumatism, is a fetich; the horseshoe over the door for good luck, is also one. Amulets are still carried in the most civilized countries of the world; and, to this day, the Tyrolese peasant objects to using grass for tooth-picks because of the demons that may have taken up their abode in the straw.[3]

Quite a number of writers seem to think that Fetichism is the lowest of all religions, that it is the starting point from which other systems have diverged. We have

1 "Western Africa," p. 214.
2 "North American Indians," London, 1866, Vol. I., p. 36.
3 Wuttke "Volks Aberglaube."

tried to show that it is only an outcome of Ancestor worship. Fetichism really is a form of idolatry. It is the symbol only. Travelers the world over have witnessed the worship of immaterial objects of all sorts of shapes and sizes, of all sorts of materials. They have too often failed to notice the accompanying belief of a spirit residing in this object, which was really the thing worshiped. When we come to consider the steps leading to this belief, we at once detect its true standing.

Let us notice another outcome of this primitive Ancestor worship, which has occasioned a great deal of discussion, we refer to the worship of animals and plants. No one needs be told how extensive is the worship of animals. There is scarcely an animal of any importance which is not especially honored, or even worshiped, in some parts of the world. Monkeys, tigers, leopards, hyenas elephants, crocodiles, all find their worshipers in Africa.[1] A similar state of affairs in regard to other animals exists in other parts of the world. Some animals, such for instance as serpents, and among the birds the dove have had a very extensive worship. In regard to trees and some other varieties of plants, similar statements can be made.

Now we must not forget that conceptions from many different sources have frequently united to form a worship; so, without denying that a number of grounds exist for the worship of animals and plants, it seems to us that one principal ground is simply Ancestor worship. One of the constant elements of tribal society, remember, is the presence of gentes. And each gens, remember, has a common name. Except in very rare instances, these names are those of animals and plants peculiar to the

1 Tylor "Culture," Vol. II., p. 146.

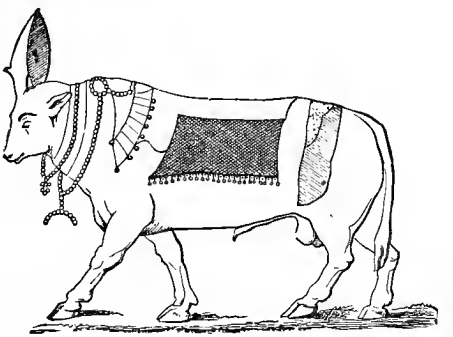
region in which the gens is located. The information is conclusive that each gens regards itself as descended from the animal or plant for which it is named. Perhaps the genesis of this belief comes from a confusion of ideas. Believing in transmigration of souls, the members of a lion gens, for instance, might readily suppose that after death the members of their gens would assume the form of lions. In this way lions generally might be regarded as the ancestors of such a gens.

When we add to the foregoing the fact that the members of a gens universally honor their totem,[1] and will not kill it, if an animal, unless pressed by hunger, and then always apologize for the violence done,[2] it seems to us that we are here simply dealing with one of the results of Ancestor worship. But, of course, what would be regarded with veneration by one gens, was not at all venerated by the next. Hence the fact that animals regarded as sacred in one section lost all their sacred character a few miles away. And we can also see how some animals would come to be regarded with greater veneration than others, simply because the gens bearing its name was stronger than others.

Take for instance the serpents. There would scarcely exist a rude tribe from Australia, Africa or America, which would not contain gentes named after some variety of snakes, so the world over snakes assume a sacred character. Of course, there are other peculiarities about serpents which would greatly increase this feeling. Casting its skin from time to time, it seems to be typical of immortality. Many of them by a bite, can soon destroy life; savages know nothing about poison, all they can see is

[1] Waitz "Anthropology," etc., Vol., II., p. 178. [2] Above page 143

that some powerful spirit is working through that serpent. Without further discussion, we may pass this part of our subject by. The worship of animals and plants is simply a necessary consequence of the belief of gentes in regard to their totem, and Ancestor worship.



Egyptian Animal Worship —The Bull Apis.

It is further evident, that at this stage of thought, any striking object in nature, such as a river, lake, precipitous cliff, singular shaped stone or commanding tree, would surely be regarded as the abode of some spirit, and would be worshiped accordingly. That such objects are worshiped the world over, we have abundant testimony, and it will be found in all such cases that there is some peculiarity about these objects which would be sure to catch the eye of savages. Take, for instance, the case of tree worship, Erman observes of a tree worshiped by the Ostyaks that "the peculiar sacredness of the tree was due to the singularity of its form and growth, for about six feet from the ground, the trunk separated into two equal parts and again united."[1] In some cases it is trees of a venerable appearance, or of great size, or standing in commanding positions.[2] Such conceptions, regularly framed in Savagery, long outlast that stage of culture. The Semitic and Aryan tribes long held to this superstition. Passages in the Old Testament show its survival among the Hebrews; and spread-

[1] "Travels in Siberia," Vol. I., p. 464.

[2] Tylor "Culture," Vol. II., p. 198.

ing Christianity in Europe frequently exercised its power to destroy the sacred trees of the barbarians.

We have made the statement that fetich workship is a low form of idolatry. It can be traced from this stage into higher forms. Of course, if the wandering spirit of some departed one may take up its residence in some insignificant object, still more readily would savages think of it choosing as its abode some especially prepared object. Thus, the Dakotas pick up most any round boulder and after painting it red, address it as grandfather and ask of it aid.[1] Some African tribes set up simply a stake in the ground to which offerings are made and prayers are addressed.[2] The Polynesian Islanders were observed to dress up rude logs in native cloth and anoint them with oil for their gods.[3] We must here understand that worship is paid, not simply to the uncouth image itself, but to the spirit supposed to reside in it.[4]

Of course, we can see that, with advancing intelligence, such images will come to be more and more refined; but throughout the old fetichistic idea, that posession of the fetich gave one a power over the spirit residing therein, survives. The Negro beats or destroys his idol if it does not give him good luck; the Ostiak treats his image well, but, if it brings him no sport, tries the effect of a good thrashing. In China, also, if the people after long praying to their images do not obtain what they desire, they try a different course. "How, now, dog of a spirit," say they, "we give you a lodging in a magnificent temple, we gild you handsomely, feed you well and offer incense to you, yet, after all this care, you are so ungrateful as to refuse us

1 Ibid. Vol. II. p. 147. 2 Ibid. 148.
3 Ellis "Polynesian Research," Vol. I., p. 337.
4 Waitz "Anthropology, etc.," Vol. II. p. 183.

what we ask of you," so they pull them around through the mud and filth. Should they receive what they ask for, they pick up their image again and clean it up, with many apologizes for being so hasty.[1] So too, but recently, "a prince of Nepaul, in his rage at the death of a favorite wife, turned his artillery upon the temples of his gods, and after six hours heavy cannonading, effectually destroyed them."[2]

Here we have shown how worship of ancestral spirits leads finally to idolatry and the worship of sticks and stones. There is another line of obeservances which leads in a more direct way from the worship of ancestral spirits to idolatry. Let us notice them because we want to make it very clear that Ancestor worship really underlies all these conceptions. We saw, some pages back, that savages suppose some mysterious connection to exist between an individual and parts of his body, or even the excretia and clothes worn. The connection is supposed to extend in other directions. A picture or an image of a man is held to be part of the individual. It is scarcely necessary to illustrate this statement. Savages, the world over, object to having pictures made of them, since the posessor of the picture thus has a mysterous power over him. And as for images, rude tribes, everywhere, believe that an image of a person, no matter of what material made, has so intimate a connection with the individual himself, that anything happening to the image, the like fate will befall the individual.[3]

Here, then, is one reason for making an image of a deceased ancestor, so as to control his soul in the spirit land and to furnish a convenient home for his soul. That such

1 Lubbock "Primitive Man," p. 168.

2 Hearn "Aryan Household," p. 25.

3 Tylor "Early Hist. of Man," p. 119.

conceptions exist is very certain. "The New Zealanders set up memorial idols of deceased persons near the burial-place, talking affectionately to them as if still alive, and casting garments to them when they passed by."[1] Another observer tells us that "they preserve in their houses small carved images of wood each of which is dedicated to the spirit of an ancestor," who is believed at times to enter it.[2] So the Sandwich Islanders make and worship an image of a dead ancestor,[3] and so of the tribes in Northern Siberia. We read that the relatives of an Ostiak "make a rude wood-image representing and in honor of the deceased, which is set up in the yurt and receives divine honors for a greater or less time, as the priest directs..." These images are preserved for several generations.[4]

We have investigated but one branch of savage philosophy, but have seen how true it is that Ancestor worship is the underlying principle. We want to speak more at length of one part of this belief. We have seen that, in forming an idea of fetich worship, savages come to the conclusion that the wandering "other-selves" take up their abode in material objects. Many savages form the conception that each individual has several souls. What is to hinder the belief that these wandering souls may take up their residence in some human body? No good ground for rejecting such a belief exists, hence it is held by widely separated people. How are we to tell when a foreign soul has entered a living body? Savages answer this question very easily. It is presumed not to be friendly to the body, hence a person who is posessed by a foreign soul, will

1 Tylor "Culture." Vol II. p. 159.
2 Shortland "New Zealand," London, 1854. p. 54.
3 Spencer "Sociology," p. 333.
4 Erman taken from Spencer Op. cit., p. 332.

be sick or crazy, or act in some very unusual way.

This belief that sickness, and all the ills of humanity are caused by some unfriendly spirit that has taken up its abode in the body, is the almost universal belief among savages, and it survives into far higher stages of culture. As all is owing to the intrusion of some spirit, the means of cure are very simple, either drive away, or coax the spirit to depart. Among our Indian tribes, the priests were generally the ones sent for in case of sickness. They proceeded to scare the evil spirit away. They sat down opposite the patient and barked like a dog for an hour at a time.[1] They drowned the groans of the sick one with the beating of drums or other rude instruments. They recited charms and incantations over him. They manufactured little images to represent the spirit of sickness and then destroyed them. They blew upon the part afflicted, rubbed, sucked, and then generally showed some hard substance which they claimed to have extracted from the body, and was the cause of the sickness; it was taken some distance off and thrown away with the exclamation; "Go thy way, devil."[2]

Similar accounts can be drawn from rude tribes everywhere.[3] Sometimes gentler means are tried, and the offending spirit is talked to, coaxed and urged to leave the body. In New Zealand, each sickness is caused by a spirit gnawing and feeding inside the victim. The priest, however, finds the path by which such a spirit has entered, and persuades it by a charm to get upon a stalk of flax and go away.[4] The Siamese take a little basket, put in it provisions and fruit and a little figure made of clay, and persuad-

1 Spencer "Sociology," p. 259.

3 Bastian "Ethnologischen Forschungen," Vol. II. p. 320.
4 Shortland "New Zealand," p. 97.

ing the offending soul to enter this, consign the basket and its cargo to some river.[1]

We will glance at only one other corollary of this savage theory of disease. It is, however, important since it shows us in a very instructive way how superstitions sometimes survive. We refer to what is known as Demoniacal posession. Prone as the savage is to ascribe all maladies to the action of spirits, we are not at all surprised to find that all extraordinary mental states, such as insanity, convulsions and nervous inflictions generally, are at once referred to such agency. Surviving into the barbaric stage of culture, the tendency is to limit such posession to the case of severe afflictions, such as epilepsy, hysteria, delirium, idiocy and madness. The general belief of the barbaric world to-day is that such attacks are caused by some demon gaining control of the body. This is the accepted belief among most Asiatics to-day. And it can be shown that a similar view was held among the Greeks and Romans of classical times.[2]

The Jews, at the time of Christ, were not an exception, and abundant passages in the New Testament show that some of the miracles of Christ were understood as the casting out of devils. The Bible being in no way given to teach science, the Great Teacher allowed this common explanation, and common error, to go unrebuked. When Christanity passed into Europe it found the partially civilized people firm believers of this demon-posession theory. It is no wonder, then, that finding this theory apparently sustained by the Bible, it should have held its way in civilized Europe until very recent times. Less than a century ago, seven clergymen at Bristol, England, succeeded, as

[1] Bastain "Reisen in Siam," London, 1867, p. 486.
[2] Tylor "Culture," Vol. II. p. 125.

they thought, in delivering a poor epileptic of seven devils;[1] and, even so late as the year 1861, in South Europe, there was an outbreak of such belief.[2]

Now let us return to another department of savage philosophy. We have already referred to the belief that posession of some article of the dead gave one power over the disembodied spirit, we have seen this develop into Fetichism and have observed that this same state of mind would inevitably give rise to a belief in magic, sorcery and witchcraft. It is instructive to notice that in the lower stages of thought the power ascribed to these arts was not believed to be necessarily dependent upon the co-operation of spiritual beings. It rested down on the older belief that you could influence an individual by means of anything belonging to him, even a representation of him, or a knowledge of his name would suffice. Thus an Australian believes that he can poison his enemy by pouring poison into the tracks of his footsteps.[3] Savages even assume that there is some such a connection between an object and its name. In Borneo, they change the name of a sickly child to deceive the evil spirit that has been tormenting it.[4] The Indians generally had a very great dislike to disclose their names, for fear that the inquisitive stranger would use them to bewitch them,[5] and thus it is that many savages have a "secret name," to divulge which "would be a serious breach of custom and good manners."[6]

But the conception that finally passes into the barbaric stage of thought is that the witch, magician or sorcerer, is powerful, because of some evil spirit which is helping him.

4 Tylor "Early Hist. of Mankind, p. 125.
5 Spencer "Sociology," p. 293.
6 "Kamilaroi and Kurni," p. 191.

It is wonderful how persistent such superstitious notions have been. Amongst all savages and barbarous people, short work is generally made of any unfortunate individual

The Druid Priestess.

supposed to have such powers. It is, however, instructive to see how this belief kept alive in christian Europe. "For

more than fifteen hundred years, it was universally believed that the Bible established in the clearest manner, the reality of the crime, and that an amount of evidence, so varied and so ample, as to preclude the very possibility of doubt, attested its continuance and its prevalence. The clergy denounced it with all the emphasis of authority. The legislators of almost every land enacted laws for its punishment. Acute judges whose lives were spent in sifting evidence, investigated the question on countless occasions, and condemned the accused. Tens of thousands of victims perished by the most agonizing and protracted torments, without exciting the faintest compassion." As late as 1780, a sorcerer was burned at the stake in Spain.[1]

Let us now refer to the savage priest-hood. Amongst the Siberian tribes, the priest is the *Shaman*, from whence comes the word *Shamanism*, and by this title savage religions, above the lowest ranks of Fetichism, are sometimes known. It seems to us, however, that this is but a department of savage philosophy in general. Throughout the savage world, Fetichism maintains its hold, and indeed far on into Barbarism and Civilization. We shall now see how the same line of thought, which led to Fetichism, would also lead to the setting aside of a select body of men, of the nature of priests.

The dividing line between a magician and a priest, in savage conception, is certainly very narrow. The savage has become familiar with the idea of spirits swarming everywhere. He stands in fear of them and believes that they can enter his body and produce sickness, destroy his reason or take away his life. He believes that they can be coerced to do his bidding, provided he knows powerful

1 Lecky "History of Rationalism," New York, 1872, Vol. I. p. 28-30.

charms, or can only get in his posession some relic of the deceased with which to control them. But not all of these disembodied spirits are enemies. Some are his relations, friends and tribesmen. They come to him in dreams, warn him of danger, teach him magic charms. Can he not now attach some of these friendly spirits to his service, can he not so prepare himself that he can almost any time put himself in communication with them, and not wait for some chance dream? Being thus favored with direct communication with the spirits, he, of course, becomes an object of veneration to his tribesmen, his power is feared, his influence sought.

Savages answer the above questions in the affirmative. It is true every one cannot get this power, but some can, and the fortunate individual does become a man of influence and is treated with great respect. The above is a fair idea of a savage priest. He is simply a great magician. One who knows such powerful charms and songs, or has such wonderful "medicine" that he can put himself into communication with spirits generally, or with some higher and more powerful spirit. He can fortell the future events and perform many wonderful things. As a material consequence, he is able to perform many cures, for by his superior strength he can exorcise the evil spirits producing the sickness. The question of morality is not considered.

Let us notice, first of all, that the savage priest claims to derive his power directly from intercourse with spirits. Among the Greenlanders, a priest is an *Angekok*, or diviner, and before assuming his office, he must enlist in his service one of the spirits of the air. He goes through a cruel novitiate, he forsakes the society of his fellow men, he subjects himself to prolonged and repeated fastings and he must fix his mind constantly on what he desires. We,

of course, see what results are sure to follow. His disordered imagination usurps the place of reason, and figures of men, beasts and monsters throng the chambers of his troubled brain. Finally a trance state is produced, and he wanders through the Greenlander's heaven and receives supernatural instructions and attaches to his service a familiar spirit, who will henceforth come at his bidding.

When his services are wanted hereafter, the proceedings are about as follows: The priest drums and dances until he has worked himself up to a proper degree of excitement. He is then securely bound and placed in a darkened room. All persons then retire, songs are sung and the priest works himself up to frenzy. If his familiar spirit does not appear, he falls into a trance state and his soul leaves his body to search for it. He soon returns and then he stands ready to answer all manner of questions. The answers are generally vague and uncertain. If the waiting audience cannot unravel them, the spirit is requested to make his answers more definite, or perhaps the priest, leaving his body behind, soars with his familiar spirit to the highest heaven and there learns the fate of a sick person, or has decided other momentous questions. When the audience is terminated, the priest is found unbound in his darkened room.[1] Let us see how it was among our Indians. The general title is "Medicine-men," but the Indians gave them various titles, such as "dreamers of the gods," "masters or guardians of the divine thought." They may be roughly divided among the northern Indians into two great classes. The *Medawin* is essentially the magician, who seeks to propitate events; the *Jesukawin* is the prophet, who foretells events. Both appeal to spirits

[1] For details see Crantz "Greenland." Vol. I., p. 194-5.

for their powers. Both make use of some fetich, by means of which the power is exercised. In the ruder tribes, this power was strictly personal. Approaching puberty, the youth was expected to fast and meditate until in dreams or vision some fetich appeared to him. These dreams and visions might be of such a nature as to indicate that he was destined to be a priest, thereupon the other priests took him in hand to continue his training. "For months and for years he is condemned to entire seclusion, receiving no visits but from the brethren of his order." Sometimes the novitiate fasted in his solitary lodge until in vision he is taken to the Indian heaven, there to be taught unutterable things.

One of the highest exhibitions of their power is to summon a spirit to answer inquiries concerning the future and the absent. Accordingly a lodge is built under the priest's directions. When he enters it, all openings are carefully closed. The priest now begins his songs and incantations. He works himself up to a state of frenzy, or perhaps, falls in a death like trance; but finally "the lodge trembles, the strong poles shake and bend as with the united strength of a dozen men, and strange unearthly sounds, now far aloft in the air, now deep in the ground, anon approaching nearer and nearer, reach the ears of the spectators." At length, the spirit is considered to have arrived and questions are asked and answered.[1]

The same conception re-appears in Australia. Among the Kurnai, of South Australia, we read of the *Birraark*, men who profess to hold communion with the ghosts, and learn from them about absent friends and other information. When his services are wanted, the evening is de-

1 Details in Schoolcraft, "Archives etc.," Vol. I., p. 358 et. seq. Brinton "Myths of the New World," Chapter X.

voted to the work. The fires are allowed to go down, and silence is maintained. The magician cries coo-e e, coo-e e, at short intervals. At length, a distant reply is heard, and soon the sound of some one jumping to the ground signifies the arrival of the spirit. Questions and replies follow, and, at the conclusion of the audience, the Birraark is found, perhaps, in the top of some nearly inaccessible tree, whither the spirits had transported him while he was sound asleep.[1]

So, of the New Zealanders, we read of the worship paid to spirits of deceased ancestors, and that some individuals are supposed to be able to command their attention. And observers tell us how the stillness of the hut, only faintly lighted, is at length broken by the noise of some heavy body falling on the roof, and the spirits make communication in a thin, whistling voice, apparently proceeding from the roof.[2]

In the Figi Islands, the priest, fixing his attention on a whale's tooth, soon goes into strong convulsions, and the spirit of his god is supposed to enter into him, and questions are asked and answered. "While giving the answer the priest's eyes stand out and roll as in a frenzy; his voice is unnatural, his face pale, his lips livid, his breathing depressed, and his entire appearance like that of a furious madman.[3]

The Zulu diviners show that in Africa we once more meet with this characteristic savage priesthood. Certain symptoms appear to individuals which are universally ascribed to possession by "*amatonga*," or ancestral spirits. Some let the affection take its course and become an *In-*

---

3 Williams "Figi and Figians," p. 176.

*yanga*, or this power may be developed. For this purpose, fasting is necessary. "The continually stuffed body," say they, "cannot see secret things." A person who wishes to develop this power sleeps only by snatches, he dwells much on his dreams and becomes, as the natives say, "a house of dreams." He has waking visions of objects that are not there when he approaches them, songs come to him without learning. He has many illusions, such as if he

The Pythian Priestess.

were flying through the air. Such a person is now an Inyanga, that is, one who is at times possessed by a spirit and has great power in finding hidden things and giving apparently inaccessible information.[1]

[1] Details in Tylor "Culture," Vol. II., p. 120. Spencer "Sociology," p. 256.

These observations could be greatly extended, but we have now seen the true savage conception of a priest. A few words, now, as to the power posessed by these priests. At the present day, only ignorance will contemptuously class them all as imposters, knaves and scoundrels. Modern science comes far short of a thorough understanding of the human mind. It has mysterious powers, the nature of which is but little understood. We do not know across what distance one mind exerts an influence on another. In the lives of all, there are mysterious incidents which our present science cannot explain. Other mysterious events happen, vouched for by witnesses of undoubted veracity, which we cannot explain. We have a number of words to express this unknown power, such as clairvoyance, mesmerism, animal magnetism, odylic force, etc.

Such force or power is lodged more plentifully in some men than in others, it may be developed by cultivation. Now, we have only to notice that savage priesthood, everywhere, picks out for its profession men endowed with this power. They cultivate it by every method known to them They withraw from the society of men, they fast to the utmost of human endurance, they hold the mind constantly on this one subject. In all ways they strive to bring on a morbid condition of the mind. Any physician knows that such states of mind can be brought about. The savage, as well as the civilized man, will then have dreams and visions of wonderful force. When the powers of the priests are sought, one of the first steps is for the priest to bring on this morbid state of the mind; and, when this state is brought about, results are sometimes obtained that our present knowledge is unable to explain.

The foregoing presents one side of the case. There is, of course, a vast amount of humbuggery and cheating,

sleight-of-hand tricks and ventriloquism abound, and many of the tricks of the Indian jugglers are known to savage priests, but this does not explain all. Often the amazed missonary is ready to conclude that the "Evil Spirit" is helping his savage disciples. If it were deemed advisable, examples could here be given of well attested exhibition of unknown force among the savage priesthood, fully as wonderful as anything known to civilized man. In many parts of the world, these priests have, when occasionally converted to Christianity, stoutly maintained that their former protestation of power was not wholly affected. They still claimed that it was something real, though entirely inexplicable to themselves.

We have but one further observation to make. We have several times shown how savage beliefs survive even to the present day. It must be evident to all, that the savage doctrine of the spirit world, the future life so like our own, the spirits of the dead everywhere about us, the power of communication with them under certain conditions, by means of certain persons, has but lately sprung into new life, and is to-day firmly believed in by thousands of individuals in America and Europe. We refer to modern Spiritualism. This statement is, of course, entirely independent of any question as to the truth or falsity of Spiritualism. We are simply concerned to point out the striking similarity of belief. There is not a phenomenon connected with modern Spiritualism, which has not its counterpart in savage philosophy. Each reader must decide as best he can whether this be an argument for or against Spiritualism.[1]

1 See a most interesting article "Spiritism amongst uncultured people compared with Modern Spiritualism," by Charnock F. S. A., in "Anthropologia," Vol. I., p. 458, and discussion of the same. See also Tiele "History of Religion," p. 9.

A ROMAN HARUSPEX.

C. BLASHFIELD.

We are now approaching a difficult part of our subject, and it is necessary for us to constantly bear in mind that no one key serves to explain the various religious conceptions framed by man to account for the mysteries he everywhere sees about him. When we take a comprehensive survey of these conceptions, we preceive that from two main sources have come the lines of thought, the results of which lie before us. Of these, one is the primitive Ancestor worship, which, in some instances, conducts directly to Polytheism and, indeed, to Monotheism ; [1] the other is from Fetichism, which, taking a firm hold on men's minds, at length carries them to the same end. In both cases, we notice the tendency is from many to one. Let us show the truth of these statements.

First, in regard to the development of the idea of Ancestor worship. At an early stage, the idea prevails that the deceased members of a tribe look out for the wants of that tribe. In New Zealand, this explains the treatment of slaves. It is not supposed that the ancestral spirits of one's own tribe will follow him in the midst of the enemy to care for him. Still less will the ancestral spirits of his captor's tribe have anything to do with him. He, therefore, is under the oversight of no spirits.[2] Hence, the invisible spirit world is considered as divided into two great classes of spirits, the hostile and the friendly ; the dead of their own tribe, and those of others. It seems to us, that here is a simple and consistent explanation of the incipient dualism, the conflict between good and evil, which can be

---

[1] This statement might be called in question by some, but we must recall that the political institutions of a people certainly influence their idea of God, and this must be a result of Ancestor worship. See Goldziher "Mythology among the Hebrews."

[2] Shortland "New Zealand," p. 62.

detected in most tribes, however low they may be;[1] but, at first, notice that no question of morality is connected with this dualism.

Let us follow this thought. Of all the various tribes of men on the earth, some are powerful and arrogant, the great majority are self-conceited, and some are feeble and conscious of their inferiority. How will these states of feelings affect the beliefs we have just noticed, for it is manifest that they will greatly influence them. Those tribes posessing power and conscious of it, worship the good (*i. e.*, friendly) spirits and defy evil (*i. e.*, foreign.) The weak and feeble tribes will, on the contrary, reverse this worship. That savage tribes are found, in the lower ranges of culture, who thus worship what they regard as the evil spirit or spirits is well known. In Mesopotamia, there is a sect of devil worshipers to-day.[2]

But, in another direction, this Ancestor worship clearly gives rise to Polytheism. Is it not clear that with development of tribal society there will arise conceptions of gods of various ranks? Will not the tribal chief be a god superior in rank to the chief of the phratry, and will not this latter out-rank the chief of the gens? So also, when the joint family develops itself, it will indeed have a family god, but this will be a grade lower than the god of the gens. Each and every step of the above can be found in the records of the the ancient Aryans. Every family has its house god, who is nothing but the deceased house-father. Above them was the god of the gens, who was nothing but the supposed common ancestor of the gens. As the descent passes into the male line, the custom of naming the gens after some animal is abandoned, and some hero is taken in-

1 See on this point Tylor "Culture," Vol. II., p. 287 et. seq.
2 Layard "Nineveh and its Remains," Vol I., p. 297.

stead as the supposed starting point, and to him worship is directed. Above these lesser gods, were ranked the tribal gods.[1]

We can turn to collected accounts of the beliefs of savage tribes and find this principle in active operation to-day. Take the Zulus. The clan chiefs pass on into deities, but back and beyond all these stands the first man, the supposed progenitor of all the Zulus. He is the "old-old one," the one who "broke off in the beginning," he is regarded as the all powerful god, the creator of all things.[2] So, among many other Indian tribes, the first man, the one from whom they feign descent, stands forth as a great god.[3] And so it is generally in Polynesia, where we would naturally look for such a result among a people who regard the heads of the families and chiefs as sacred persons.[4] We are told that there is good reason for connecting this first man in Polynesia with the first king of Hawaii.

Here, then, we see, how in a very natural and simple manner, Ancestor worship might pass into Polytheism. And we think that all must recognize the force of this tendency. To further help us in this matter, let us refer to one more class of facts. Where Ancestor worship prevails, any noted personage, inventor or warrior, medicine man or prophet would surely receive special honors after death. We have mentioned this tendency among the Hindoos to-day. We may well believe it exists elsewhere. Therefore, when Galton says the Damaras showed him the grave of the god Omakuru, we may possibly see here an instance

3 Müller "Urreligionnen," p. 133.

4 Shortland "New Zealand," p. 84.

of savage apotheosis.[1] In this connection, let us recall what was said as to certain Mexican deities in the preceding volume.[2] Among primitive people, the great and successful war-chief would almost surely be raised to the ranks of the gods. Perhaps this was the origin of the Aztec god of war.[3] Most of the Chinese gods and goddesses are of this character. Their birth-days are held sacred. Tales are told of their early life. As might be expected, the war god is the spirit of a famous warrior.[4]

Among most people, however, the line of development seems to have been from Fetichism to Nature worship, and so to Polytheism and, eventually, Monotheism. And in all this, it has followed a perfectly natural course. From out the great mass of fetich gods, there gradually emerges more important nature fetiches, if we may so call them. Among these greater fetiches, are heaven, earth, water, sea, fire, sun and moon. The blue, over-arching heaven is regarded, in a primitive stage of thought, as a great fetich. Advancing culture serves to distinguish more and more clearly between heaven itself and the powerful spirit residing therein. The like process takes place with others of the more powerful nature fetiches. The results come before us in Polytheism. And we see how true it is, that only comparatively advanced people can thus originate a pantheon.

Let us illustrate the truth of this statement by reference to some items of primitive belief. The Iroquois prayed to *Garonhia* which is simply the word for sky, [5] but a more advanced stage of thought is implied in the

name, sometimes used, of *Garonhiawagon*, literally meaning, sky-comer. This illustrates the separation of the indwelling spirit from the fetich itself. Equally significant phrases occur among the more civilized nations of the South.

In Africa, also, we perceive the worship of the heaven as a fetich, giving place to the worship of a spirit residing in heaven. The Zulus sometimes speak of heaven as able to punish evil doing, and then again of a Lord of heaven, who exercises this power.[1] We find that, in East Africa, the same word may be used for the name of the highest god or heaven or cloud.[2] So the ruder Siberian tribes scarcely, if at all, separate in thought the visible heaven and the divinity residing in it, using the same word for both.[3] The same transition of thought can be traced in China. *Tien*, or heaven, is by many spoken of as the Ruler and Lord of the universe.[4] The Ayrans also show a similar stage of belief. "We find a Zeus, chief god among the Greeks; a Jupiter, among the Romans; we have a Zio, an important divinity with the Teutons, and a Dyaus with the old Indians."[5] All these names are derived from one word meaning sky.[6]

This idea of a heaven-god, which we find thus rising from a conception of heaven as a fetich, presents different forms amongst different people. It is not strange that meterological phenomena should often be thought of as attributes of this heaven-god. Thus, the winds, tempests, thunder and lightening, though sometimes thought of as

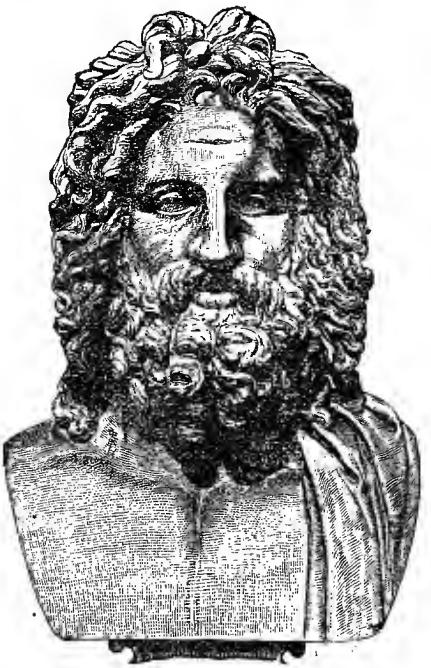
the functions of a separate god, are more often conceived as the heaven-god himself exercising a special function. All these commotions of the elements herald their approach by appearances in the sky, hence they are generally regarded as significant of various states of feeling of the heaven-god—the thunder-storm, significant of wrath; the genial showers, of goodness. Sometimes other conceptions appear, and the storm-gods and wind-gods are regarded as separate beings but under the control of the heaven-god.



Jupiter.

Much the same course can be traced in regard to earth worship. Among many of the ruder tribes of men, the earth is regarded as a great fetich, The Incas worshiped the earth as a goddess.[1] The Algonquin Indians in the north would sing medicine songs to the earth, whom they styled the "great-grandmother of all."[2] A similar conception is found in West Africa, where the earth is worshiped as a goddess second only to the heaven-god.[3] Throughout Asia, the same conceptions re-appear, and we detect the same change—from the worship of earth as a fetich, to

1 Müller "Urreligionnen," p. 369.
2 Tylor "Primitive Culture, Vol. II., p. 244.
3 Waitz "Anthropology, etc.," Vol. II., p. 170.

the worship of a god of the earth.[1] The Aryans entertained the same views. "The Vedic hymns commemorate the goddess Prithivi, the broad earth;"[2] and, from the primeval home, the migrating tribes carried this belief with them. To his surprise, Tacitus observed the ancient Germans worshiping the earth even as his own countrymen did.

We have now spoken of but two of the greater nature fetiches and have seen how natural is the transition from them to Polytheism. We do not wish, in this chapter, to speak at any great length about Mythology, but the subject cannot be entirely passed by since "no religion which has any hold on the affections and imaginations of men can be without a mythology."[3] A myth is a story that has gradually grown up to account for certain observed phenomena. A vast number of them are nature-myths, to explain the most ordinary occurrences of nature. It is evident, that as religion passes out of the stage of Fetichism to Nature worship and, subsequently, Polytheism, that myths will, at once, make their appearance.

It was so with the two great nature fetiches we have examined. A very common conception, meeting us among tribes low in the scale and continuing to exert an influence far along in Civilization, is to regard the over-arching heaven and the fruitful earth as father and mother; whose offspring are the living creatures, men, beasts and plants. Throughout Polynesia, this myth is found; and interesting stories of native origin are given to account for their separation.[4] The same conception exactly re-appears in China, which illustrates how true it is that the human

---

1 Tylor Op cit., 246-7. 2Ibid.
3 Baring--Gould "Origin of Religious Belief." p. 171.
4 See on this point Tylor "Culture," Vol. I., p. 290 et. seq.

mind, everywhere, obeys the same law of thought. Among the primitive Aryans, we are continually told of the two great parents, Father-heaven and Mother-earth. The conception of earth as a mother is more general than that of heaven as a father. "The Caribs, when there was an earthquake, said it was their mother-earth dancing and signifying to them to dance and make merry likewise, which accordingly they did."[1]

We have still two other important fetiches to treat of, and show how the worship of them passed into Nature worship and Polytheism, these are fire and water. In that stage of thought, where any striking object may be worshiped as a fetich, it is, of course, not strange that rivers, lakes and springs, and especially whirlpools, rapids and cataracts should be worshiped; and, finally, that worship should be paid more directly to the spirit residing therein. Such worship meets us everywhere. Our Indians were observed to make prayers to the deities of rivers and lakes. In times of sickness or drought, sacrifices are made to them. Examples of barbaric customs in this respect could be gathered from the most widely scattered portions of the earth.[2] Traces of this world-wide superstition still exist as survivals among the more ignorant people of Europe. "The Bohemians will go to pray on the river bank, where a man has been drowned, and then they will cast in an offering, a loaf of new bread and a pair of wax candles." The Bulgarian throws some water out of every bucket full brought from the well, so that if any harmful spirit be floating thereon, it may not be taken into the house.[3]

Let us here take notice of the steps which, in some

---

1 Ibid. 295. 2 Details in Tylor "Culture," Vol. II., p. 190. et. seq.
3 "Positive Philosophy," Martineau's Translation, New York, 1853, Vol. II., p. 204.

cases, conduct directly from Fetichism to Polytheism. It is simply, a process of generalization. Compte says; "When certain phenomena appeared alike in various substances, the corresponding fetiches must have formed a group, and at length coalesced into one principal one, which thus became a god: that is, an ideal and usually invisible agent, whose residence is no longer rigorously fixed. Thus when the oaks of a forest, in their likeness to each other, suggested certain general phenomena, the abstract being in whom so many fetiches coalesced, was no fetich but the god of forests."[1] We can now see how difficult it was for primitive man to frame the conception of a water-god; the difficulty of bringing the many different forms of water under one conception.

Neptune.

But the sea, as being the greatest body of water known, naturally enough gives rise to the conception of a sea-god or gods. And here, we see the same stages of thought as before pointed out. The first thought is of the sea as a fetich, something alive, animated by a spirit. Many instances of this worship are known, as among certain African tribes who sacrifice directly to the sea. It survives into higher stages of thought, and even Xerxes thought to chastise the sea for destroying his bridge. But the higher stage of thought is where the sea is no longer a person but is ruled by indwelling spirits; finally appears the conception of a god of the sea, who con-

[1] Tylor "Culture," Vol. II., p. 253.

tinues to play an important part in the mythology of the ancient world.

The worship of fire is one of the most important of primitive worships. We can only briefly examine it. It presents the two stages noticed in reference to the great fetiches. Perhaps, all that is necessary is to point out that the worship of fire, in one sense or the other, is certainly very general among the barbarous races of men. In some localities, it is "conspicuous for its absence." In the South Sea Islands, there is sarcely a trace of fire worship,[1] and but one instance is recorded of its worship as a fetich among the Africans. In Dahomey, "A pot of fire is placed in a room and sacrifice is offered to it, that fire may 'live' there and not go forth to destroy the house."[2] It will be observed, that the worship of fire is lacking in warmer regions of the earth. This may be nothing but a coincidence, however.

In other sections, we are sure to come on traces of fire worship. It is true, however, that a great many rites of other worship require the use of fire, and we are liable to confound this use with worship paid to fire. Still it remains that worship was paid to fire. The Indians were extensively given to this worship.[3] It is almost general throughout Asia.[4] The Semitic people were extensively given to it. The worship of Baal was extensive throughout Assyria, Phœnicia and Chaldea, and passages in the Old Testament show how prone the Hebrews were to fall into this species of idolatry. The primitive Aryans were very extensively given to fire worship. It survives to-day among the Persian Parsees. When the

1 Tylor "Culture," Vol. II., p. 253.
2 Ibid. 3 Müller "Urreligionnen," 54.
4 Tylor "Culture," Vol. II. p. 254.

Aryans entered Europe, they brought with them this fire worship. Each joint-famly had its sacred fire, which was carefully screened from the gaze of strangers and never supposed to go out.[1]

It is interesting to trace the survival of this ancient fire worship in Europe. When a Russian family is about to move, after everything else has been taken from the house, a brisk fire is lighted for the last time in the stove at the old house. Precisely at midday, the embers from this fire are raked, by the oldest women of the family, into a clean jar, covered with a napkin and taken to the new house. There the jar is greeted with; "welcome grand-father to the new home."[2] The Esthonian bride consecrates her new home by casting some money into the fire for the "Fire-mother."[3] "To the Bohemian, it is a godless thing to spit in the fire,—'God's fire,' as he calls it. It is not right to throw away the crumbs after a meal, for they belong to the fire. Of every kind of dish, some should be given to the fire."[4] To have luck, the baker must daily throw pieces of bread to the fire.[5]

From fire worship, the transition is easy and natural to sun worship. Indeed, the sun would be worshiped as a great fetich from early times; but any well developed fire-worship would almost certainly lead its votaries to the worship of the sun. Sun-worship, like fire-worship, is very

---

[1] Coulanges "Ancient City," p. 46. Keary "Primitive Belief," p 132. It should be observed, however, that among the Aryans, fire seems early to have passed the fetich stage and was regarded simply as the means of communion with the spirits of deceased ancestors. The Parsees, usually regarded as fire worshipers, disclaim this title and maintain that fire is only the symbol of the deity. [American Antiquarian] March 1887, p. 119.

[2] Ralston "Songs of Russia," p. 138.

[3] Tylor "Primitive Culture" Vol II., p. 259.

[4] Ibid. [5] Wuttke "Volks Aberglaube," p. 86.

extensive though not universal. It is certainly significant that, like fire-worship, the worship of the sun is not extensively prevalent in warm and torrid countries, though here again we must accept this statement with caution.[1] Sun-worship was certainly very extensive among the Indians of America, though there may be some uncertainty as to the rank of this worship. One writer concludes that all the Indian tribes were sun-worshipers,[2] but Dr. Brinton tells us, that the Nachez alone, among the North American Indians, were true worshipers of the sun.[3] It certainly remains that great honor was shown the sun, by a great number of tribes.[4]

In Mexico, Central America and Peru, the worship of the sun was well established; especially is this true of the Incas, where it was, what might be called, the state religion.[5] Passing into the old world, we find sun-worship still prevalent among the northern Turanian tribes, where sacrifices are still offered to him.[6] The aboriginal tribes of India, likewise, continue his worship. It is scarcely necessary to recall that the Egyptians and Semitic inhabitants of Western Asia were likewise given to the adoration of the sun. The Hebrews themselves, were continually relapsing into this idolatry.

We have seen that the ancient Aryans were fire-worshipers. We, therefore, expect to find among them the worship of the sun. There are probably no exceptions to this rule. All nations of the Aryan stock worshiped the sun under various names and aspects. It was part and

5 Brinton Op. cit., p. 142. 6 Tylor "Culture," Vol. II., p 265.

parcel of the ancient religion of Europe, and it presented a most stubborn barrier to the spread of Christianity; and, in fact, the great sun-festivals were adopted by the infant church, too weak to abrogate them. Easter, St. Johns Eve and Christmas are but ancient sun-festivals now doing duty for another faith. In Saxony, the peasants still climb the hills on Easter morning to see the sun dance.[1]

Moon worship follows almost as naturally as sun-worship. It is significant to note that in Africa, for instance, over a large section of country where sun-worship is virtually unknown, the moon is regarded with great veneration. They dance and sing all night in her honor, when shining at her full; they shout greeting to the new moon and make prayers to it.[2] In the new world, the worship of the moon was spread over a large extent of country, and she was generally regarded as the goddess of water.[3] Many are the myths relating to the sun and moon and eclipses of these bodies, but we must pass them by at present.

We have in the last few pages endeavored to show how from a stage of Fetichism gradually arises Nature-worship, and, from that, Polytheism, or the religion of many gods, arises. We can see that we have now largely passed out of the stage of primitive religion. Savage people, indeed, worship the great nature fetiches, sky, earth, sun, water and fire. But it is only the more advanced people who come finally to separate the indwelling spirit from the fetich body; and, only when that stage is reached, does Polytheism proper begin.

Nor is it singular that confusion at once begins to show itself in such advanced religion. As soon as the sky-

[1] Tylor "Culture," Vol. II., p. 269.
[2] Ibid. [3] Brinton "Myths," p. 130.

god becomes dis-associated from the fetich-sky, various conceptions will begin to be formed, and he is represented in different ways. Now, he is represented as the storm, wind, rain or thunder god; and, again, he is simply a god that controls and governs these lesser storm gods. So the sun; in how many different ways it is represented. It may be the rising or setting sun, or the sun of midday; and, in connection with all this, there goes that tendency of the human mind which, in the childhood of a race, leads to the formation of myths; and these mythical stories, being constantly changed from time to time, serve only to increase the confusion.

We have yet before us a most important part of our subject. Quite low in the scale we come upon savages having dim conceptions of one supreme deity, and it is necessary for us to examine this subject to some extent to see how such conceptions might originate. It is plain that here, also, Ancestor worship, logically carried out, must land its followers in Monotheism. Back of the ancestors generally, back of the deceased chiefs and kings, there looms up, in thought, the idea of the deceased first ancestor, the one from whom the race first sprung. One striking illustration has already been stated; viz., that of the Zulus. It is equally apparent that, even where Ancestor worship has not been carried to its logical development, still it has greatly influenced savage conceptions of the future world. When people have developed far enough to have a regularly organized tribal government, they must conceive of a government of the future, framed on substantially the same model; and, of necessity, there is a head of authority somewhere. So it is not at all singular that, even among quite rude tribes, we come upon evidence of a belief in some Supreme Spirit, who exercises dominion over all the

others. This belief, in its first stages, is, of course, shadowy, ill-defined and contains contradictory features.

We would make a mistake, however, to conclude that this was the only road leading to Monotheism. The savage begins by adoring as a fetich each individual tree or bush; he ends by forming the conception of a god of trees or of agriculture. As a savage, he worships for his fetich the individual lake, fountain or spring; he ends by adoring the God of water. From this belief in a number of gods, each ruling his own department—water, vegetation, animal life, winds, etc.—it is but another step to the conception of one force back of all.[1] The trouble is for partially civilized men to give this thought expression.

It finds vent, however, in two directions. One is to conceive of a spiritual entity, far removed from all the affairs of men, too mighty and benevolent to care for the praise and adoration of men, knowing little about their affairs and caring less. The Indians in Texas believed in such a one "who does not concern himself about things here below."[2] A great many of the African tribes believe in such a being "who, they suppose, is too far removed or is too indifferent to feel much concern in the affairs of men."[3] So too, of the supreme God of the Figians, *Ndengei*. "He is the subject of no emotion nor sensation, nor any appetite except hunger.... giving no sign of life beyond eating, answering his priest, and changing his position from one side to the other."[4]

To satisfy this same longing, one of the great nature or fetich gods is sometimes raised to the primacy. The

sun or the heaven-god is often assigned to this place of honor. In the case of the heaven-god, this has taken place over a wide region of the earth. It appears among the South American Indians;[1] throughout the Polynesian Islands,[2] the same idea is found; it is also wide spread in Africa.[3] The same conception comes to the front in Asia, and especially among the Turanian tribes and among the Chinese;[4] and we have already pointed out that all the Aryan people had a heaven-god for the supreme deity.

We have, in this chapter, been investigating the religion of savage people generally. We have examined the superstitions of the lower races and have seen how they have developed with advancing culture. We have had to pass by a good many subjects of interest and must here drop the discussion. We have space only for a brief summary of our conclusions. We have found that the savage theory of dreams, shadows and reflections naturally gives rise to the belief in "another-self," posessing mysterious powers, capable of living apart from the body; and that death is, simply, the prolonged absence of this "other-self." From this as a starting point, we have investigated the savage theory of the future world and savage philosophy in general. We have found that the key which unlocks vast numbers of their superstitions is a belief in spirits swarming around them. This explains the savage theory of sickness, also the belief in magic, witchcraft, sorcery, etc., and it also explains the savage theory of the priest-hood.

We have seen that, at first, worship was paid to the spirits of the dead and have seen how persistent such belief

1 Tylor "Culture," Vol. II., p. 306. But see Brinton Op. cit., p. 54.
2 Tylor Op. cit , 312.
3 Waitz "Anthropology, etc., Vol. II., p. 168.
4 Tylor "Op. cit.," p. 318.

is, since to this day more than half the world are worshiping the spirits of the dead. But, at different stages of culture, this worship crystalizes into certain systems. Amongst the lowest tribes we find Fetichism, which, indeed, survives into the higher stages of culture. It is no exaggeration to say that the majority of the world's inhabitants today are fetich-worshipers. Amongst the higher tribes, Fetichism gives place to Polytheism. This result takes place in two directions, either by fusing the conceptions of a number of individual fetiches into one general fetich; forming, for instance, the idea of a god of water from the individual fetiches of fountains, lakes and rivers; or disassociating the indwelling spirit from the great nature fetiches, as, for instance, the idea of a sun-god from the fetich-sun.

We have further seen, that the same line of reasoning which conducts from Fetichism to Polytheism, leads on to Monotheism and have discovered still other lines of thought leading thereto. Even Ancestor worship, logically carried out, leads to the same end, and examples of this are given. Yet again, the tendency of the human mind to seek for some first cause, influenced, no doubt, by the savage idea of a future life like the present, induces even savages to form some vague, shadowy conception of a Supreme Being. We have to notice, in all this, that savage religion has but very little to do with morality. It is only advancing intelligence and civilization that finally unite morality and religion. Savage idea of the future life failed to exert its great influence for good, because of this. It is only in advanced stages of thought that the future life is held to be one in which happiness or misery is held to be conditional on the life led here. Savages conceive of friendly and hostile spirits, but only advanced civilization finally

changed these conceptions to others in which the question of morality, good and evil spirits, enters. Our subject has called for no discussion of the higher religions, such as Confucianism, Buddhism, Brahminism, Mohammedism or Christianity; it would be found, however, that these religions were the first and only religions that assigned the right place to morality, have made that, indeed, the corner stone of their system.

What shall we finally say of the results thus spread before us? They raise questions, the discussion of which would be very much out of place in this book. At least two results seem plainly indicated. The first is that even savages and but partially civilized people are so constituted that they come by entirely natural means to the fundamental conceptions underlying all religions, such as belief in God and immortality. The second shows us how far they come short of framing worthy conceptions on these and kindred topics. Christianity abandons arguments from nature and rests down upon the revealed will of the Most High, imparted to inspired men of old.

This chapter has been written solely for the purpose of enabling us to understand the religious beliefs of the Ancient World. Leaving the Hebrews entirely out of the question, for they play but a small part in the Ancient World, we have a difficult task before us to show how the great people of antiquity, who certainly did not derive their religion from the Hebrews, came to possess their great Polytheistic systems of religion. This question we have now attempted to answer. We can but notice how true it is that in religious culture, as in everything else, man has lived a life of progress. This affords room for the cheering hope that the world will grow better as well as wiser; and we can look forward to the time when Christianity will pre-

vail over the entire earth and free mankind from the superstitious depths of primitive religion, even as the science and Civilization of to-day extend their benignant sway.

We now bring to a close this series of introductory chapters and will turn to consider the development of culture in each of the three great groups of races. We have ranged over quite a number of topics not necessary for the mere historian to consider, but they are indispensible for one who would learn of the growth of Civilization. Two persons may both admire a flower, but the one who understands the outlines of botany is fitted for a higher enjoyment than one ignorant of it. Civilization is a beautiful flower, blooming on the vine of progress; all can certainly admire it in its present form, but he who has taken some pains to acquaint himself with the laws of its development and growth, and can compare the present results with those of an earlier age, derives a much higher enjoyment than one destitute of this knowledge, knowing only of the present.

We trust that all who have followed us will be impressed with a sense of the worth and dignity of man. In realizing the depths from which he has ascended, we can look forward with hope to the future. If it be true, that the elements of our present Civilization are simply the results of unknown years of progressive efforts, then let us trust that, as the years go by, Civilization will steadily grow higher, nobler and, in all ways, more in keeping with that life which the highest, purest, holiest instincts of man teach him he should live.

Let us not take a gloomy view of Civilization. The scholar, who laments that there is so much ignorance in the world; the philanthropist, who sighs over the many cases of man's inhumanity to man; the moralist, who sees

so many ways in which human conduct should improve; the philosopher, who views in amazement the thousands of superstitious customs of the world: should bear in mind that that which they severally deplore was once the universal rule of action. If we may judge the future by the past, we may see in the distant future the dawning of a better day. The Golden Age, of which the poets sung, is no myth, but instead of looking for it in the past, we are to look for it in the future. Each should so live that when his brief day on earth is past, his influence, which lives after him, will be felt as an elevating and ennobling one and thus contribute to the bringing on of that better Civilization of the future.

HAVE now reached an important point in our work. We are like travelers, who have been toiling up a long ascent, but are now in position to profit by our previous exertions. Let us now apply the principles we have examined and pass in review the nations and races of the world. Let us ask what part each one took in the work of Civilization. This research ought in no wise to fatigue us. We are not to sojourn along some beaten and dusty highway, we are not concerned with dynasties and the march of armies, but with the growth of Civilization. Whether we gaze on the monumental ruins of Egypt, over which unknown chiliads of years have winged their flight; ponder over the but just recovered cylinder of some Chaldean king inscribed with records already ancient when first the light of history lit up the Mediteranean area or scrutinize the records of Chi-

nese sages of unknown antiquity and meaning—our main purpose is to see how, in each case, Civilization was advanced.

We must, however, proceed in some definite order, or else, as the records of the past unroll before us, we will become confused and so miss the many details which make up the beauty of the whole. We will, therefore, take up the second great group of races and in this chapter inquire as to the part they have taken in the great work of human progress. We have seen that, for convenience, we may divide the many races of men into three great groups of races, the Black, Yellow and White Races. On the supposition that the the Black Races were the first to people the earth, we may ascribe to them the invention of the first language, the artificial production of fire and the utilization of stone for implements and weapons. They must have made the first beginnings in social life, carrying this organization forward at least as far as the class division of the Australians. In short, they must have advanced through at least the lower stage of Savagery.

It is, perhaps, not strange that at this stage the Black Races halted. The advance they had achieved, though small in the aggregate, was relatively great. As they spread from their primitive home, going forth to possess the earth in that primitive long-ago, they, of course, became exposed to greatly different surroundings. The descendants, then, of this primitive people would in time diverge from the ancestral type. In a former chapter,[1] we have suggested that the Yellow Races were the first to diverge from the primitive Black Races. We shall, probably, never be able to solve this and similar questions referring to the

1 This Volume, p. 78.

morning time of human life with certainty; the only way for us to do is to accept the solutions as convenient working hypotheses, ready to exchange them for any other theory that will best explain all facts requiring explanation. At present, however, we may assume that the Yellow Races represent the second great stock of people; and now let us see what was their condition in the Ancient World, and what they did to advance Civilization in the ages lying near the dawn of history.

The origin of the Yellow Races must be placed far back in time. No petty term of years will suffice. We are not able to give a definite answer, but everything connected with the antiquity of the Neolithic Age compels us to assume the passage of thousands of years.[1] Can we, in any way, determine the primeval home of the Yellow Races? On this, as on other points, all we can do is to come to some provisional answer, one that will do until we obtain further light. At the present day, the Black Races are found in Africa, Australia and the islands of Western Polynesia.[2] In accordance with present light, it seems reasonable to assign the primeval home of the Black Races to South-eastern Asia; bearing in mind, however, that the outline of the continent of Asia when man first appeared, was, doubtless, considerably different from what it is to-day.[3] The migrations of the first men, suited as they were for only warm and tropical regions, were mainly in a direction east and west; and hence it is, that we detect traces of their presence in Southern India,[4] and that they finally found a most congenial home in tropical Africa.

We may, of course, assume that they made extensive migrations into the temperate regions of the north. As

[1] Vol. I., p. 261. [2] This Volume, p. 80. [3] p. 64.
[4] See Keane appendix to "Asia," London, 1882, p. 704.

Paleolithic tribes, we seem to have caught sight of them in Preglacial times in Europe,[1] and they probably spread into the New World as well.[2] A recent writer assures us that Chinese immigrants found them in the center of what is now China, at a date preceding 2000 B. C.[3] But it becomes equally evident that, in their new homes, they would certainly be exposed to greatly different surroundings; and, in process of time, divergence from the original type would certainly take place.

More than one scholar has pointed out the influence of elevated, dry regions of land and of mountain ranges. A glance at the map of Asia will show that no great advance towards the interior could have been made, starting from the south-eastern section, before the spreading tribes of primitive men would come upon elevated dry table lands, bounded by great mountain ranges. In the course of time, then, it is not singular, that to the north of the center of Asia, a second great stock of races, the Yellow Races, make their appearance. This seems to be the original home of the Yellow Races. It corresponds well with all that is known of their movements in early times. If we are justified in assigning any considerable portion of our Indians to some original home, that home was Northern Asia. The Neolithic invaders of Europe, quite probably, came from that same section, and certain it is that the movements of all the great bodies of Turanian or Mongolic people, known to history emanate from that source.

Changes, both mental and physical, have taken place. There is, probably, now no longer a doubt that the new race type was the superior in both structure and intellect

---

[1] Vol. I., p. 98. [2] Ibid.

[3] Prof. T. De La Couperie, Introduction to Colquihoun "Amongst the Shans," p. XLII., London, 1885.

to the Black Races. Living in a dryer and cooler habitat the color tends to become lighter.[1] But a more important change has taken place in mental endowment. In this respect, the Yellow Races occupy a higher scale than the Black; and, probably, the dryness of the climate serves to advance them in this direction also.[2] The Yellow Races had a great work to do in developing nascent Civilization. Taking up the work where the Black Races had come to a stand, they carried it forward. They are the childhood races of mankind. The period of infancy was past; but, just as the child is impatient of restraint, is moved by impulse but not by judgement, begins many things but carries few through and soon comes to the limits of his powers—so do we find it with the Yellow Races of mankind.[3]

We do not know how long a time elapsed, during which the Yellow Races remained near each other in this second center of dispersion. Yet increasing numbers and gradual separation in search of new locations, gradually tended to the formation of sub-stocks. Strife would, in time, spring up between them, and so from this center great bands would sally forth to escape the tyranny of more powerful tribes. But tribal organization appears to have been fully developed before these migrations began; and that peculiar system of relationship, which we have designated the Indo-American,[4] was developed and carried by migrating members of this race—on the one hand, to America, on the other to India. However, on this matter, we must exercise caution. The results just stated seem to be in keeping

with our present knowledge. Treating of these far-away times of which we have absolutely no record, we need not be over sure in our statements.

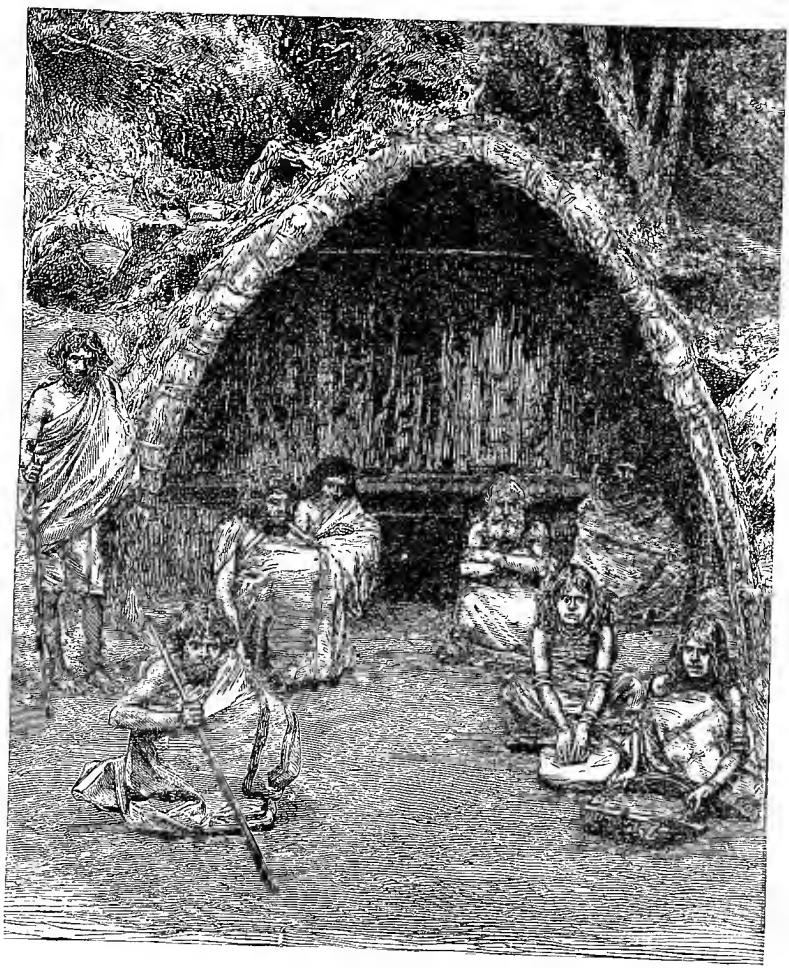
As to their general culture, not much is known, that is of the period preceding their migrations. Assuming, if we choose to, that the Neolithic inhabitants of Europe were among the first to leave, they had by that time attained to the possession of some domestic animals and at least the rudiments of agriculture, though they were as yet in the Stone Age of culture. These invaders were, probably, allied to the Turanian division of the Yellow Races,[1] though they might have formed a family apart by themselves or might have been closely allied to some of the other families, as, for instance, the American. Several scholars have thought this last suggestion reasonable, and some even have supposed that the Indians came from Europe to America.[2]

The Turanian division includes the most typical and important members of the Yellow Races. Its home seems to have been along the Altai mountain range. Its language has been sufficiently discussed.[3] At a very early time, some thousands of years before the Christian era, they began to send out great bands of migrating people and, from time to time, during the historic era, similar movements occurred. They not only sent one stream to Europe but at that same early date, they sent great streams of invading people into South-western Asia; and here they reached a comparatively high stage of culture, which exercised a great influence on the Civilization of both Europe and Asia.

Let us first see what traces we can find of this south-

1 Vol. I., p. 210.
2 Hale "American Antiquarian," 1883.
3 This Volume, p. 41.

western migration which took place at a time long before the dawn of history, doubtless earlier than five thousand B. C. In this cut, we have represented Dravidians from Southern India. The race to which they belong,



Dravidians.

doubtless much changed from the original stock, is one of very great interest. We do not know when they entered India. The evidence is to the effect that they invaded the

country from the north-west. After the lapse of many centuries, the number of which we can not now determine the Aryans entered India from the same direction and commenced a long-continued and stubborn contest with the Dravidians for the country. The result was the latter were continually pressed to the south. In the time of Solomon, they still held possession of Ophir, the country at the mouth of the Indus.[1]

At the present day, the Dravidian language is spoken by over forty millions of people in Southern India.[2] As far as we can now determine, the Dravidians did not reach any very high stage of culture. What they were able to accomplish in this direction was more an imitation of the higher culture of the Aryans. Thus, in comparatively modern times, they have developed considerable of a literature "which is in some respects unique in the East."[3] Some would assign to them the origin of the Indian architecture,[4] but we have the very best of reasons for concluding that this is a mistake.[5]

It is a most interesting question, who were these Dravidians? The Vedic hymns of the Aryan invaders speak of them collectively under the word "Dasyus."[6] This, however, was not a race name, it simply meant "enemies." More significant, perhaps, are the hymns describing the personal appearance of the non-Aryan Tribes. The flat-

6 Geiger "Civilization of the Eastern Iranians," p. 35.

nose, so descriptive of the Asiatics generally, is especially dwelt upon.[1] We must remember, that at the present day, the Aryans and Dravidians of India have become greatly mixed.[2] The main distinction between them is that of language.[3] Perhaps this point is not sufficiently considered by some of our more modern scholars, who are inclined to class the Dravidians among the White Races.[4] As a general thing, the Dravidians are classed among the Yellow Races. Perhaps they represent one of the very first emigrations out of the common home of the Yellow Races.

Passing more to the west of the Dravidians, there came, probably at a subsequent period, another great invasion of Turanians. Perhaps it was the march of their tribes, which forced the Dravidians out of the territory lying to the east and south of the Caspian Sea, into India. For the Dravidians themselves were intruders; when they entered India, the country was already filled up by Kolarian tribes, who came probably from the south-east and were related to the Black Races.[5] Be all this as it may, we have excellent reasons for saying that Turanian tribes were early settled in Mesopotamia and the country to the south and east of the Caspian. The Avestas, the epic books of the Aryan Persians, contain many references to Turanian tribes in that vicinity.[6] It was the Turanian tribes that finally occupied the country around the lower courses of the Tigris and Euphrates that possess great interest for any one who studies the origin of Civilization

This brings us to one of the most interesting discoveries of modern times. It is only within the last few years

---

[1] "Encyclopedia Britannica," Article, India.
[2] Keane "Asia," London, 1882, p. 286. [3] Ibid. 704.

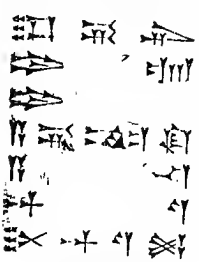
[6] Geiger "Eastern Iranians," p. 41.

that our scholars have become convinced that at a time long preceding the beginning of history, a Turanian people dwelt in Southern Mesopotamia as well as in the fertile portions of modern Persia. Let us see how they have been able to satisfy themselves of this.

Probably all are aware that Mesopotamia, the strip of land through which flow the Tigris and Euphrates rivers, has all evidence of being one of the centers of early Civilization. Through pestilential marshes, can still be traced the remains of ancient canals, which once made this now desolate land a fruitful valley.

Here were the cities of Babylon, Ur and Calneh and many more cities mentioned on the pages of Holy Writ, and the country itself was none other than the plain of Shinar.[1] This is not the place to recite how such explorers as Rich, Botta, Layard, Smith and others, finally succeeded in partially recovering for us the history of these extinct cities. The veil of oblivion has been here and there lifted, and we read of doings of kings, descriptions of their conquests, their worships and sacrifices, at a time removed from us by several thousands of years. These results have been attained only by the exertions of men who devoted their lives to the cause of science. Who followed one clew after another, until they succeeded in wresting from mysterious arrow-shaped inscriptions, such as are here shown, their hidden meaning.



Cuneiform Writing.

We are here trenching on a subject that will be considered later.[2] Thousands of inscriptions have been deciphered, and, thus it is, that we are now enabled to see

1 Genesis, X. and XI. 2 See Chapter IX.

clearly on many points in the history of these far away times and places. But still the unknown is greatly more than the known; and, further, nearly every day brings some new discovery to light, so that it becomes us to speak with great caution on all points connected with this ancient land. The following may be considered as the present conclusions, and the probabilities are that future discoveries will not greatly change them.

The beginning of Civilization in this section of country was along the lower reaches of the rivers, near the old shores of the Persian Gulf. This was the home of numerous closely related tribes, who had mainly adopted a sedentery life, possessing each a fortified citadel, or city, and each under the government of its own chief,[1] who, like all such officers in primitive times, was not only the head of the tribe, but the head of the religion as well. These tribes did not live together in peace and amity any more than do rude tribes generally. Some of them continued in a nomadic state of life, and thus a distinction was early known between them of highland (Accadian) and lowland (Sumerian) or, better still, the *nomadic* and *sedentary* inhabitants.[2]

Among the Sumerians there was, of course, the usual scenes of tribal rivalry. One tribe endeavoring to bring the others under its sway, and the supremacy resting now with one tribe and now with another. We may well suppose, also, that, at times, the sedentary tribes had to unite their forces, under the leadership of some noted tribe, to repel the attacks of the more savage nomadic tribes. But, as time passed on, the nomadic tribes, which might have included tribes of various races, gradually adopted the culture of the settled tribes; and now the rivalry for leader-

[1] A "Patesi" Ragozin, "The Story of Chaldra," N. Y. 1886, p. 203.
[2] See Rawlinson "Clay Cylinder of Cyrus the Great," in J. R. A. S.

ship among the tribes was transferred to a wider field. As for the language spoken by these tribes, there were, of course, numerous dialects,[1] because, in general, different tribes denote a difference in dialect.[2] The most numerous stock language in this section was of an agglutinative type and belonged to the Turanian class.[3] The evidence is to the effect that to the west and south-west of this early civilized area there were vast numbers of nomadic tribes, and certainly a large proportion of them were Semitic tribes. They might have formed an important element among the nomadic tribes that the more settled sedentary ones had to contend with. Be that as it may, it was Semitic tribes that commenced at an extremely early day to exert a pressure upon Turanian tribes. We have no reason to suppose that this pressure was exerted in a peaceful way only.[4] We may suppose the usual scenes of inter-tribal warfare ensued. Sudden and unexpected raids, cruel massacres, crops destroyed and people carried away to captivity. As time passed on, these nomadic Semites grew in culture, adopted

---

1880, p. 71, Note, where he takes this view of the meaning of the two divisions. See also Lenormant "Chaldean Magic," p. 411. There seems to have been an ancient division of these people into Accadians and Sumerians. Some think this division indicated dialectical divisions, but more think it a geographical division.

1 On this point see Rawlinson's Article in Journal Royal Asiatic Society for 1880. Also Lenormant "Chaldean Magic," p. 412.

2 This Volume, p. 146.

3 On this point see Pinches "Language of Mesopotamia," in J.R.A.S, 1884, p. 301. He points on the monosyllabic tendencies as displayed in Chinese, p. 309. See also Sayce "Science of Language," Vol. II., p. 189. By same Author, "Fresh Light from Ancient Monuments, London, 1884, p. 20. Also, "Babylonia," 1885. But especially see Lenormant "Chaldean Magic," Chapter XIX. and XX., where both resemblances and differences are pointed out. The contrary view is maintained by M. Halevy, see J. R. A. S , 1879.

4 The contrary view seems to be the opinion of many writers. See Ragozin "Story of Chaldea," N. Y., 1886, p. 202 et. seq. Yet this is opposed by all that we know of Ancient Society.

more and more the ways of sedentary life and so settled among the Turanians, whom they doubtless reduced to a more or less completely subject condition; and now commenced that long interchange of culture, the old, arrested, perhaps decaying civilization (such as it was) of the Turanians sprung into new life and activity, when it felt the infusion of new blood. The language and culture of the Semites gradually prevailed, but they prevailed greatly modified by the older culture of the Turanians.

We are here only concerned with these people before they became thus "Semitized," so let us not trace the development of culture in this section of country to a later stage but make further inquiries in regard to these aboriginal inhabitants. In the first place, where did they come from? Reasoning from general principles, we have already stated that their original home was the Altai mountain range. There are several significant features of their culture which bear out this supposition. In the first place, as we shall see later, they were the inventors of the cuneiform system of writing. This, in its earlier stage, was picture-writing,[1] and in many cases the original form of the hieroglyphic can be made out. Now if we inquire as to the origin of the one hundred and eighty elementary characters of the cuneiform writing, we are told that they bear all evidence of originating in a more northern country than ancient Chaldea.

For instance, in Chaldea, the lion was a most common animal, but no hieroglyphic of the lion is met with; but the hieroglyphics of both the bear and wolf, animals unknown in Chaldea, are found. In Chaldea, palms and the vine flourish; but, in the country where this writing was first

[1] This Volume, p. 247.

invented, they were unknown, their place being taken by cone-bearing trees. In Chaldea, no metals are known to exist; but, among the elements of Turanian writing, there is a sign for copper and another for precious metals such as gold and silver. Their name for camel is only true of the double humped camel of Upper Asia.[1]

Equally significant, are the directions of the points of the compass. The evidence is to the effect that their east, west, north and south were not the same as our points, but just between them. Thus east was what we call north-east; their south, south-east, etc.[2] The easiest explanation is that they marched from north-east to south-west and took those two directions as two cardinal ones. This supposition is rendered extremely probable by another inscription which said, in substance, that the right of the moon was north, the front west, the left south and the back east, showing that they were marching in a westerly direction, when the cardinal points received their names.[3]

Still another coincidence is to be noted. We have suggested in another place that, when a migrating people begin to loose the recollection of the land from whence they came, it straightway becomes to them a legendary land and the special home of the blessed. So in the case before us. The mountain peak of Rowandiz in Western Persia, to the north-east of Babylon, has been connected by Prof.

---

1 Lenormant "Chaldean Magie," p. 359-363. Ragozin "Story of Chaldea," p. 147.

2 See Pinches "Language of Mesoptamia" in J. R. A. S. 1884, p. 301. An ancient inscription reads; "The South is Elam, the North is Aecad, the East is Su-edin and Guti, the West is Martu." It is a most interesting and highly significant coincidence that Prof. T. De La Couperie points out that early Chinese immigrants placed their cardinal points the same way—see his article "Beginning of Writing about Thibet" in J. R. A. S., 1885, p. 449, Note 1.

3 See Pinches' Article just referred to.

Sayce with the mountain of Nizir, where, according to the traditions of the early settlers of Babylonia, the Chaldean ark rested. This mountain was a veritable Olympus, here was the home of the gods and here was the happy land of Aralli, where the spirits of the most blessed were allowed to live a happy existence, though the majority descended by way of the setting sun to an under ground world of spirits.[1]

We seem, therefore, justified in concluding that these early settlers were Turanian tribes from near the Altai mountain range. Can we now form any conclusion as to the date of this migration? At present, all we can do is to make certain general statements. We notice that when they left the home land, they worked at least some of the metals, since the sign of copper occurs. They were, therefore, probably leaving the Stone Age behind them. They were later in time, then, than the majority of the Neolithic inhabitants of Europe. It is an almost hopeless task to give any definite date. From what we have seen to be probably true of the slow Semitization of these inhabitants, we conclude that the process was certainly a very slow one. After this process was completed in Northern Chaldea, a king ruled at Agade[2] that is generally known by the name of Sargon I. The date of his reign is now generally acknowledged to be about 3800 B. C.[3] Yet at this early date Northern Chaldea had become completely Semitized. The ancient language of the country existed only as a sacred language. The mass of the people did not understand it. It was, however, the language of their sacred books, their magic formularies, their myths and

1 Sayce "Freshlight from Ancient Monuments," London, 1884, p. 32 and 35. Lenormant "Chaldean Magic," London, 1877, p. 132 and 168.

2 The Accad of Gen. X. 10.

3 How this date is arrived at will be explained in a future chapter.

legends, their hymns and prayers. In order, therefore, to provide against the calamity of loosing its knowledge altogether, great compilations were made together with a translation of the same into the Semitic language. Grammars, vocabularies and reading exercises were also made-in short, it is by these means that our scholars have been able to come to an understanding of Turanian Chaldea.[1]

Engraved Stone with Sargon's Name.

It is evident that this early date, 3800 B. C., by no means goes to the beginning of Civilization in ancient Chaldea. Long, long before this date, a tribe in the southern part of Chaldea, with headquarters at what is now Tello, evidently raised themselves to a high pitch of culture. M. DeSarzec, making explorations there, uncovered the statues of one of their *patesi* or priest-king, literally their chief, bearing the inscription of Gudea. This belongs, not to the most ancient, but still to an early period, when the Semite was not yet in the southern part of the land. The inscriptions are in a Turanian language only, and the characters in which they are written stand very close to the hieroglyphics, out of which they were developed. The heads of the statues show the typical Asiatic features, and they are shaved and turbaned like the Asiatics of to-day.[2]

---

1 Ragozin "The Story of Chaldea," N. Y. 1886, p. 208. We do not think Sargon should be given this credit See Hommel Babylonian und Assyrian, p. 305-7.

2 See Ragozin Op. cit., 214. See also Sayce in "Contemporary Review" for 1886, p 104..

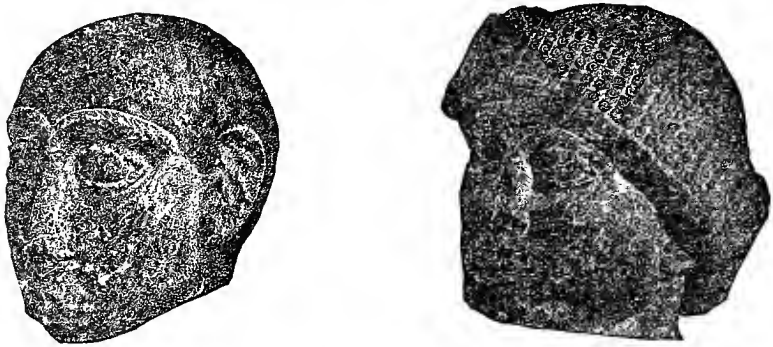
We call these earlytribes Turanians, but what did they call themselves? As a matter of course, each separate tribe bore a special name but, generally, related tribes have a race name as well. Now on such a subjuct as this, no one is entitled to express an opinion who has not made an especial study of Assyriology. We will, however, make a mere suggestion. Classical literature knew of many tribes dwelling in the eastern part of Armenia, whose names all commence with some sound of K. For instance, we have *Kardakes*, *Kardouchoi*, *Karduaioi*, *Kurtioi*, *Kosscans*, etc., and, in modern times, the *Kurds*.[1] This is admittedly the direction from whence the Turanian tribes entered Chaldea. One of the principal tribes of Turanians in Chaldea was the *Kaldi*, afterwards of sufficient importance to give their name to the whole country. We would suggest that collectively these tribes were the *Cushites*, and that this was the race name of the Turanian Accads. None of these Cushite tribes, we must remark, were strong enough to retain their race qualities. Those in Armenia became Aryanized, just as those in Mesopotamia became Semitized.

Gudea Statue.

[1] Lenormant "Chaldean Magic," p. 361.

This however is not given as a "result" but as a suggestion worth considering.[1]

Now, what was the culture of these Turanian tribes, that is, before they became mixed with the Semites? This point is a difficult one to decide, yet it is important. We think it has been overestimated. Not sufficient care has been taken to separate the pure Turanian culture from the same culture improved by contact with the Semites. We see no reason to suppose that the literary compilations, of which we spoke, give us a faithful picture of Turanian cul-



Heads from Tello.

ture, but rather of the mixed culture of the Semitic and Turanian tribes. Let us try and set forth what we think the culture was. In regard to tribal life, it was doubtless well developed. Turanian tribes, generally, had con-

1 This rather bold suggestion has some facts in its favor. See Mr. Pinches' article in J R. A. S. for 1884, p. 302; and especially see Lenormant Op. cit., p. 362. He shows that in classical times the inhabitants of Armenia possessd the same legend as those of ancient Accadia about the Chaldean ark resting on Mount Nizir [Rowandiz?] and remarks "The inhabitants of these same mountain regions, who have kept the name of Kurds up to the present time, became Aryanized many centuries ago .. but before that ..the Cuneiform Monuments exhibit their country as occupied exclusively by Turanian tribes closely allied to the Turanian tribes of Chaldea." [Lenormant, however, does not accept our statement.] We submit that such a suggestion as we make above removes many difficul-

siderable ability in this direction.[1] In full accordance with this, is the fact that the Semitic tribes copied to some extent the organization of the Turanians. This is shown by the names of officials adopted from the Accadians. The general-in-chief of the Semitic forces bore an Accadian title.[2] The Accadian word *sak*, meaning officer, re-appears in the title of a number of Semitic officers, amongst others in Rab-sha-keh or prime minister.[3] The old title for chief *Patesi* becomes the Semitic title for vice-roy.[4]

In their social life, we must notice several things. Though the Turanians were one of the first people, probably, to change to male descent, yet, in several ways, the former higher rank of the mother is shown. "The son who denied his father was sentenced to a simple fine, but he who denied his mother, was to be banished both from land and sea."[5] It might be remarked, that this feature of social life is still a distinguishing feature of the Turanian race. As the Turanian people early adopted the descriptive form of relationship,[6] which probably did not originate until monogamy became fully established,[7] it is interesting to know that, apparently, the Turanian Accad could form a legal marriage with but one wife.[8]

---

ties about the Kushites, or Cushites. Amongst others it would settle the dispute so hotly waged between the French and German Assyriologists whether the Cushites or Semites were the ones who brought a higher culture to the Turanian tribes [See Ragozin p. 186.] Notice that all the cities mentioned in Gen. x. 10, as Cushite cities were, at least in their first stage, Turanian cities.

1 Lenormant Op. cit, p. 373. The Mongols, at a subsequent date, founded the greatest world-wide empires that ever existed. See Prof. Jüly in J. R. A. S., 1882, p. 43.

6 This Vol., p. 100. 7 Ibid. 104. 8 "Chaldean Magic, p. 384."

In other directions, they seem to have made considerable advance. The joint family was certainly well developed and possibly the individual family as well. The father seems always to have had authority over his son. There appears the same sacredness about the house as among the Aryan nations, arising, as we have seem in a former chapter, whenever the joint family was well developed.[1] This house was a "sanctuary." A house-father could settle on

Origin of Cuneiform Writing.

a member of his household a portion of land but could not compel him to leave the community. On the other hand, the power of the house-father had not gone to the despotic length it subsequently did among some branches of the Aryans. Thus, he could not disown his son without risk

[1] Page 217.

of banishment, and he was even held responsible for his treatment of slaves.[1]

In the direction of practical knowledge, we have seen that they brought with them the elements of cuneiform writing. It was certainly in a very crude state and perhaps owes its development to Semitic influence. In this cut, we have a specimen of this early Writing. It is considered as proved that the Turanians also introduced the system of irrigation by means of canals and brought agriculture to quite a high stage.[2] They probably possessed but the rudiments of astronomy.[3] In this matter, the culture mostly came from the Semites. On the other hand, inasmuch as other branches of the Turanian race, such as Uigers, Mongols and the mantchoos, as well as the Chinese, based their calculations of time upon the number sixty, and as this is also the base of Chaldean mathematics, we conclude that the Turanians were the inventors of the system.[4] Tables of the cubes of numbers from one up to ten have been found.

In their calendar system, it is difficult to decide just how much of it was Turanian and how much was Semitic. The year was divided into twelve months of thirty days each. Then every six years an extra month was added.[5] In early times, this month seems the have been added, sometime at one period of the year and some-times at another,[6] showing

---

a lack of system, Each day of the month was assigned to some particular god or goddess, and further considered as lucky or unlucky.[1] The most interesting fact is that, commencing with the first of the month, every seventh day of the month was a holy day, in fact, the same as the Sabbath of the Jews.[2]

We now approach an interesting part of our subject, the religious culture of the old Turanians, and, in this connection, we must constantly bear in mind the conclusions reached in a former chapter. Perhaps nothing will give us a truer idea of their real state of culture than a knowledge of their religious development. We have pointed out, perhaps with tiresome emphasis, that savages and but partially developed people are of the opinion that the surrounding world is swarming with spirits,[3] and that this belief leads to several collateral beliefs. It is not singular to learn that the Accadians believed in the surrounding spirit world also. According to their philosophy, spirits were at the bottom of everything. "They caused evil and good, guided the movements of the celestial bodies, brought back the seasons in their order, made the winds to blow and the rains to fall and produced by their influence atmospheric phenomena, both beneficial and destructive. . . There were spirits everywhere. In the starry heavens, in the earth and in the intermediate regions of the atmosphere: each element was full of them, earth, air, fire and water; and nothing could exist without them."[4]

---

1 Compare with Vol. I., p. 731-2.

4 Lenormant "Chaldean Magic," p. 144. See also Sayce in "Records of the Past," Vol. I., p. 131. Sayce "Babylonian Life and Hist." p. 131. Sayce Assyria," p. 55. "The Accadians believed that every object and phenomena of nature had its *zi.* or spirit."

We may look, then, for the usual accompaniments of such belief, and we find a splendid exhibition of barbaric and savage philosophy. As might be expected, all kinds of sickness were thought to be the results of evil spirits that had taken up their residence in the body. We can see, then, that the theory of medicine in Chaldea was very simple. Care must be taken to guard against evil spirits, or, if they had fairly taken posession of a body, to drive them hence. To drive away the evil spirit, prayers were made to good spirits or their services were commanded by means of charms and incantations. The following prayer was made over a sick man. "May the goddess wife of the god.....turn his face in another direction, that the evil spirit may come out of him and be thrust aside, and that good spirits and good powers may dwell in his body."[1]

Sometimes the images of gods were brought into the chamber, for the belief was very firm that these fetiches could expel the evil spirits. In one place we read the following direction; "Place the guardian statues of Hea and Marduk at the door, on the right hand and on the left." In addition to this, holy texts, were to be employed. The people were commanded to place to the right and left of the threshold "holy texts and sentences, and to place pieces of parchment or papyrus inscribed with holy texts on the statues." The following very definite directions are recorded: "In the night time bind around the sick man's head a sentence taken from a good book." In still more serious cases, recourse was had to a mysterious substance called the *namit*, but we are ignorant of its nature. It was to be used as follows; "Take a white cloth. In it place the *namit*, in tbe sick man's right hand, and take a

[1] Fox Talbot in "Records of the Past," Vol. III., p. 139.

black cloth, wrap it round his left hand. Then all the evil spirits, and the sins which he has committed, shall quit their hold of him and shall never return."[1]

Now without extending this part of our subject, it is sufficient to remark that the belief in magic and sorcery was, as we would expect, fully developed. We have seen that this state of culture necessarily arises, when once the idea of innumerable spirits, swarming everywhere, has been formed Here is an incantation against a magician. "He who forges images, he who bewitches, the malevolent aspect, the evil eye, the malevolent mouth, the malevolent tongue, the malevolent lip, the finest sorcery; ... Spirit of the heavens conjure it! Spirit of the earth conjure it!"[2] In this matter, the ancient Chaldeans were in much the same state of culture as African tribes of to-day. The fear of their life was the magician. In their opinion; "There was no evil which the sorcerer could not work. He ordered at will the fascination of the evil eye or of unlucky words; his rites and formulas for enchantment subjected the demons to his orders; he let them loose upon the person he wished to injure, and made them torment him in every way." He could destroy life itself by means of waxen figures,[3] and, by magical imprecations, he could compel to his services both demons and gods.[4]

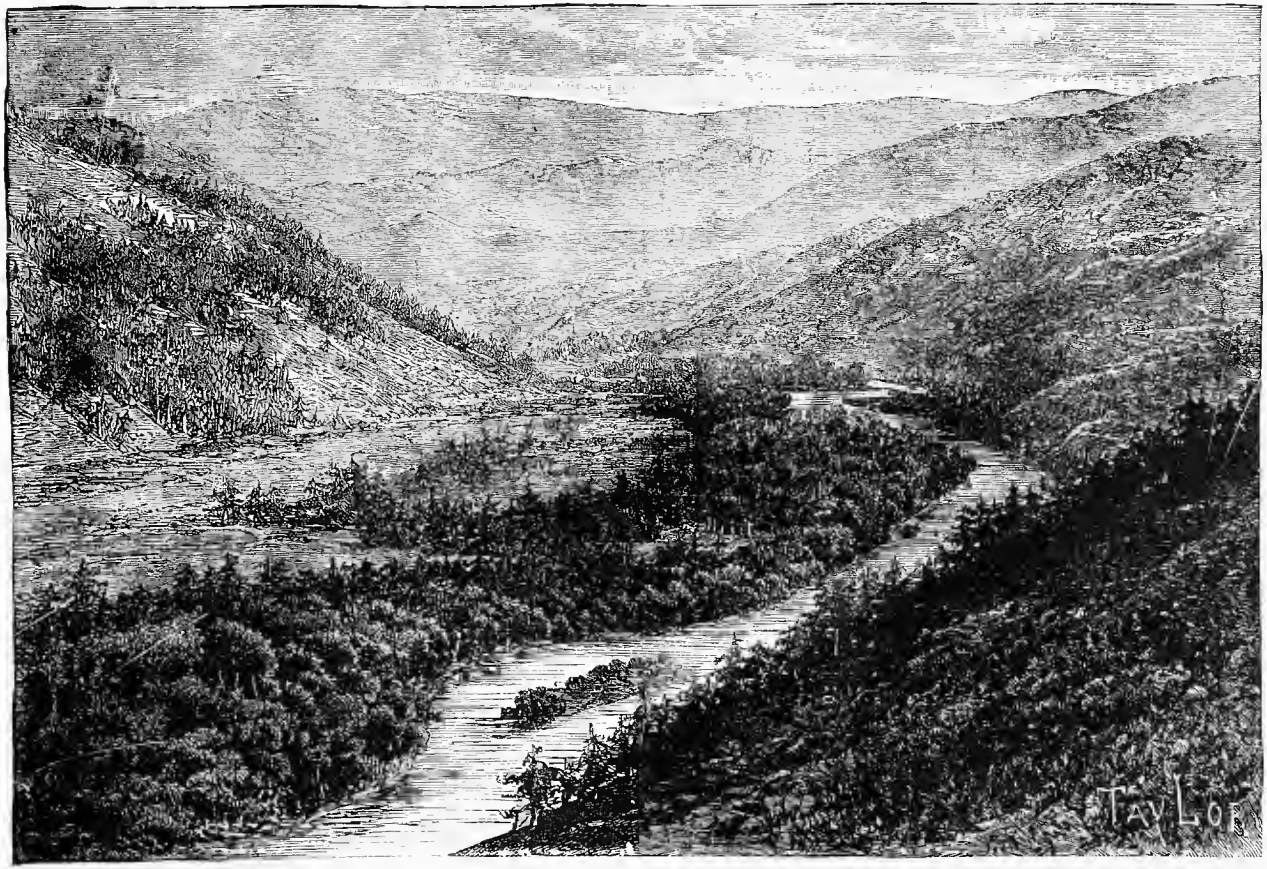
We must hurry on. Let us see what further progress had been made in religious belief. Have we any trace of Ancestor worship. This belief, as we have seen, necessarily accompanies the foregoing philosophy. On this point, we have but very little light indeed. Yet we feel sure that

---

1 Ibid. 2 Lenormant Op. cit., p. 5. Compare the "forging of images" what is said in this volume, p. 317.

3 Compare with p. 323.

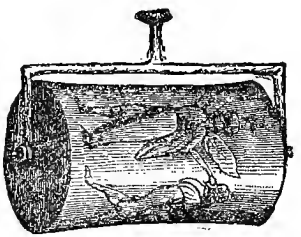
4 Our authority for these statements is Lenormant's oft quoted work.



HOME LAND YELLOW RACES.

this was a part of their religious belief. In the first place, this is a fundamental part of Turanian belief at the present day.[1] We know this much that they believed the soul of each individual (there were indeed two souls, a male and a female) was a god, corresponding exactly to the Persian *Fravishis*, and we have seen that they were worshiped after death.[2] We are of the opinion that when further light shall have been shed on this obscure subject it will be found that ancestral spirits played a most important part.

We are on firmer ground when we talk about Fetichism. There is no doubt that they were firm believers in the power of fetiches. The fetiches of the Accadians were called talismans, and were of very different make. Some of them consisted of bands of cloth covered with written formulae and were fastened to the furniture or the garments. Amulets of various kinds were worn around the neck as safeguards against diseases, demons and misfortunes. These amulets were frequently of hard stone engraved with figures, and contained sentences of some magical formula. They knew also how to make fetich images, which, placed underneath the threshold of a house, would protect it from all harm. Such images have been dug up under the pavements of palaces.[3]



Cylinder.

It is also thought that many of the sculptures that are found on the walls of old palaces are really talismanic. That is they were fetiches placed there to guard the

[1] This Volume, p. 297. [2] Page 299.

[3] Lenormant "Chaldean Magic," p. 50.

palaces. Thus the winged bulls placed in the gateways were guardian fetiches.[1] But the Accadians had evidently passed the first stage of Fetichism and had entered on Polytheism. An effort had been made to reduce the innumerable spirits of the first stage to some orderly arrangement. Seven general classes seem to have been formed, and each was further regarded as divided into groups of seven[2] We know but very little about the ranks of these various gods. Though some were good and some were bad, yet no question of morality was raised. Indeed, inscriptions exist, showing that some spirits belonging to the evil class are sometimes considered good. Thus, *Utuq* is the name of a class of evil spirits; but favorable Utuq are frequently opposed to evil Utuq.[3] It seems that each class of evil demons had power over a certain part of the human body; one upon the forehead, one upon the chest, etc.[4]

Winged Bull.

It is interesting to trace the development of the great fetich gods, which afterwards became the greater gods of their polytheistic pantheon. We are not surprised to learn that the fetich-sky was their chief god. The sky,

[1] Ragozin "Story of Chaldea," p. 164.

[2] Seven, it will be noticed, was a sacred number. The seven classes consisted of two good classes, *Mas* and *Lamma*, and five evil classes, viz: *Utuq*, *Alal*, *Gigim*, *Telal* and *Maskim*.

[3] Lenormant, p. 148. [4] Ibid 36.

according to their notion, was a solid substance separating the celestial waters, which at times descend as rain from the waters beneath, that is the all-surrounding ocean, on which the hollow earth floated. The sky was *Ana*, or as a fetich was spoken of as *Zi-ana*, literally, *spirit-heaven*. In this form he is always addressed in the inscriptions that have come down to us. "Spirit of the heavens conjure it" is always the acclaim. At a later date, Ana re-appears as a chief god.[1]

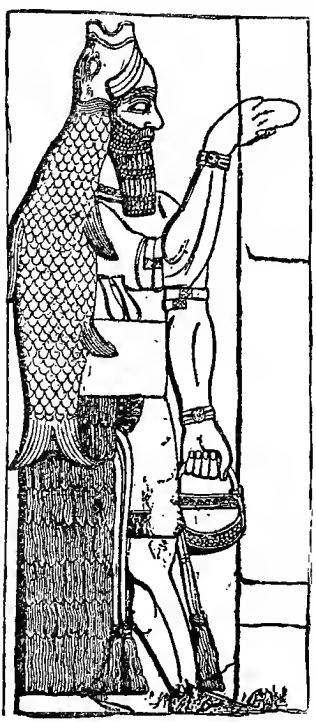
We saw, further, that rude tribes make a great fetich-god of the earth. This is often considered the beneficent mother of all and takes high rank as a fetich. It was just so among the Accadians. The inhabitable surface of the earth was *ki*, under the form of *kia*, it meant both land and water. The incantation against the magician, given some pages back, ends with the phrase "Spirit of the earth conjure it." Here the original is *Zi-ki-a*, "spirit of earth and water." But this fetich-god early became separated from its material object, and so received a separate name. In this case the name was derived from one of the titles of this god. He was called first *In-ki-a-gi*, meaning "Lord of the earth's surface;" then, in course of time, it was gradually shortened, first to In-ki-a, then to I-a, which is usually written Ea or Hea. This god Hea or Ea is spoken of as the god of the waters or the deep.[2]

It is interesting to note the great importance of this god derived from the fetich-earth, the mother of all. As

[1] Now, that a number of scholars have pointed out the connection between Chaldean culture and that of the early Chinese, it is safe to point a resemblence between the name of "*Tien*" or "*Thian*" the chief god of the Chinese, and *Zi-ana*. Thus *Thi-ana* and *Zi-ana*.

[2] See Sayce "Assyria," p. 56. Also "Babylonia," p. 128, or "Ancient Empires of the East," p. 146. We follow Hommel. Op. cit., p. 254. Ragozin, "Chaldea," p. 154, says that Hea was the great spirit of earth and water which is exactly the conception.

all was derived from him, he was the god of wisdom. He especially cared for his children, men. His care preserved them from sickness and charms. Even when under the influence of the most powerful sorcery, *Hea* could release them, for he knew all things. He was invoked when other gods failed. He was god of both earth and water, and in Chaldea water was a most precious element. So the ocean was regarded as his especial home. Hence we understand how they came to represent him as part fish and part man, and we understand the old legendary story that Berosus had to relate of the early Babylonians; how a monster, part fish and part human, came up out of the Persian Gulf and instructed them in all things pertaining to Civilization.



Fish God.

It is, perhaps, not necessary to say more of the Chaldean gods. We can understand how the sun, moon, fire and the planets would all give rise to greater polytheistic gods. Let us now see what was their ideas as to the future world. There is the usual confusion which we notice in the beliefs of rude tribes generally. That the first stage of belief was that the spirits of the departed continued to reside in the near neighborhood, seems indicated by several considerations. One is that the various classes of evil spirits are supposed to reside, some in near deserts, some on the neighboring heights and some in the

towns.[1] At a later stage they believed in an especial place of abode for the dead. This was the hollow interior of the earth. Here the great majority of disembodied spirits went to reside. The entrance to it was across the waters, by the mountains of the west, where the sun set.

This abyss or *ge* was ruled by a god and goddess *Mul-ge* and *Nin-ge*. Their conception of the life led here was certainly of a most gloomy kind. Here was "the home which one may enter but never leave, towards the road from which there is no return." This was the home of all. The same fate awaited all "whatever may have been their conduct during life." It was only at a later stage, under the influence (we think) of Semitic culture that the idea began to prevail of a happy home for those deserving it. Then did the righteous man, who had been constant in the duties enjoined by the gods, comfort himself in his last sickness by the thought that the god Marduk and the goddess Ishtar would approach his chamber, that he should hear the voice of Hea, and that like a bird his soul would fly to a lofty place, to the holy hands of its god.[2]

Let us now sum up some conclusions on the ancient Accadians. They played their part in the great drama of the world's history and disappeared from the stage of action a number of thousand years before the Christian era. Yet we feel confident that they wandered forth from the great home land of the Yellow Races, the vicinity of the Altai mountain range in Asia. They were doubtless far in advance of the majority of the world's inhabitants at that far away time, but their culture was indeed crude, judging from their religious conceptions. Further, just as Mr.

[1] Lenormant, p. 49.

[2] Talbot "Records of the Past," Vol. III., p. 34, 135 and 141.

Pinches has shown, that, even at the earliest stage in which we can detect them, their language shows all signs of being a decrepid worn-out language, so we conclude they had reached the limit of development for the Yellow Races. Just as these tribes lost their purity of blood and disappeared in an ethnic sense and became merged in the ranks of the advancing White Races, so did their culture become merged in the culture of the new comers. The tendency has been, we think, to give too high a value to the influence of their culture on that of the ancient world. They formed but one element of the culture of ancient Chaldea, and that not the most important one.[1]

The Accadian tribes, however, formed but a small part of the Turanian tribes migrating to the west, and Chaldea was but a small part of the territory they settled. To the east of Chaldea, was Elam, and further north, Media. We are certain that the original inhabitants in these countries were Turanian tribes.[2] It was among these tribes, that the Aryan Persians made their appearance about the middle of the ninth century B. C.[3] But these Aryans only constituted the ruling tribes. One striking point, showing their superior energy, is the fact that they succeeded, in time, in Aryanizing all these tribes. Their language and culture supplanted the language and culture of the Turanians. We have no good account of the culture of the latter, having the most complete details in respect to their religion. This was, as we would expect, thoroughly Shamanistic. The worship of fetiches, especially the fire, was very pronounced; and, of course, they believed in

---

1 Lenormant, Op. cit., p. 377.

2 See Lenormant who states that the labors of Westergard, De Sauley, Norris, Oppert and Mordtmann establish this opinion.

3 Rawlinson "Seven Great Monarchies," Vol. II., p. 430.

magic and spiritism. The power of their magicians, Shamans or priests was very great. They were called magi. It is sometimes stated that they formed a distinct tribe by themselves. This is so improbable a statement that we have no hestitation in rejecting it. Each and every tribe had its own priests, and they doubtless took care that the youths admitted to their ranks should be the ones most fitted for the duties. And in this respect, mental fitness was regarded.[1] This was exactly the state of affairs among our Indian tribes and is to-day true of the Shamans of the Siberian tribes. Of course, as Civilization advanced, and the tribes became more closely connected, they would tend to form a class or caste by themselves; and, finally, when, as in the case of the various Armenian tribes, their very existence was threatened by the conquering Persians, they would present a united front and so might be spoken of as a tribe, but they could never have formed a tribe in the proper sense of the word. In Chaldea, the Turanian inhabitants exercised a great influence on their conquerors by means of their religious views; so in Armenia, the magi succeeded in greatly influencing the Persian religion.[2]

From what we have now seen to be the distribution of Turanian tribes just before the dawn of history, we would naturally expect to hear of their further extension in Asia Minor. We think the probabilities are that all Southwestern Asia was inhabited by them. But the Semitic tribes had dispossessed them of large parts of this area long before the dawn of authentic history. However, we have within the last few years, within a decade in fact, become

---

[1] See page. 326.

[2] See This Series, Vol. III., Chapter II. For a general view of Magian religion. See Rawlinson work cited, p. 60 and 62. Herodotus mentions the magi as a tribe. Also Lenormant "Chaldean Magic," Chap. XV.

aware of a warlike branch of this people who, under the name of the *Hittites*, held a controlling influence ni Asia Minor and Palestine. This is one of the most unexpected results of modern research. The Hittites were, probably, the chief among a great many allied tribes; or, perhaps,

Hittite Confederacy.

it was but a general name for all the tribes. According to our view, they were all Cushite tribes. The Assyrian monuments speak of them as the *Khattai*, the Egyptian as *Kheta*, the Bible as *Hittites*.

Classical history knew nothing about these people

and never mentions them; Homer speaks of them once as *Khateioi*;[1] and yet, thanks to the efforts of recent scholars, we now know of the existence in the territory pointed out, of this powerful tribe or confederacy, which, for some thousands of years previous to its final overthrow at the hands of the Assyrian Sargon in 717 B. C., held the balance of power. They were strong enough to cope with Egypt on equal terms and compel a commercial and social alliance. Egypt, in her most palmy days, could not wholly reduce them, and Assyria only accomplished it after some centuries of warfare. In their culture, they greatly influenced the culture of the Aryan tribes on the western shores of Asia Minor and through them the Greeks of classical times. It is a striking commentary on the transitory nature of human fame, that this erstwhile mighty people had so completely disappeared from the pages of history that all knowledge of them was lost.

Probably the oldest account referring to the Hittites is from Chaldean sources. At the time of Sargon I of Agade (or Agane) whose reign, as we have seen, probably goes back to 3800 B. C., the Hittites are mentioned as being a great power in the land,[2] in an astronomical tablet of this king we read; "The king of the Hittites plunders and on the throne seizes;"[3] and, on another tablet, we are told of a strong enemy spoiling the country and placing the Accadians under tribute.[4] The enemy is said to "tyrannically march through the land," and we are told that this subjection lasted thirty years. The suggestion is made that these references are to the Hittites.[5]

[4] Ibid. 161. [5] Wright "Empire of the Hittites," p. 36. It should be added that there are serious doubts whether these references are really

The writer of Genesis represents the land of Canaan as in the possession of the Hittites at the time of Abraham[1] and represents the latter as moving among these more settled tribes. In Egyptian history, the Hittites first come before us in the records of twelfth dynasty; when we have a record of towns and palaces of the Hittites destroyed on the very borders of Egypt. This shows that they were, at that time, the ruling people in Southwestern Asia; there is some authority for concluding that the Hittites were the mysterious Shepherd kings of Egypt.[2] Passing this point by for the present, it suffices to point out that the Hittites were, at that early time, a great people.

It is interesting to show references to the Hittites in the pages of the Bible, as this is the only source of reference to them except from Egyptian and Assyrian monuments. We have already pointed out a few references above. Hebron was, in fact, a Hittite city. The Canaanite who had betrayed his fellow citizens at Bethel to the Israelites, dared not entrust himself to his countrymen, but went away "into the land of the Hittites."[3] We read also of wars between David and the Hittites,[4] but the relations between the Jews and the Hittites were often pleasant. They intermarried, even the mother of Solomon is said to have been the wife of a Hittite.[5] Commercial dealings were common. Solomon imports horses from Egypt which he sold to the Hittites.[6] In later years, the Syrians fled panic stricken from the siege of Samaria, for they fancied they heard the Hittite army coming to the assistance of the Israelites.[7] These Bible references are at a late date in the

of the same age as Sargon, Hommel "Babylonien und Asyrien," p. 304-8.

history of the Hittites. Before the migrating Hebrews entered Canaan, it was largely in possession of the Hittites. They were the leaders in the coalition of tribes that met to oppose the invading Semites.[1] Jerusalem itself was, probably, an ancient stronghold of this people.[2] We have referred to the statement that, probably, the Hittites were represented among the dynasties of the Shepherd kings. At any rate, when Egypt succeeded in freeing their land from these hated foreigners and became an invading and conquering people themselves, the people against whom they directed their vengeance was principally the Hittites. The eighteenth dynasty, which finally drove out the Shepherd kings, was a warlike family. Thothmes I., about the middle of the seventeenth century, after consolidating his power in the southern part of Egypt, resolved to "wash his heart," that is to revenge the insults offered to Egypt by invading people from Asia Minor. Now commenced a war between Egypt and the Hittites, which, with varying fortune, lasted for nearly five centuries.

Thothmes III. was especially active in this matter, and from the twenty-third to the fortieth year of his reign, he made some fourteen expeditions against Western Asia.[3] He was very successful in reducing the scattered tribes to tribute. Most interesting records of the wars of this king have come down to us. They show us that, at this early time, the Hittites were the leaders in the great confederacy formed to oppose the Egyptians. The opposing forces met in a great battle before the town of Megiddo. We have the details given of a council of war held by the Egyptian king at Ihem. The king informed his generals that the king of Kadesh (Hittite capital) had arrived at Megiddo, that he

1 Josh., IX. 1., XI. 3., XXIV. 11. 2 Ezek., XV. 13.
3 Brugsch "Egypt under the Pharoahs," Vol. I., p. 363.

had assembled the kings of all the people who dwell from near the waters of Egypt as far as the land af Naharain (Mesopotamia.) The best road to Megiddo was then discussed, and then follows the accounts of the battle in which the Egyptians were successful, and tribute was imposed upon the allies.[1]

A list is given of one hundred and nineteen towns and nations represented by the confederates. Here we must make allowance for Oriental exaggeration. Though campaign follows campaign, and the "vile Kush," that is the Hittites, are represented as crushed, yet it was only along the borders of the Hittite country generally, that the war raged. About two hundred years past by of comparative quiet between the Egyptians and the Hittites. Finally, about the middle of the fourteenth century B. C., a warlike king, Seti I., reigned in Egypt. With him, commences another series of campaigns aginst the Hittites and their allies, and the advantage seems to have remained with Egypt. Seti was succeeded by his son Rameses II. We judge that the Hittites had quietly gathered their forces to test the question of strength. In the fifth year of Rameses II., we find him with his forces before Kadesh on the Orontes; where were gathered the forces of the Hittites and, among these confederates, there are some that possess for us the liveliest interest. These are the confederate forces from Western Asia Minor. The Dardani and the people of Ilion, together with the Lycians, Myscians, Carians and others are mentioned.[2]

The great battle of Kadesh follows, where the forces of Asia and Africa contend for the supremacy. As we are

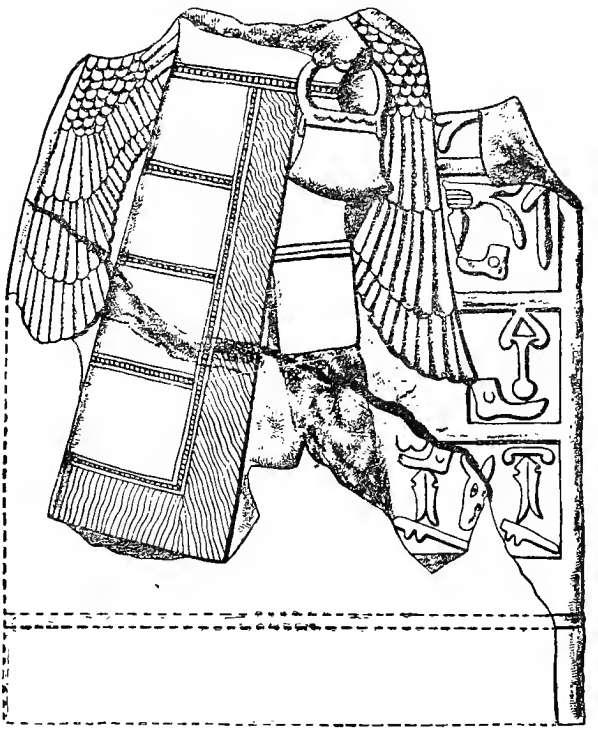
following an Egyptian account, it is not strange that they should represent the Egyptians as the successful ones, but, in point of fact, it was a drawn battle. Only with the utmost difficulty, Rameses himself escaped with his life. After the battle, the Egyptians immediately return to Egypt. There is no list of plunder borne home by them, and the best proof is that a treaty is entered into between



Hittite Art Inscribed Stone.

the Hittites and their allies on the one side, and Egypt on the other, by which both sides agreed to respect the other's territory. As is so often the case in ancient history, a dynastic alliance followed the diplomatic one. Rameses married a daughter of the king of the Hittites, and thus the two greatest nations of the time became friends to each

other, in the Egyptian temple of Abu Simbel, is a sculptured representation of this great battle. We will only notice one point in this scene—that is the representation of races. "In this picture the Hittites and their allies are represented as distinct races with different weapons. The one race (the allies) are bearded, the other, beardless and... the Chinese-like appearance of the Hittities who have long pigtails (!) is very remarkable. They are of a light red color with high caps."[1] We will have occasion to refer to this great battle scene again.

This treaty between the Hittites and the Egyptians was long respected. About a hundred years later, we find "a great confederacy assailing Egypt by land and sea. Rameses[2] defeated the invaders in a great naval engagement near Migdol, at the Pelusiac mouth of the Nile. He then proceeded to wage a campaign of vengeance in the home land of the invaders. He was victorious, and among the names of the conquered on the temple of Medinet Abou is that of the miserable king of the Hittites as a living prisoner."[3]

Here they disappear from Egyptian history. These scattered notices show us that, for more than a thousand years, the Egyptians and the Hittites stood facing each other. The shock of invasion from Egypt appears to have exhausted itself along the frontier, leaving the greater part of the Hittite territory untouched. From this time on, we follow their history by means of Assyrian inscriptions.

We have already pointed out that at the time of Sargon I. the Hittites are mentioned with great respect as a mighty people. Many centuries later, under the reign of Tiglath-Pileser I., we again meet with the Hittites as a

2 Rameses, III. 3 Wright "Empire of the Hittites," p. 35.

most formidable power beyond the Euphrates. This king's entire reign was little else than a series of campaigns against the Hittites.[1] In one inscription, he says; "There fell into my hand altogether, between the commencement of my reign and my fifth year, forty two countries with their kings, from beyond the river Zab to beyond the river Euphrates, the country of the Hittites." For about four hundred years, the inscriptions show the Assyrians in continual conflict with the Hittites. Two points are to be noticed.

Semitic culture and influence from the very earliest times had been on the increase in South-western Asia, and the time was drawing near when it was to sweep every thing before it. The Hebrews, Syrians and Assyrians now confronted the Hittites all along their border. While the Semites, and especially the Assyrians, were gathering strength to crush everything before them, the Turanian Hittites were loosing ground. No powerful confederacy appears to unite the scattered tribes under one powerful leader. Turanian rule in Western Asia was doomed to defeat before the growing power of the Semites.

In the second case, we must notice the extravagant statements of old annals. Year after year, the same people and cities are represented as being totally destoyed. We must constantly bear in mind the nature of an Oriental conquest. A marauding expedition starts out, the cities along its march are confronted with a demand for tribute. If they yield, well and good. Their name is enrolled among the conquered ones and on the force marches. The danger past, the people throw off the yoke and are ready to be conquered anew the next year. Thus, scattered through-

1 Here the word *Hittite* is used in a wide sense, meaning the people of Western Asia.

out the Assyrian records for about four centuries, are continual references to Hittite cities destroyed or laid under tribute. At length, we come to the time of Sargon who completely broke the Hittite power and carried away the principal tribe as captives. From this date, 717 B. C., the Hittites disappear from history.

We have been thus somewhat full in sketching the historical outline, because it is such a new field. Slight as is the foundation thus laid for a history of the Hittites, it is all that we now possess, and this has become known only within the last few years. From it we dimly perceive the presence in South-western Asia of a great confederacy of Turanian tribes. This confederacy appears at its greatest strength just as history dawns. We gather, further-more, that the territory was occupied by a vast number of mutually independent tribes, so typical of ancient society in general, that it was only now and then that great and powerful confederacies were formed, such as confronted the Egyptians. From the very earliest times, we detect these tribes gradually being forced back before the advancing Semitic and Aryan tribes.

We have spoken of these tribes as Turanians. Probably this conlusion will be strengthened as time passes on, and more records inscribed on ancient monuments are read by our scholars. We may, however, have to revise this conclusion. We have seen the presence in their name of that phonetic element represented by K. They are the "Hittites of the Old Testament, the *Kheta* of the Egyptian monuments, the *Khattai* of the Assyrian records and the *Khateioi* of Homer."[1] We have seen how the Turanian tribes of Chaldea (Khaldea) are intimately connected with these same tribes. We shall show a few pages further,

1 Taylor "The Alphabet," Vol. II., p. 120.

that the archaic reading of the name of the first Turanian dynasty in China is *Kutti* or *Kutta*. In our opinion, these tribes with this phonetic element in their name are Turanians; and they are, in fact, the Cushite tribes of the Old Testament.

We have already referred to an interesting observation by Captain Conder on the physical appearance of the Hittites depicted on the Egyptian monuments. Others have noticed the same peculiarities. Says Prof. Sayce; "They were thick-set and somewhat short of limb, and the Egyptian artists painted them without beards, of yellowish white color, with dark black hair.[1] And Sir Charles Wilson; "The sculptures show that the Hittites did not belong to a Semitic race. The features are rather those of a northern people; and, on the temple of Ibsamboul, the Hittites have a very Scythic character, with shaven head and a single lock from the crown."[2] Captain Conder further remarks, on this point; "It will, in the end, probably be found that the Hittite and the Accadian come of one stock; akin to the old, dark Turanian race, which the Semitic Assyrian subjugated in Chaldea; and the pig-tails of the Hittites seem to point to their kinship with the Mongols and Tartars—the oldest, perhaps, of existing Asiatic races.[3]

One feature about these Turanian tribes in Southwestern Asia must now be pointed out. That is their susceptibility in absorbing the culture of more highly organized races. We have already pointed out how the Turanian tribes in Chaldea became, in course of time, Semitized. This points to an extensive intermixture of

1 "Fresh Light from Ancient Monuments," London, 1884, p. 97.

2 Wright "Empire of the Hittites," p. 85. The word Scythic above means about the same as Turanian. 3 "Heth and Moab," p 27.
